Here Sam paused for breath, and, looking up for the first time, caught the scowl on the chairman's face, which, as he glanced around, was plainly reflected in the others. Sam had come from the west, and had ideas which did not fully accord with the time honored standard of Gloucester county, and, moreover, was allowing the farm which he had come in possession of by the death of his old father-in-law, to run down, which was alone a sufficient fact to warrant his silence when momentous questions were to be considered. Then, too, it was whispered that Sam was not above a pronounced affection for a certain brand of tamarack juice, in quest of which he made frequent pilgrimages to the town. It was on one of these occasions, when returning after a two days' visitation, that one of his horses had succumbed to the heat, and when discovered the next morning was dead by the roadside, while the other was in an almost helpless condition for want of food and water. Sam, however, seemed in no ways the worse for his experience and took the whole matter with a good natured, matter of fact manner, saying, "What's did is did, and there's no use croaking." This had been pronounced a fitting climax, and since then Sam was under a ban. It made no difference to him, however, what people said or thought, and he came to the meetings just as before. What provoked them the most, however, was the fact that his ideas were generally good, even if new to them, and to have this makeshift, from no one knew where out west, presume to suggest to those who had grown up on the farms which had been in the family for several generations, was simply exasperating. Hence, Sam's speech, unmistakably in favor of the proposed electric road which was to connect several towns and villages, was all that was necessary to kindle the flame of opposition and settle the case, so far as that section of the route was concerned.

Sam settled back in his chair, and pulling out a black plug from somewhere in his dilapidated garment, deliberately cut off a generous piece, and after unsuccessfully offering it on the point of his knife with an interrogatory expression of countenance, as slowly placed it in his mouth.

"I hain't so all fired sutin about these trolleys," finally ventured Farmer Barnstall. "I've heard tell on how they was mighty dangus, and how as in one city where they wur, all the wells went dry, and how out west they didn't have no rain, and bimby it got so bad the guv-

THE CHAIRMAN.

ment had to send men up in balloons with lightnin' rods for to git the 'lectricity down outen the air so the clouds could git back again, and then it rained for two days and a night, and there wuz so much water saved up, and it came down so hard, that all the corn was laid flat and even in some places it broke in the barn roofs; and goodness knows we don't want no such foolin' goin' on here."

"Yes," chimed in Neighbor Gordon, encouraged by this arraignment, "my son Octavious, what has bean to college, he sent me a paper from Baltimore with the account in of his lawsuit what he won, and on the very front page it told how as the mayor had made the car folks put a kind of cow catcher on the end of the cars to keep the electricity from jumping out and killing people; and I heard that already how more than 300 folks, especially children, had got killed that way, and they couldn't stop it nor make the car companies quit runnin' the cars, cause they sayed the electricity cars cost 'em a big pile of money, and the law 'lowed 'em to run 'em for ninety-nine years without payin' no taxes. No, sir, I'm agin it."

At this juncture Pete Cook took his turn, and remarked that it would look very bad to have wires hung all along the road, and if they ever wanted to chop a tree and it happened to fall on the wires the tree would get full of lightning, and how was anybody going to remove the tree or chop it up without being killed. Sam Hull's suggestion that there wasn't a tree on Pete's place passed unheeded. Pete also dilated on the fact that if a bird, or maybe a chicken, chanced to roost on that wire it would be instant death, and that eggs had not hatched out very well this season and fowls were going to be high.

This evidently reminded Farmer Skaggs of something he wanted to say, for he broke in with—

"Yes, and jest as like if so be a grasshopper was killed on the wire and fell down in the stubble, and the turkeys came along and eat him, then the pizen would get in the turkey and like as not when the turkeys was eat next Thanksgivin' the folks as eat the turkey would get pizened, and then we couldn't sell no more turkeys, which you all knows is hard enough to raise, and how as copper is pizen, for didn't Bill Smyth's boy swallow a big copper cent and he died."

SKAGGS.

This overwhelming and impending disaster evidently found great belief, and in triumph, Skaggs looked sideways through the mass of red whiskers which enveloped his entire face.

Farmer Sibley, who sat in the back row and who had been listening very attentively, was now appealed to. When his name was mentioned he started, blushed like a schoolboy, but rose, and grasping the back of the chair next in front, pumped it up and down as if he was shaking down a bag of oats. Sibley was a well-meaning, harmless old fellow, who seldom ever said anything to anybody. It could hardly be said that he was imposing in appearance, for he was short and thick and was extra-

ordinarily bowlegged. Moreover, he had a way of protruding his lower jaw and working it spasmodically, keeping time with a blinking of the eyes, which made a striking combination, to say the least, particularly when observed for the first time. Mr. Sibley had two daughters, long and lank and lean, with colorless blue eyes and fiery red coarse hair, which was neither short nor long, and hung as straight as wire, quite after the fashion of a thatched roof.

Just why old Sibley guarded these unfortunate damsels for whom nature had done so much—such as it was—could not be explained. But he kept a big, cross dog, and took pains to inform the young men that they were not welcome around the place. Inasmuch as the girls were never allowed to go to church or town except when chaperoned by himself or the old lady, and inasmuch further that no young men had shown any inclination to even look at the house as they rode past, this surveillance is unaccountable. True, one day a spruce young fellow from the city had run the gauntlet of the dog, which he kicked with great exactness and vigor, and had poured words of admiration and regard into the famished hearts of the young women. He had also conversed fluently with the old people at much length on the necessity of guarding against the advances of designing young men, and had wound up by displaying a picture of a patent piano which parents everywhere were buying, with which to make home attractive and keep the young people from any desire to look elsewhere for amusement, and had finally secured old Sibley's note for \$300 for one of the afore-said music boxes, which promptly came, with freight charges collect, and out of which the only note which was ever extracted was the one Sibley signed.

General wonder was evident as to what Sibley knew about electric cars, or anything else, but he piped out:

"Mr. Chairman and President, I have listened attentively to all the speeches, and while I don't know anything to the contrary it may all be so. But the most important thing, it seems to me, has been forgot. If this electric railroad is allowed to come they will run cars, and cars don't run themselves. They take conductors. Is there any conductors here? Do you know of any electric conductors living in these parts? Did you ever see one around looking for jobs in harvest? No, I guess not. Who then is these conductors? I'll tell you who they be; they be them city chaps; that's who they'll be. And then what? With their city ways, and blue uniforms, and brass buttons, and a cap, and a badge, and a punch, and like as not shaved twice a week, and wearing posey's in their coats, they'll be making love to all the girls along the line; and more likely than not flirting with them, and throwing kisses as they shoot by. And pretty soon they'll be fetching candy and such things and the fust thing you know they'll be eloping with our daughters, more likely than not with *my* daughters, and then where'll I be?" and overcome by his emotions Sibley dropped exhausted in his seat and wept frantically.

MR. SIBLEY.

A painful pause ensued, which was at last broken as all eyes turned toward Squire Crosby. No one presumed to ask the Squire—they knew he would speak when he was ready. The Squire was known to take two papers and one illustrated magazine, and had even been to Philadelphia several times. What his decision would be was awaited with painful anxiety. Bowing to the chair and then to the assembled gathering he spoke in measured, thoughtful tones:

“Mr. President and gentlemen, the occasion which calls us here today is one of great and vital importance. What we do, what the decision of this assembly, will not rest alone with us, it will be more lasting, it will reach out into the unknown future long after we have been laid to rest beneath the sod, and will make our influence felt in generations yet unborn. We must not allow any personal expectation of individual aggrandizement to deviate us one hair’s breadth from the straight and narrow and inflexible path of duty. While there may be certain considerations which would seem to make such an undertaking desirable there are others which outweigh them in the scale of calm and unbiased judgment as the solid portion of this terrestrial sphere outweighs the oceans. But to my mind none of you have touched on the greatest evil, the most insidious danger. It may be, occupied as you are with other things and having had no occasion to study the secrets of this wonderful enigma, that you are unaware of the awful consequences which are buried within the dreadful secrets of electricity. You have heard how it has been chosen as the terrible instrument of death in one of the great penal institutions of our land, and how it there works out its fearful consequences and tears the spirit from the unwilling body of its victims. If you permit this road to be constructed you will be in constant peril of just such a death!”

A shudder of horror ran through the group and one or two looked behind them for what, they did not know themselves. Sam Hull alone was unaffected, and straightening out his right leg which was crossed over the other, spat vigorously at the toe of his boot, and smiled to see how near he could come without hitting it.

“Yes, I repeat, just such a death. Ever since electric roads have been permitted, people in the cities where they are, have been dying. At home, in their own beds, with loved ones by their side unable to aid or succor, they have died. And what has been the cause? What will be the cause if such a road is built here? Ah, I will tell you! I will write upon the wall the terrible word, the key with which to unlock the secrets of disaster. It is *electroleesis*! What is that you ask? I do not wonder you tremble at the word, and desire yet, fear to know. But I have studied for us all, that I may raise a word of warning and save you from such a fate. I have done this that you may act in time. It is impossible to confine this terrible agent, electricity. It will leak in spite of all they can do, and so when a car passes along it drops

THE SQUIRE.

unseen into the ground just as wheat or oats fall through the cracks in a wagon box. It soaks into the ground, but unfortunately it does not stay there. It finds its way into the homes of men, it lurks in the gas pipes and water faucets of the house, and spits out sparks of fire when a human hand touches them in the dark. How does it get there? When it soaks into the ground it seeks the water and gas pipes and gets inside of them, and when once in the pipes, of course there is only one way to escape, it must come out of those pipes into the house!”

The death-like stillness lasted but one second, for Sam Hull blurted out—

“Well, you old pumpkin, there haint no gas nor water pipes within ten miles of the Big Pike road, and I haint afeared of no lightning, wet or dry, inside or out!”

The squire did not even look at Sam, and before the assembly had time to reflect, proceeded to read the following resolution:

“RESOLVED, that the citizens of Bigfool township, in mass meeting assembled, hereby denounce the construction of an electric or other railroad as unnecessary and as inimical to the best interests of the public, nor do we approve of the use of the public roads, or any other land, public or private, for any such intent or purpose.”

The squire nodded to the chairman who called for a vote on the adoption of the resolution, and as the “ayes” still hung upon the air, pronounced the resolution adopted by a unanimous vote; and it was with great difficulty that Sam Hull, as he rose and gave his trousers a hitch, could be heard in the exercise of that prerogative which belongs to every American as he voted a disgusted—

“No!”

## THE METROPOLITAN L ELECTRIC CONTRACTS.

The contracts for the equipment of the Metropolitan West Side Elevated Railway of Chicago, have been let. Bids were entered for all or portions of the equipment by the following firms: General Electric Company, Schenectady, N. Y.; Westinghouse Electric & Manufacturing Company, Pittsburg, Pa.; Siemens & Halske Electric Company, Chicago; Walker Manufacturing Company, Cleveland, O., and Electric Construction Company, London, England. Owing to the tariff the latter company was entirely unable to compete. After due consideration the entire electrical equipment was let to the General Electric Company at a price, estimated, of from \$200,000 to \$225,000. Those most active in securing the contract for the General Electric Company were Captain Eugene Griffin, W. H. Knight and Theo. P. Bailey, the latter of Chicago.

The contract covers the generators, switch-board, motors, line and construction work. Four generators are called for, two of 1,500 Kilowatts each, to run at 75 r. p. m., and two 800 Kilowatt machines designed for 100 revolutions. The entire capacity of the station will be about 6,000 horse power. The units will be direct coupled.

Three car trains, 55 in all, will be the initial equipment. Each motor car will be equipped with two 100-

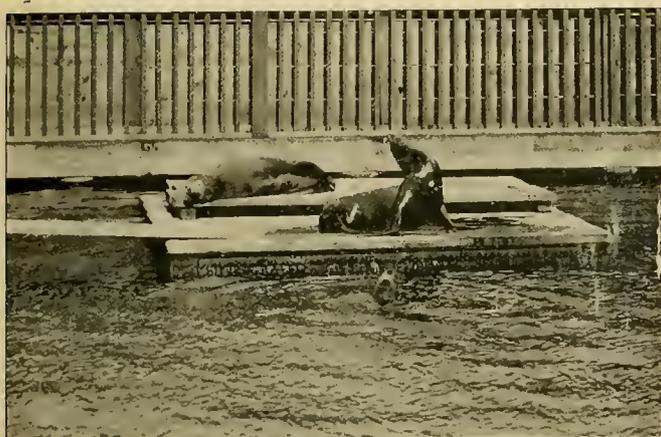

horse-power motors and series-parallel controllers will be used. A third rail will transmit the 500 volt current. The General Electric has every reason to be pleased with this, the consummation of the Intramural elevated idea.

#### A BABY AT LESCHI PARK, SEATTLE.

Our readers will remember with pleasure the description of the beautiful Leschi Park resort, at Seattle, Wash., which appeared in our January number. Since then another important attraction has been added, the arrival of which is thus chronicled by the Seattle papers:

"BORN—At high noon, a son, to Tony, wife of the late Jack Sea Lion, of Leschi Park."

Superintendent Haas was somewhat surprised to get a telephone message from the park ordering a physician and nurse for the sea lioness in the tank. Mr. Haas and the attendants immediately went to the place to find the happy mother fondling the new comer as a cat does a kitten. The baby at birth was about eighteen inches long with a little pug dog head and face and fully dressed

in a steel gray coat. The father of the new arrival died five weeks before the birth of his son and heir. Another sea lioness, Blinkey by name, was greatly exercised over the event and it required all Mrs. Tony's exertions to keep her away from the infant. Superintendent Haas caused a platform to be floated into the pond as a nursery until the youngster shall have been taught to swim and dive and to acquire other nautical accomplishments. The California sea lion (*Zalophus Californianus*) is about half the size of the Arctic sea lion and is thought to have been unable to breed in fresh water. This idea is now thoroughly exploded.

A PARTY of 275 employes of the Pennsylvania Iron Works, of Philadelphia, recently took a trip on the Third avenue cable, New York City, in company with their families. A special train and a supper tendered by General Manager Grist were features of the occasion. All the men had been employed in the construction of the cable road.

#### TRAMWAYS IN THE UNITED KINGDOM.

That excellent English authority, Engineering, under the above title, reviews the absorption of street railway properties by the municipalities, as follows:

"The growing tendency toward what is regarded as municipal socialism, is probably most manifest in the desire on the part of public authorities to absorb tramway systems inaugurated, and in many cases brought to success, by private companies, and no excuse need therefore be made for some investigation into the extent and financial results of the tramways throughout the kingdom. Of the 960 miles of tramway, only 274 are now the property of local authorities, and in nearly all cases the lines are worked by lessees. This leaves 686 miles belonging to private companies. As a rule, corporation owned lines are of greater extent, or, in other words, public authorities have only started the systems where the requirements were great, and the prospects correspondingly satisfactory. The capital expenditures on these tramways is just over 14 millions sterling, or nearly £15,000 per mile; but this includes not only equipments but buildings. It is noteworthy that while in the case of local authorities the cost, including expenditure on buildings and equipments, was only £11,350, in the case of private companies it works out to just over £16,000. It seems difficult to explain this entirely by assuming that a company necessarily requires greater floating capital than a corporation. The idea suggests itself, that while in the case of local authority lines, the paving, etc., is not charged to the tramways, corresponding work is exacted from private companies, to the advantage of the community, and must be charged to first cost of the tramways. Of course, it is possible that part of the difference is due to greater economy, but this can account for only a small, if indeed for any, part of the excess. In England and Wales where there are 761 miles, the capital paid up is equal to £14,650 per mile; in Scotland, where there are 86 miles, it is £15,000 per mile; and in Ireland, with 113 miles, the difference is most marked, as the capital paid up is only equal to £11,200 per mile. Before departing from the capital account, it may be mentioned that there has been little addition for several years, which seems to indicate that under present conditions extensions are not numerous. On ten years, however, there has been a great advance; the capital expended has increased from 8¼ millions to just over 14 millions.

"The traffic has quite justified this advance, for in the ten years the number of passengers has more than doubled, being now 598¼ millions, and, as the number of cars is 4,098, it appears that each car takes 149,800 passengers for the year, or 428 per day, assuming that each works 350 days in the year. The return for the past year shows the receipts for the carriage of these 598¼ million passengers were £3,606,095, or, on the average, nearly 1½d. per passenger. Working expenses absorbed nearly 80 per cent. of the receipts—much more than on railways—or £2,837,446, so that the net receipts were little more than a fifth of the gross receipts. The total net receipts were £768,649, which affords about 5½ per cent on the paid up capital, without making any allowance for depreciation of ways, plant and stock. As to whether municipalities will attain a more satisfactory result it is somewhat difficult to positively determine.

"For several reasons the experience on the Birmingham tramways is most important. In that city, municipal government has more nearly attained the ideal than any other,

except, perhaps, in Glasgow, which stands on as high a plane. Moreover, all systems of traction are adopted—steam, horse, cable and electric—and there are about twenty-five miles open for traffic. In this case the working expenses absorb 75 per cent. of the receipts, so that the results are by no means superior in this respect to the average, and perhaps, are in excess of those in other cities where the tramways are worked by private companies. The income is £154,684, or, £6,187 per mile of tramway. In Glasgow, on the other hand, the receipts are £8,700 per mile, but the ratio of expenses to receipts is over 80 per cent. The expenditure at Birmingham totals £116,969, and the net receipts £37,715, which is equal to £1,508 per mile, so that the return must be regarded as satisfactory, because the capital expenditure probably did not exceed £16,000 to £18,000 per mile. On this point the Board of Trade return does not enable reliable data to be given. A point of interest which may incidentally be referred to is that the cable tramway at Birmingham seems to require barely 50 per cent. of the receipts for the ordinary working expenses, while the electric (storage battery system—Editor) practically absorbs all the receipts: the steam tramway requires about 70 per cent and the horse considerably more. Certainly, private companies have worked the tramway system, generally speaking, most satisfactorily; and it is well that corporations should carefully weigh all considerations before entering upon enterprises simply because they conform to present ideas as to municipal socialism.”

In considering the above it must also be remembered that in those cities where the municipality is operating the lines, it is doing so from choice, having availed of an expiration clause in company's charters. We have yet to learn of any but paying roads being so absorbed and with everything in perfect repair and all the details worked out it is no wonder or special credit if a good showing is made. Then too, municipal officers retain their positions only so long as they can show satisfactory records, and it is to be expected that in the effort to accomplish this, every possible advantage will be taken to make many items of expense, such as paving, etc., formerly borne by the company, as small as possible, by charging them to other departments of the city's accounts. The taxpayer foots the bill nevertheless, forgetting that a possible reduction in fares is at his own expense in another form. Then again, the city may not require of itself expenditures which it does not hesitate to inflict upon private corporations. Any showing, however good, of municipal management of street railways for one or two years, is by no means conclusive proof that any saving is being made the public, even though the figures are made to say so.

ON Sunday, June 24, C. E. Healy, of Detroit, the well-known inventor of the Healy motor, together with two young ladies, daughters of the chief of the Detroit fire department, were drowned. Mr. Healy's two daughters, who were also in the party, were rescued. The party was sailing in a steam launch on Lake St. Clair, when a sudden squall capsized the craft with the above unfortunate result. Mr. Healy's kind disposition has made many friends, who will be shocked to hear of this sad ending of a useful career.

### SHORT CIRCUITED AFFECTION.

He was a hustler, says the Detroit Free Press. On a Brush street car the other evening was a young colored man and his girl, and they not only held each other's hand as they rode, but the young man slipped his arm about her waist and didn't seem to care a copper for the winks and smiles of the other passengers. After a time a white man got up and passed out on the platform and beckoned the young man to come out. The latter hesitated to leave a good thing, even for a minute, but finally did so, and was asked:

“Young man, do you love that girl?”

“Yes, sah, I does,” he promptly replied.

“And she loves you?”

“She do, sah.”

“How long have you known her?”

“'Bout an hour.”

“Isn't that falling in love pretty rapidly?”

“Yes, sah, but dat's de way I does. Doan take me ober ten minutes to fall in love with anybody. We hain't like white folks 'bout dat.”

“How long does it take you to fall out again?”

The young man looked into the car and saw that another colored man who had been standing by the front door had taken his seat. Not only that, but he was holding the girl's hand in his and their heads were bumping together in the most affectionate manner. He took this in at a glance.

“How long, sah? How long? Why, just 'bout ten seconds, sah, an' de ten seconds hev expired.”

And he dropped off the car and went off in the darkness whistling a tune without a quaver of sadness in it.

### OTTAWA'S OPERATIONS.

Ottawa, Canada, is justly proud of its fine system of street railways, which was one of the first in the Dominion and one of the foremost in improvement. In 1866 the first street railway was talked of in Ottawa, and two years later the first car was run, with a completion of the road in 1870. Sleigh service was used in the winter and the comfortless horse cars made their weary way with more or less success until 1892 when the first electric was run. For twelve years of horse car service not a dividend was paid. In 1881 Messrs. Ahearn and Soper acquired the road, electrifying it ten years later. The first year's record of the trolley was 1,520,000 passengers, the next year showed 2,400,000 fares registered, and from that time since, the growth has been even more marked, until for the year ending May 31, '94, the number carried was 2,700,000. The company runs sixty-five cars including three postal cars and has available 1,700-horse-power to operate them, and employs 200 men on an average. The president of the company is J. W. McRae, and T. Ahern general manager; the secretary is J. D. Fraser and the superintendent, J. E. Hutchinson.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Damages for Cutting Trolley Wires.*

Where a street railway company authorized by a city to change its motive power to electricity, strung trolley wires across the defendant's railway track at a height of nearly 20 feet, offering to have them raised to the height of 22½ feet, which was the standard height for bridges above the railroads of the state; the defendant company was liable for all damages resulting from its act in cutting away the wires above its track, although it had notified the plaintiff that it would not allow the wires to be strung at a less height than 24 feet, which was the height fixed by the railroad commissioner.

The Michigan Central Railroad Company operates its road across Genesee and Washington streets, in the city of Saginaw, upon the track of the Detroit & Bay City Railroad Company, which latter company has had the right of way across the streets by grant from the city of East Saginaw, since the year 1878. The Saginaw Union Street Railway, then operating its road by horse power, in December, 1889, changed its operating power to electricity, by permission of the city, granted by ordinance. It saw fit to use the trolley system; it placed the trolley wires across the defendant's tracks on Genesee and Washington streets. At Genesee street the overhead wire was placed 19 feet 9½ inches above the defendant's track-rails; at Washington street, 19 feet 6 inches above such rails. On the 16th day of May, 1890, while the plaintiff was in the full operation of its road, and running its street cars, the defendant company cut the wires of plaintiff where they crossed its tracks on Genesee and Washington streets. For this act the plaintiff brought this suit in trespass and recovered a verdict and judgment for \$933.03.

The defense to this action was, in substance, that in operating the defendant company's road it was necessary to pass under these wires cars from 12 to 14 feet and 3 inches in height from the tracks and cars loaded with lumber to the height of 15 feet; that it was necessary to have brakemen standing on the top of these cars to signal the engineer, and for other purposes, and that, under these necessities, the wires of plaintiff were not placed at sufficient height from the ground so that defendant railway could be operated in the usual manner with safety to its employes. That February 11, 1890, John T. Rich, then state railway commissioner, issued an order to the general managers and superintendents of Michigan railroads, instructing them not to permit the erection or maintenance of the wires of electric street railways at a less distance above their tracks than is allowed for bridges and other obstructions not suitably guarded, and that this distance should not be less than 24 feet above the track. April 12, 1890, W. A. Vaughan, division superintendent of the defendant, notified the plaintiff by letter that its wires were less than 24 feet above defendant's tracks and of the railroad commissioner's order, and asked plaintiff company to comply with such order. April 15, 1890, the president of plaintiff company replied to this letter, that it was its intention to have its wires 22 feet 6 inches above the track at steam railway crossings, being

advised that such height was sufficient and was the standard for railway bridges. This letter Mr. Ledyard, president of the defendant company, answered by letter of May 3, 1890, stating that such company would not permit the wires of plaintiff to be strung across its tracks at the height of 22 feet 6 inches, and further wrote: "I am constrained to advise you that if by May 15, 1890, the wires of your company, wherever they may cross the right of way of this company or any of its leased lines, are not placed at the height of 24 feet, this company will proceed to remove the same from its right of way." Nothing further being done by the plaintiff's company, the defendant cut the wires of plaintiff at these two street crossings about 4 o'clock p. m., May 16, 1890.

We are satisfied that the evidence shows that there was ample time while the motive power of the plaintiff was at rest, and when its cars were not running, to have removed these wires; the removal of them was done at a time when it involved great loss to plaintiff and great danger to human life. Under the circumstances, the defendant company was a trespasser ab initio and liable for all damages. It was shown that no bridge on the defendant's company's line was higher than 22 feet, and that the railroad commissioner had sanctioned and consented to the wires of other street railroad companies at West Bay City and Lansing being maintained at a height of 22 feet 6 inches. The defendant company refused to permit the plaintiff to string its wires at this height. The commissioner of railroads had no arbitrary power to fix 24 feet as the height at which such wires must be maintained in the absence of any showing that a less height was insufficient to prevent any danger to the employes of the railroads. The refusal of the defendant company to permit plaintiff's wires to be raised to 22 feet 6 inches—and the testimony shows they could have been so raised without cutting the wires or destroying the property—and its choosing of the time to cut such wires when the plaintiff company was in full operation of its sixteen miles of road in the city of Saginaw was such a violation of the plaintiff's rights as cannot be excused, and justifies the recovery of all damages suffered by the plaintiff on account thereof.

(Supreme Court of Michigan. Saginaw Union St. R. Co. vs. Michigan Central R. Co. 91 Michigan 657.)

*Street Railway Extension—Strict Construction of Charter.*

A statute authorizing a street railway company to extend its lines to portions of certain streets lying "between" Montgomery street and Germantown Road does not allow an extension along the Germantown Road, when construed in accordance with the principle that, in construing grants of powers to corporations, whatever is not given in clear and express terms or by necessary implication, is conclusively considered to have been withheld.

When a charter granted to a street railway company requires the consent of the city council for any extension of the railway lines and a supplement authorizes the extension of the road without consent, a second supplement which is silent as to consent is to be taken subject to the requirement of the charter that consent shall be obtained.

(Supreme Court of Pennsylvania. *City of Philadelphia vs. Citizens Passenger R. Co.* 151 Pennsylvania State Reports, 128.)

*Personal Injury—Right to Presume that Company has Complied with Law—Contributory Negligence.*

In an action against a street railway company for death at a crossing, it was error to instruct the jury that the deceased had a right to presume that the defendant had complied with the law as to providing bells for its teams, in the absence of knowledge to the contrary, and that the failure to have bells on the team hauling the car, was negligence, and if the failure to provide the bells was the direct cause of the injury they must find for plaintiff, where it appeared that the accident happened in the daytime, that the street was clear from obstructions, that the team was moving at a walk, in full view of the deceased, who was well acquainted with the street and in full possession of his senses; because the instructions took from the jury the question whether, if the boy had exercised due care, he might have discovered the absence of the bells, and because the presumption that the defendant would obey the laws and attach the bells must cease if actual knowledge to the contrary were shown.

In such a case the defendant has the right to rely upon the exercise of ordinary prudence on the part of the plaintiff, as in this case, on the part of the deceased, and the plaintiff has the right to presume due care on the part of the defendant; the obligation being mutual and correlative.

(Supreme Court of Missouri. *Lynch vs. Metropolitan Street R. Co.*, 56 American & English R. R. Cases, 571.)  
*Electric Car—Frightening Horse—Care Required of Motorman.*

Plaintiff was riding in a buggy with his daughter along Beach street, Lynn, when his horse became frightened at the sound of the motor and continued sounding of the gong of an electric car, and ran away, throwing him and his daughter from the carriage. The evidence tended to show that the electric car was 100 feet away when the animal first took fright, and that the motorman continued to sound his gong. The defendant contended that it was not negligence on his part to sound the gong, but rather a duty which it owed to pedestrians and other travelers on the streets.

It is a well-known fact that most horses are frightened at their first view of a moving electric car, especially if they encounter it in a quiet place, away from the distracting noises of a busy street. It is only by careful training and frequent repetition of the experience that they acquire courage to meet and pass a car on a narrow street without excitement. The rights of the driver of a

horse and manager of an electric car, under such circumstances, are equal. Each may use the street, and each must use it with a reasonable regard for the safety and convenience of the other. The motorman is supposed to know that his car is likely to frighten horses that are not accustomed to the sight of such vehicles, while most horses are easily taught after a while to pass without fear. It is his duty, if he sees a horse in the street before him, that is greatly frightened at the car, so as to endanger his driver or other persons in the street, to do what he can, reasonably, in the management of his car, to diminish the fright of the horse; and it is also his duty in running the car to look out and see whether by frightening horses, or otherwise, he is putting in peril other persons lawfully using the street, on foot or with teams. Of course, the owners and drivers of horses are required at the same time to use care in proportion to the danger to which they are exposed.

The verdict of \$2,000.00 for the plaintiff is sustained.

(Supreme Court of Massachusetts. *Ellis vs. Lynn & Boston Railroad Company.* 2 American Lawyer, 235.)

[NOTE.—*Greeley vs. Federal St. R. Co.*, 25 Atl. Rep. 796, 4 STREET RAILWAY REVIEW 225, was a case of collision with a horse which had become frightened while traveling through a cut in a street. The court said: "There was evidence that the car was going through this cut at a high rate of speed for an electric car—faster than usual. If this be so, and the jury have so found, it was gross negligence on the part of the company. The cars should have been run slowly and with great care through a place of this description. The cut in the street, and dirt piled upon each side of the track, was a work of its own creation and for which it was responsible."

In *Muncie St. R. Co. v. Maynard*, 32 N. E. Rep. 343, 1 STREET RAILWAY REVIEW 225, plaintiff's team became frightened and backed the carriage upon the track in front of a street railway train. It appeared that the engineer could readily have stopped in time to avoid the collision, but failed to do so. The company was held liable.

In *Lincoln Rapid Transit Co. v. Nichols*, 55 N. W. Rep. 872, 3 STREET RAILWAY REVIEW 702, which is a suit for damages caused by a horse becoming frightened by a street railway car operated by steam, the court suggests that the use of steam engines in operating street cars on a crowded city street is negligence of itself, even though the use of such motive power may have been authorized by the charter of the company.—ED.]

## CEMENT FOR STEAM PIPES.

What is said to be a useful cement for steam pipes in filling up small leaks, such as a blowhole in a casting, without the necessity of removing the injured piece, has been compounded. The cement in question is composed of 5 pounds of Paris white, 5 pounds yellow ochre, 10 pounds litharge, 1 pound red lead, and 4 pounds black oxide manganese, these various materials being mixed with great thoroughness, a small quantity of asbestos and boiled oil being afterwards added. The composition as thus prepared, will set hard in from 2 to 5 hours, and possess the advantage of not being subject to expansion and contraction to such an extent as to cause leakage afterwards, and its efficiency in places difficult of access is of special importance.

THE Washington, D. C., offices of the General Electric Company were transferred to 227 East German street, Baltimore, Md., on June 21.

### MINNESOTA VESTIBULE LAW VALID.

The vestibule laws passed by the granger legislatures of a few states have not generally met with very tender mercy at the hands of the courts. That it is a piece of "class legislation" seems to be the general opinion.

The Supreme Court of the State of Minnesota, however, has declared constitutional the law compelling the use of the "vestibule" for the protection of motormen during the winter months. The test case was that of Superintendent Hoskins, of St. Paul, who was arrested for failing to comply with the requirements of this ordinance.

The Twin City Rapid Transit Company carried the case to the Supreme Court with the result indicated.

The law was sustained at all points. The court holds that when running at a speed of eight or ten miles an hour, with the mercury below zero, the motorman's position is not only one of discomfort, but of actual danger to health and sometimes to life, not only to himself, but indirectly to the passengers in his charge. The corporation held in its plea that the measure was class legislation and not an exercise of the police powers of the state.

One of the vestibules which was built last winter by the Twin City Company, is represented in the accompanying engraving.

### NEGLIGENCE OF A CO-EMPLOYEE.

Suit was begun not long ago against the Metropolitan Street Railway Company, of Kansas City, Mo., by Henry D. Ely, an employe, who sued for damages, alleging as the cause of his injury the negligence of a fellow workman. The plaintiff sought to hold the company liable under Section 1, Chapter 93, of the Laws of 1874, which section provides that: "Every railroad company organized or doing business in this state, Missouri, shall be liable for all damages to any employe of such company in consequence of any negligence of its agents, or by any mismanagement of its engineers or other employes to any person sustaining such damage."

The defendant contended that cable street railway on which the accident to Ely occurred was not a railroad company within the meaning of the act, and upon a demurrer to the plaintiff's evidence, the judge so decided. No written opinion was handed down, the court adopting the view that a street railway was not a railroad unless there was something in the legislative act indicating an intention to include it therein, a doctrine recognized in the following cases: *Thomas, etc., Company, v. Simon*, 20 Or. 60; *Front Street Cable Railway v. Johnson* (Wash.), 25 Pac. Rep. 1084; appeal *Montgomery 20*, Atlantic Rep., 399; *Money Penny v. Sixth Avenue Railway Company*, 4 Abbott Pr. (N. S.—367); *Lax v. Forty-second Street Railway Company*, 46 N. Y. Super. 448; *Louisville, etc., Railway Company v. Louisville City Railway Company*, 2 Duval 175; *Cream City Railway Company v. Chicago, etc., Railway Company*, 63 Wis. 93.

*Pratt, Ferry & Hagerman*, of Kansas City, Mo., were attorneys for the defendant, to whom we are indebted for the above data.

### WILL MAKE LOCOMOTIVES SNORT.

The *Railway Age*, a standard authority on steam railroading, thus comments on electricity as selected for elevated work in Chicago.

"The engineer who is installing the electric power plant for the new Metropolitan Elevated Railway in Chicago, figures that the use of electricity will save that company \$300,000 a year in operating expenses, compared with the cost of running trains by anthracite-burning locomotives. The saving in fuel alone by using soft coal in stationary boilers instead of hard coal in locomotives is figured at \$200,000, and the difference in salaries, if high-priced engineers had to be employed for each train, with other economies which electric power will give, are expected to amount to at least \$100,000 a year more. If experience demonstrates the correctness of these estimates, the steam locomotive will have received another serious setback.

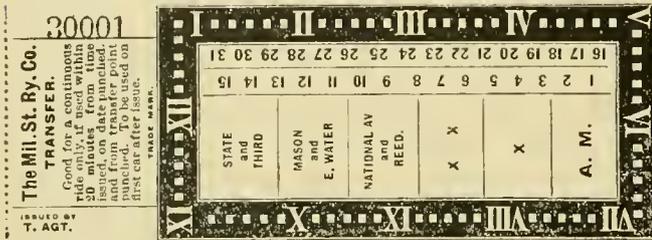

### HOW IT WILL BE A. D. 2,000.

The *Chicago Record's* prophet was seized with a vision, and the vision was as follows:

"A few persons riding in a West Madison street car, last night, witnessed an amusing episode. The car was full, and a stylish young gentleman who entered was preparing to stand during the rest of the trip, when two handsome dressed ladies arose and politely offered him their seats. He took one with a bow of thanks. Soon after, another man, clad in cheap attire, and rather plain features, entered, but the young lady whose seat the first gentleman had not accepted kept her eyes fastened on her newspaper and affected not to see him. The poor fellow would doubtless have had to stand all the way had not the stylish young gentleman arisen with flashing eyes and given up his own seat. The handsome lady evidently felt the rebuke, for she got out at the next crossing, while a suppressed titter ran through the car."

## MILWAUKEE'S NEW TRANSFER.

The new transfer tickets placed on the Milwaukee street railway lines by General Manager Wyman are to be used both by conductors and transfer agents, the black border denoting the one and the colored border the other. The aim has been simplicity and distinctness, to avoid mistake on the part of both conductor and passenger. The acceptor of the ticket has his attention strongly called to the fact that he is on a time limit. In the use

of a. m. and p. m., for p. m. the letter a is simply punched out. The day of the month reference is left out and the tickets numbered consecutively, which is regarded as a check on the matter of monthly issue. The rules referring to transfer have no adjacent reading matter, so that the passenger can not make a mistake as to his obligations. Rand, McNally & Company, of Chicago, were the printers of the ticket and collaborated with Mr. Wyman in the matter.

## BLOCKING CARS WITH PROCESSIONS.

Three months ago a Milwaukee alderman in casting about for some excuse to poise as a friend of the dear people, presented an ordinance, preventing street cars and other vehicles from breaking through processions. Nobody paid any attention to it and the act slid through. The other day a prominent man died and an immense funeral procession was the result. Another result was the complete blocking of all street cars in the heart of the city for three hours, during which time the outside lines also suffered, until the magnificent system of the Milwaukee road was paralyzed. As usual in such cases, appointments could not be kept, travelers missed their trains and officials and patrons were alike in a state of mental and physical distress. The chief of police even refused to allow the cars to slowly move alongside the procession. To make matters worse, several thousand people were making frantic endeavors during the tie-up to get to a circus in the outskirts of the city. President Payne in commenting on the occurrence said:

"The ordinance has been a bad thing for the public as well as the street cars, and it is to the interest of the business community to see that it is repealed. The case to-day was such a flagrant one, that people have realized the true state of things. Why, the entire traffic was stopped on Broadway, Wisconsin street and Grand avenue up to Ninth street, and this route was such, as to stop cars on important streets that intersected. If the police had allowed us to run cars alongside the procession it would not have been so bad, but this they have never allowed us to do. Business men freely

denounced the ordinance, and I saw two traveling men who had missed their train because of the stopping of the cars. They could not understand how the business of a city so large as this could be stopped by a funeral procession, no matter how much honored the man."

There can be no question as to the injustice of the ordinance which should at least be amended so as to limit the time in which cars can be delayed to fifteen minutes at the most. With electric traction, a halt in the procession for only one or two minutes would enable the men to get all the accumulated cars across the line of march even on such routes as run on very short headway. Proper respect to the dead is all right, but there is a certain amount of respect due the living also, and such delays can never occur without jeopardizing not alone business interests, but often the lives of persons who are ill or injured.

Unless the ordinance is speedily corrected, General Manager Wyman says he shall instruct his men in cases of prolonged delay, to disregard the ordinance and then he will protect his men and appeal the case to the supreme court, where we confidently believe it would be declared unconstitutional.

## HOW IS THIS FOR A KICK?

The following delicate recalcitration recently appeared in a paper of a neighboring city;

To the Editor of the Trumpet:

The infernal racket of the electrical "thrashing machines" now used as motor cars on North Pandemonium street, by the Citizens' Street Railroad Company, is an intolerable nuisance, worse by far than the braying of an army of mules, yet the city authorities tamely submit and quietly draw their salaries, while the wax continues to accumulate in their ears. This modest railway corporation now claims a perpetual right to all the streets of Pugville, and has employed gifted lawyers to plead its cause before the federal courts. In this case success is possible, for law is uncertain, but may God in His infinite wisdom prevent such a disaster.

HELEN BLAZES.

AN automatic track switch is in use in Newark, N. J. It is the invention of two street railway men and is said to give satisfaction so far.

## WANTED, A TICKET COUNTER.

The secretary of a large western road writes us inquiring if we know of a machine for counting the tickets returned from conductors. We can readily see that celluloid and aluminum tickets could be counted by using a rack with a scale of amounts, but it would seem a very difficult thing to improvise an accurate and satisfactory machine for counting paper and card tickets, especially after they have been carried by passengers and conductors, and more or less broken and crumpled out of shape. If any of our readers know of such a machine we shall be glad to be advised of it, and will take pleasure in illustrating and describing it. It would seem, however, as though it was one of those things in which manual labor cannot very well be supplanted by mechanical operation.

TEST OF THE WYANDOTTE & DETROIT RIVER RAILWAY PLANT.

The following figures, taken from a paper read by Jesse M. Smith, at the Montreal meeting of the American Society of Mechanical Engineers last month, will be of value for reference, as the road is a small interurban, very similar to many others.

The plant contained two 150-horse-power compound condensing high speed engines, made by the Phoenix Iron Works, of Meadville, Pa. Each engine is belted direct to a 150-horse-power Westinghouse generator. Only one engine and generator was run during the test. The load was not up to the maximum permissible, at any time during the test, so that the conditions were not favorable to economy. The engine was guaranteed up to a load of 225-horse-power. The Conover air pump and condenser was belted directly to the engine shaft. No changes were made in the plant for the test and it was run as in daily practice. The plant was three months old. Indicator cards were taken at intervals of five minutes during the 17½-hour test. All the testing instruments were carefully calibrated. The detailed description of the plant is as follows. We omit the data on fuel and boilers, because oil fuel was used, and the method of burning proved by the test to be inefficient.

ENGINE.

Phoenix Iron Works compound condensing; high pressure cylinder, 11¼ inches; low pressure, 20¾ inches; stroke of piston, 15 inches; two 78-inch fly wheels, weighing 2,445 pounds each; speed, 234.

AIR PUMP.

Conover Number 7; diameter, 15 inches; stroke, 7 inches; revolutions per minute, 67.

DYNAMO.

Westinghouse 4-pole Number 1; 111.9 kilowatts, or 150-horse-power rated capacity; standard speed, 625; speed when tested, 604.

CARS.

J. M. Jones' Sons, 16 foot; weight, 14,500 pounds; seating capacity, 22; motors, two Westinghouse 30-horse-power. Three cars in use.

ROAD.

10.5 miles long; 52 and 56-pound T-rail.

The variation of engine speed as shown by the tachometer during the regular run was 1.7 per cent, or from 233 to 237.

DISTRIBUTION OF POWER USED.

|  |                |
|--|----------------|
| Power consumed by friction of engine, air pump, and boiler feed pump, with main belt off.....        | 9.22 I. H. P.  |

| Average number of cars in use during test $\frac{50.25}{17.33} =$ .....                    | 2.89.                 |

THE ELECTRIC OCTOPUS GOES.

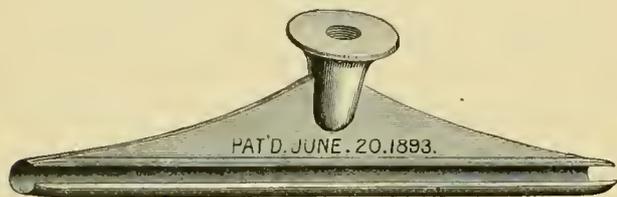

The fraternity is indebted to the Trenton, N. J., Gazette, for a choice new synonym, a twin brother of the "deadly trolley." "The lazy tourist may now ride at his ease by the trolley road to Round Top, on the Gettysburg battlefield, all the suits to restrain the electric octopus having failed. The chief sufferers will be some impracticable sentimentalists and the hackmen's combine."

THE SPILLMAN TROLLEY EAR.

The accompanying cut shows different views of the Spillman trolley ear which the Ohio Brass Company of Mansfield, Ohio, has recently made arrangements to manufacture and is now offering to the trade. The ear has several features peculiar to itself which commend it to the users of similar devices. It is safe to say that the Ohio Brass Company will find a large sale for them.

The great objection raised to the use of soldered ears, namely that of burning the trolley wire, the time and material consumed in soldering, the difficulty of adjusting the hanger on the wire after once in place, as well as the objection to many clamps, that of sparking when the trolley wheel passes over it, have all been overcome in the design and construction of this ear. It has been given a practical test, both on straight line and curve

work, for over a year past, on one of the largest roads in the west, and its utility thoroughly demonstrated. The ear is screwed onto the hanger body and the trolley wire placed in the concave lip. The trolley wire is then pulled to the necessary tautness and the lip of the ear is compressed over it. A metal block is held on the back side of the ear, and a copper hammer used to do the forming with, beginning at the center and working toward the ends. On curves, the ear should be hung so that the side strain of the trolley wire is against the web. If it is necessary to adjust the hanger, the lips can be opened sufficiently to slip the ear along the trolley wire.

A SWITCHBACK AT DECATUR.

A stock company has been formed at Decatur, Ill., for the purpose of operating a switchback railway at Riverside Park, a resort owned by the City Electric Railway. The company is partly composed of those in the street railway, the moving spirit, being of course, General Manager W. L. Ferguson. It is expected that the investment will be a paying one in itself, aside from the increased travel on the electric railway, as the switchback has proved very profitable at other places where it has been tried.

THE FOURTH AT CHAMPAIGN, ILL.

One of the many ways in which the Fourth of July was celebrated by street railways is shown in the accompanying reproduction of a mammoth poster sent out by the management of the West End Park, of Champaign. The West End Park Company is simply an auxiliary

FOURTH OF JULY.

THE GREATEST CELEBRATION

... IN YEARS WILL BE GIVEN AT ...

WEST END PARK,

Champaign, Illinois,

The Greatest Summer Garden in the State.

THE PROGRAMME WILL INCLUDE

- Grand K. P. Band Concerts, Morning, Afternoon and Evening.
- Good Baseball Games, Morning and Afternoon
- Dancing in the Pavilion, Morning, Afternoon and Evening
- Casino Theatre, Grand Attractions, Morning Afternoon and Evening
- The Great Switch-Back Railroad, All Day and Evening

Mons. Geller, The Aerial Wonder, Morning, Afternoon and Evening

Grand Fire-Works Display, Magnificent Illumination, and Wonderful Stereopticon Exhibition at Night, And Many Other Attractions.

Hundreds of Electric Lights and Lanterns, Bowling Alleys, Shooting Galleries, Refreshments, Swings, Photographs Day and Night, Seating, Shelter Etc. Etc.

THE GREAT Midway Plaisance OF CENTRAL ILLINOIS.

ELECTRIC STREET CARS RUN TO THE GATES. Fare, 5c 6-Mile Street Car Ride.

All the Railroads, being aware of the number of people along their lines desirous of attending this great celebration, will sell Round Trip Excursion Tickets at Low Rates.

The Greatest Garden and the Greatest Celebration in the State.

of the street railway. The road is a very small one, but by virtue of a very energetic policy it carries a business that would be the envy of some much larger. Champaign is becoming a favorite point for excursions from all the surrounding country, and all on account of the efforts of the West End Park Company.

THE PARTRIDGE CARBON COMPANY.

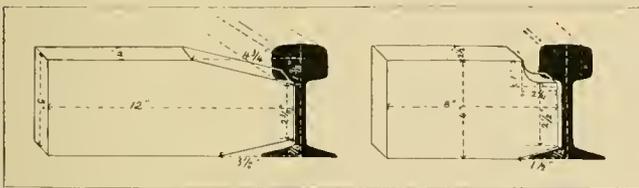

At Sandusky, Ohio, is located the Partridge Carbon Company, of which James Partridge is manager and J. S. Speer secretary. Going into a field well occupied by similar concerns this company is making a magnificent record.

The specialties made, are electric light carbons and carbon motor brushes. The latter is the pet of the company and is rapidly getting the same reputation with users. By putting on the market only first-class material, the concern has gained its fame among its patrons both east and west.

It is claimed for the Partridge brush that it will wear a quarter longer than any other, and will keep the commutator in perfect condition. One company actually complained that the brush was too long lived! Both hard and soft qualities are made and samples are cheerfully furnished. One of the largest factors in the success of the company is the complete practicalness of the men, in technicality as well as business. Mr. Partridge is a man of ripe experience, and Secretary J. S. Speer a man of great business talent and foresight. The company is rapidly pushing its business under the most favorable conditions, with a factory capacity of 15,000 motor brushes and 35,000 light carbons per day.

**A PEORIA T RAIL LINER.**

A special form of brick for paving to T rail is in vogue at Peoria, Ill. Two types are used and both are successful. Figure 1 shows the small brick evidently for crowded or down town streets where as near as possible an approximation to the girder rail is necessary. The small brick is 8 inches long, 2 1/2 inches wide and 4 inches high. It is beveled to fit the rail foot with an inch and a

half bevel and curved to allow for the rail head. A 2 1/2 inch web is allowed for.

The larger brick is 12 inches long, 4 inches wide and 5 inches high. It is beveled for both head and foot. The head bevel is 4 3/4 inches and for the foot 3 1/2 inches. A 2 3/8 inch web is accommodated. The large brick is evidently applicable to streets where traffic is lighter or where there is no curve, crossing or switch work. To C. E. Flynn, electrical engineer of the Central Railway Company, we are indebted for the sketches and information.

**THE TIME CARD AND THE POWER STATION.**

The possibility of greatly improving the service from the standpoint of the public, and at the same time saving in power and in wear and tear of machinery, was well illustrated by the result of a recent move made on the Calumet Electric Street Railway, of Chicago. The change consisted in the adoption of a regular time table. Previously, starters had been employed to keep regular intervals between cars. While the adoption of the time table cut down slightly the speed and consequently the daily car mileage, it practically gave the public a much better service. The load on the power station was previously such that it was just too much for two units and not enough to load three. Of course the three had to be

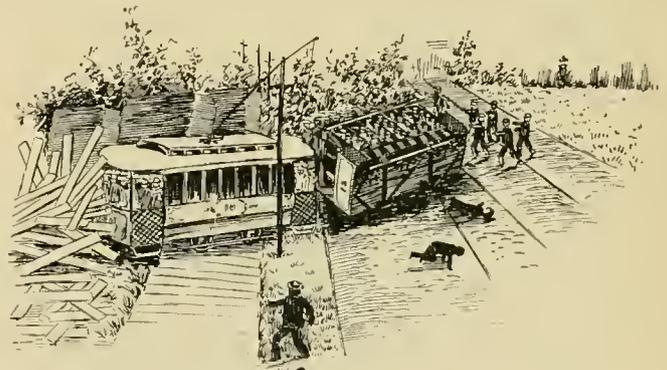

run underloaded. The time table cut down the power necessary to such an extent that the two units could carry the load. Slight but profitable changes of this kind are often possible, and a competent manager will always be on the lookout for chances to make them.

**NEW JOHNSON WORKS AT LORAIN.**

The Johnson Company, of Johnstown, Pa., as is known, have for some time contemplated the erection of additional works in or about the city of Cleveland. It is now stated on good authority that they have purchased 3,600 acres of land for the use of their mills and on which to erect the homes for employes. Five million dollars is the amount which it is stated will be spent in the enterprise, and that the mills will be among the largest in the country. Details of the enterprise have not been given out, and it is not known what other departments, if any, than the rolling of girder rail, will be carried on in the new plant, but it is expected that the works will be very complete, and the undertaking on a large scale.

**A DETROIT ACCIDENT.**

What promised to be a serious and costly accident was narrowly escaped recently, when a Fort street motor car on the line of the Ft. Wayne & Belle Isle Electric Railway, Detroit, jumped the track, taking the trailer with it. The trail car was pulled but a short distance from the rack when the twisting strain threw it upon its side and

its seventy passengers into the dust. An investigation showed, that the train, consisting of a closed motor car and an open trailer, was running "on the multiple" a speed strictly forbidden by the management and dangerous, as shown by the sequel. No one was seriously injured. The most remarkable thing about the accident is the fact that the motor car retained its upright position.

NEW YORK'S L roads have acquired a phraseology of their own. On the upper west side the "L" road passengers are divided into patrons of the Ninth and Sixth avenue branches; and at Eighty-first street one morning, a guard on a Sixth avenue train, bound south, yelled out to the crowd on the platform, "Now then, youse Nines let them Sixes get aboard, why don't you?"

## GRAND RAPIDS RESORTS.

Bonded by bands of steel, Grand Rapids, Mich., has two beautiful summer resorts for the pleasure of the inhabitants of that busy city. One of the resorts is called North Park. It nestles close to Grand river at the north end of the Consolidated line. The other is Reed's Lake, a water gem in the setting of wooded hills which surround it. Both are ideal spots for rest and pleasure and bring to the street railway company many deserved

REED'S LAKE

sheckels—this year more than usual. Heretofore, North Park has had no transportation facilities adequate to its need, but with the acquisition of the North Park Street Railway by the Consolidated, this trouble has been remedied, and the freest passage may be had to its pleasures by all inhabitants of Grand Rapids. The purchase not only enables the company to connect the two resorts, but is an advantage to both. At Reed's Lake all sorts of aquatic recreations are obtainable, together with band concerts and theatricals. At North Park, the native

## STREET RAILWAYS NOT COMMON CARRIERS OF PARCELS.

An interesting case is in the courts at Detroit, in which a passenger seeks to recover damage for loss of a parcel which he deposited upon the front platform of a car, taking a seat inside. When he left the car some passenger had done so before him and thoughtfully carried the parcel along, and hence a suit which was begun in a justice court, is now appealed by the plaintiff

to the circuit court. In the lower court it was held that the street railway was not a common carrier of parcels, and it is hard to understand how any one can expect to secure a reversal of this decision by going any higher. It has been repeatedly established elsewhere that street railways are not common carriers of baggage, and that passengers taking such into the car with them, do so at their own risk. In fact it is ordinarily understood, and so expressed in many ordinances, that the passenger is entitled to trans-

NORTH PARK

beauty of the place, its lovely grounds and its wholesome air will divide honors with the older pleasure ground. We show a sketch of the two resorts and only regret that many other street railway systems can not obtain as many natural advantages. However, as shown from time to time, even a corn field can be made to offer inducements of a surprisingly pleasurable nature.

portation at a certain price only for himself and ordinary hand baggage which can be carried in the hand or on the lap. Larger baggage in most places is charged for at an extra price, or is prohibited altogether, except on such lines as operate a light freight or express department, in which case, of course, they become common carriers; but the case in question is quite dissimilar and there can be no doubt as to the verdict being confirmed.

A RECENT order on the Atlantic Avenue Railroad Company's lines, of Brooklyn, N. Y., requires motormen to weigh not less than 168 pounds, to be 5 feet 9½ inches tall, of good moral character, and perfect eye sight.

THE Hammond, Whiting & East Chicago Electric Railway Company, since the coal strike, has put in oil burners as well as connecting with the natural gas mains.

TRAMWAY TRACTION METHODS  
COMPARED.

THE request of the town council of Newcastle-upon-Tyne, England, W. George Laws, borough engineer, has prepared a report on three systems of tramway traction for Newcastle. The systems considered, were horse, conduit, electric and cable. The report favors

the cable, but not without a thorough discussion of the merits of the electric conduit. The Budapest system is considered at length as being the only successful conduit system now working. Although a success at Budapest, Mr. Laws considers that there are reasons why it would not be successful at Newcastle. His report on the conduit system is as follows:

“This system has not as yet had an extensive trial in England, and, unfortunately, the limited experience obtained has not been very happy. Thus at Blackpool, where a conduit system was laid and promised well for a while, when taken over by the Corporation it gave so much trouble, owing to excessive leakage and deterioration of the apparatus, that for some time it has been worked by horses. One or two other small conduit systems in England have proved failures. There has, however, been an installation of the conduit system at Budapest, in Hungary, which has proved successful both mechanically and commercially, and where the cost per car mile has been brought down so low as to fairly bring the system into the field as a strong competitor. It will be fair, therefore, to take the figures of this system, making such modifications as are rendered necessary by the different conditions of the case to reduce it to English standards. Thus, Pesth is specially favorable for electric traction, being practically flat. The chief streets are extremely wide, sometimes 150 and 200 feet, and this allows the tram lines being run outside of and parallel with the ordinary traffic, while leaving ample room for carriages and carts alongside the footwalks. In consequence of this peculiarity, the speed of running is much greater than could safely be allowed in our narrow and crowded streets. Labor in Pesth is one-third less than in England, while fuel is one-fifth more. The chief facts in Budapest are:

|                                  |            |
|----------------------------------|------------|
| Mileage open (single line) ..... | 14 miles.  |
| Length of route .....            | 7½ miles.  |
| Miles run, per annum .....       | 1,437,000  |
| Passengers carried .....         | 11,000,000 |
| Receipts, per car mile .....     | \$0.2372   |
| Expenses, per car mile .....     | \$0.1264   |
| The cost per single mile of—     |            |
| Construction .....               | \$58,320   |
| Equipment .....                  | \$13,365   |
|                                  | <hr/>      |
|                                  | \$71,685   |

The service on the electric route is at intervals of 1¼ minutes, and the average speed is 12 miles per hour—viz., 9.3 miles in the heart of the city, 11.16 in the residential parts, 15.5 in the suburbs. The cars are small,

to seat 20 passengers only, but with wide platforms, on which many stand. They have no seats on top. The population of Budapest is 520,000, but as the tramways are laid in Pesth, probably 300,000 is a fair estimate of the population served. Buda, on the other side of the Danube, is hilly, while Pesth is flat. The difficulty of working electric lines on any but very flat gradients has prevented the extension of the system into Buda, and the authorities are now enquiring into the possibility of introducing the cable system there. Commercially, the result in Pesth is that the shareholders have received dividends of 7 per cent in 1892, and 8 per cent in 1893, while a tax of 2 per cent is paid to the authorities for the concession. On a total capital of \$1,360,240 (which includes, however, some miles of steam lines), the earnings were, in 1892, \$334,819, of which, after payment of expenses, about \$117,126 was available as profit, and \$85,050 was divided among the shareholders. For 1893 the figures were:

|                          |             |
|--------------------------|-------------|
| Capital expended .....   | \$1,360,240 |
| Total earnings .....     | 395,263     |
| Net earnings .....       | 156,716     |
| Divided as profits ..... | 139,486     |

These figures have been taken from the officially published balance-sheets of the company.

There are some specialities of construction which must be noted as bearing on the applicability of such a system to English towns, and especially to Newcastle. For these particulars the committee is indebted to W. N. Colam, who visited Budapest in the course of business, with a view to see the details of a system that promised so well, and who has put the results of his investigations promised so well, and who has put the results of his investigations before you. The construction may be broadly described as the same as the cable system—viz., with a conduit underground to carry the moving power, but with this difference, that while in the cable system the conduit for the rope lies in the center of the way between the rails, in the electric system it is placed under one rail. At first sight it would appear as if this was a distinct saving in first cost by avoiding the central slot rail; but the saving is more apparent than real, as the actual cost of the way is about \$4,860 per mile more than in the central slot system. Besides this, however, there are disadvantages as compared with the central slot which are very serious and more than counter-balance the saving of the central rail. The central slot is not subject to the wear and tear from the flanges of the wheels since they do not run in it, and consequently there is no tendency to wear it down or widen it, and it remains permanently at its original width of 5/8 inch, and the edges remain unworn. With the conduit under one rail, on the one hand, the slot takes the flanges of the wheel and it is subject to rather heavy wear and the edges are rapidly rounded off and the slot widened. The width required to allow the electric “collector” to pass is larger than is needed for the cable “gripper,” for while all the power of the gripper may be conveyed by a plate 1/2 inch thick, the electric “collector,” though thinner, has to be protected on each side by “insulators,” and these

again have to be defended from wear by iron plates on either side. The result of this is that the original width of the electric slot must be at least  $1\frac{1}{4}$  inch or  $1\frac{1}{3}$  inch, rather more than double that of the cable slot. As a matter of fact, Mr. Colam found that in Pesth the slot was in no case less than  $1\frac{1}{2}$  inch in width, while this had in many cases, and especially at curves, been enlarged by the wear of the wheel flanges to 2 inches. This very wide slot, which is tolerable in Pesth, where the ordinary traffic need not cross the tram lines, except at a safe angle, would be a nuisance in our streets, where the horses wear caulkers, and where the ordinary cart and lorry traffic must work over the lines at all angles, while a bicycle wheel would drop through altogether with the risk of "short-circuiting" the conductors, and stopping the traffic on the line within that section. The electric system needs a quick means of getting at the underground conductors to remedy defects of insulation and for cleansing of the conduit, which is specially necessary to prevent accumulations of dirt or water, which at once stop the work by "short-circuiting." To provide this means of easily getting at the tube, two courses of brick in mortar are laid under the rails on the top of the concrete conduit, and when any stoppage occurs a rail is taken up, these bricks pulled out, and the necessary repairs done, after which the bricks and rails are replaced. This seems rather a clumsy way of working, and if it has often to be resorted to would become an intolerable nuisance in our crowded streets. It may answer in a town where the streets are so wide (as in Pesth) that the ordinary traffic has room to avoid the chasm laid open without being seriously inconvenienced, but with us, where every foot of the street width is used, and the ordinary traffic uses, and must use, the tram lines quite freely, such a system would be unworkable. There seems reason to fear also that the electric conduit, which seems to be specially susceptible to dirt even in a dry climate, would be more so in our wet and muggy weather, when the amount of mud that must pass through so wide a slot would cause constant trouble, and interruptions from that cause would be even more frequent. This seems to have actually been the case at Blackpool, and to have practically made the conduit system unworkable as first laid down, so much so that it is at present given up for horse traction, pending extensive alterations by which the corporation hope to overcome the difficulties. Snow, too, has been found very difficult to deal with on the electric conduit, and has occasionally stopped the lines for days together. The use of loose brickwork for the rails to rest upon makes the Pesth road rather a flimsy one, and such as would not satisfy us here. It seems to be only tolerable where the street width allows the ordinary street traffic to avoid the tram lines.

There seems to be good reason to suppose that the very successful financial result in Pesth is due to local conditions and could not be realized in England—or at least in English towns. The chief reasons that would increase the expense of working per car mile in England are:

1. The cheaper labor obtainable abroad—viz., 33 per cent cheaper for half-skilled labor, such as conductors, drivers, clerks, etc., and nearly 50 per cent cheaper for cleaners, greasers, and the like.

2. The very high speed allowed in the streets—viz., an average of 12 miles an hour, as against 8 miles, the utmost hitherto allowed in English towns. This at once increases the car mileage and shows reduced cost.

3. The difficulty of applying any electric systems to towns where there are hills to surmount. The increase of power required to take an electric car up a moderate hill is out of all proportion to the work done. Thus, a car which would consume 10 electrical-horse-power on the level would require 28 electrical-horse-power to carry it up 1 in 20, and 36 electrical-horse-power on 1 in 10, the speed on 1 in 20 being also reduced 40 per cent, and on 1 in 10 by 66 per cent; or, to put it in another way, to carry the same load at the same speed up 1 in 20 would require four times the power, and up 1 in 10, 11 times the power required on the level. This involves the further disadvantage that each car must carry motors powerful enough to surmount the steepest hill on the route, although they are useless dead-weight on the level. For instance, a car must carry motors in Clayton street four times more powerful than necessary, in order that it might be able to crawl up Westgate hill at one-third the speed. This is not very promising for electric traction in such a town as Newcastle or Leeds, and yet engineers on both sides seem to be agreed as to the fact of the unsuitability of electric motors for even moderate gradients. They differ only in their estimate of the waste of power, but, taking the most sanguine figures, it is practically fatal to cheap transit.

4. The moister English climate is unfavorable to the rather delicate apparatus, and promotes leakage of energy by keeping the conductors damp, and would also presumably require even closer attention to keeping the tube clean. A piece of damp paper (such as we see too much of in streets) would, if blown or dropped through the slot, and falling on the conductors, be enough to short-circuit them and stop all traffic on that particular section until its whereabouts was discovered and it was removed.

It is difficult to estimate the actual increase in cost per car mile for each of these items, except in the case of No. 1. Allowing for dearer labor and cheaper coal in England raises the car mile cost by \$0.015—viz., from \$0.1264 to \$0.1414. The difference produced by No. 2—that is the lower working speed here—can only be inferred by working out the reduction in car mile cost made by increasing the speed on the cable roads; but taken in this proportion would be about \$0.016. The difference caused under No. 3—viz., the disadvantage on gradients—would depend greatly on the proportion of steep streets worked on the system. Assuming that in Newcastle the proportion of steep gradients is one-third of the whole, the total power required would be increased as 5 to 3, which would mean an addition of about \$0.015 per car mile. Under No. 4—the influence of climate on the system—there is no means of making

an estimate. It might be so great as to stop working altogether, as at Blackpool. Putting all these together, the probable cost is raised to \$0.1724 per car mile, which corresponds pretty closely with American experience, where the best information that can be got puts the cost per car mile of electric traction at the best at \$0.03 below horse traction, which brings it to \$0.21 in America, where prices of labor are high. Assuming horse traction here, in Newcastle, to cost \$0.20 per car mile, which is about the figure, that would bring the electric system to \$0.17 as compared with \$0.1724, as obtained above. There is one point which should not be forgotten in comparing the results at Pesth with those, say, in Edinburg—viz., that the average fare per passenger is \$0.028 in Pesth, against \$0.022 in Edinburg. To bring the fares down to English standard would at once reduce their traffic receipts by \$58,320, and take just 5 per cent off the dividends earned. The fare system abroad is somewhat different to that prevailing in England. We stop to pick up at any point where a passenger may call; on the Continent the "stations" are fixed, and cars do not stop between. In Pesth they have also a plan of using fare books, by which a considerable saving is effected. Thus, though their lowest single fare is \$0.04, return and season tickets bring down the average fare to rather under \$0.03.

### THE CABLE TRACTION SYSTEM.

In this case one has surer ground to work on, because the system has been extensively tried both in America, England and elsewhere, so that the costs both of construction and working are pretty well known \* \* \* The special feature of the cable system, that every additional car put on only adds a few pounds of coal consumed at the engine house, but does not increase the fixed charges, while it does increase the car mileage, renders it especially applicable to a growing traffic and to the further development of traffic.

The disadvantages of cable traction are:

1. The high cost of construction, which is about \$48,600 per single mile—less, it is true, than electric conduit, but double that of horse lines. The cost of equipment, however, is only \$4,860 per mile, as against \$13,365 on the electric system. A cable car, complete, costs about \$1,070, while an electric car costs about \$3,400.

2. The central rail is a further interference with the streets, and with the ordinary street traffic. \* \* \* It seems to me that as to cost of construction there is not much to choose between the two systems. The electric, apparently, has cost more in Pesth, in spite of cheap labor; but there seems no real reason why it should. The work to be done is practically the same—viz., to lay a conduit for the conductors or cable and the rails. There should be little or no difference in first cost. The cost of equipment is certainly much larger for electric haulage, and must necessarily be so, since motor cars cost about three times as much as cable cars, but this is a matter more for the lessees than the corporation, as equipment is a lessee's cost. It is only important as

affecting the amount of money that must be earned to pay interest on capital. Cost of working is the next consideration, and here the advantage is in favor of cable haulage. Budapest shows a very good result; but, as has been shown, this result has not been realized in America, and is not likely to be realized here, while, on the other hand, both English, American and European experience has confirmed the low cost per car mile of cable traction, and the fact that the larger the mileage run the less the average cost. The cost of cable haulage in America on the larger lines is put at under \$0.10 per car mile, which, allowing for American prices, would correspond to about \$0.08 here. Where it has had a favorable chance, as at Brixton, that result has already been realized, and on popular fares, too. Applying Edinburg results to Budapest figures, shows that with such a service—viz., 1 1/4 minutes, and carrying the same number of passengers—the cable would be worked even below \$0.08, thus beating electricity on its own ground."

The above report may give a few pointers to conduit inventors as to why capitalists will "persist" in clinging to cable traction for heavy traffic. The fact is, not one conduit inventor in ten, seems to realize that the cable system is a possible competitor in places where it is proposed to build conduits. The electric conduit may be made a mechanical success and even a commercial success, as it is at Budapest, but still the third question comes in as to whether it is as good an investment as a cable road would be in the same place. Mr. Law's report seems to show that it is not.

### TOLEDO'S TRANSFER.

In common with many other managers, W. S. Jewell, of the Toledo, O., Consolidated Street Railway Company, has found many a slip—not transfer slip—between the transfer and the transferred. The reprehensible

**CONSOLIDATED STREET RAILWAY CO.—TRANSFER.**

Good only for this current trip, to line punched, on first car from point of transfer, after time canceled. Subject to Rules of the Company.

The time of waiting is allowed to be a part of the continuous trip. This is not a stop-over and is not transferable. One of the conditions upon which it is given and accepted is that the passenger examine date, time and privilege, and see that the same are correctly included, and comply with all its conditions, otherwise it is void. (over.) Issued by Conductor No.

941 *W. S. Jewell* 436

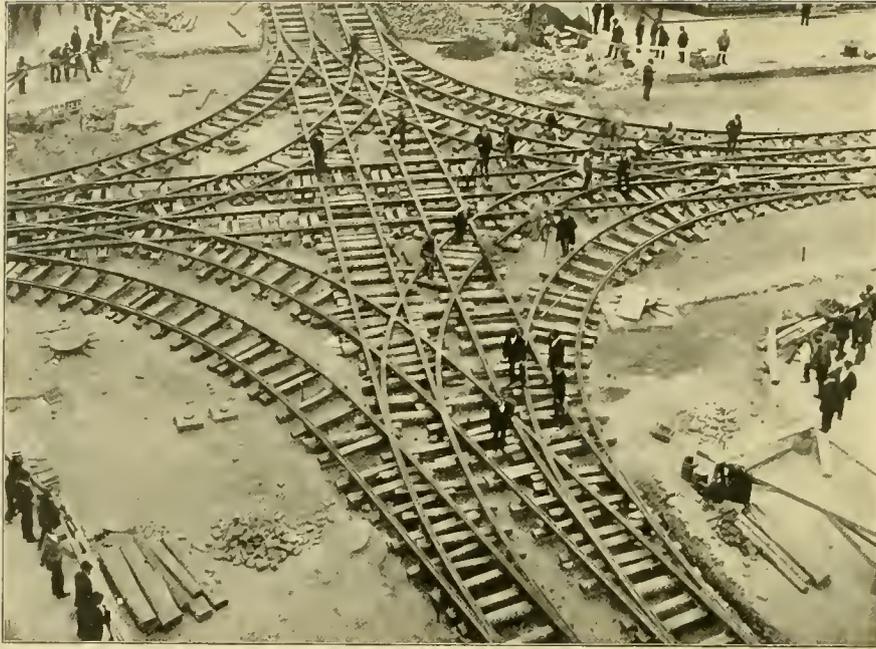

General Manager.

practice of getting two rides, not continuous, for one nickel, made some sort of change necessary, and the ticket shown in our engraving is the result. In form it differs only in the arrangement of the figures. It is a neat affair, not too large, and elastic enough for general use without being too general in its terms.

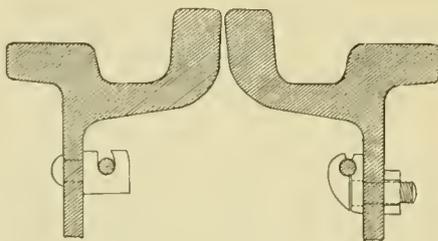

SUPERINTENDENT PEARCE, of the Negaunee & Ishpeming Electric Railway, is a lucky man. He recently drew a \$135 bicycle and a horse and cutter at a raffle, at the expense of one dollar.

SOME FINE SPECIAL TRACK WORK AT ROCHESTER.

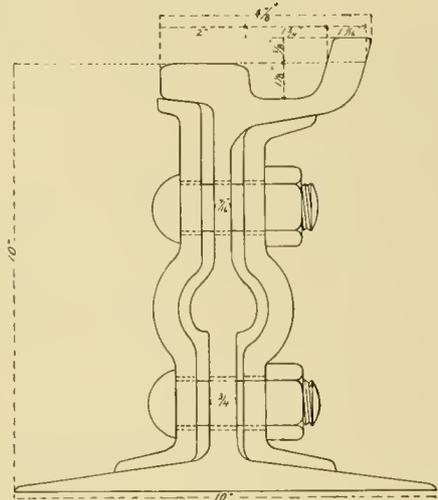

The corner of State, Exchange and Main streets, at Rochester, N. Y., is the down town terminus of twenty-two lines. Four thousand cars pass that point daily. President J. N. Beckley, of the Rochester Railway Company, therefore planned wisely and well when he made arrangements for some special work, that probably has no equal in this country. The contract with the Johnson Company called for a double track crossing, with switches both ways. The general plan of the crossing is shown in our engraving, made from a photograph taken before the paving was laid. The guard rails stand 10½ inches above the ties at the highest point of the flange. They have electrically welded chairs three feet apart, and the rails together with the chairs weigh 100 pounds to the yard. The chairs have a bearing on the ties of 8

Special care was used in designing, to provide easiest curvature upon tracks most in use. There are 1,348 feet of single track in this piece of work, and the weight of the whole is about forty tons. The electrical return is a continuous insulated Number 0000 copper wire, fastened with rivets made specially for this purpose. They were made by the railway company, and are the invention of Alfred Green, electrician, and Wm. Rosborough, superintendent.

FASTENINGS FOR RETURN WIRE.

by 10 inches. A cross section of rail, chair and joint plate is here shown. Eight 1-inch bolts are used at the joints. Transition arcs are used at the curves in order to allow a uniformity in tongue switches. The switches are all curved for 100 feet radius. The tongues are held in place by a single set screw and washer, and can be removed without disturbing the adjacent pavement. The whole work rests on a concrete bed thirteen inches in thickness, seven inches of which is below the ties. All joints between rails and between rails and paving were carefully filled with paving pitch, thereby excluding moisture.

SECTION THROUGH JOINT.

In laying, the curves were carefully checked with the transit, and everything went along without a hitch. The work was designed by Houston Barnard, the engineer of the Rochester Railway Company, and built by the Johnson Company, of Johnstown, Pa. It is one of the most thorough pieces of special crossing and curve work in the country, and is bound to be followed by many more, as nothing but the very best construction will give satisfactory service under electric motors running on frequent headway.

**ELECTROLYSIS OF POTATOES.**

"I have a protest," said "Farmer Beettops" as he leaned up against the newly whitewashed wall of the engine room and looked reflectively at the engineer.

"Well, take it to the office."

"But I want to know first ef its right."

"Out with it then," said the engineer.

"Wall, I wanter know ef 'lectricity eats wires and water pipes ef the stuff won't kill my taters."

**ELECTRIC LAUNCHES AT PUEBLO.**

Superintendent W. A. Martin, of the Pueblo City Railway, reports that his company has purchased, through its receiver, H. E. Chubbuck, one of the launches used at the World's Fair, and it is now making regular trips on Lake Minnequa. This lake is the largest in Colorado, and situated about three miles south of the Pueblo court house. The launch makes trips every twenty minutes. The fare is ten cents. The boat is No. 6, and those familiar with the World's Fair launches, will recollect that this was the first electric launch that ever turned a wheel in the lagoons of Jackson Park. The batteries are charged from a motor generator driven from the railway circuit.

**PROPOSED INSURANCE LABORATORY.**

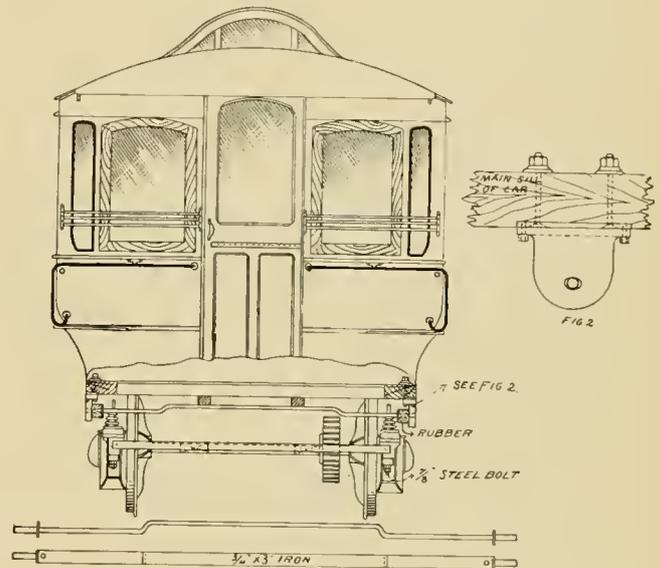

The western underwriters are considering the matter of establishing an electrical bureau at Chicago for the purpose of collecting information regarding electrical fires, testing electrical apparatus and appliances, and disseminating useful information in regard to the safe use of electricity. Such an institution would of course require a complete laboratory for making all necessary tests. The bureau would be a great benefit, not only to the insurance companies but to all others, and it is to be hoped that the plan will be carried out. It would act as the electrical adviser for all the western country, which comprises about twenty states and territories. At present there is absolutely nothing of the kind, and while the laboratories of various colleges and universities may in some cases be able and willing to make the desired tests or collect such information, such work should manifestly be in the hands of a corps of men who make it their regular business.

AFTER having been in court for thirteen years, a Mrs. Freeman has been awarded \$300 for the death of her husband, which was alleged to have been caused by an accident on the Dry Dock, East Broadway & Battery Railway Company, of New York.

THE new rapid transit commission of New York has appointed Lewis L. Delafield secretary, and Wm. Barclay Parsons chief engineer. Ex-corporation counsel, H. R. Beekman and H. B. Boardman, were chosen as counsel for the commission.

**WRIGHT'S NEW METHOD OF MOUNTING CARS ON SINGLE TRUCKS.**

The West End Street Railway, of Denver, is equipped for winter service with sixteen and eighteen-foot cars mounted on rigid single trucks. They were found unsatisfactory because of the jolting when going around curves and on and off switches. Indeed it became a question whether they would not have to be abandoned in favor of thirty-six-foot double truck cars. To make this change meant an increase in the coal bill. S. Roy Wright, the superintendent, made a careful study of the matter, and finally hit upon a plan that overcame the objection to a degree that exceeded all his expectations. It was first tried on an eighteen-foot car. The plan is simply to allow a slight swivel motion of the car body,

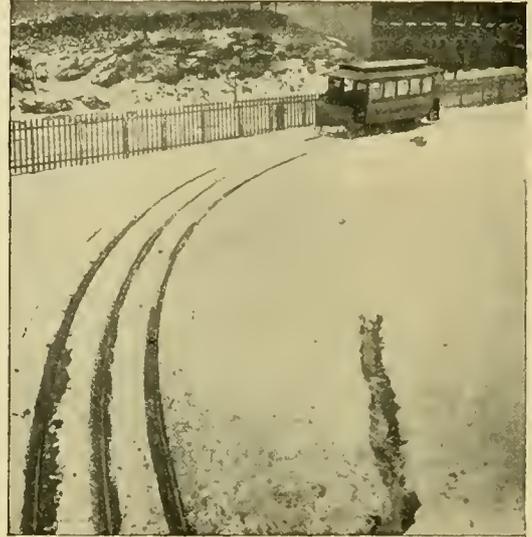

this motion being cushioned by rubber buffers. The accompanying drawings show it as applied to a Bemis truck. It can be put on any make of single truck. A three-quarter by four-inch iron forms a support for the car sills. This iron has its ends rounded so as to extend through plates attached to the side sills. When it is necessary to take the truck from under the car it can be done by simply disconnecting the motor and jacking up the car. There is not a single nut or bolt to be removed, thus making a great saving in time. The first car so equipped has been in service over three months without requiring any repairs, and it goes around curves and over switches with almost as little jerking as the thirty-six-foot double truck cars. It would seem that this plan would save both the track and the car body.

THE official returns regarding the working of the electric tramway at Marseilles, France, show that it is being greatly appreciated by the inhabitants. During the first two months of this year, the number of passengers carried over the lines—which is about five miles long—amounted to 645,384, as against only 423,267 in the corresponding period of last year.

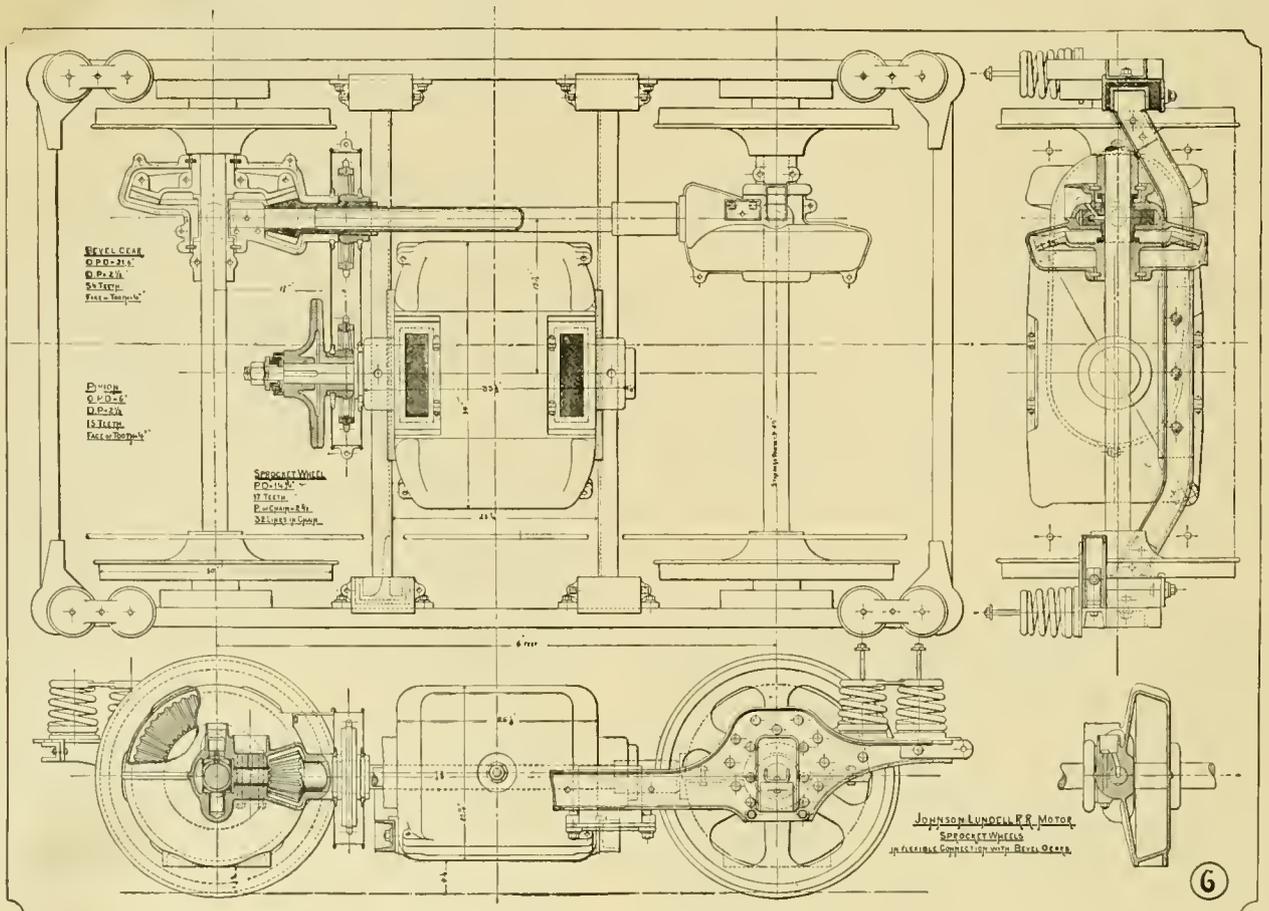

THE JOHNSON-LUNDELL ELECTRIC RAILWAY.

An underground system, devised by E. H. Johnson, president of the Interior Conduit & Insulation Company, and Robert Lundell, of dynamo and motor fame, has been operating on an experimental road in New York City for several months. The track is of the ordinary construction, except that a third rail is used to take the place of the trolley wire. This third rail is uninsulated save by the pavement. It is divided up into short sections insulated from each other. These sections are cut in and out by electro-magnetic devices as the car moves along. The switches are located in water tight boxes alongside the track. The current is taken from the third rail by a steel brush. The voltage is 300. A small storage battery is carried to supply current at crossings and switches, and to act as a reservoir into which the current from the motors can be turned in making stops, thus acting as an electric brake. Probably the feature that is of most interest to practical men is the motor. It is of such construction that the advantages of series-parallel control are made possible with but one motor. This is done by having two armature windings in parallel with each other. These two sets of windings are connected to different commutators, one at each end of the armature. It is evident that these two windings can be treated as the circuits of two separate motors, and can be

thrown in series or parallel with the same results as are obtained with two motors. This is an important device, and does away with one of the principal present objections to single motor equipments. The motor is connected to

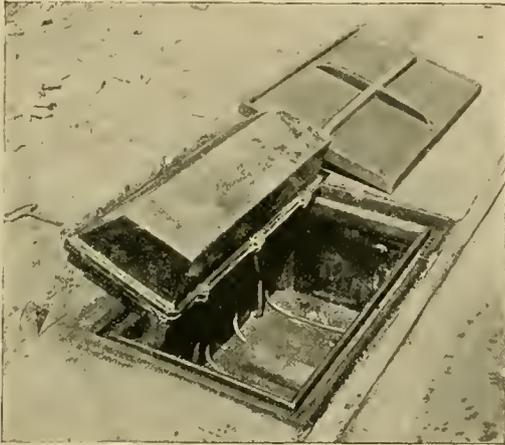

a shaft carrying bevel gears by a sprocket gearing. A bipartite screw coil placed on the armature shaft saves jerking in starting. Owing to the fact that very few technical details are given out by the company in regard

PLAN AND SIDE ELEVATION OF TRUCK.

to the majority of the radically novel points in the construction of supply conductors and motors, it is impossible to form an intelligent opinion as to the merits of the system. The inventors have a reputation of being emi-

nently practical men, gained from their work in the past, and there is therefore some reason to think that this system will, in a measure, correspond with previous efforts.

INTERURBANS IN THE WYOMING VALLEY.

The ultimate usefulness of electric railways for long distances has been heretofore discussed by the REVIEW holding the idea that in usurping the traffic now universally controlled by steam roads, the advance would not be by building long lines outright, but by connecting different smaller systems. This has been proved to a large extent by the consolidations of the last few years, and still there are more to follow.

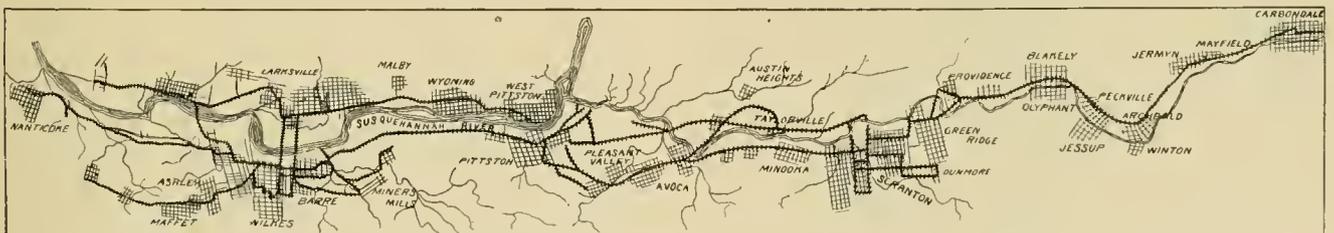

Ohio and Pennsylvania offer the best fields for interurban electrics as the towns of these states are situated closely enough together and have both enterprise and ability to carry out the undertakings.

Wilkes-Barre and Plains with another line in the city. The Wilkes-Barre & East Side Railway Company runs through Millvale, Port Blanchard and other villages to Pittston and from there to Pittston Junction with a franchise yet to be built upon to Duryea. This line will finally connect with the Scranton Traction Company's system at Taylorville. The Scranton Company, as is well known, has a magnificent interurban to Carbondale, as heretofore described in the REVIEW. The distance over the outlined trackage from Nanticoke to Carbondale, over the two systems, is 44 miles of main line, and counting the branches leading to other villages, 85 miles. Forty-five towns are connected, and a population of 250,000 is given the inestimable blessing of safe and rapid transit. The Scranton & Pittston Traction Company has a proposed route from Scranton to Pittston, via Minooka, Moosic and Avoca. The scheme of connection is almost certain to be carried out within this year, and a lesson of progress may be looked for from the Wyoming Valley.

HIS BUSY DAY.

A prominent superintendent in the east has been working for a year or more on an improvement in street car operation, and recently put his plan in successful use. The REVIEW has watched the development with great interest, and in its efforts to secure a complete account for its readers, has written the gentleman in question an average of twice a month. His last answer is full of hope and gives a glimpse into a busy life which will be recognized by many of our readers. He says:

"Yours of the 28th received. I note that 'there is no rest for the wicked.' It also strikes me that your rain descends upon the just and the unjust. As you say, at this time of year I am very busy. What with concocting a cure for rheumatism in the wrist, entertaining conductor's brothers-in-law, devising schemes for a transfer system that transfers only the original package and inventing a time card that will admit of the ladies going back two

CHAIN OF INTERURBAN ELECTRICS IN THE WYOMING VALLEY.

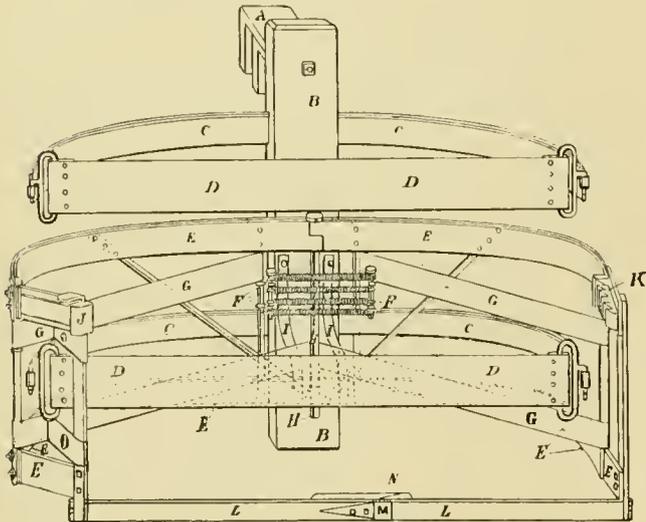

Our map of the Wyoming valley shows what will be done very shortly by building a few connecting links of track and wire. Starting with the Wilkes Barre & Wyoming Valley Traction Company, which has 54 miles of track in operation, the system extends to Nanticoke, eight miles in one direction. The Coalville Passenger Railway, of the same system, runs five miles to Sugar Notch, and the Wilkes-Barre & Suburban lines connects

blocks to kiss the baby, thrown in with regular routine work, I am busy, but shall certainly try to make the effort to 'help save the country.'"

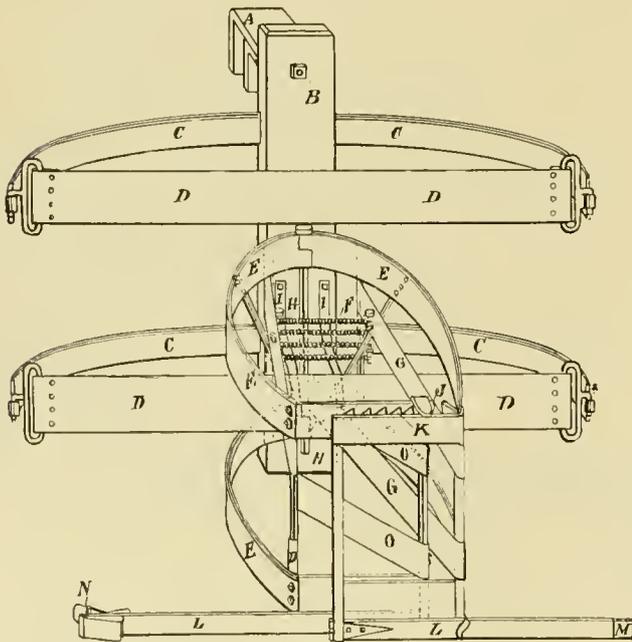

FRENCH and German municipalities have begun trying to compel street railway concessioners to put in mechanical instead of horse traction. This is the case at Havre, Marseilles and Nancy.

### DEDERICK'S FENDER.

We once thought that all the possibilities had been exhausted by fender inventors, but were somewhat shaken in that belief by the appearance of the fender herewith illustrated, which is the invention of Levi Ded-

erick, of 23 Wilson street, Albany, N. Y. The fender operates by closing two pairs of arms around the victim. When in use on a car it is set and appears as in Figure 1. The person caught strikes first against the trigger LL,

and it buckles inward. He then strikes the buffer DD, and before he rebounds the arms close around him and he is safe. The buffers G on the arms prevent his being hurt by the arms and also hold him fast. Children are caught by the narrower lower arms only. We are informed it has given good results in experimental trials on the Albany Railway.

### RESUSCITATION AFTER ELECTRIC SHOCKS.

The eminent electrician, Dr. A. D'Arsonval, maintains that persons being revived from severe electric shocks should be treated as if from drowning. Electric shocks have two effects on the system. In one case the result is lesion or destruction of the tissues, caused by the disruptive and electrolytic effects of the discharge. In the other case there is simply an excitement of the nerve centers which causes an arrest of respiration and fainting. In the latter case, death is only apparent, and the person can usually be revived by the same treatment as that given to one drowned. Artificial respiration should be practiced, care being taken that the tongue is loosened, so as not to hinder breathing. He cites an instance in which a man was in this way revived who had been stiff for over an hour from the effect of a shock, the shock having lasted several minutes.

### FIRE APPARATUS ON ELECTRIC ROADS.

The common council of Lynn, Mass., recently passed an order for the investigating of some method of carrying fire apparatus over the Lynn & Boston Electric Railway tracks to outlying districts and suburbs. The fire department, after due consideration, regarded the matter in Lynn's case impracticable. This, however, does not neutralize the value of the idea. The suggestion is eminently a good one and in many places both in larger and smaller towns would greatly expedite fire service. When fire apparatus is needed at a given point it is needed badly and immediately and a few seconds lost may mean considerable damage. Traveling on the tracks would not be more dangerous than traveling on the road, and a department employe could in a few days become a good motorman for emergencies. Let our inventive geniuses design a fire department trolley car and see what can be done in this regard.

### STEAM AND ELECTRICITY MIXED.

The Beaver & Ellwood Railroad, a steam road of western Pennsylvania operating three miles of road between Ellwood Junction and Elwood City, has been using both steam and electricity for some time. The electric cars carry the passengers and the switching and freight haulage is done by steam. The freight men are given certain schedule hours in which to do their work and the balance of the time is given over to the electric car for the passenger business. This car makes fifteen trips a day over the three miles of road. The company has found the arrangement satisfactory and it is well received by the traveling public. The road connects with the Pennsylvania company's system at Ellwood Junction, the Lake Shore system at West Ellwood, and the Baltimore & Ohio at Ellwood City.

### CABLE EXTENSIONS IN NEW YORK.

The Scientific American, in presenting the accompanying view of the work on the Ninth Avenue Cable road in New York, comments on it as the last act in the conversion of a roadway originally constructed for horse drawn vehicles into a doubled-storied avenue in which two forms of mechanical traction are used. The scene

is on Ninth avenue, under the Ninth Avenue elevated. The Ninth avenue extension is a part of the Broadway Cable line, owned by the Metropolitan Traction Company. It enters Ninth avenue at Fifty-third street and runs north on that thoroughfare to Ninety-eighth street. Another branch of the Broadway line is being built on Lexington avenue, from Twenty-third street to Seventy-ninth street.

### STEAM AND ELECTRIC RAILWAYS.

In the "railway number" of the Independent, Thomas L. Greene contributes an article on the above subject, of which the following is an abstract:

The development of electric railways into what may be called suburban systems is having certain results not at first foreseen. The comparative cheapness of electric propulsion cannot be denied. One result of the joining of near-by villages and towns by electric roads is that the steam railways, which have for years carried the local travelers who journeyed from one station to another, have felt the competition in some cases seriously. For a ride of but a few miles it is clear that a surface road has a number of important advantages. If the speed be reasonably rapid, and electricity allows of that, the traveler will have to spend very little if any additional time on the journey, and any slight excess of time required is more than made up by the privilege of beginning his journey at any hour which may suit his convenience. Perhaps the electric cars pass his door, while the steam railway station is some distance away. So, too, at his destination, the electric car will land him at whichever portion of the city or village he may wish to go. Pos-

sibly in cities this advantage may save him an extra fare which he might have to pay some street road from the railway station. An instance of the effect of this competition is seen in the service between St. Paul and Minneapolis, Minn. The distance between these two cities is about ten miles. The travel between them had been accommodated by local trains run at convenient hours throughout the day by the two principal steam railways. The completion of the electric street railway system between the two cities, however, was followed by such a complete falling off in the travel upon the steam railways that they practically abandoned their local service. In Connecticut, where the steam lines running through populous districts were threatened by the competition of electric roads, there has been a long legislative wrangle over the equities involved.

The situation is such that the steam railways must expect to lose a certain proportion of their station-to-station travel. Rapid transit in the streets and along the highways has become so important from a public point of view that it is not easy to see how the steam roads can retain their old number of short-distance travelers; nevertheless, the competition is unjust. The steam railway has spent large sums of money for its roadbed, equipment and plant, and, as the owner of real estate in the town or county, usually pays a large proportion of the public taxes. On the contrary, the electric road usually pays nothing for its right of way, because the privilege of laying its tracks on the public streets or on the public wagon roads without charge is commonly granted to it; and in these privileges it has a material advantage over the steam road, which, indeed, is often indirectly taxed to support its rival through street or road repairs, or something of the sort.

In another way, also, the electric road has the steam road at a disadvantage. No more precautions were necessary to be taken by the horse car company than by the owners of private wagons; but rapid transit has changed these conditions, while the slow law has not caught up with them. As yet the electric roads have not been compelled to take any precautions such as experience has shown to be necessary on steam roads, and which the law makes obligatory upon the latter. The electric railways are not obliged to put up any signal apparatus or to protect the public in any way against the new danger—such, for example, as fencing off its tracks, a thing the steam road must do often at large expense. Safety both for electric and steam passengers demands the enactment of laws in every state requiring that no electric road shall cross a steam railway at grade, unless the most approved signals and derailing switches are set up.

But while the competition of electric roads between villages is felt by the steam railways which have heretofore carried all the travel, that statement does not exhaust the subject. Even in regard to this same competition it must be remarked that frequent and rapid transit creates travel, and that more people journey from village to village under those circumstances than would take the steam trains, if the latter were the only means of inter-village

conveyance. More than that, it is highly probable that the effect of the extension of electric roads outside of cities will in the long run benefit the steam railways and facilitate their business. Not every electric road competes by running alongside a steam railway. A great many of them are built to connect distant villages, which have no steam communication, directly with some railroad station. In all such cases, the value of the electric roads as a feeder of the steam railway is rightly considered great. The demand for electric connections is sure to be heard from all the interior towns and villages of local importance. It is possible that the expansion of the new system of street and road transportation, when once extended into the rural districts generally throughout the country, will have important effects upon our political economic problems as well as upon the revenues of the steam railways, which must continue to be the only method of travel for longer distances.

The argument of Mr. Greene's in regard to the "unjust" competition of electric roads will hardly stand. While it is true that the steam road must buy its own land and pay taxes on it, it is also true that the electric road also pays taxes on its roadbed and plant. The fact that the electric road is given its right of way is abundantly paid for by the cheaper service of the electric road, which is often less than one cent a mile. The electric road requires only eight feet of roadway, and that eight feet can usually be given not only without any material loss to the public, but with a great gain. It might also be mentioned that there are numerous cases where inter-urban electric roads own a part or the whole of their right of way. In regard to signals and safety regulations, practice has not demonstrated the need of them. It is safe to say that suburban and interurban roads are the safest in existence to-day. Grade crossings are chiefly dangerous when the steam road, by a short-sighted policy, forces the electric road to jump the steam tracks.

The fact, is, that the electric road is from its very nature cheaper and more convenient than the steam road for a certain class of travel. To try to even up the difference between steam and electric roads by legislation would be like trying to make it possible for the stage coach to compete with the railroad by the same means.

#### A SOUTHWEST CHINA TRAMWAY.

Georgetown is an English, or rather an Anglicized settlement on the Penang Straits, Southwest China. It is the most flourishing of the Straits settlements and a place of considerable commercial importance.

Its most distinguishing feature is, however, a steam tramway which runs from the quay through the principal streets, terminating in two populous villages. The inducements to build the line were the considerable freight and passenger traffic, the latter of which is developing as the natives get used to the "devil machine."

The rolling stock and plant were furnished by Kerr,

Stuart & Company, London, under designs of F. H. Gill, C. E., the engineer of the firm. The road is five miles long and is laid with steel ties, the only material proof

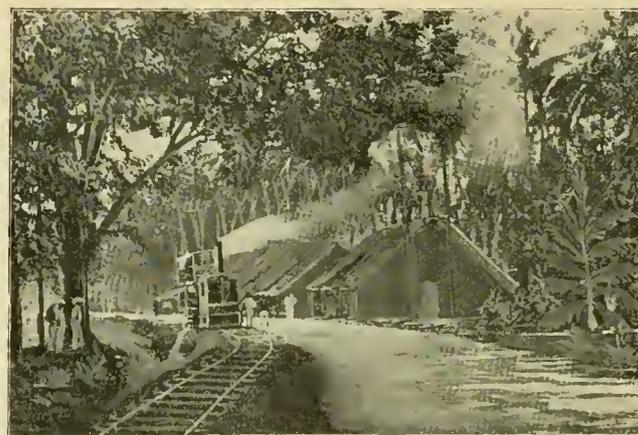

CONSTRUCTING THE LINE.

against the ravages of the voracious native ants which devour everything except bamboo, teak and iron. Of these, bamboo is too light and teak too expensive.

Clearing the right of way was not child's play, as a dense growth of palms had to be cut away. To do this work a big traction engine was employed to "pull stumps" a la Western American practice.

The peculiarities of the traffic demanded a style of rolling stock absolutely unique, namely a combination passenger and freight car. The cause of this was the fact that passenger traffic is valuable only on holidays. At these times the whole population of the entire district assembles at Georgetown, while on ordinary days tout le monde stays at home. Therefore the cars are made with a side entrance and on the two-story plan, the first floor being first-class and the second, second-class. The conductor stands in the middle and commands the only means of egress and exit. This is absolutely necessary on account of the wild and restless nature of the passengers, who take every means of "beating their fare" just

SCENE ON THE TRAMWAY.

as ordinary American citizens are wont to do. The freight cars are fitted with a movable roof which may be hoisted and thus transformed into fourth-class coaches.

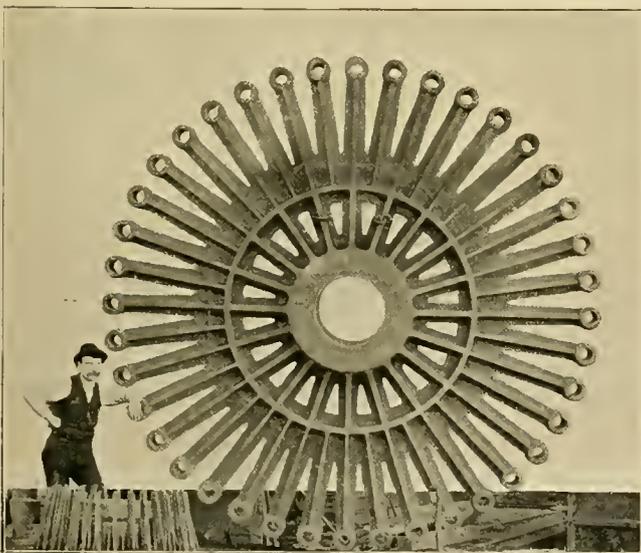

They run on four wheeled trucks. Seats are not provided, as the native is unused to this luxury and contents himself on the hard floor.

The locomotives are of the boxed-in type so familiar in England, and built especially for the purpose. The engineer's life is not all one happy dream, as a single incident will show. One night an engine was left as usual in its shed and the fire put out. On trying to raise steam next morning the engineer worked unavailingly, but could not account for the low pressure. Finally the fire was raked out and the boiler examined and the cause of the delay discovered. The boiler tubes were found crowded with snakes which, no doubt, attracted by the warmth had taken up an abode there over night. They were nicely roasted. Another inconvenience is the native festival which is often recurrent. At these times the natives get beastly drunk and lie down at will along the track. The fireman then has to run ahead at intervals and pitch a drunken coolie into the ditch.

Although the cost of the plant was considerable, it is said that the tramway is a paying concern.

**THE LARGEST ARMATURE STAR IN THE WORLD.**

The accompanying engraving represents one of a pair of what are probably the largest armature stars or carriers in the world. A pair of them have recently been made by the Wells & French Company, for the Seimens & Halske Electric Company of America. They are to be installed at the power house of the Toronto Street Railway. The machines when completed will weigh about 60 tons each and have a nominal capacity of 1,200 kilowatts or 1,600 electrical-horse-power and will be over compounded for a 12 per cent line drop. They will be

LARGEST ARMATURE STAR IN THE WORLD.

direct connected to a pair of horizontal cross compound condensing engines running at 80 revolutions per minute. The stars are 13 feet in diameter and weigh something

over 10 tons each. The brush carriers, made by the same concern, will be 14½ feet in diameter. The castings came from the mould without warp, crack, flaw or blow hole, and the Wells & French Company is to be congratulated on the success of the first trial at making these large and difficult castings.

**A MEXICAN AIR LINE.**

A correspondent of the REVIEW who is now traveling in Mexico, sends a sketch of a novel means of transport-

A MEXICAN AIR LINE.

tation found in operation several hundred miles back from the coast. It is the well known form of ropeway and is used for the transportation of both passengers and freight. The line crosses two very deep canyons and the intending passengers need to take a very level head on their shoulders, as any sudden dizziness arising from peering down the more than 1,000 feet of space could hardly result other than in a fatality. Nevertheless the air line is well patronized and after one has become accustomed to the ride it is said to be exhilarating and even enjoyable. Two passengers constitute a load and no difficulty is experienced in enforcing the "no seat, no fare" rule.

THE Richmond Electric Club, Richmond, Va., is one of the newest organizations of electricians. The officers are: George A. Tower, president; T. L. Martin, vice-president; Harrison Tabb, secretary; F. J. Craigie, Jr., treasurer. The REVIEW extends congratulations.

THE strike that failed occurred down at Pine Bluffs, Ark., last month, when the force of 15 conductors and drivers walked out. It took 15 minutes to get 15 men to take their places and the strike was declared a dismal failure.

SERAJERVO, Austria, is to run an electric light and railway plant on the municipal plan.

NIJNINOVGOROD, the great Russian market town, is to have an electric railway on the overhead plan.

CLONTARF, Ireland, is to have an electric railway, and the Dublin tramways apply for electric rights on the Hill of Howth line.

ULM, Germany, will soon be riding by electricity. The Schuckerts, of Nuremberg, have received a fifty-year franchise on a percentage basis.

The Brazilian Street Railway Company finds in spite of war and hard times that traffic is on the increase, amounting to £42,560 against £38,360 in 1892.

An interesting feature of the Lyons, France, exhibition is an electric tramway on the alternating current system, put down by the celebrated Creusot Works.

HANNAN & Co., are about to establish a permanent sample exhibition at Johannesburg, South Africa. An efficient staff will be organized to exhibit and care for machinery of all kinds.

A NEW electric railway is now building between Lyons and Oulins, France. Thomson-Houston generators are in use. The old rolling stock of the company is being refitted for overhead trolley work.

PNEUMATIC tires for omnibusses are coming into vogue in England. McLellan & Co., of Glasgow, are making extended experiments on the subject. The brake is applied to the nave of the wheel when the pneumatic tires are used. Why not make it an air brake, brethren?

THE management of the Grand Berlin Horse Tramway Company, of Berlin, has erected an accumulator station in Waldenser and Wicief streets, and will experimentally work a line on the accumulator system from Werftstrasse (Moabit) to Hansaplatz, Luzowplatz, and Potsdamerstrasse.

THE Allgemeine Electricitats Gesellschaft, Berlin, Germany, has decided to appoint selling agents for its goods in the United States. New York, Chicago, Cincinnati, Atlanta, San Francisco, Boston, Philadelphia, St. Paul, Washington, Denver and other cities will be so

honored, and electrical firms wishing to handle these goods are requested to forward offers to the main office, 22 Schiffbauerdamm, N. W., Berlin.

GERMANY has more electric railways under construction than any other European country. There is no opposition to the trolley among these most scientific people and electrical industry will see great commercial progress before the end of the century. The English electrical papers bewail the conservatism of their country and are making a gallant fight for the more extended use of the trolley. France follows Germany in this particular, and Russia is waking up wonderfully upon the subject.

AN electric locomotive is in use at the Globe Machine Works, of Castleton, England, for shunting freight cars on the works' siding. The raw goods are backed into the siding by the railway engines, and are taken wherever required by the electric locomotive, worked on the overhead wire system. The packing department is provided with an electrical crane for hoisting the machinery either into railway trucks or on the wagons. The energy is generated by a dynamo in the main engine room, driven from the works' engine, which is of the horizontal tandem compound type.

#### The Big Four Route Has the Best Terminal Facilities at Chicago.

All trains enter Chicago on the Illinois Central tracks along six miles of the Lake Front, through the most picturesque portion of the city, and land passengers in the magnificent new Central Station on Twelfth street and Lake Front. This station is convenient to the Auditorium, Richelieu, Victoria and Leland Hotels, and within two blocks of the State and Wabash street cable lines and the South Side Elevated Railway. Convenient stops are also made at Hyde Park, Thirty-ninth street and Twenty-second street stations.

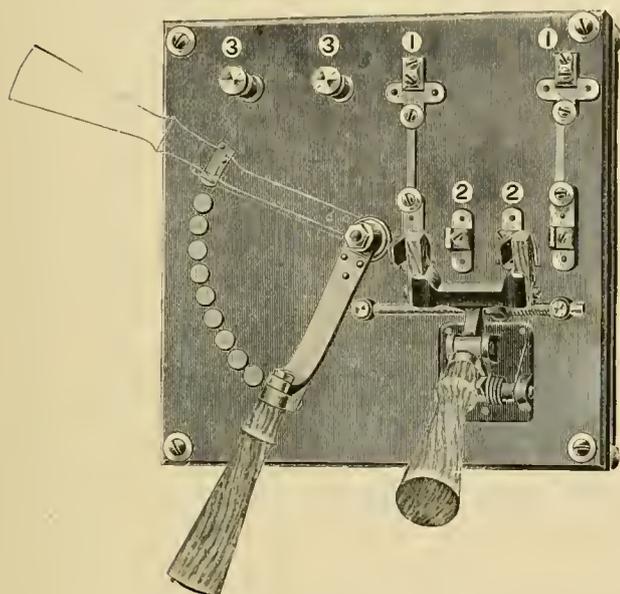

Magnificent vestibuled trains, parlor cars, Wagner sleeping cars, private compartment buffet sleeping cars and superb dining cars. No transfer across Cincinnati to make connections.

Your ticket should read via the Big Four route to enjoy these privileges. E. O. McCormick, Passenger Traffic Manager; D. B. Martin, General Passenger and Ticket Agent, Big Four Route, Cincinnati, O.

THE New Haven Car Register Company, of New Haven, Conn., has equipped the Chestnut and Walnut street lines of the Philadelphia Traction Company with the New Haven register. The machines were especially made with large faces adapted to the cars in which they are used. The New Haven is an elegant, durable and reliable piece of mechanism, and its popularity is a just reward for its quality and appearance. The manufacturers report a lively demand for and many enquiries after the device. In addition to the elegant appearance of the New Haven register, its positive action, safety and continuity of registration, and its strong construction, make it a most desirable and efficient device.

**THE HILL AUTOMATIC RHEOSTAT SWITCH.**

The W. S. Hill Electric Company has placed on the market a combination switch and rheostat that prevents

the current from being turned through a stationary motor unless all the resistance is in circuit. This accident is liable to happen when there is a switch separate from the rheostat. By combining the two with an interlocking device, safety is secured, and at the same time the price is less than for the rheostat and switch separate.

**MEETING OF THE NORTHWESTERN ELECTRICAL ASSOCIATION.**

The summer meeting of the Northwestern Electrical Association will be held in St. Paul, July 18, 19 and 20. There is an excellent promise of a large meeting. At the last meeting held in Milwaukee, 150 were present, and a larger number is expected at St. Paul. Representatives from all surrounding states have written that they will be present. An excellent programme has been prepared and the best expert electrical talent of the United States has been secured to address the convention. Current will be furnished to illustrate lectures as well as to accommodate exhibitors. Manufacturers and supply houses will be accorded every courtesy by the Association. Henry C. Thom, of Madison, Wis., is secretary.

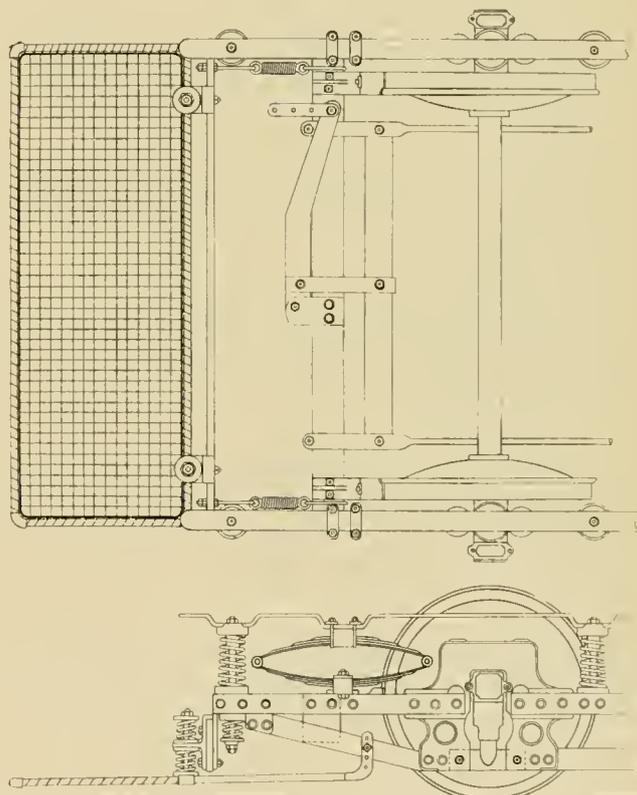

A. B. BLACKBURN, M. I. C. E., has been appointed to succeed Thomas Parker as chief engineer of the Electric Construction Corporation, of Wolverhampton, England.

THE Bernese Oberland Railway, of Switzerland, is said to be about to substitute electricity for steam. The contract is a tremendous one, as ten trains are usually simultaneously on the tracks.

**PECKHAM'S AUTOMATIC LIFE AND WHEEL GUARD.**

It is to be expected that when the Peckham Motor Truck & Wheel Company attempts anything the attempt is successful. So thorough and careful a company can not afford to put upon the market anything but the best and most reliable devices.

The new Peckham automatic life and wheel guard, illustrated herewith, in connection with the improved extra long extension truck, combines simplicity, lightness and strength with safety and positive action. The guard is constructed of one inch wrought pipe, carrying a wire screen. It is five feet eight inches long and thirty inches wide, and attached to the guard plank by two cast iron brackets, in which are two pockets for spiral springs, one of which allows an upward motion in case of contact with an immovable object. The rear extension is bolted to the truck truss bar and provided with three holes, so that easy adjustment may be made to carry it at any desired height above the track. The screen is inclined at a sufficient angle, so that when a moveable object is struck, the spring allows the screen to drop to the track. As the device is centrally suspended by the special

PLAN AND END ELEVATION.

spring, its tendency is downward when any moveable object is struck. The guard is designed expressly for the Peckham cantilever extension truck so well known to the trade.

ALEX. H. LEWIS, well-known to the electrical trade, has taken the Cincinnati agency of the Abendroth & Root boiler.

## HALF FARES.

Interesting Bits of Information from All Parts of the Country,  
Boiled Down for Busy Readers.

THE Columbia & Donegal Electric Railway was formally transferred to the Pennsylvania Traction Company, Senator Patterson's system, July 1.

THE Chevy Chase resort, near Washington, D. C., has been opened for the season. Boating, band concerts and an electric fountain are the attractions.

THE Bangkok, Siam, tramways use the sawdust from teak wood saw-mills for fuel. The tramways have done well financially during the first year of operation.

OUT of the thirteen street railway patents issued on June 27, seven were for fenders. Our statistical editor says that if this record can be kept up it will make 364 per year.

A BOSTON ex-councilman has a \$10,000,000 elevated railway scheme to perpetrate on the long-suffering city of baked beans. His little bill will be put before the legislature.

MOODY MERRILL, formerly president of the Highland Street Railway Company, Boston, who left Boston as a fugitive from justice, announces his marriage to a Mexican heiress.

NEWBURG, N. Y., has an electric street railway now in operation. It was opened for traffic June 9, the first car carrying a distinguished party of street railway men and city officials.

THE Nilgiri Railway, of India, has twelve miles of Abt rack rail on grades as steep as 8 per cent. It uses wooden ties, and is the only Abt rack in the world to do so except the Pike's Peak Railway.

THE inventor of an electrical appliance recently patented, assigned eighty-three one hundred and twenty-eighths of his patent to four other parties. What a time there will be dividing up the profits!

IT is proposed to build an electric tramway between Champel and Petit-Saconnex, via Geneva, Switzerland. A line is already building between Langenthal and Huttwyl. Siemens are the contractors.

AN ELEVATED JOKE.—Josh Hayseed—I put two tickets in the box. What are you going to do about it? Ticket Chopper—Well, as it isn't a ballot box, we'll let you off this time with a reprimand.—Texas Siftings.

PRESIDENT SHEPHERD, of the Cincinnati, Covington & Newport Street Railway, says that the report of a contract for fifty cars from two different car companies is incorrect, and adds that Brownell cars are used exclusively.

AS VIEWED from Boston, the Home Journal says: "According to a New York ruling every fourth street car must be closed. But who, in these rushing days, will let three go by in order to see whether the company lives up to the law?"

THE first summer traffic of the Brooklyn electric line augurs well for the season. On the second Sunday in June 500,000 people were carried to the various pleasure resorts, or more than five times the number carried on the corresponding day last year.

THE Bellwood and the Gaysport branches of the Altoona & Logan Valley Electric Railway, of Altoona, Pa., were opened for traffic June 28. The company now has 27 miles of track, two power plants, 63 cars, and the investment is rated at \$1,000,000.

An automatic horse-feeder is the invention of a Missouri genius. It depends on gravity for the dropping of feed into the bin and upon clock work for its regulation. Some bright street car mule will learn to "turn on" the clock before it has been in a street car stable a week.

GEORGE CUTTER, of the Rookery, Chicago, was down east on a business trip recently and tells the following as a true story: "Boston street car conductor—How old are you, my little girl? Little girl—If the corporation doesn't object I'd rather pay full fare and keep my own statistics."

W. T. ADAMS is made temporary receiver of the Chattanooga Electric Railway Company. Mr. Adams is president of the company and but recently elected. The road was in bad shape financially when he assumed charge, but a combination of circumstances necessitated this last movement.

THE Second Avenue Traction Company, of Pittsburg, has contracted with the Russell Engine Company, of Massillon, O., through F. G. Borden, the Pittsburg agent, for a cross compound condensing engine of 1,800-horse-power. The engine will be installed at the new power house to be built at Glenwood.

ONE Miss Bessie Off, while riding her bicycle recently at Asbury Park, N. J., carelessly ran before a motor car. She sustained a compound fracture of the right arm and two fractures of the leg below the knee. The plucky girl, while on her way home, sent word to the company that it was her own fault, exonerating the motorman.

A BOSTON paper tells of an "idiot" who suggests combination cars, half open and half closed, and pronounces the scheme an unheard of lunacy. Exactly such cars are, however, in use on both the West and North Side cable lines in Chicago, and on several electric roads on the Pacific coast, and have been in operation several years.

ALL the street car mules in Nebraska City, Nebraska, were destroyed by fire not long ago, with one exception. This latter animal, although badly burned, will live. This particular mule seems to bear a charmed life. A few years ago the barn was struck by lightning and every four footed animal, except the above mentioned, was killed. May he live long and be pensioned.

AN old lady of Middletown, O., came into the office of the new Middletown & Goshen street railway recently and bought a dollar's worth of tickets, saying: "I have had a few rides on the electric cars and I find that I have had more relief from my rheumatism than I have received in the past three years. I want a book and I'll ride as often as I can find time to do so. It's cheaper than medicine."

B. S. COLER, of the West Side Street Railway, Kansas City, Kan., holds an annual reception to newspaper men and city officials at Brown's Park. Refreshments are served and the street railway lines placed at the disposal of the guests. This year's reception was held July 2. These occasions have always been of the most pleasant nature and result in a friendly feeling on the part of all so entertained.

ON the morning of June 21, a crowded interurban car, plying between Minneapolis and St. Paul, jumped the track on the Twenty-first avenue bridge and dashed onto the railing with terrific force. The rail broke and fell into the river, but the car stopped and swayed on the edge. The conductor stood at the door, which was just over the stream, and held the passengers back, thus preventing them from crowding each other into the river, nearly 100 feet below.

IT is estimated that 2,000,000 head of half-breed horses range the plains of Nevada, Washington, Oregon, Idaho, and Nebraska. They are useless except as food and fertilizers, and the agricultural papers lay the blame of all of it upon the electric railway. Verily, "Othello's occupation's gone. Why not give these horses to the Coxeyites and save railroad fare and provender. When the mounted commonwealers reach Washington they could eat their steeds and save the poor fund.

BUILDING a street railway line in Passaic, N. J., is not all one blissful dream. It is a battle, a hand-to-hand conflict, in fact, a fight. Not long ago a gang of men were set to digging holes for the side poles, when not only the male inhabitants of the vicinity but the females rushed forth, and while the latter held the workmen's shovels the former filled up the holes. One old woman knocked down the foreman of the gang, and the police had to interfere to protect the lives of the unfortunate pole-setters.

A LITTLE Keokuk, Ia., girl was sent out one day to make some small purchases. Five cents were left in the form of a nickel wherewith to pay street car fare home. As she was picking up her packages, she inhaled sud-

denly and swallowed the nickel. She gasped for a minute and then said, "Gracious! I've swallowed my nickel, and I'll have to walk home." When asked if she felt uncomfortable, she said, "It hurts here," pointing to her heart. Suddenly gathering her packages, she started home on the run. No wonder some people have indigestion.

WE are in receipt of a general letter issued by the J. H. & D. Lake Company, of Massillon, O., and signed by the president of the company, stating that the concern is in the sheriff's hands, at the instance of the Board of Trade and the Merchants' National and Union National Banks of Massillon, demanding immediate settlement of loans. Mr. Lake also says that by the failure of B. H. Parkhurst, the company's endorser, the above-named creditors refused further promised assistance. W. F. Ricks, president of the Massillon Board of Trade has the matter now in hand.

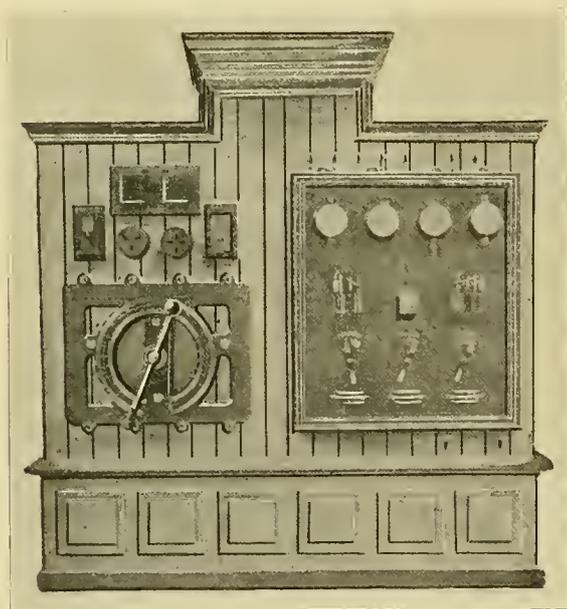

HAVE you one? According to the Electrical Review, London, a firm of London electrical contractors has had a very amusing enquiry regarding a machine required for the Indian market. An Indian customer wants to know the price of a machine which "(1) gives electric shocks and sends out sparks; (2) is a magic lantern of sorts; (3) can make any noise desired, and can ventriloquise. The name of the instrument has been forgotten." It is evident that somewhat exaggerated ideas are abroad in India as to the wonders of electricity, or perhaps it is pneumatic-storage battery arrangement with the inventor connected with it.

THE members of the Knox Church, at Hamilton, Ont., in prayer-meeting assembled, passed the following resolution: "The congregation of Knox Church, this city, hereby earnestly raises its protest against the flagrant and, in its judgment, wickedly-unnecessary disturbing of public worship on the Lord's day by the running of the Hamilton street cars. The pretence that the said cars are run for the accommodation of the Lord's people is the veriest cant, the sheerest hypocrisy of this mammon-pursuing age of the world. They are run for gold alone.—Mungo Fraser, unanimously endorsed by the prayer-meeting."

WHEN that organ of othersidedness, the New York Recorder, isn't blessing street railways with the left hand it is saying something nice like this: "The open street car is a great blessing. It is the poor man's carriage, the sick baby's health resort in hot weather. Ninety-nine people out of a hundred prefer the open car, night or day, but a few bloodless busybodies, who have plenty of time to growl, make more noise than the great majority, City people never get too much open air, anyhow. If a person catches cold on an open horse car even at night, there's probably something the matter with his nose or lungs which a doctor might remedy." It all comes of the open car schedule mentioned last month, which the Recorder disagrees with. Why? Who knows?

## ACCUMULATORS IN CENTRAL STATION RAILWAY WORK IN SWITZERLAND.

Switzerland is justly regarded as the center of the electrical industry in Europe. This is particularly the case in the electric traction field, and to Switzerland we look for the latest developments of long distance transmission. In a series of articles on the development of electrical science in this country, the "Electrical World" of June 30, 1894, gives an extended account of the Zurich-Hirslanden Electric Railway. The line runs from the center of Zurich to the suburb of Hirslanden, over a series of grades ranging from 0.4 per cent to 6.3 per cent; with a total length of about three miles. The gauge is 39 inches and when all are commissioned 18 cars will be operated. The power equipment consists of two 100-horse power engines belted direct to Oerlikon generators, and one 45-horse power engine. The two large generators have a capacity of 66 kilowatts. Under ordinary

THE SPECIAL SWITCHBOARD.

conditions at 450 r. p. m., the output is 120 amperes at 550 volts. The smaller engine is coupled direct to an auxiliary generator for charging the "extra" battery cells. To the accumulator practice of this station this story particularly appertains. At the rear of the power house is another building in which are placed 300 Tudor type secondary battery cells, to equalize the station load and permit of shutting down for short intervals in case of accident to the generating machinery. The line is a small one, but in plants of this size the storage batteries offer the greatest saving and convenience, added to which is the economy of power in ascending the constant succession of grades when greater power is necessary.

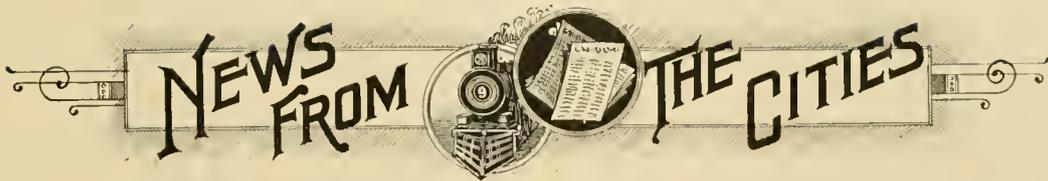

Of the 300 cells, connected in series, 240 constitute the battery proper and are always in parallel circuit to the

generator; the remaining 60 cells are used for regulating purposes and through a circular switch are put in, out of the line circuit as required. Each cell has a normal capacity of 245 ampere hours with an 80 ampere discharge, although 160 amperes can be taken momentarily without damage. The battery as a whole is rated as capable of giving 120 amperes at 550 volts and is estimated as sufficient to run the line with nine cars for from 1½ to 2 hours, independently of the generators. The 60 additional cells having such an important function are carefully conserved. For at least an hour each day when the least load is on the line the small generator charges them independently of the rest of the battery. As a rule the extra cells are found to be "run down" at the end of the day. It is found that the average current output from the station with nine cars on the track is 90 amperes, although the momentary fluctuation may vary from 0 to 200 amperes. When the cars are drawing no current the whole of the current output from the generator passes into the battery for storage, while in the latter condition the generator supplies the line with 120 amperes and the battery makes up the deficiency of 80 amperes. Load variations may cause variation in the speed of the engine amounting to two or three per cent, and the question as to the source of supply at a certain moment of overload depends upon whether the cell regulation or that of the generator responds the quicker. It is the function of the cells to take up the highest peaks of the load, so that an economy can be effected in the size and first cost of engines and generators. The use of the battery makes it possible to run on half the size of the plant otherwise necessary. Only one generator need run continuously.

A special switchboard, in addition to the ordinary railway board, controls the battery. On this board are arranged the "high" and "low" voltage relays, ammeters and discharging switches for the battery, which forms the direct source of power to the line. The most conspicuous apparatus is the circular switch which cuts in and out the cells to suit the variations of the line voltage. In this "cell regulator switch" the contact arm actuated from behind by two selenoid magnets acting by reverse pawls upon toothed wheels, swings around the contact plates in either direction with continued and unvarying accuracy. A "minimum cut out" disconnects the generators whenever the charging current from the generators falls below 10 amperes. All the regulation on the board is automatic.

### A PROMISING OPPORTUNITY.

What seems to be a very promising interurban enterprise is being organized to connect several other towns from Lancaster, Ohio, to the Buckeye Lake Park. A. Bauman, the manager of the Lancaster Electric road, is promoting the affair, and a liberal amount of local capital is promised to put it through. Some outside money is necessary to carry out the plan. Inquiries may be sent to A. Bauman, manager, Lancaster, Ohio.

**Alabama.**

OPELIKA, ALA.—Opelika & Auburn Electric Railway elects M. E. Gray, Columbus, Ga., president; A. H. Slaughter, treasurer, and C. I. Daughtry, secretary. Payment of first installment on stock called for within thirty days.

**Arkansas.**

HELENA, ARK.—The plant and franchise of the Helena Electric Light & Power Company have been sold at receiver's sale to the Helena Gas Company. New power house will be built.

**California.**

SAN FRANCISCO, CAL.—Adolph Sutro applies to supervisors for franchise to the Cliff House.

SAN FRANCISCO, CAL.—W. F. Rudolph succeeds S. B. McLenagan, as superintendent of the Oakland Central avenue road.

SAN FRANCISCO, CAL.—The Presidio & Ferries Railroad Company applies for additional franchises, including use of electricity.

BERKLEY, CAL.—W. E. Sell, J. G. Gardner and J. R. Little have petitioned the trustees for franchise over several routes in this suburb.

SAN DIEGO, CAL.—The Security Company, which acquired the old Park Belt Line, has secured a franchise through the city and will begin work soon.

SAN FRANCISCO, CAL.—Sanford Bennett, the receiver of the San Francisco & San Mateo, wants permission to mortgage the property for \$100,000, which amount he says is necessary for immediate improvements.

SAN FRANCISCO, CAL.—Three years ago a franchise was obtained for the Market Street Cable Railway for a line on Page and Frederick streets. A conduit was placed but nothing else done. Franchise has now expired and an attempt will be made to nullify the rights of the company.

**Canada**

BELLEVILLE, ONT.—S. A. Lazier & Sons, of this city, ask for franchise for street railway and light plant.

MONTREAL, QUE.—The Standard Light & Power Company announce that they will begin work immediately on an electric railway to Lachine via the Upper Lachine road.

HAMILTON, ONT.—John Patterson, projector of the Hamilton Radial Railway, says that he has succeeded in getting several New York capitalists interested in the enterprise.

ST. JOHN, N. B.—The St. John Electric Railway, elects directors: Sir Wm. Van Horn and James Ross, Montreal, and J. J. Tucker, H. P. Timmerman and H. H. McLean, St. John. Van Horn was made president.

OSHAWA, ONT.—The plans of the electric railway which Capt. Carter, of Deseronto, Ont., proposes to construct here, have been accepted by the city council. The road will be built in three sections and will receive a cash bonus of \$75,000.

HULL, QUE.—The city council has granted a charter to Mr. Viau's local company to run an electric railway in Hull. The charter is for thirty-five years, the work not to start before two years from now; \$15,000 must be spent in the first year after starting, and \$5,000 a year for the next ten years. In twenty years the corporation can buy the whole outfit by arbitration.

**Chicago.**

CHICAGO.—The Cicero & Proviso asks for extensions in the village of Harlem.

CHICAGO.—Permit to Lake Street L to build bridge across the river for North Side branch has been granted.

CHICAGO.—Organized: Columbia Motor Company, Chicago; capital stock, \$1,000,000; incorporators, Walter E. Sparks, Richard W. Robinson and John C. Wilson.

CHICAGO.—The Illinois Supreme Court decides that street railway companies must provide fenders around the wheels of their cars to protect the public from injury.

CHICAGO.—A franchise is introduced in the city council by Alderman Powers, giving the Central Rapid Transit Company right to build a "storage battery, caloric or hydraulic" street railway on the South West Side.

CHICAGO.—A. E. Lancaster, secretary of the Chicago syndicate controlling the Cass Avenue lines, of St. Louis, says that the J. N. Campbell scheme, to consolidate Saint Louis Street Railways, is so far simply a scheme of Mr. Campbell, who is a bright and successful promoter. The syndicate has not been approached.

CHICAGO.—Organized; Schuttler Ratchet Drill Company, at Chicago; capital stock, \$25,000; incorporators, Joseph W. Hiner, Woodland I. Todd, and Henry E. Byers.

CHICAGO.—Council committee recommends passage of the Northern Electric Railway franchise ordinance introduced May 24. It provides for double track electric railway on West Forty-seventh street from Lake to Thomas streets, and in that neighborhood.

The committee also recommended the passage of the ordinance of the Cicero and Proviso Railroad Company for a double track road on west Forty-eighth street from West Lake street to West Chicago avenue; on West Chicago avenue to West Fifty-second street with the right to connect with the other lines of the road.

**Colorado.**

DENVER, COL.—Supreme Court decides that Denver Tramway Company's original franchises for cable and electric lines are valid.

**Connecticut.**

WALLINGFORD, CONN.—Meriden Electric Railway Company has decided on extensions.

BRIDGEPORT, CONN.—The Bridgeport Traction Company has the following officers: President, Col. N. H. Heft, of Bridgeport; vice-president, Elias Ward, of Newark; treasurer, Wm. Sheerer, of Newark; secretary, Thos. L. Watson, of Bridgeport.

HARTFORD, CONN.—The Hartford, Manchester & Rockville Tramway Company is organized as follows: President, M. S. Chapman; secretary and treasurer, H. J. Wickham; directors, E. Stevens, Henry and William H. Prescott, of Rockville; Elisha Morgan and R. W. Day, of Springfield; G. Henry Whitcomb, of Worcester, and E. C. Hilliard and M. S. Chapman, of Manchester. Company has plenty of money and will begin work immediately.

**District of Columbia.**

WASHINGTON, D. C.—The Columbia railroad has made application to the commissioners to cable part of its lines.

WASHINGTON, D. C.—Ex-Representative Hlenphill, of South Carolina, and Washington capitalists, have a bill before congress to incorporate an electric elevated between Washington and New York.

**Florida.**

TAMPA, FLA.—E. S. Douglass, president of the Consumers' Electric Light & Street Railway Company has bought the Tampa Street Railway & Power Company, and will consolidate it with his own company. He will improve the service.

KEY WEST, FLA.—The Key West Gas & Electric Company has increased its capital stock from \$75,000 to \$250,000. The change will allow enlargement of plant and building of a street railway. Some equipment is already bought.

ST. AUGUSTINE, FLA.—The St. Augustine Railway & Steamboat Company is preparing to build its line from St. Augustine to North Beach. There is about two and a half miles of old embankment to repair and a half mile of new grading, the remaining distance being on the streets of the city. Some new piling and other trestle work is required. Electric power will probably be used. Contractors and others supplying equipment for street railways may meet by appointment, or address, until July 15, Chas. Sperry, superintendent, 12 West Thirty-first street, New York City.

**Georgia.**

AUGUSTA, GA.—Superintendent Thomas A. Roberts died, June 27, at the age of 30. He is succeeded by W. E. Moore, electrician of the company.

DONALSONVILLE, DECATUR COUNTY, GA.—The Donalson Lumber Company wants 5 miles of 30-pound relaying rail with bolts, spikes and fish plates, for tram line.

**Illinois.**

BELLEVILLE, ILL.—City council grants Belleville City Street Railway Company right of entering the city on Seventh street.

AURORA, ILL.—The Street Railway Company will convert the Scharschburg farm into a summer resort. It contains eighty acres. Attractions wanted.

WAUKEGAN, ILL.—Organized: Bluff City Electric Street Railway Company, Waukegan; capital stock, \$200,000; incorporators, Dewitt L. Jones, S. D. Talcott and Charles Whitney.

**Indiana.**

TERRE HAUTE, IND.—The street railway company is arranging to burn oil fuel.

INDIANAPOLIS, IND.—Elwood Electric Street Railway will issue \$50,000 in bonds to construct line from Elwood to Frankton. Chicago parties will buy issue.

INDIANAPOLIS, IND.—Indianapolis & Broad Ripple Rapid Transit Company having been refused right of way by county commissioners, has been getting private right by purchase.

WABASH, IND.—The Wabash Electric Railway Company appoints A. J. Ross, A. H. Plummer and Nathan Meyer as committee to confer with supply men and manufacturers in regard to cost of building the line.

HAMMOND, IND.—The Hammond, Whiting & East Chicago Electric Railway Company elects: President, Charles F. Griffin; vice-president, A. M. Kaufman; secretary, treasurer, general manager, A. M. Turner

FT. WAYNE, IND.—Ft. Wayne Electric Corporation is organized to liquidate the affairs of the Ft. Wayne Electric Company. Its capital is \$1,500,000, and it will absorb all existing contracts and business of the present company.

ELKHART, IND.—Since the transfer of the Elkhart Street Railway to the Indiana Electric Railway Company, Chicago, it is understood that the line will be greatly improved and extended. New lines will be built and other improvements made.

INDIANAPOLIS, IND.—J. C. Shaffer has been awarded \$25,000 as the last payment of the \$100,000 commission for the sale of the Citizens' Street Railway to the Sellers-McKee-Verner syndicate. The case attracted considerable attention.

TERRE HAUTE, IND.—Incorporated: The Terre Haute Electric Railway Company. Capital stock, \$500,000. The directors are: Paris P. Thomas, John G. McNutt and M. F. Burke. Russell Harrison is a principal stockholder in the concern.

TERRE HAUTE, IND.—The Terre Haute Electric Railway Company has had the franchise of the Terre Haute Street Railway transferred to it. The new company was organized with the object of increasing the capital stock of the road and making extensions and improvements.

**Iowa.**

SIoux CITY, IA.—Sioux City Traction Company is about to buy extra trailers for holiday and Sunday use.

ATLANTIC, IA.—A prominent business man of Atlantic is said to be organizing a street railway company for this town.

DES MOINES, IA.—B. F. Clayton, A. A. McGarry and E. W. Hartman are at work on a scheme to build an electric road from here to Indianola.

COUNCIL BLUFFS, IA.—City council grants franchise to the Council Bluffs & Lake Manawa Electric Railway. Electric lights required every two blocks within the city limits.

FT. DODGE, IA.—S. T. Meservey has received a twenty-five-year franchise for an electric railway and lighting plant from the city council.

SIoux CITY, IA.—Receiver Mohler, of the Sioux City Cable Railway, has tendered his resignation and recommends that the property be turned over to its owners, as all but \$14,000 of the liabilities have been wiped out and there is \$19,000 cash in hand.

COUNCIL BLUFFS, IA.—Council Bluffs & Lake Manawa Electric Railway is incorporated at \$50,000, by Jeff W. Bedford, L. H. Kent, J. P. Finley, H. B. Coryell, D. D. Gregory, E. S. Rood, Isador Gluck, C. A. Starr, and C. W. Reed. All but the two last named will constitute the first board of directors.

SIoux CITY, IA.—Receiver Mohler, of the Sioux City Cable Railway, says that the line has earned \$10 a day net since equipping electrically. He has issued \$63,110 in receiver's certificates, all of which have been taken up by the consolidated capitalists. He requests that the receiver be discharged and the property turned over to the consolidation.

Receiver A. M. Jackson, of the Sioux City Rapid Transit Company, reports net loss during his term, while steam was used as traction power, of \$802, and a net profit for the nine months of electric traction of \$152.

**Kansas.**

LEAVENWORTH, KAN.—The receiver's sale of the street railway has been confirmed.

ARGENTINE, KAN.—Ernest L. Enggren et al. apply for electric railway franchise in this place.

KANSAS CITY, KAN.—The incorporators of the Kansas City Electric Street Railway Company are: Ben J. Jones, New York; F. B. Wilcox, Kansas City, Mo.; Lewis Humane, West Chester Pa.; J. H. Parrott, R. A. Kope, P. F. Spickles, Kansas City, Kan.

LEAVENWORTH, KAN.—The Leavenworth Electric Railway has been sold at receiver's sale for \$80,000. After the purchase a new company was organized as follows: President, Newman Erb, of New York; vice-president, Herbert N. Smith, of Boston; secretary and treasurer, J. P. Edrington, of Denver, Col. The new directory is composed of the following named: Newman Erb, J. P. Edrington, Herbert N. Smith, M. Summerfield, W. D. Bethel, of Memphis, Louis M. Erb and E. E., Godlove, of this city.

**Louisiana.**

NEW ORLEANS, LA.—The Carrollton Railway will establish a resort at the head of St. Charles avenue and build line thereto.

NEW ORLEANS, LA.—Orleans Railway Company directors will petition council for electric rights in down town district. Peter Congot is president, and L. N. Petitpain is secretary. The building of the new line will be given to the lowest bidder.

## Maine.

BATH, ME.—The Bath Street Railway has let a contract to the Worcester Construction Company to improve the entire line.

## Maryland.

CRISFIELD, MD.—A company is being formed to connect Crisfield, Mariners, Asbury and Abes Hole with an electric road.

BALTIMORE, MD.—Baltimore and Harford, turnpike contract to grant the City Passenger Railway right for electric line; consideration, \$6,000.

BALTIMORE, MD.—It is said that the purchasers of the Maryland end of the Baltimore & Lehigh Railroad are contemplating changing the operation of the line from steam to electricity.

BALTIMORE, MD.—J. W. Kohlbe, master mechanic of the City & Suburban, has resigned.

BALTIMORE, MD.—Mortgage for the Pimlico & Pikesville Railway Company for \$350,000 is recorded, also one of the same amount for the Baltimore & Curtis Bay Railway Company. Both are issued by the Baltimore Traction Company.

BALTIMORE, MD.—Managers of stock exchange recommend listing of \$2,500,000 stock of the City Passenger Railway Company. The earnings of the company are shown to have been, for 1891, \$835,400.43 gross, \$86,233.40 net; 1892, \$780,388.29 gross, \$85,712.54 net; 1893, \$794,450.24 gross, \$128,102.89 net. The company has 21.6 miles of cable and 23.4 miles of electric road completed.

## Massachusetts.

LOWELL, MASS.—The South Side Street Railway (new company) is seeking franchises on certain streets.

BROCKTON, MASS.—The Brockton Street Railway has been ordered to use girder rails on its lines, which are soon to be relayed.

## Michigan.

ADRIAN, MICH.—It is announced that the Adrian Electric Belt Railway has been sold to Philadelphia capitalists.

BATTLE CREEK, MICH.—F. J. Willson has declared that if properly treated he will rebuild and rehabilitate the street railway system for the town.

SAGINAW, MICH.—The Union Street Railway is to be known as the Riverside Park Railway and an extension is ordered to be built immediately.

ANN ARBOR, MICH.—Dr. W. B. Smith signs an agreement, which, if accepted by bondholders, will result in resumption of traffic on the street railway.

TRAVERSE CITY, MICH.—The Grand Traverse Herald is authority for the rumor of an electric railway between Traverse City and Old Mission.

ADRIAN, MICH.—The street railway has shut down and will probably not resume until it changes hands. Cars are in bad repair and electric equipment in poor condition.

SAGINAW, MICH.—Isaac Bearinger, capitalist, of this place, wants to build an electric railway from Saginaw to Bay City. The line will be 16 miles long and touch other places.

SAGINAW, MICH.—The differences between the Union Street Railway and the city have been amicably settled, and the paving and extension of lines will now proceed. The entire system will be rehabilitated during the year.

## Minnesota.

WINONA, MINN.—Winona General Electric Company has made satisfactory arrangements for extending its lines. A. H. Hill is made general manager.

MINNEAPOLIS, MINN.—The Twin Cities Rapid Transit Company will extend its line to Fort Snelling. The government has heretofore withheld right of way but now grants it.

STILLWATER, MINN.—Stillwater Street Railway elects: President, Allan Curtis, of Boston; vice-president, E. P. Motley, of Boston; treasurer, George E. Warring, of Boston; secretary, J. C. Nethaway.

WINONA, MINN.—George E. Duffie, of the Winona General Electric Company, in conference with General Manager Hill, says that the West Fifth Street route will be extended and considerable other improvement made in the system.

## Missouri.

KANSAS CITY, MO.—The cable consolidation case will not be heard until the October term of court.

KANSAS CITY, MO.—Walter Gillam has been made superintendent of the L system. He is succeeded on the Armourdale line by Thomas Grover.

SEDALIA, MO.—F. E. Hoffman and Dr. A. V. Small are at work to make a summer resort out of McAllister Springs and build a street railway line thereto.

JOPLIN, MO.—Col. H. H. Gregg and S. C. Henderson were in St. Louis recently making arrangements for the extension of the Joplin Electric Railway to Baxter Springs.

JOPLIN, MO.—The Interurban to Galena is regarded as certain. It will be built by Joplin capital, and the new company will absorb the Joplin Electric Railway & Motor Company.

JOPLIN, MO.—The Southwestern Electric Light & Water Power Company will erect a big light and power plant, including repair and manufacturing shops, for a general electrical business. An electric railway to Galena, Kan., is also proposed.

ST. LOUIS, MO.—James Campbell has secured the Grand Avenue line for the Union Depot Company. The Grand avenue franchise is a valuable one and must be built on or before October 15. John Scullin is the new owner and will begin at once to make his arrangements.

KANSAS CITY, MO.—The Kansas City Consolidated will spend \$30,000 on enlarging the Woodland avenue power house and general improvements on the cable lines. The 2,000 horse-power Allis Corliss from Machinery Hall, at the World's Fair, has been purchased.

KANSAS CITY, MO.—Judge Slover declares the franchise of the East Fifth Street Railway Company forfeited on account of non-user.

The West Side Street Railway of Kansas City, Kansas, is preparing to ask for two franchises, one from Riverview to the Union Depot and another to connect with the Ninth Street Cable line.

KANSAS CITY, MO.—A car wheel and cable pulley factory, to be known as the Kansas City Car & Foundry Company, is chartered by W. N. McMillan, William McMillan, W. K. Bixby, Calvin Davis, W. D. McLeod, W. T. Woolsey, and S. M. Blewitt. The McMillans and Bixby are large holders in the Missouri Car Wheel Foundry, of St. Louis.

ST. LOUIS MO.—The Grand Avenue Railway Company reorganizes under the Scullin management. The new board comprises John Scullin and his sons Fred and Harry, James Campbell and his cashier, W. F. Reed. Vice-President Alonzo C. Church and Attorney Thomas E. Ralston of the Wiggins Ferry Company; secretary, J. H. Roach of the Union Depot Line, George M. Black and John G. Kelly.

## Nebraska.

NEBRASKA CITY, NEB.—Barns and plant of the Nebraska Street Railway destroyed by fire. Eighteen horses lost.

OMAHA, NEB.—Lightning struck the Nineteenth street power house of the electric railway destroying a dynamo. Loss, \$1,500.

FALLS CITY, NEB.—F. C. Oakley, representing a company, asks for a street railway franchise here. Business men encourage the idea.

LINCOLN, NEB.—W. E. Shepard, late electrician of the Lincoln Street Railway Company, has gone to Long Island City, L. I., as electrician for the Steinway Street Railway.

### New Hampshire.

DOVER, N. H.—The Union Street Railway Company has been placed in the hands of a new receiver, Geo. E. Macomber, of Augusta, Me. He takes charge at once.

KEENE, N. H.—The Keene Electric Railway Company elects E. F. Lane, president; G. A. Litchfield, treasurer, and F. H. Whitcomb, clerk. Opinion expressed that local capital should build the line.

NASHUA, N. H.—The annual meeting of the stockholders of the Nashua Street Railway Company resulted in the election of the following directors: Arthur E. Denison, John A. Fisher, John D. Chandler, E. F. Chandler and John P. Goggin; treasurer, John D. Chandler; clerk, John P. Goggin. At a subsequent meeting of the directors the following organization was made: President, John A. Fisher; vice-president, John D. Chandler; secretary, John P. Goggin; general manager, John A. Fisher.

### New Jersey.

MORRISTOWN, N. J.—Aug. W. Cutler, attorney, represents citizens of Morristown, who wish to get a street railway franchise, paying percentage for use of streets.

NEWARK, N. J.—The North Jersey Traction Company elects J. K. Corbiere, president; H. M. Doremus, vice-president; William S. Johnson, secretary and treasurer; Halsey M. Barrett, counsel; James Owen, chief engineer. An executive committee composed of John L. Johnson, W. L. Johnson, W. J. Davis and J. K. Corbiere, the latter a member ex-officio, was appointed. The capital stock of the company is placed at \$5,000,000. The address of John L. Johnson is Prudential Building, Newark.

### New York.

JAMAICA, N. Y.—The Long Island Electric Railway has made application for a franchise here.

ITHACA, N. Y.—The Cayuga Lake Electric Railway has been leased to the Ithaca Street Railway.

MOUNT VERNON, N. Y.—John R. Conron has been made local manager of the Union Electric Railway Company.

NEW YORK CITY.—The General Electric Company has secured an attachment for \$500,000 against the Ft. Wayne Electric Company.

BUFFALO, N. Y.—The Crosstown Street Railway Company has secured a grant to connect its Main Street line with Hertel avenue.

GREENPOINT, L. I.—The Long Island Electric Railway has been granted permission to lay tracks on certain routes on a per centage basis.

NEW YORK CITY.—The Coney Island & Brooklyn Railroad Company has applied to the state commission for right to trolley a part of that system.

ILION, N. Y.—Mohawk & Iliion Street Railroad Company elects: President, C. W. Carpenter; secretary, H. D. Alexander; treasurer, R. M. Devendorf.

NEW YORK.—It is again rumored that the Manhattan L will adopt electricity. The management will, however, await the demonstration of the Metropolitan, of Chicago.

AUBURN, N. Y.—H. V. S. Lord, president of the Business Men's Association, is at work on a project to connect Auburn, Skaneateles and Port Byron with an electric railway.

NEW YORK CITY.—The Metropolitan Traction Company has applied for permission to cable Twenty-third street from Broadway to Lexington avenue and thence to Thirty-sixth street.

NEW YORK CITY.—Goodwin & Swift, electric and surface railway construction firm, promoters and bankers, at 66 Broadway, assign to Arthur E. Waldradt; liabilities about \$500,000.

NIAGARA FALLS, N. Y.—The Niagara Falls, Whirlpool & Northern Electric Railway is now assured. J. W. Hoffman & Co., Philadelphia, will build the line by August 1. Power will be rented.

NEW YORK, N. Y.—The Forty-second, Manhattanville & St. Nicholas Avenue Railroad has applied for permission to build a road on West Eighty-sixth street, between Eighth and Tenth avenues.

JOHNSTOWN, N. Y.—R. T. McKeever buys J. S. Burr's interest in the syndicate owning the road, and is elected director. There is a rumor that H. Walter Webb is again seeking to control the road.

GLEN FALLS, N. Y.—William Finnigan, once superintendent of the Albany street Railway Company, has become general manager of the Glen Falls, Sandy Hill and Ft. Edward Street Railway Company.

SYRACUSE, N. Y.—The court has authorized Receivers Mack and Rice, of the Syracuse Consolidated Street Railway, to issue receivers' certificates to the amount of \$5,000, for relaying the track on Delaware street.

WHITE PLAINS, N. Y.—S. L. H. Ward, E. C. Sniffens, Edward Phelps, S. Gainsboro and John Duffy, of this village, will apply for franchise to build an electric line from Elmsford to Mamaronek, through White Plains.

LEWISTON, N. Y.—The Lewiston & Youngstown Electric Railroad Company has elected the following officers: President, Hon. Elton T. Ransom; vice-president, W. A. Philpott; secretary, Dr. W. R. Campbell; treasurer, Dr. W. D. Hough.

BUFFALO, N. Y.—The Buffalo, Tonawanda & Sanborn Electric Railroad will begin operations Aug. 1. New officers of the road were elected yesterday. They are: President, L. F. W. Arend; vice-president, Louis T. Payne; treasurer, E. G. Reisterer; secretary, Lee R. Sanborn.

WATERTOWN, N. Y.—A certificate of consolidation of the Watertown Street Railway and the Watertown & Brownville Street Railway Company, forming the Watertown & Brownville Street Railway Company, with a capital of \$100,000, has been filed. The directors are Byron B. Taggart, Senator Joseph Mullin, Hiram F. Inglehart, E. S. Goodale and Samuel F. Buggale of Watertown, and John C. Thompson and Charles A. Starbuck, of New York City.

NEW YORK CITY.—A syndicate has been quietly getting right of way for a Long Island electric railway for some time past. Fourteen miles of right of way is now secured. There is a paid up capital, it is said, of \$600,000, with a million or more in reserve. A. R. Hart, of Brooklyn, is president of the company; Charles H. Mullen, of Mount Holly Springs, Pa., is vice-president; Clarence Wolf, of Philadelphia, treasurer J. C. Von Arx, secretary, and Jerry A. Wernberg, counsel.

### Ohio.

PAINESVILLE, O.—Painesville, Fairport & Richmond Street Railway increases stock from \$50,000 to \$150,000.

COLUMBUS, O.—Forrester & Co., Cleveland, are granted railway franchise on National road east of the city.

NORWALK, O.—The old board of directors of the Sandusky, Milan & Norwalk Street Railway is re-elected for the ensuing year.

ASHTABULA, O.—J. N. Stewart has begun suit for \$150,000 damages against the village for destruction of his street railway in 1890.

GALLIPOLIS, O.—H. R. Bradbury takes charge of the electric railway as receiver. He is authorized to spend \$2,000 in improvements.

CLEVELAND, O.—A twenty-five year franchise has been given to the Big Consolidated for South Brooklyn. Line will be double tracked.

CUYAHOGA FALLS, O.—It is not unlikely that the Akron & Cuyahoga Fall Rapid Transit Company will extend to Kent. Work will begin in the fall.

**AKRON, O.**—The Walsh-Babcock Street Railway Company gains franchise to Barberton. Work begins at once. Address E. L. Babcock, Cuyahoga Falls, O.

**CLEVELAND, O.**—The Cleveland & Elyria Street Railway Company is incorporated by B. F. Phinney, Jay Comstock, J. M. Gasser, H. D. Coffinberry and Dallas Beebe.

**DELAWARE, O.**—Delaware Electric Railway Company elect W. A. Hall, president; Hon. F. M. Marriott, secretary, and C. Riddle, treasurer. The line will be extended.

**COLUMBUS, O.**—W. E. Hoyer, W. T. Thorn, Captain Wm. Penny, et al., have been granted a 25-year franchise for an electric railway from Worthington to Flint and Westerville.

**STUEBENVILLE, O.**—Thomas Johnson, T. Barclay, G. W. McCook, R. Sherrard and Dr. Stanton, buy the Steubenville street railway for \$12,357. They will re-equip (electrically) and operate it.

**SPRINGFIELD, O.**—General Manager Nelson, of the Springfield Street Railway, urges the company to refit the system and spend \$75,000 in improvements for rolling stock and electrical equipment.

**MANSFIELD, O.**—Samuel Huenerfauth, former manager of the Citizens' Street Railroad, has become identified with the Card Electric Company and A. J. Haycox, of Cleveland succeeds him.

**AKRON, O.**—Judge Nye has dissolved the injunction suits brought against the Akron Street Railroad by Thomas Post and the Falls Rivet and Machine Company, and work is going ahead rapidly.

**COLUMBUS, O.**—Columbus Central Railway Company has determined to build several long extensions southward. John J. Shipherd, of Cleveland, is at the head of the enterprise. Yost & Packard are planning the power house and barns.

**TOLEDO, O.**—The Consolidated Street Railway Company is in the field for the city lighting contracts, to be let in September. The Subsidiary Company is incorporated at \$100,000 by Chas. Wright, A. E. Lang, W. S. Jewell and R. H. Baker.

**TOLEDO, O.**—The two proposed Toledo-Maumee & Perrysburg electric lines are to be consolidated. The consolidated scheme will then connect with the Toledo consolidated.

The consolidated asks for two extensions to make the connection with the country lines.

**LORAIN, O.**—The village council has granted a franchise to Tom L. Johnson, A. J. Moxham and W. T. Bien, stockholders in the Lorain Street Railway Company, to build and operate an electric railway system through the streets of the town. The old road, over which horse cars are now running, will be torn up and the work of grading for the new system will be begun at once.

**TOLEDO, O.**—A new Electric Railway called the Toledo, Presque Isle & Nilosean Beach Suburban Railway is incorporated. The incorporators are Frank B. Losee, Capt. David W. Stroud, Henry T. Niles, Adam Burger and Horace Potter. The capital stock has been divided into shares of \$12 each, that the citizens of Toledo may co-operate with the incorporators in the building of the road.

**CINCINNATI, O.**—The Cincinnati, Middletown & Dayton Railway Company, to build electric line between towns mentioned, is getting right of way. Those interested are: Mr. H. B. Morehead, of Cincinnati, president of the company; Judge Dennis Dwyer, of Dayton; W. A. Mays, of Miamisburg; O. M. Gottschall, of Dayton; Postmaster John Zumstein, of Cincinnati, and O. B. Brown, of Dayton.

**COLUMBUS, O.**—Central Street Railway Company has following official list: John J. Shipherd, Cleveland, president; M. H. Neil, first vice-president, and Thomas A. Simons, second; E. W. Radder, Cleveland, secretary; G. W. Meeker, assistant secretary; F. W. Merrick, attorney; Barney McGighe, New York, superintendent of engineers; C. F. Fitch, Brooklyn, assistant; J. W. Doherty, New York, superintendent of construction; Joseph Cooper, assistant; local directors, H. H. Neil, T. A. Simons and G. W. Meeker.

## Oklahoma.

**GUTHRIE, OKLA.**—Chas. J. Fitzgerald, of this town, will get a street railway franchise. He promises to build line in six months.

## Oregon.

**PORTLAND, ORE.**—Thomas N. Strong, attorney for the bondholders of the Portland Cable Railway Company, is having estimates prepared of the cost of electrifying the road from the power house to the northern terminus at the Union depot.

**PORTLAND, ORE.**—The following equipment is for sale: Electric rolling stock, line equipment, steel rails and steam plant for sale cheap, in lots to suit buyer. Apply to S. Z. Mitchell, Portland, Ore.; W. J. Grambs, Seattle, Wash.; J. R. Mason, Port Townsend, Wash.

## Pennsylvania.

**POTTSVILLE, PA.**—The Schuylkill electric railway is transferred to the Philadelphia syndicate. J. B. Stuart is made general superintendent.

**LANCASTER, PA.**—The Pennsylvania Traction Company has permission to relay its tracks on East King street. Very heavy construction will be used.

**SHENANDOAH, PA.**—The borough council extends right of way of the Lakeside Electric Railway on several streets, and to connect with the Schuylkill Traction Company.

**BRADFORD, PA.**—Bradford Electric Railway Company organizes: President, Lewis Emery, Jr., Bradford; secretary, J. B. Steele, Bradford; C. S. Whitney, Belmont, N. Y., is interested.

**LANCASTER, PA.**—The Columbia & Donegal Electric Railway was formally transferred to the Pennsylvania Traction Company, July 1. B. J. McGraun is empowered to act for the stockholders.

**STROUDSBURG, PA.**—A line from here to Port Jarvis is proposed. W. H. Dimmick and Charles E. Hague, of the Union Electric Construction Company, of Philadelphia, are arranging the route.

**MEADVILLE, PA.**—F. B. Krause, secretary of the Electrical Engineering Company, of Cleveland, O., is investigating the feasibility of a street railway to connect Meadville with various other towns.

**PHILADELPHIA, PA.**—L. Calvin Mans, Philadelphia, is president of the newly chartered Philadelphia & Trenton Electric Railway, to which J. Uhle Bethell has subscribed nearly all the stock. Capital, \$150,000.

**POTTSVILLE, PA.**—W. H. Conrad has resigned superintendency of the Schuylkill Electric Railway. He has two positions offered him, one with the General Electric Company and one as superintendent of a street railway.

**TARENTUM, PA.**—The officers of the Tarentum Passenger Railway Company are: B. F. Rafferty, president; F. R. Dravo, treasurer, and J. B. Crawford, secretary and superintendent.

**ALLEGHENY, PA.**—The Monongehela & Allegheny Railroad Company is chartered at \$60,000 capital to build a line six miles long. The president is George T. Richardson, of Pittsburg. The directors are James Doig, L. H. Partridge, James Duncan, Jr., William Smith, C. H. Sackrider and R. S. Frazier, of Pittsburg.

**PHILADELPHIA, PA.**—The select council has passed ordinances permitting the Brown & Parrish Streets Railway Company to construct a trolley line, and granting like privileges to the Citizens' East End Company, beginning at Marshall and Berks streets, and to the North End Company, beginning at Sedgely and Germantown avenues.

**SCRANTON, PA.**—H. H. Archer resigns the general management of the Scranton Traction Company. Taylor Archer, master mechanic, also resigned. J. R. Beeten succeeds the general manager, and Robt. F. Fox takes the place of Taylor Archer. General Manager Archer resigns on account of ill health, and the master mechanic on account of his brother's resignation.

**BUTLER, PA.**—A charter has been granted at Harrisburgh to the Butler Traction Company, with a capital stock of \$75,000. Joseph Hartman, president of the Butler County National Bank, is president. J. V. Ritts and I. G. Smith, of the National Bank, and John Berg, of the banking house of John Berg & Co., form the board of directors.

**HARRISBURG, PA.**—The Harrisburg & Mechanicsburg Electric Railway Co. has sold its franchise to the Cumberland Valley Traction Company. The gentlemen interested are: President, E. Z. Wallower, Hon. B. F. Meyers, H. C. Ross, H. B. Mitchell and Naudain Hamilton, of the Harrisburg and Mechanicsburg Company, and S. R. Ickes, president, and O. A. Ormsley, of the Cumberland Valley Traction Company.

### Rhode Island.

**WOONSOCKET, R. I.**—The Woonsocket Street Railway is granted additional franchises.

### South Carolina.

**COLUMBIA, S. C.**—The Belt Electric Railway line is now assured. It will operate in July. The Columbia Electric Railway Company will build two long extensions also.

### Tennessee.

**KNOXVILLE, TENN.**—West End Electric Railway Company has let contract for extension of the Highland Avenue line. Other extensions are to be made.

**NASHVILLE, TENN.**—Nashville Traction Company, successor to the Overland Electric Railway, has organized by the election of F. W. Hunter, president and general manager; James Compton, vice-president, and Thomas Taylor, secretary and treasurer.

**CHATTANOOGA, TENN.**—The Chattanooga Electric Street Railway has been placed in President W. T. Adams' hands as receiver, on application of the St. Louis Trust Company. All claims must be filed in the U. S. Circuit Court. Alleged liabilities, \$650,000.

**NASHVILLE, TENN.**—The Nashville Traction Company has secured a charter. The company is organized to purchase the Overland Railroad of Rudolph M. Hunter, who bought it at a recent sale. Improvements are to be made. The officers of the new company are F. W. Hunter, president, and Thomas Taylor, secretary.

### Texas.

**CORSICANA, TEX.**—R. B. Moffet buys the street railway and will improve and operate it within 90 days.

**GREENVILLE, HUNT COUNTY, TEX.**—A local company has applied for a street railway franchise here. It is referred to council committee.

**FT. WORTH, TEX.**—In the petition of the International Trust Company versus the Ft. Worth and Arlington Heights Street Railway, Judge Harris appoints Robert McCart as receiver. He will take charge of all properties of both railway and the Improvement Association.

### Virginia.

**RICHMOND, VA.**—Judge Simonton, of the United States Circuit Court, has appointed A. M. Seddon, receiver of the Richmond & Manchester Electric Railway, with authority to take temporary charge of both companies.

G. E. Fisher, general manager of the Richmond Railway & Electric Company, says that the company is solvent and expresses surprise at appointment of receiver. He will ask that the injunction be dissolved.

**NORFOLK, VA.**—The purchasers of the Norfolk Street Railroad elected the following officers: Murray A. Verner, of Pittsburg, Pa., president; Thomas Clyde, of New York, vice-president; H. C. White, head, of Norfolk, secretary and treasurer; W. H. White, of Norfolk solicitor; M. A. Verner, W. P. Clyde, H. C. Whitehead, Thomas Clyde, and A. E. Krise, directors.

### Washington.

**EVERETT, WASH.**—City council grants franchise to the Everett Railway & Electric Company, with transfer stipulations.

**SPOKANE, WASH.**—The Spokane & Montrose electric line, better known as Cook's railway, has been transferred to the Provident Trust Company to secure bonds. A large amount of real estate has also been transferred by Francis H. Cook, president of the Electric Company, to Charles G. Reeder, manager of the Trust Company.

### Wisconsin.

**GREEN BAY, WIS.**—The Fox River Electric Railway has begun operation. W. P. Harvey is manager, assisted at present by C. H. Holmes, of Racine.

**MARINETTE, WIS.**—J. I. Scott, Louis Leisen, W. A. Curry and Andrew Matison ask for a franchise for a street railway here for a summer resort electric line.

**LA CROSSE, WIS.**—The La Crosse & Onaska Street Railway has elected the following officers: President, Hon. F. Pooler; vice-president, J. B. Canterbury; secretary and treasurer, J. E. North; executive committee, Hon. Frank Pooler, J. B. Canterbury and J. E. North. Peter Valler, of La Crosse, superintendent. A contract has been made with parties at La Crosse for a term of years, to take care of the cars and furnish power to operate the line.

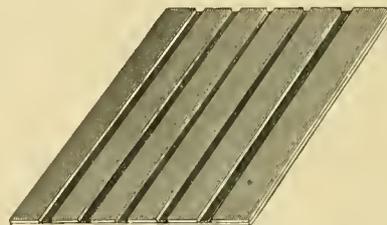

### Russia.

**ST. PETERSBURG, RUSSIA.**—The street railway system here will be changed to electric, and asks bids on equipment. No favoritism will be shown. Write to H. N. Mollwo, 72 English Quay, St. Petersburg, Russia, for full particulars.

## PATENT GROOVED SABLE RAWHIDE BELTING.

The well-known qualities of the belting made by the Shultz Belting Company, St. Louis, namely, durability and power, arise from the fact that the material is tanned only on the surfaces, thus preserving a rawhide interior with a soft kid finish on the driving surface. This is claimed to give better contact with the pulley and yet not detract from its durability and power.

The latest improvement of this able company is the patent grooved sable rawhide belt, shown in our engraving.

It is made of the same oak tanned material as the other belts, with the peculiarity, obvious to the eye, of grooves running lengthwise. These grooves are intended to serve as channels for the escape of air, thus obviating the air cushion, without the necessity of puncturing the belt. The grooves are kept constantly clean by the air current itself and it may be run either with slack top or bottom. The company has the highest confidence in the grooved belt and will send it on trial to responsible parties. The St. Louis Electric Light & Power Company, having three of this style of belt for two years, says that it is a good driver, runs slack, shows no sign of wear and is perfectly noiseless.

## EXPERIENCES OF A SUPERINTENDENT.

By C. P. Young.

## PART V.

Opinions differ greatly in regard to what kind of men make the best motormen. Some contend that old horse car drivers make very good ones and others say they do not. I belong to the latter class, and have tried hundreds of them and have never seen but two of the whole number become what are considered good motormen. They never learn to handle the controller right; they are too rough on the brake, and as a rule are too slow in case of trouble; they are more or less afraid, and never develop intuition to quickly locate anything that may be wrong. Their whole previous experience has blunted their mental faculties and so dulled them that it is almost impossible to make them feel the responsibility of their new position. The best men, in my experience, are between 28 and 36 years of age—none younger or older.

I have had splendid success with ex-brakemen, firemen, and men who have worked more or less around machinery. I find all ex-steam railroaders to be very rough in the beginning, but by constant watching and talking to them, and by explaining everything, they soon outgrow their roughness and become first class men. I also find that express wagon drivers do very well. A few raised in the country who have lived in the city a few years do very well but are slow to learn.

The motorman, more than any man on the whole road, has in his keeping the welfare of the road. He should therefore be a man of great judgment and coolness, should have presence of mind, and thoroughly understand everything about the car. If roads would take more pains to select and train their motormen, their accidents, lawsuits and repairs would be much less. Their work is a great deal harder and they carry a great deal more responsibility than the conductors, so that they should be better paid than the conductor.

Conductors' positions can almost be filled by petticoats, as their principal talents must be honesty, politeness, gentleness, and a quick eye, together with sobriety and neatness. Their greatest virtue should consist in knowing how to handle cranks, and to make friends for the road instead of enemies, especially in cities where competition exists. Married men make the most honest, and, in fact, the best conductors, hence I always prefer them. Presidents and directors should carefully analyze what kind of motormen and conductors are in charge of their cars, and a superintendent should be a keen judge of human nature, so as to select the right kind, for a great deal depends upon these men. They stand between the company and the public, and make the road popular or unpopular. By having men (not slaves, as some roads seem to prefer) that take interest and pride in their cars and work, they undoubtedly increase the revenue of the road. If only two fares are missed or lost on each half trip, and a car makes say thirty half trips per day, this makes \$3 per

car. On a hundred car road this makes \$300 per day, and in a year \$109,500, which is equal to the interest at 5 per cent on a capital of \$2,190,000. At the directors' meeting this means something, and ought to show them what kind of management they have. If the men are the right kind and they are managed properly the road will be in the above sum, while if, on the other hand, they are not the right kind and mismanaged, the road is the loser in missed fares and a disgusted public, who only as a matter of necessity patronize the cars. Untrained and careless motormen will use too much current, rawhide the motors, injure the trucks, cars, tracks and overhead construction, increase accidents, and, in fact, depreciate the value of every detail part of the road, which as a matter of course keeps dividends down and makes directors and stockholders disgusted, and the road a failure as far as profit is concerned. This is to-day the trouble with a large number of roads. A great writer on political economy, after a thorough inspection of the steam railroads in Germany, said that they might well employ a Vanderbilt and pay him \$1,000,000 a year to reorganize their railroads, and they would be the gainer by at least \$10,000,000 a year. This may with equal emphasis be applied to most electric roads. If they would employ better men and not be so stingy on the salary they would very likely profit by it. The majority of business men would gladly pay \$10,000 for the sake of earning \$100,000, but the majority of electric railroad directors and presidents do not see things in this light, and hence their investments have not come up to their expectations.

Every power house should have a fire alarm, so as to inform the engineer in what locality and street the fire is located. All streets should have their own feeders, and they should be so arranged on the switch board that any feeder can be cut out without disturbing the others.

Every feeder should have a circuit breaker, and a gong alarm should be attached to each circuit breaker, so that if one cuts out, the engineer is immediately notified by the ringing of its gong. In larger cities, where there are several roads, there ought to be a lineman's tower wagon with all necessary tools and one expert and one assistant lineman at no less than four fire stations. In case of fire this wagon and lineman should hasten with the engine to the place of the fire to attend if necessary to the cutting of wires and afterwards repairing the same. The expenses should be paid by the various roads according to their mileage. In smaller cities where this would be too expensive, a tower wagon should always be ready for use in case of fire.

Electric railroading is no longer an experiment; it is a positive science and a business that ought really to be the very best investment in the business world of to-day. It is a business that is carried on no less than eighteen hours per day, three hundred and sixty-five days per year, and is cash down. When other industries are standing still on Sundays and holidays, then come the best days for an electric road. There can be little excuse for not making them all a success. Yet many are in receivers' hands and a very few are a success. This is due to tw<sub>o</sub>

great causes, viz: cheap and imperfect installation and ignorant management. A properly installed and operated electric railroad ought to be maintained at between 33 and 40 per cent of the gross receipts. If your road is not operated within this figure something is wrong, and the sooner you set to work to locate your leaks and remedy them the better for every one. If you neglect this you are the wrong man in the wrong place, and the directors ought to look for a new manager. If railroads were built in the following manner they would inevitably be a financial success. Power houses located if possible about the middle of your system at a place where water can be had free. Get your coal either by boat or car right up to your power house. Automatic coal conveyers, economic boilers, slow speed compound condensing engines, large units, multipolar generators, skilled engineers and firemen, a good track with no less than 63 pound rail laid on large ties no more than two feet apart, all laid on well tamped ground and plenty of ballast. Plenty of copper in your feeder system, a complete metallic circuit for your ground return, convenient car barns with all necessary tools, good machine, carpenter and paint shops, skilled and well trained mechanics. Single reduction motors on easy running trucks. Well built and strongly put together cars. Well trained motormen and conductors. Good and sure lightning protectors. Above all, have a thorough man to operate your road, well posted in all departments and details of the science of electric railroading, and then leave him alone free to act.

I plead for a higher class of employes and a better management of property and men engaged in this new enterprise or profession. If the few grains of thought and experience that I have scattered in these pages should be read by some financially interested in electric roads and my advice be acted upon, I shall consider that the time I have taken between busy hours well invested and my labor well repaid.

## STREET RAILWAY PATENTS.

ISSUED JUNE 5, 1894.

|  |         |
|--|---------|
| Electric motor truck. John C. Henry, Westfield, N. J.....  | 520,780 |
| Electric motor controller. William J. Hopkins and Theodore Stebbins, Boston, Mass., assignor to the Thomson-Houston Electric Company of Connecticut..... | 520,784 |
| Electric locomotive. Walter H. Knight, Lynn, assignor to the General Electric Company, Boston, Mass.....   | 520,787 |
| System of circuit control for electric machines. Charles E. Davis, Chicago, Ill., assignor to John H. Leslie, same place.....                            | 520,822 |
| Fender for railway cars. John E. McBride, New York, N. Y.....  | 520,857 |
| Railway rail chair. Henry O'Shea, Johnstown, Pa., assignor by mesne assignments to the Johnson Company of Pennsylvania.....                              | 520,860 |
| Railway frog. Henry O'Shea, Johnstown, Pa., assignor to the Johnson Company, same place.....   | 520,861 |
| Trolley wire support. Louis McCarthy, Boston, Mass.....  | 520,937 |
| Closed conduit for electric railways. Paul Plodeck, Sr, Cleveland, O.....  | 520,938 |
| Electric overhead switch. Miller A. Smith, Brooklyn, and William Clabaugh, New York, assignors to the New York Electrical Works, New York, N. Y.....     | 520,971 |
| Trolley. Edgar M. Tousley, Jamestown, N. Y.....  | 520,973 |

|  |         |
|--|---------|
| Converter system for electric railways. George Westinghouse, Jr., and Chas. F. Scott, Pittsburg, Pa..... | 520,975 |
| Conduit electric railway system. James B. Brand, Milwaukee, Wis.....                                     | 521,010 |

ISSUED JUNE 12, 1894.

|  |         |
|--|---------|
| Contact trolley. Robert W. Hawkesworth, East Orange, N. J.....   | 521,163 |
| Bond for electrical conductors. John Herr, Philadelphia, Pa.....   | 521,238 |
| Pilot or guard for cars. R. A. Crawford, Allegheny, Pa.....  | 521,307 |
| Trolley wire finder. T. E. Gressle, Indianapolis, Ind., assignor of nine-twentieths to Frank Hittle, Baltimore, Md.....  | 521,311 |
| Conduit system for electric railways. Harry Alexander, New York, N. Y.....   | 521,326 |
| Safety attachment for car coupling. John A. Markley, Clifton Forge, Va., assignor of three-fourths to Jas. Clivre Carpenter, J. A. Roberts, J. Z. Duncan and J. C. King, same place..... | 521,243 |

ISSUED JUNE 19, 1894.

|  |         |
|--|---------|
| Safety appliance for street railway cars. Oswald R. Routh, Jersey City, N. J.....  | 521,477 |
| Cable street railway. Fred Hoch, Wauwatosa, Wis.....   | 521,500 |
| Fender for cars or locomotives. James B. Krause and Robert H. Crosby, Williamsport, Pa.....  | 521,503 |
| Conduit electric railway. Thomas Annat, Washington, D. C.....  | 521,562 |
| Trolley pole catcher. Owen G. Cates, Jr., St. Louis, Mo.....   | 521,602 |
| Electric railway car motor. John C. Henry, Westfield, N. J.....  | 521,651 |
| Coupling for electric locomotive. Edward D. Priest, Lynn, assignor to the General Electric Company, Boston, Mass.....  | 521,669 |
| Safety car fender. Frederick H. Reich, Baltimore, Md.....  | 521,670 |
| Fender for tram cars. Samuel J. Rosenfield, New York, N. Y., assignor by direct and mesne assignments to himself and Joseph A. Louchheim and Edwin S. Simon, Philadelphia, Pa..... | 521,672 |
| Supply system for electric railways. Thomas Harris, Detroit, Mich.....   | 521,711 |
| Car fender. James Tobin, Indianapolis, Ind.....  | 521,741 |

ISSUED JUNE 26, 1894.

|  |         |
|--|---------|
| Railway car truck. Norman C. Bassett, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut.....                               | 521,778 |
| Conduit electric railway. Charles J. Reed, Orange, N. J., assignor by direct and mesne assignments to the Reed Electric Company, Philadelphia, Pa..... | 521,891 |
| Conduit electric railway. Chas. J. Reed, Orange, N. J., assignor to the Reed Electric Company, Philadelphia, Pa.....                                   | 521,892 |
| Safety guard for cars. August Soffel, Brooklyn, N. Y.....  | 521,866 |
| Safety appliance for street railway cars. Frank W. Jenkins, Brooklyn, N. Y.....  | 521,981 |
| Trolley stand. Eleazar F. A. Hastings, Avalon, Pa.....   | 522,057 |
| Car fender. Marguerite Maidhof and Victor F. Maidhof, New York, N. Y.....  | 522,070 |
| Automatic switch operating mechanism. Cyrus P. Bachelder, Pawtucket, R. I.....   | 522,096 |
| Life guard for cars. Joseph J. Beals, Cambridge, assignor one-half to Wallace L. Broadbent, Boston, Mass.....  | 522,099 |
| Safety guard for cars. Joseph W. Betz, Brooklyn, N. Y.....   | 522,100 |
| Wheel fender and safety attachment for street cars. Frank H. Homan, Patchogue, N. Y.....   | 522,115 |
| Flexible fender for street railway cars. Richard B. Chambers, Chester, Pa., assignor to Crosby M. Black, same place.....                               | 522,147 |
| Trolley wire hanger. Thomas J. McTighe, New York, N. Y., assignor by mesne assignments to Frederick K. Fitch, same place.....                          | 522,180 |

SEVERAL years ago the consolidated Street Railway Company of Cleveland, O., put into service a number of McGuire Manufacturing Company's trucks. Since that time trials have been made by the Consolidated of a number of different other makes, but came back to the McGuire people with an order for 80 trucks. It is a compliment to the McGuire specialty that is fully appreciated by that company.

THE western department of the Chas. A. Schieren Belt-  
ing Company reports a first-class summer trade.

W. D. HOFFMAN succeeds Huxley & Hoffman as Bos-  
ton agents for the Buckeye engine, of Salem, O.

THE Chicago agent of the Heine boiler, James H.  
Harris, has removed from McVicker's Theater building to  
1521 Monadnock.

THE McGuire Manufacturing Company has bought  
the Christensen air brake patents and will put it on the  
market guaranteed.

THE Dodge Manufacturing Company, of Mishawaka,  
Ind., has opened a Boston office in charge of F. W.  
Underwood, at 137 Purchase street.

THE C. D. Morse Car Manufacturing Company, of  
Millbury, Mass., does a large business in interior house  
finishing in addition to its car building.

THE American Electrical Works, of Providence, R. I.,  
have decided to open a Chicago wareroom and sales  
office under charge of Francis E. Donohue.

THE International Register Company, Chicago, reports  
through Manager Englund, an excellent business and  
bright prospects for the International fare register.

THE Card Electric Company, of Mansfield, O., sends  
us the cheering news of the sale of ten equipments. For  
a company so young, in a field so crowded, the Card  
people have ample reason to congratulate themselves.

J. S. GUSTIN & Co., Chicago, report orders for the  
Hercules trolley clamp, numerous, and enquiries coming  
in strong. As the clamp can be fitted to any style of  
hanger, managers easily appreciate the convenience of it.

THE Abendroth & Root Manufacturing Company, 28  
Cliff street, New York, still keep up with the boiler pro-  
cession. The Root improved water tube boiler is strictly  
high class, and merits its patronage of street railway and  
light men.

THE Graham Equipment Company has established its  
own plant at Providence, R. I. and those enterprising young  
men at the head of the enterprise, namely, J. H. Graham  
and G. S. A. Gardiner, find their hands full of work.  
Trucks are now under construction for Atlanta, Ga.,  
Boston, Mass., Trenton, N. J., and Hazleton, Pa. All  
machinery in the factory is run by electricity, and three  
tracks are available for assembling the trucks.

THE Chicago Electric Truck Company, Chicago, is  
about to erect a plant for the manufacture of the excel-  
lent truck of that name. This move will give the com-  
pany ample means of filling any number of orders for its  
popular and easy riding truck.

BEST, FOX & COMPANY, Philadelphia, Pa., of which  
W. K. Mitchell is general sales agent, make a specialty  
of pipe fitting and castings for street railway power  
stations. Among its specialties are blast furnace tuyeres,  
coolers, bosh plates, cinder notches and pipe bending of  
all sizes up to twenty-four inches.

WE have recently seen a series of bonds of a small  
Illinois railroad. These bonds were engraved by the  
Western Bank Note Company, of Chicago, and are ele-  
gant samples of the excellent work of this company,  
which makes a specialty of engraving such documents  
for street railways and similar corporations.

AT the invitation of John Farson, twenty gentlemen  
and their ladies made a formal tour of inspection of the  
Calumet Street Railway, Chicago. The entire fifty miles  
of track was traversed and the visitors entertained by  
Superintendent Oliphant. The celebration was finished  
by a luncheon at the Hotel Florence, Pullman.

THE Jackson & Sharp Car Company, Wilmington,  
Del., reports sales of 150 cars distributed among the fol-  
lowing roads: Tonawanda & Buffalo, N. Y.; Hartford,  
Conn.; New Bedford & Fall River Railway, Mass.;  
Gardner, Mass.; Akron, O.; Hazleton, Pa.; and 100 cars  
for the Electric Traction Company of Philadelphia.

THE McGuire Manufacturing Company, Chicago,  
reports the sale of 170 of the well-known McGuire  
trucks to the Philadelphia Traction Company, together  
with a call for 50 from Norfolk, Va.; 10 for Green Bay,  
Wis.; 18 for Toledo, O., and a number of smaller orders.  
This looks like business, and a revival in street railway  
industry.

THE Bristol, Eng., "Times and Mirror" of June 5,  
says: The STREET RAILWAY REVIEW, a bulky monthly,  
published at Chicago, gives in its May number a descrip-  
tion of the Bristol Tramway system, with illustrations of  
one of the new double-decked cars and of the Suspension  
Bridge, and a portrait of Mr. Challenger, the general  
manager.

T. ISBESTER and H. Woodland, both of whom have  
been connected for many years past with the Utica Head-  
light Company, have severed their connection to repre-  
sent and handle in the west the products of the Star  
Headlight Company, of Rochester, N. Y. They have  
commodious offices in the Western Union building, in this  
city, and have already entered upon a vigorous campaign  
in which their light will not be concealed under a peck  
measure.

THE Mark Railway Equipment Company, recently reorganized in Illinois, has opened offices at 564 Monadnock Block, Chicago. The new company has as president, C. E. Marks; C. H. May, vice-president, and Geo. T. Warren, secretary and treasurer. The specialties to be marketed are rails, rail chairs, joint bridges, crossings, ties and spikes.

THE Mica Roofing Company, 73 Maiden Lane, New York City, sends the REVIEW samples of "mica" building paper, which is applicable to buildings for every circumstance requiring sheathing, particularly under metal roof. It is odorless and water proof, and not a coal tar product. It is said to be saturated with an odorless mica compound, and to be acid proof as well.

HOOVEN, OWENS & RENTSCHLER, of Hamilton, O., are congratulating themselves over the good record made by their tandem compound condensing Corliss, in a test made at the Lynn & Boston Railroad's plant, at Salem, Mass., by J. H. Bickford and G. H. Davis. The engine took 14.87 pounds of steam per indicated horse-power hour, working on an approximately steady load.

THE Mosher Electric Company, the Chicago Nickel Works and the Reimann Company have been consolidated, and will hereafter be known as the Union Brass & Manufacturing Company. The offices and plant will be as before at the corner of Ontario and Franklin streets. The president is Adolph Weinberg, formerly treasurer of the Adams & Westlake Company.

THE Wallace Electric Company, Chicago, has just added a line of electrical house goods, and has in preparation an extensively illustrated catalogue. The goods are the standard devices formerly sold by the Ansonia Electric Company but now handled by the Wallace Company as general western agents. No shopworn or old type goods are handled, but all are new and complete.

THE Ellis Manufacturing Company, 218 South Fourth street, Philadelphia, is now manufacturing and selling the excellent Hansell truck. The officers of the company are: Harvey Ellis, president, and Joel C. Hancock, secretary and treasurer. Both of these gentlemen are well-known in street railway circles, having been connected for eighteen years with the Cambria Iron Company.

THE Consolidated Car Heating Company, of Albany, N. Y., has acquired the sole right for the United States of introducing the Pope system of car lighting by means of compressed oil gas. Many English railroads have adopted the Pope system, which is claimed to be as efficient as the Pintsch method. A number of contracts have already been made for American roads and correspondence on the subject is solicited. At present over 14,000 English cars are said to be equipped with the Pope light.

STERN & SILVERMAN, Philadelphia, report business good in all departments. In railway contracts they have undertaken the reconstruction of the Brigantine Transit Company's road, Brigantine Beach, N. J., which will require seven miles of trestle. Other contracts are: an extension of the Logan Valley Railroad for the Pennsylvania system, eight miles, and the Roxborough Incline Plane & Railway, six miles, running from Philadelphia to Barren Hill.

THE Composite Brake Shoe Company, Boston, has arranged with the Kinzer & Jones Manufacturing Company, of Pittsburg, Pa., for the manufacturing and delivering of composite brake shoes. This latter company will have charge of the district contiguous to Pittsburg and for the present of the country west of the Alleghenies and southern points. All orders should be sent to Boston, where all business is transacted. In case of great need, duplicate orders may be sent to Pittsburg also.

THE Clonbrock Steam Boiler Works, Brooklyn, N. Y., makers of the famous Morrin Climax steam generator, for the United States, have just closed a contract for a 4,000 horse-power Climax generator, with the Edison Electric Illuminating Company, First District, Pearl street, Brooklyn, N. Y. The great success of the Climax boiler since its recent introduction to power users of this country, has been due to the absolute merits of the specialty and the courteous treatment accorded all by the American makers.

MICANITE, is the title of a 24-page pamphlet issued by the Mica Insulator Company, 218 Water street, New York City, sole manufacturers of the high grade insulation of that name. Micanite commutator segments, troughs, transformer spools, cloth, paper, washers and insulators for rheostats are illustrated and described, as well as listed as to size. A number of testimonials as to the reliability of the material are published. The line of insulators has been largely increased, and a growing demand is found for the material in Europe. The brochure may be had on application.

AN article in the Watertown, N. Y., Daily Standard of April 6, on the Watertown Electric Street Railway, under the successful management of Superintendent G. W. Adams, contains the following reference to the rawhide pinions of the New Process Rawhide Company: "Two rawhide pinions, purchased of the New Process Rawhide Company, of Syracuse, N. Y., running about eight months in car No. 10 of the street railway company, have made a mileage of about 21,000 miles. These pinions make five revolutions for every time the car wheel moves around once, an average of about 400 revolutions per minute. In this 21,000 miles the wheels of car 10 made 13,440,000 revolutions, and the armatures and pinions have made 67,220,000 revolutions." The pinions in question, we learn, are still in regular service, and "the end is not yet."

THE Mather Electric Company, of Manchester, Conn., is in receipt of encouraging orders for its new direct connected and belted generators for railway and light work. Fourteen years' experience in the business gives the Mather Company ample precedent for its excellent work. J. Holt Gates, 1139 & 1140 Monadnock Building, Chicago, general western agent, reports a good, steady business.

E. J. WESSELS, formerly of the Short Electric Railway Company, has been appointed general manager of the Genett Air-Brake Company, with offices at 33 Wall street, New York. These offices are conveniently located in the heart of the financial district. Mr. Wessels reports business very promising. The company has just closed a contract with the New Orleans, La., Traction Company to equip a number of its cars with its air-brake. Mr. Wessels' intimate knowledge of the street railway business and his large acquaintance among managers will make him very efficient in his new capacity.

THE Garton-Daniels Electric Company, of Keokuk, Ia., reports a gratifying increase in the sales of the well known Garton lightning arrester. The coming of spring thunder storms brought out some serious thoughts on lightning losses among many managers, who forthwith invested in Garton arresters. Recent foreign shipments to Siemens Brothers & Company, Woolwich, England, will be placed on the Tasmanian, Australia, lines, now being built. The Siemens Company also used the Garton on its Panama, C. A., line, built a year ago. This second order means the success of the first one.

THE Union Brass Manufacturing Company, of Chicago, is the caption of a new corporation composed of the Chicago Nickel Works, the Reimann Company and the Mosher Electric Company. The consolidation has its offices and plants at the corner of Ontario and Franklin streets, Chicago. The president of the organization is Adolph Weinberg, late treasurer of the Adams & Westlake Company. A general line of hardware specialties and electric lamps will be made, and the concern is well equipped to promptly execute all orders in its line.

The well-known Mosher arc lamp will be the principal point of interest to our readers.

MANY THANKS.—We doff our hat to our enterprising electrical contemporary across the water, which stands representative of all electrical industry and progress in Italy, and which is doing much to promote things electrical. *L'Elettricista*, published at Rome, Italy, has the following appreciated mention:

"The STREET RAILWAY REVIEW, a splendid monthly review, in Imperial quarto size, published at Chicago, and devoted chiefly to everything that regards tramways, is illustrated with such a wealth of beautiful engravings as to completely obscure the very best of our old world periodicals 'con una ricchezza di incisioni che è affatto sconosciuta ai migliori periodici del nostro vecchio mondo.'"

THE Electrical & Mechanical Engineering & Trading Company, 39 Cortlandt st., New York, of which J. H. Vail is president, has in hand, besides a large number of electric light plants, contracts for car house, cars, motors, trucks and generators for Hoosick Railway Company, Hoosick Falls, N. Y.; and acts as supervising and consulting engineer for the Poughkeepsie City & Wappingers Fall Electric Railway Poughkeepsie, N. Y. This plant will involve a 600-horse-power steam plant, and there will be some fine long distance work, as one section of the road extends ten miles to the towns of Wappingers Falls and New Hamburg, operating cars in and between both towns. The plant will incorporate the use of Sterling boilers, compound condensing engines, direct driven General Electric generators and G. E. 800 motors.

THE Composite Brake Shoe Company, 620 Atlantic avenue, Boston, has succeeded to the business and all rights, titles and interests of the Safety Brake Shoe Company, Boston. The safety brake shoe, which has been constantly growing in favor with managers, has now larger facilities and abundant capital to carry on the most extensive operations. The specialty has in no wise departed from its original standard of efficiency and wearing qualities, and William W. Whitcomb still remains at the head of the organization, as popular and as progressive as of yore. We congratulate him upon the success of his invention and his increased facilities for marketing it. Geo. C. Ewing remains as superintendent, and Chas. H. Burrage is made secretary and treasurer. President Whitcomb's energy and persistency is to be applauded in this extension of his usefulness.

FEED WATER heating and purifying according to Hoppes makes a very interesting story. A list of the concerns lately adopting the Hoppes live steam feed water purifiers and exhaust steam feed water heaters, includes the Citizens Street Railway Company of Muncie, Ind.; the Columbus, O., Street Railway Company, which bought 1,000 horse-power; the Waco, Tex., Electric Railway & Light Company, 800 horse-power heater; Peoples Traction Company, Philadelphia, 3,000 horse-power heater; Calumet Street Railway Company, Burnside Crossing, Ill., 1,000 horse-power purifier, and the Bay City, Mich., Union Railway Company 400 horse-power purifier and 400 horse-power heater, besides a large number of gas and electric light plants that recognize the value and economy of these appliances. The offices of the Hoppes Manufacturing Company are at Springfield, O.

Two little girls, presumably not in blue, at Elmira, N. Y., were barely saved alive by the frantic efforts of the motor man to stop his car. When the children were asked why they had gotten in front of the car, one of them spoke up and said: "Why, we wanted to see how it would feel to be dead," and sure enough they had stepped on the track with the determination of being run over.

F. A. SEIBERLING, of the Akron, O., Street Railway Company, was a June visitor in Chicago.

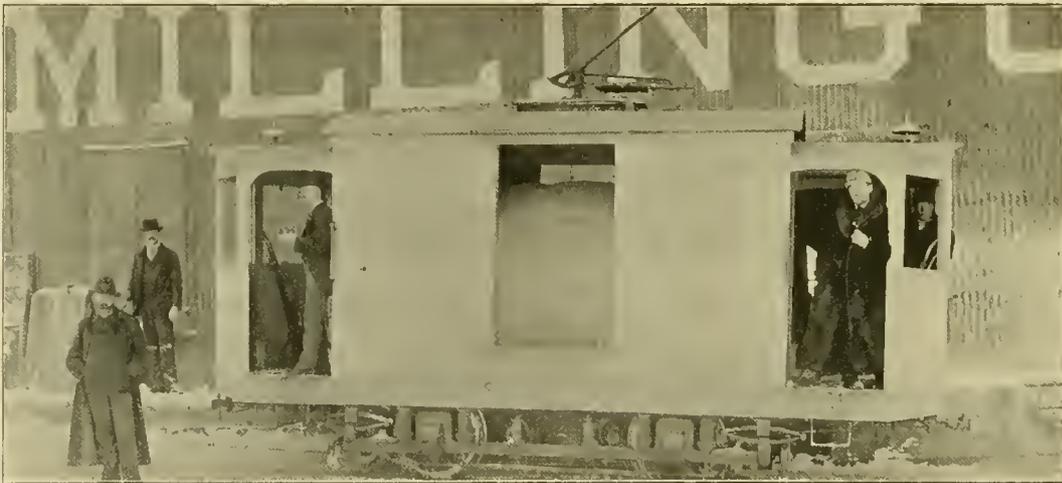

OSBURN BROTHERS, Chicago, have removed to larger quarters at 304 Dearborn street, whither increase of business has taken them.

THE Miller Electrical Works of 4 North Fifth street, have taken the Philadelphia agency for the Garton-Daniels lightning arrester.

JOSEPH PSYBYSCKI, of St. Paul, is suing for \$20,000 worth of personal damages received at the hands of the Minneapolis Street Railway Company. Joseph fell off a car and sprained his name so that he has to wear it hyphenated now, which spoils its looks.

A MULTITUDE of June bugs settled on the street railway tracks at Aurora, Ill., recently, and actually blocked

THE Altoona Manufacturing Company, of Altoona, Pa., reports the following orders for the M. A. Green automatic cut off engines, received during June: One 280-horse-power engine for the Akron Street Railway Company, of Akron, O., to be direct coupled to a 250-horse-power generator, built by the Walker Manufacturing Company, of Cleveland, O.; one 150-horse-power enclosed type self-oiling engine, for the Watson Mining & Manufacturing Company, of Monongahela City, Pa., for an electric mining and haulage plant; one 65-horse-power enclosed type self-oiling engine, for the Lyceum Theater, Philadelphia; one 175-horse-power standard center crank engine, for the Freeport Electric Company, Freeport, Ill.; one 65-horse-power enclosed type self-oiling engine, for Knight Brothers, Fayette, Ia. There is considerably more inquiry, and with a settlement of the railroad strike it is believed that a substantial improvement in business will be the result.

ELECTRIC GRAIN CAR AT SPOKANE.

the cars, so great was their number. A gang of shovelers was sent out and several car loads of the innocent June bugs were precipitated into the river.

THE Ohio Brass Company, of Mansfield, Ohio, is distributing to the trade a neatly gotten up price list of railway motor bearings. It includes all the different styles of bearings for the various types of railway motors. This company is pushing its line of material actively, and increasing orders show that both quality of stock and workmanship are satisfactory.

THE railway apparatus built by the Card Electric Company, of Mansfield, O., is progressing in its fame and name among the street railways. The controlling stand is favorably regarded on account of its simplicity, consisting as it does of a series of break switches, doing away with sliding contacts. J. Holt Gates, 1139-40 Monadnock building, Chicago, general western agent, reports many inquiries and an encouraging amount of work on hand. Card motors are now in operation at Fremont and Mansfield, O., where they have been thoroughly and successfully tested.

#### THE SPOKANE FREIGHT CAR.

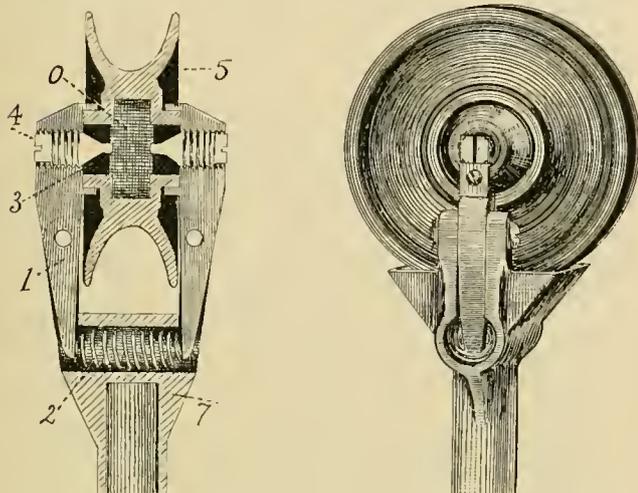

We present herewith an engraving made from a photograph of the grain car at Seattle, described in our last issue, which arrived too late for publication with the article. The car proper is no longer than the truck, the only overhanging portion being the platforms. It is the design of W. S. Norman, general manager.

THE Newton Street Railway Company, of West Newton, and the Newton & Boston Street Railway Company, of Newtonville, Mass., have both adopted the Grinnell Dry Air Sprinkler system for fire protection in car houses and power plants. The General Fire Extinguisher Company, Providence, R. I., makes the device, which is efficient for the purpose, being automatic and positive in action.

THE Urbana & Champaign has been obliged to install a separate 150-horse-power Westinghouse generator to take care of its stationary motor business. The recent move of the insurance companies, prohibiting grounded circuits in buildings, is the cause.

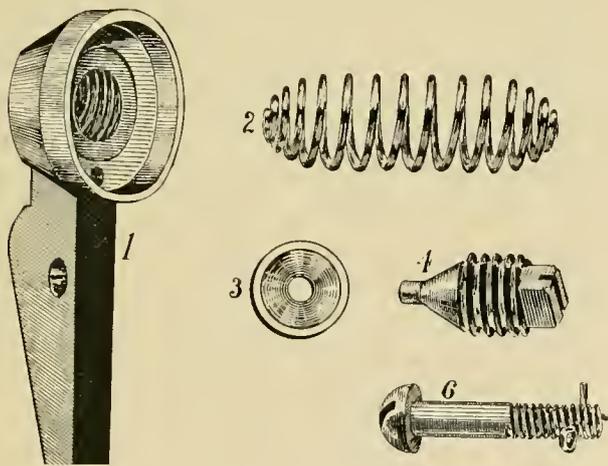

THE FALK TROLLEY HEAD.

When such a large and important system as the Milwaukee Street Railway equips all its cars with a new type of trolley head within a short space of time, and even before that type of trolley is placed on the open market, there is rightly a good deal of interest manifested as to the details of the new device. The maker of the

trolley is the Falk Manufacturing Company, of Milwaukee, which has good reason to feel proud of the immediate success of this, its first effort. The trolley in question discards the use of graphite bushings or roller bearings, and employs instead, cone bearings, which automatically adjust themselves to compensate for any small wear.

The detail parts are shown in the engravings. Every part is steel. Brass wheels will be furnished, if insisted

on, but their use is not recommended, as they wear out much faster than steel. As seen in the cross section of the trolley, the cone bearings are kept tight automatically by the spiral spring which presses outward on the arms which hold the cone points. This is an important feature, as it prevents rattle and keeps a good electrical contact, while, at the same time, there is a slight play of the wheel under severe strains. The cones and the wheel bushings against which they bear are of hardened steel.

To adjust the bearings for the wear which takes place in the course of a long time, the cone points can be screwed in or out with a screw driver, and the adjustment is kept by the split pin as shown. In case the cones break, there is still a shoulder to prevent the wheel from falling out, and to act as a bearing until it can be conveniently fixed. Inside the wheel is a hollow space for dope. This is applied every few nights by removing one of the cones and inserting the nozzle of a specially made dope can, which fits the hole in the bushing. When the inspector replaces the cone, he, of course, adjusts the bearing so that the spring holds the cones at the proper tension.

Thus the wheel needs absolutely no attention beyond the oiling until it is worn out. At Milwaukee, one man will dope thirty cars in an hour and a half. The harp is shaped so that it can not catch on span wires. However, the most interesting information about a device of this kind is as to its practical performance. The fact that it has been adopted by the Milwaukee Street Railway, with its trying center pole construction and small wire, shows that it is a superior article. Superintendent Lynn says that they have discarded all other types, as they proved very expensive, and that since using the Falk trolley they have had little or no expense for this item.

The steel bushings will easily last four months, which is about equal to the number of days some bushings will last. The cost of maintenance is exceedingly low. This is partly accounted for by the fact that there is never any play or rattle. A small rattle soon becomes a big one and the wear increases accordingly.

ELECTROLYSIS OF IRON PIPES.

At a meeting of the Western Society of Engineers at Chicago, July 11, Professor D. C. Jackson, of the University of Wisconsin, read a paper giving the results of a scientific investigation of the process of the electrolysis of iron pipes by railway currents as carried on by students of the University during the past year. It is unnecessary here to review all the experiments performed, but simply to state briefly the facts proved. Some trials were made with artificial solutions and some with actual street soils placed in electrolytic cells. The amount of action was determined by the loss in weight of the iron positive plates. It was found that the most action took place when the water of the soil had in solution a large amount of chloride salts. Common salt, of course, comes under this head. Nitrate salts were found to come second in destructive effect, and sulphates third. Electrolysis was found to take place to a certain extent with a very slight difference of potential. This disproves the old idea that a pressure of from one to two volts is necessary. This would be the case were the destruction of pipes caused by the electrolysis of pure water, and the consequent oxidization of the positive pole, due to the setting free of oxygen. This, Professor Jackson disproved, both by laboratory experiment and by the fact that iron pipes destroyed by electrolysis do not show signs of rusting.

From the practical man's standpoint the paper was most valuable as showing that electrolysis is as much dependent on the nature of the soil as on the size of the railway system. Not only was this shown conclusively by the laboratory experiments, but it was shown to be the case in actual experience where one road installed five months gave trouble, while others much older had no signs of electrolysis. The remedy recommended by him was that tried at Milwaukee, viz: frequent connections from pipes to rails within the district in which the current is leaving the pipes.

O. M. Rau, electrician of the Milwaukee Street Railway, was present and in the discussion which followed gave an excellent practical example of the influence which soil has on electrolytical action. One of the Milwaukee lines which has been down four years had a bare supplementary copper wire running its entire length. The two ends of the route were the same distance from the power house. On one end which was laid on lake sand, the supplementary was in perfect condition when the track was relayed a short time ago, while at the other end the supplementary disappeared over two years ago. The fact of the difference in soils had been taken advantage of in relaying lead service pipes, and as far as possible they had been covered with lake sand.

In England it has been the custom to charge double street railway fare on holidays and Sunday. The house of commons has a bill under consideration requiring a discontinuance of the practice.

THE annual report of the interstate commerce commission for the year ending June 30, 1894, is at hand. The report shows a healthy increase in nearly all items over the previous year. The number of employes per mile of line averages up 515, of which 21 were assigned to general administration, 151 to maintenance of way, 103 to maintenance of equipment, and 234 to conducting transportation. One employe was killed out of every 115 trainmen, and one passenger killed for every 1,985,153 carried. Of the stock outstanding, 61.24 per cent paid no dividends. Only 10.5 per cent paid dividends of over 5 per cent. The per cent of mortgage bonds paying no interest was 10.9 of the total. Of the income bonds 82.56 per cent paid no interest.

### Custer's Last Battlefield.

A visit to this spot, which is now a National Cemetery, is extremely interesting. Here, seventeen years ago, General Custer and five companies of the Seventh U. S. Cavalry, numbering over 200 officers and men, were cut to pieces by the Sioux Indians and allied tribes under Sitting Bull. The battlefield, the valley of the Little Big Horn, located some forty odd miles south of Custer, Montana, a station on the Northern Pacific Railroad, can be easily reached by stage. If you will write Chas. F. Fee, St. Paul, Minnesota, inclosing four cents in postage, he will send you a handsomely illustrated 100 page book, free of charge, in which you will find a graphic account of the sad catastrophe which overtook the brave Custer and his followers in the valley of the Little Big Horn, in June, '76.

### STREET CAR LICENSES IN NEW YORK.

Comptroller Fitch, of New York City, has made out the following statement in reply to a question of a Philadelphia professor of political economy. The data go back to 1880. Some companies make payments according to franchise stipulations, others are subject to municipal ordinances, while the rest are taxed under a general railroad law.

The three methods are easily recognizable from the amount of the taxes.

The Broadway and Seventh avenue and Broadway Surface Railroad paid to the city from 1885 to 1890 three per cent of its gross receipts and \$50 per annum license fee for each car; from 1890 to 1893, five per cent of its gross receipts, \$50 a car, and an additional sum of \$40,000 a year; from 1893, five per cent of gross receipts, not to be less than \$150,000 a year, and \$50 a car.

The Sixth Avenue Railroad Company, \$50 a car a year since 1889.

The Chambers & Grand Street Ferry Railroad, three per cent from 1887 to 1891, and five per cent, with \$50 horse car fee, since 1891.

The Central Crosstown Railway Company, three per cent of its gross receipts from 1887 to 1893.

The Central Park, North & East River Railroad Company, \$50 each car a year since 1886.

The Ninth Avenue Railroad Company, \$50 each car since 1889.

The Second Avenue Railroad Company five per cent gross receipts from 1890 and one-third of one per cent on extensions.

The Third Avenue Railroad Company, \$20 for each car every year from 1886 to 1893.

The Twenty-third Street Railroad Company, five per cent of gross receipts from 1890.

The Twenty-third Street Railway, one per cent of gross receipts from 1891, and \$50 for large cars and \$25 for small cars.

North & East River Railroad Company, sold at auction for thirty-eight per cent of gross receipts; unable to pay it; operated by contractors.

Hudson River Railroad Company, dummies, \$50 a year.

Elevated Railroad, five per cent net proceeds; paid nothing since 1890; suit brought by city recently decided by Court of Appeals that city can recover five per cent of net income only on passenger traffic on Ninth avenue line, between Greenwich and Sixty-first streets, and two and a half per cent from Sixty-first to Eighty-third street.

Christopher & Tenth Street Railway, paid three per cent of gross receipts since 1888.

Dry Dock, East Broadway & Battery, five per cent net proceeds, \$50 each for large cars, \$25 for small cars, since 1888.

Eighth Avenue, \$50 a car since 1882.

Forty-second & Grand Street Ferry Railroad, \$50 a car since 1888.

Forty-second Street, Manhattanville & St. Nicholas Avenue Railroad, three per cent gross receipts from 1885 to 1891, and five per cent from 1891.

Houston, West Street & Pavia Ferry Railroad, \$1,000 a year and \$50 a car.

New York & Harlem, three per cent on gross receipts of extensions from 1885 to 1893.

Twenty-eighth & Twenty-ninth Street Railroad Company, not completed, to pay three per cent on gross first five years and five per cent thereafter, to which add 29 2-10 per cent bid at time of sale.

Metropolitan Crosstown line, six per cent on gross, and \$50 a car from 1891.

Union Railway Company, one per cent gross when the average reached \$1,700 a day; paid nothing in two years.

BASLE, Germany, has decided to build a municipal electric railway between the Baden railway station and the Central railway depot.

OSWEGO, N. Y., has a 12-car road. At the beginning of the rumor of the recent strike 100 men presented themselves at the car barn looking for the strikers' jobs. The strike hasn't come off yet!

**MURPHY & BRUNING POLES.**

The firm of Murphy & Bruning, the well-known electrical experts and engineers, of Charleston, S. C., enjoy the advantage of being in the midst of a very rich timber region, and so are able to furnish direct any amount of the best electric railway poles. Shipments can be made by water, and prices made very low for northern delivery. The firm are to be congratulated on their location, and they will, no doubt, do a large electric railway business.

**THE STANDARD RAILWAY SUPPLY COMPANY EXTENDS ITS FIELD.**

The Standard Railway Supply Company, of Chicago, of which Garson Myers is president and manager, without a flourish of trumpets has built up a business that stands in the first rank of street railway supply houses in Chicago. For the last two years this company has devoted its energy to the introduction of the "Standard" Car Stove and "Gilt Edge" Steel Gongs. The excellency of the Standard stove is now known throughout the length and breadth of the land, and can be found in use on many street railways, among which are some of the largest in the country. Not only in the United States has Mr. Myers succeeded in introducing the Standard stove, but in Germany and throughout Canada as well. Contracts with leading manufacturers in these countries have been made for the manufacture and sale of his stove. A test made in Frankfort, Germany, last winter, of the Standard stove, resulted in its adoption by the German Tramway Association, which holds the same relation to the railway companies in that country as the American Street Railway Association occupies with us.

Another, and entirely new stove, has been made by this company which will be placed on the market in a short time, to be known as the Myers Self Feed Car Stove. This heater is made entirely of cast-iron to contain sufficient coal to operate the stove for eighteen hours, and is so constructed as to deliver the coal to be consumed in the proper quantity without waste of fuel.

It is designed to be placed either on the car seat or upon the floor. When placed upon the seat, it is rigidly fixed in position there without cutting the car seat in any way whatever, and when placed on the floor, the addition of a coal box compartment is a part of the stove. The new stove has been severely tested, and its heating qualities thoroughly demonstrated, and the manufacturers state that they will guarantee to heat cars 25 feet in length at a cost not to exceed 10 cents for eighteen hours.

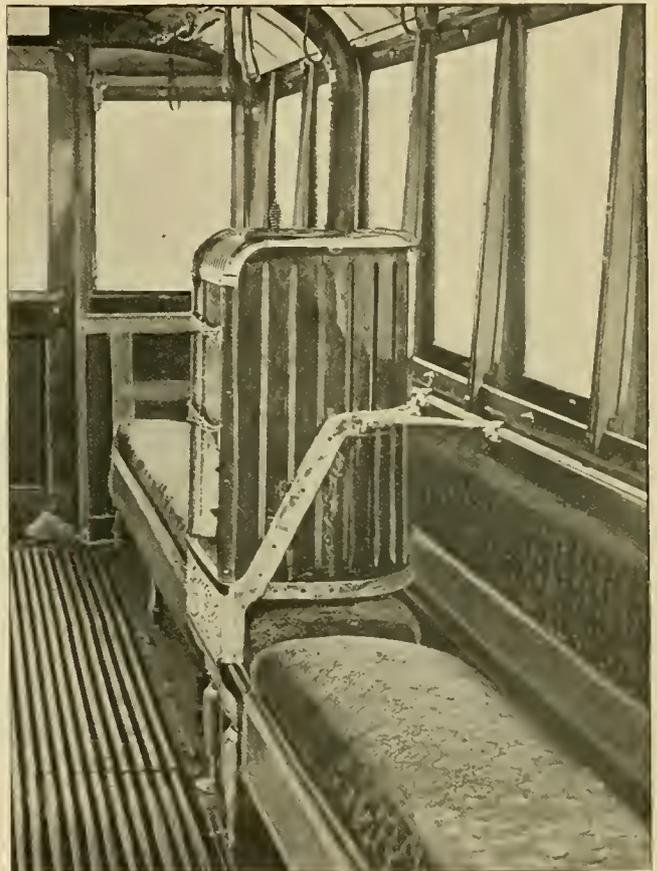

This company has just been appointed general agent for Chicago and the north west, of the R. D. Nuttall Company, of Allegheny, Pa., whose gears, pinions, trolleys and electric railway supplies are in general use on railways throughout the country. The high character of the Nuttall Company's goods is testified to by its many customers. Mr. Myers' wide acquaintance among

the street railway men, and his business methods, will no doubt make him as successful in his new venture as in his original enterprise.

**THE COLUMBIA MAGAZINE CAST IRON STREET CAR HEATER.**

We are pleased to announce that the well known firm, the McGuire Manufacturing Company, Chicago, is about to extend its business, and has added to its specialties the Columbia magazine car heater, herewith represented.

In general, it may be stated that this heater can be placed in any car without marring or cutting the seat for the stove castings. It does not rest upon the seat, cushion or covering, being supported by two legs in

front and by a frame thereto attached. The frame is a solid casting, embracing the front apron, the strap that passes around the back and the arms that fasten it to the top of the seat rail. The legs are adjustable to any desired height. The stove is placed in the car by first arranging the frame and its legs, and then lifting the body of the heater upon it. The operation requires but ten minutes time, and any ordinary mechanic can accomplish it. Once in position it cannot be moved except by the use of tools. It is, altogether, a handsome piece of furniture when thus placed, but if preferred it may be set on any part of the car floor, in which case a stand is used for the foundation. The heater is a self feeder, holding

twelve hours supply of fuel, and, it is claimed, requires no attention from the conductor for this length of time. It burns one pound of hard coal an hour, heating a 21-foot car at the cost of five cents a day. The exterior is so constructed that it remains cool, allowing passengers to sit next to it without danger or inconvenience.

The McGuire Company has purchased the exclusive right to make and sell the Columbian, under patents which have been allowed. With the acknowledged financial strength of the makers and their well known mechanical skill, the new stove will no doubt become very popular among street railway men.

### THE TOWER BRIDGE, LONDON.

We are fortunate in being able to present to our readers, this month, an engraving of the remarkable

TOWER BRIDGE, LONDON.

Tower Bridge, London, England, recently opened by Wales and approved by his royal mamma.

The bridge is of the bascule type, with two leaves, each weighing 1,000 tons, and the time occupied for opening or closing is two minutes. It will be noticed that at the top of the towers is a connecting foot bridge for pedestrians, and inside the towers run two elevators for the convenience of "bridged" walkers. The leaves are raised and lowered hydraulically, and a 360-horse-power steam plant is required in the operation. The corporation of London built the structure at a cost of £830,005, or roundly, \$4,150,025. We are indebted to London Engineering for the illustration and the data given.

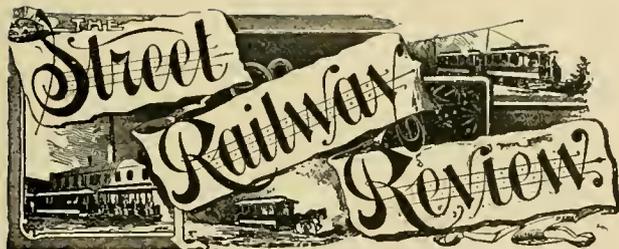

THE Hubley Manufacturing Company, of Lancaster, Pa., reports a first-class trade in trolley wheels, harps and dynamos and motor bearings. The Hubley special

bronze wheel claims a record of 1,000 miles and is still running on its patent graphite bearings. The trolley harps made by the company are of bronze, brass, steel, or malleable iron, as desired, and give the best of satisfaction, being light and strong. The Hubley company also makes a specialty of complete overhead equipment and car trimmings of excellent design and finish. The price list and catalogue of all the Hubley specialties will be mailed on application.

THE Card Electric Company, of Mansfield, O., is building double motor equipments as well as single. It is very evident that on small level roads it is useless to weight down a car with double equipments, and for this reason the company advocates the single motor equipment. For roads on which there is heavy traffic, trailers have to be hauled and heavy grades encountered, it

recommends double 20's, 25's or 30's, as the case may require. The Card Company build its motors for high speed for interurban business, and of a medium speed for ordinary traffic.

THE Mather Electric Company, of Manchester, Conn., is making a specialty of direct connected generators for railway work. Until recently, people preferred to use belted machines, but now the direct connected type has been so thoroughly tried that there no longer exists, in the minds of many street railway managers, any doubt as to the superiority of this type over the belted machines. The Mather Company build direct connected machines for both Corliss and high speed engines, from 100 horse-power up. Their new type of railway machine has proven very satisfactory, and a good business is being done by this company in the railway field.

WINDSOR & KENFIELD,

PUBLISHERS AND PROPRIETORS,

269 DEARBORN ST., - - - CHICAGO.

Editor.

F. S. KENFIELD,  
Business Manager.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW.

269 Dearborn Street, Chicago

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4.

AUGUST 15, 1894.

NO. 8.

THE Supreme Court of Wisconsin has ruled in the "Janesville case" that the city ordinance requiring the electric railway to erect and maintain guard wires where its lines are crossed by telephone wires, is within the province of its powers, and has supported the telephone company in its petition for mandamus. The telephone wires were in place before the trolley wires were strung.

PLATFORM gates are, in almost all cases of operation on double track, a desirable and valuable safe-guard. When once, however, they are placed upon a car, care should be taken to see that they are used, as a passenger alighting from a car through an open gate, and receiving injuries, may be able to strengthen his case in event of damage suit, on account of the failure to keep the gates closed at places and times when they are customarily in use. The best defense in a damage suit is to prevent the accident.

THE Albany, N. Y., Argus, has made a discovery. The fabled Argus had a hundred eyes. We don't know how many the Albany breed has. But this is the discovery:

"A Baltimore man has received a patent for an underground trolley for the propulsion of electric cars."

If any man in Baltimore, white or black, hasn't invented an underground trolley will he please arise and be decorated.

THERE is not the difference between the rate of fare on American and European roads that is commonly supposed, and in addition to this the interesting statement is made that our cities spread out and occupy vastly more territory in proportion to the population than do European cities. For instance, there are, in this country, eleven cities occupying more area than Paris, while there are seventeen cities here which cover more ground than Berlin. The long hauls in this country more than offset the occasional lower fares abroad.

AS THE date approaches for the annual convention of the American Street Railway Association, managers are reminded that they must begin in ample time to arrange their work so as to be able to leave. The trip this year takes us farther south than ever before, and into the very heart of a country full of natural beauty and historic interest. The indications strongly point to a very large attendance, and the well known southern hospitality promised can confidently be counted on in providing every possible means to make the occasion one to be greatly enjoyed and long remembered.

ON a transfer law case at St. Paul, Minn., in which it is alleged that the plaintiff abandoned the car before reaching the transfer point, the court held:

"As stated upon the trial, I am still of the opinion that abandoning the car at a point other than at the intersecting point was the abandonment of a continuous passage; that a regulation requiring the transfer trip to be initiated at the point of intersection was in all respects reasonable and proper, without which, or some equivalent, it would be impossible for defendant company to protect itself from fraud and imposition."

A motion for a new trial was refused and the case now so stands.

AN item originating in some patent inside newspaper office has gone roaming over the country, to the effect that the Amalgamated Association of Street Railway Employes has been successful in every effort during the past year in resisting an attempted reduction in wages. The alleged association has done nothing of the kind, but on the contrary, has been notably successful in a few exhibitions of a want of a very ordinary amount of common sense, and in getting its members in a hole, where they lost good jobs. Dissention and dishonesty among its officers has completed the wreck of what was going to be the salvation of the down-trodden street railway employe, not one of whom could earn as much money at any other honest occupation.

NOR only in Indianapolis and Savannah have the street railway managers voluntarily advanced wages in the last 30 days, but at many other points. Since the fearful financial stringency has been relieved, the managers have, of their own accord, resumed the old scale or an approximation thereunto. The hypercritical daily press has made amusing comments upon this turn of

affairs, but the managers pay as little attention to the compliments as to the former abuse. Even when the papers feel it necessary to offer advice upon every imaginable subject and take a paternal interest in the running of the system, the past has shown and the future will show that the policy of fighting any man or corporation that has a "good thing" is the principal actuating impulse of the editorial pen.

It may be very interesting to compare a few statements of the various Philadelphia papers on the trolley question. The Philadelphia Record was originally a bitter opponent of the electric car. All the venom that pen is capable of was injected in the articles, leaders and news items of that publication. But lo, the change!

On July 11, the Record says editorially:

"The passing of the horse car goes steadily on in Philadelphia, and before the year shall have ended, that vehicle will be as truly obsolete as is the omnibus or the stage coach. Yesterday, the trolley service was inaugurated on the Fourth and Eighth Streets line, and everywhere along the route the advent of the new cars was greeted with demonstrations of satisfaction—a feeling which all Philadelphians may share, since every extension of the system means growth and territorial expansion for the city."

THE Glasgow papers are making a great cackle over the elegant new cars put in service by the city on its now corporation operated street railway, and referring to the rolling stock in use until June 30 last. As a matter of fact the new cars, while comfortable, make no pretense to elegance as interpreted by the American public, and on the lines of one hundred small cities in this country are operating to-day street cars which in construction, finish and comfort, as compared to the new Glasgow cars, are as palace sleepers to ordinary day coaches. With the certainty of confiscation which has hung over the street railway company during the past five years, there can be no surprise that it did not keep pace with the times nor improve its equipment and motive power, as it would gladly have done long ago under conditions prevailing in this country. The new Glasgow broom is in good sweeping order, but 30 days, nor 30 months, may not be sufficient time to bring about conditions which are likely to prove the poor policy of the plan. There can be no question but that the operation of the street car systems of our cities by the municipality would be attended with political and other evils which would be both dangerous and costly to the public.

THE insurance rates on car barns in large cities are getting to be enormous, and although we have freely criticised the underwriters associations for their uncalled for action in regard to grounded 500-volt circuits, we can not blame insurance companies for charging high rates on what actual experience has proved to be a very dangerous class of risks. Cars are from their nature exceedingly combustible. Add to this fact the unfavorable surroundings which prevail in so many car barns and there is an excellent chance for a total destruction of

the property every time a fire occurs. The only way out of the difficulty is to build more in accord with the rules of fireproof construction. In our issue of last March we gave a synopsis of the standard construction and safety precautions specified by insurance companies for power houses, car barns and repair shops. For each item which does not correspond to the standard an additional rate is charged. Thus the designer and builder of a power plant or car barn is able to tell what the insurance rate will be before the building is begun. In other words, it is possible for street railway companies to make their own rates on new buildings. While it is generally impossible to answer all the requirements of the insurance rules, it is easily possible to answer enough of them so that a very low rate can be obtained, to say nothing of the advantages to the railway of increased safety from fires. A saving of from one to six per cent per annum on insurance is worth consideration, and no man should consider himself competent to design a building until he is well acquainted with the requirements of the insurance companies.

CORONER ASHBIDGE, of Philadelphia, has made a statement of the duties of his office for the years of 1892, 1893, and the first half of 1894, touching street railway accidents. The records show thirty-one deaths in 1892, thirty-five in 1893, and twenty-five for the first half of 1894. In 1893 four deaths were chargeable to electric traction, eleven to the cable, and twenty to the horse car. During the first half of 1894 nine deaths are alleged to have been occasioned by the cable and nine by the electric cars. Not one mentioned is reputed to have been caused by the current. The Philadelphia Times says editorially \* \* \* "The special outcry against the trolley seems from the figures to be based upon preconception rather than upon fact. The new cars are still a curiosity. The children are attracted to the street by their very appearance; the more venturesome try to steal rides, while others will place themselves on the tracks in front of the approaching cars, just to see how long they can remain and still escape being run over. With the disappearance of the novelty this spirit of reckless daring on the part of the boys will subside, and there will be more care exercised by them to avoid danger instead of courting it. No one who has experienced the increased comfort and speed of street transit since the introduction of the trolley, would for a moment think of advocating a return to the horse car system, and it is reassuring to know that even the objection of increased danger, which has been so harped upon, has been greatly exaggerated." In the language of the obituary column, "will the Brooklyn papers please copy."

MANY of the light consumers in Lincoln, Neb., have been taking current from the trolley lines. The insurance people are now putting on the thumb screws and will cancel policies. A special agent of the insurance companies, sent to Lincoln to investigate, spent several days, and by dint of sitting up late nights and otherwise

overtaxing his mental and physical system, at last succeeded in avoiding a water haul. He caught a fish, but it was a pretty small fry. And here it is: "The engineer of one of the largest hotels in Lincoln explained to the special agent sent to look into the risks in that town, that bell boys in the hotel were constantly blowing out fuses by short circuiting the wires to see the sparks fly!" This ought to be sufficient warrant to cancel every policy in the state. Suppose, for instance, the power house should shut down for a few hours. Deprived of their accustomed pastime of watching "the sparks fly," they might burn the hotel and court house, and maybe a church or two. The awful appetite of these ferocious bell boys once whetted with a lot of sparks, who knows that they would stop until the entire town was in ashes, and then we might expect the amalgamated bell boys' union would join in the spark business and go on burning until the fair villages of the far west had been laid low in dust and ashes. And why all this? Because, forsooth, the bell boy, as per report of the special agent, is allowed to monkey with light wires, when he should be promptly slippered and sent to bed. For re-distilled and condensed purity of argument, this special agent and his special report on the special bell boys, short circuits our patience.

THE Brooklyn Traction Company, of Brooklyn, N. Y., was assessed by the Board of Assessors upon its personal property or capital stock at \$1,015,000. The company applied to the board to have this reduced, on the ground that its capital stock was invested in the stock of the Atlantic Avenue Railroad Company. This was refused, and the matter brought before the court. Judge Gaynor handed down a decision sustaining the proposition of the company, and compelling the board to review its action and pay the costs of litigation. Judge Gaynor said:

"All lands and personal property, whether owned by corporations or individuals, are alike liable to taxation. The property of a corporation is called its capital. The capital of a corporation is the same as the capital of an individual, and each is subject to the same taxation. It is not the paper certificate of shares of capital in a corporation that are taxed. They merely represent and evidence the distributive portions of the capital or substance of the company, which would go to the different share owners upon the dissolution of the company.

"To tax property and then the paper certificates representing it would be taxing the same property twice. It would be the same as taxing so many acres of land and then taxing the title deeds of it. The Legislature expressly made the 'owner or holder' of the stock in any corporation which is liable to taxation on its capital, not liable to be taxed for such stock (2 R. S., Part 1, Chap. 13, Title 1, Section 7), obviously meaning the paper certificates of the shareholders, and not the proportion of the property, real and personal, of the corporation represented by them, for the title to that is not in the shareholder. The relator, the Brooklyn Traction Company, is the owner of shares of stock in the Atlantic Avenue Railroad Company, and it may no more be taxed upon said shares than may any other owner of shares in the said company."

THE three-wire system for electric railways seems not to have received the attention it has deserved by constructing engineers. There are, we believe, only two systems so operating to-day, one at Portland, Oregon, which Mr. Balch described in our issue of last April, and the one at Bangor, described in this issue by J. G. Carroll. If it has been found possible to keep the balance between the two sides of the circuit in as small a system as that at Bangor, it certainly seems as if there ought to be no trouble where the conditions are much more favorable, as they are on the larger double track roads. When adopted on double-track side-pole construction, and the two wires are made of different polarity, it might be necessary to put a strain insulator or two between the trolley hangers. The section insulators at crossings would have to be made to withstand 1,000 volts. To put over against these objections, we have a saving of 50 per cent in the copper feed wire necessary, leaving out of account the ground return, which would not need to be as good as with the present two-wire system. In addition to this we have the advantage of being almost certain to be free from electrolysis if the system is installed with any degree of common sense. Moreover, we find that the system does not require any changes in the modern power station, except at the switchboard. For carrying the ordinary heavy station load it is now common practice to install three power units of equal size, one of which is held in reserve. With the three-wire system, the two units in service would be switched on to the two sides of the circuit. The liability of shutting down the road through accidents to machinery would be in no way increased. It has been objected that if the cars got bunched on one side of the circuit it would cause a great overload. This is true, but on a large system this is not liable to happen, and when it does, more machines can be thrown in on the overloaded side. The three-wire system is not a good thing for all places, but it has much more of a place than has yet been given it.

It's all in the reporter's eye. "A motorman in Binghamton, N. Y., suffered a distressing accident this morning," says a daily paper. "The flesh of both legs was cut and his pants badly torn." His legs will mend themselves, but the pants will cost money and time to repair.

LITTLE DANNIE FERGUSON is a Brooklyn youth of nine summers. He never had the advantages of a correspondence school of electricity, nor as yet is he an E. E. But he nearly became a D. C., which means a dead corpse, on account of original investigations in electricity. This young martyr to science, in company with some other boys, thought it would be a fine thing to climb a center pole of the Atlantic Avenue Railway. Dannie was first at the top, and grasped boldly at the wire. The connection was only fair, but it took two doctors two hours to bring Dannie back to a realization of circumjacent material objects, and the arms of his tearful parents.

## ELECTRIC POWER ON THE CHICAGO CITY RAILWAY.

The Widest Application of Electric Power Yet Made in Street Railway Work—Inauguration of a Plant that May Radically Change Cable Road Practice—Cables Moved by Electricity.

Before many days, the southern division of the State street cable in this city will be moved with the power given it by an electric motor located in the Fifty-second street cable plant. The source of electric energy will be the electric plant of the same company, located across the alley from the cable plant. If the results are as good as anticipated, and there is every reason to think that they will be, motors will probably replace the steam plants in the other cable stations of the system. This is the boldest move in electrical engineering lines that street railway practice has seen since its beginning. It is, however, perfectly in accord with the advanced policy which has been characteristic of the Chicago City Railway for

many years past. This road was the second in the world to adopt the cable system, and it has always been among the foremost in making improvements which lead to economy or better service. The length of the territory which it covers has necessitated a great economy of operation, and it is safe to say that no system in the United States makes such long hauls for five cents. It also has the longest cable routes in

M. K. BOWEN.

the world, the State street line being  $7\frac{1}{4}$  miles long and the Cottage Grove line nearly 9.

In addition to being a pioneer in cable practice this company has the honor of being the first of Chicago's three great roads to begin the substitution of electricity for horses on its crosstown lines. The recent passage of the ordinances, giving the right to change nearly all the present horse lines of this company to electricity, will result in a system of electric power distribution for railway purposes that for its completeness can not be equaled in this country. The plans of the company here described should be placed to the credit of M. K. Bowen, superintendent, Robert Hill, chief engineer, and G. W. Knox, electrician. These gentlemen hardly need any introduction to REVIEW readers, as Mr. Bowen is well known as a street railway superintendent of long experience, a master of men and of mechanical details as well; Mr. Hill, as the engineer of steam plants which have a world wide reputation for efficiency; and Mr. Knox, as an electrical engineer who knows how to combine science and practice. To these names should be added that of

C. J. Reilly, head engineer of the Fifty-second street electric station, who has made a special study of the possibilities of supplying the power required for all purposes on the entire system from the one electric station.

The idea of supplanting the engines of a cable station with electric motors seems at first absurd, but when the actual conditions are studied, the aspect changes. As shown by the map the company has three cable plants. The one at Twenty-first and State streets, runs all the cables north of Thirty-ninth street. That at Fifty-fifth street and Cottage Grove avenue runs the Cottage Grove avenue cables south of Thirty-ninth street and the Fifty-fifth street branch. The south end of the State street line is run from a plant at Fifty-second and State streets. Across the alley from this latter plant, and fronting on Wabash avenue, is the electric plant which will supply all the electric lines of the company. It has at present machinery for two-fifths its full capacity, or about 2,800 horse-power.

G. W. KNOX.

Some time ago, when Mr. Hill was considering the matter of supplying electric power to the various car barns and doing away with the numerous expensive small steam plants, it suggested itself that if electric power was more economical on a small scale, it ought to be so in a degree on a large. Accordingly the question of supplying the cable plants with electric power was taken under consideration, with the result that an order was placed with the Westinghouse company for a 600-horse-power 500-volt motor, to be placed in the Fifty-second street cable plant. This plant was chosen for the experiment, not only on account of its nearness to the electric plant, but because it is the smallest cable plant of the system and the proportional saving in labor would be greater than in the larger plants. The power has to be transmitted only across the alley. The change from steam to electricity will be made very easily.

The cable plant has two double engines, either one sufficient to carry the load, and belted one to each end of the cable driving shaft. This shaft has couplings at each end for disconnecting either engine. The rim and spokes of one of the engine fly wheels will be removed and the motor placed behind the engine. The belt from motor to cable shaft will pass above and below the engine hub. The other engine will still be on hand for emergencies, and the engine to be replaced could be put in

ROBERT HILL.

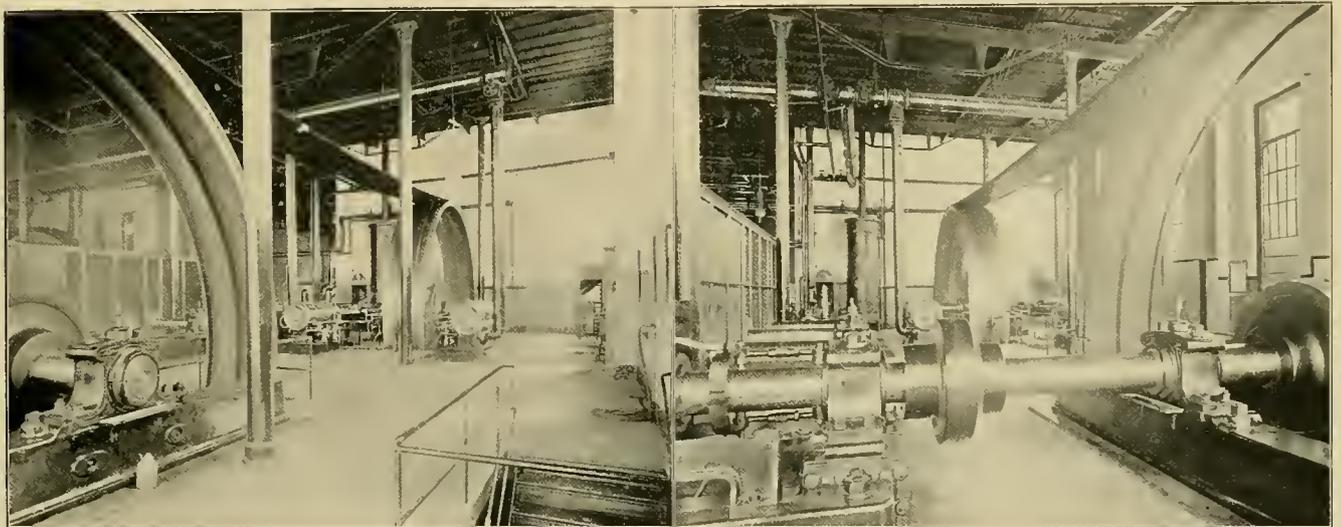

running order inside of ten hours. The engine foundation is large enough, so that the motor will not need to have a special foundation built for it but will rest on the engine foundation. The motor, which is 600-horse-power, is identical in construction with the Westinghouse 700-horse-power No. 6 railway generator, except that it is shunt instead of compound wound. It is a six pole machine, and runs at 300 revolutions a minute. Its capacity is 1,044 amperes. It will be started with the aid of an iron wire resistance kept cool by running water.

The average daily load of the cable plant is 250 horse-power. The maximum load (which occurs in the winter at the time of heavy snow storms) is about 600-horse-power. To conduct the current across the alley, copper wires having a sectional area of 1,000,000 circular mils will be installed. This is about the equivalent of five No. 0000 wires.

This will probably be one of the largest, if not the

plant and the oil used, so that Chief-Engineer Hill calculates that \$35 per day will be the total saving in station expenses. The fuel bill of the electric plant will be the only thing that will be increased. The electric plant is now very much underloaded. There will be a saving in fuel during the hours of very light load, when both plants are doing little except overcoming friction. By substituting the motor, the friction of the cable engines will be eliminated, and the saving on this item will for several hours of the day be enough to counterbalance the double transformation of energy.

The loss in transforming the power into electrical energy and back again can not be over 17 per cent (10 per cent in the motor and 7 per cent in the generators), while it may be less. As the fuel bill of the cable plant now averages about \$45 per day, the increased cost of fuel would be 17 per cent of this, or \$7.65 a day, to put against a saving of \$35 on the other items. The cable

VIEWS OF CABLE ENGINE TO BE REPLACED BY ELECTRIC MOTOR.

largest electric motor running in the world, but there is no reason to believe that it will not do its work exactly as expected by its installers. It will be shunt instead of compound wound, because shunt winding is the simpler and will keep the speed within a two per cent variation, which is as near as the steam engines now keep it.

The use of this motor will offer a splendid opportunity to study the variations of power required by the cable.

It will also be possible to tell much more closely than ever before the per cent of power required to move the cable without cars. The difficulties of taking engine indicator cards quickly has always been in the way of studying closely the performance of cable machinery, but this difficulty will disappear when an ammeter is substituted for the indicator.

The saving in labor alone due to the change will amount to \$28 per day. The electric plant will require no additional force, while that in the cable plant can be cut down enough to make the saving mentioned. To this saving must be added the repairs on the cable steam

load is more steady than that on the electric lines, and it is thought will help to make the performance of the electric station steam plant even better than its present excellent showing, a record of which will be found in the STREET RAILWAY REVIEW of November, 1893. A horse-power hour is generated with  $3\frac{3}{4}$  pounds of screenings, at \$1.50 per ton.

If the experiment is successful, the next cable plant to abandon the direct use of steam will be that at Cottage Grove avenue and Fifty-fifth street. The average load on this station is 750 horse-power, and in case electric motors are installed, two of 1,000 horse-power will be used. The distance from this to the electric power plant is about  $1\frac{1}{4}$  miles, and as it will require the equivalent of fifty-one Number 0000 wires to carry the necessary current this distance, with the proposed 25-volts drop, the conductors will, of course, have to go underground. About half of the distance from one station to the other is over Washington park, so that underground work will not be as expensive as if otherwise. There is the fur-

# Street Railway Review

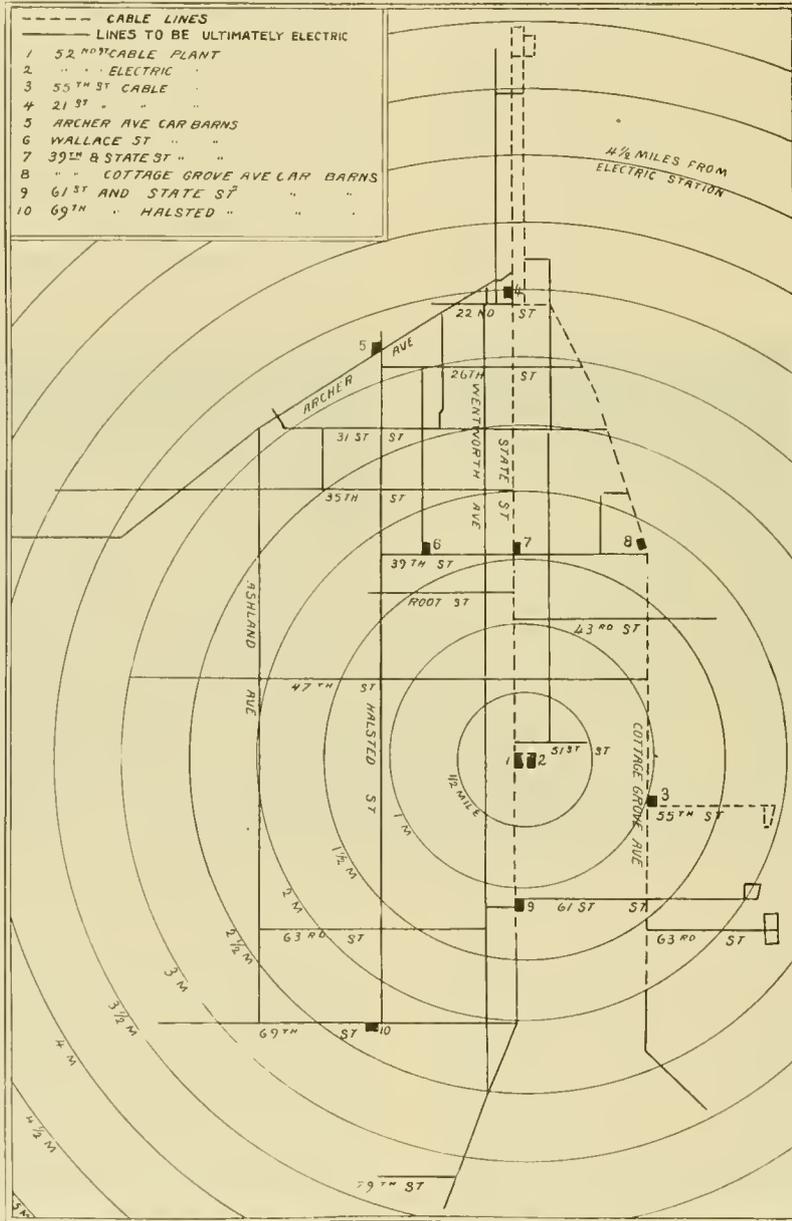

ther possibility that in time the Twenty-first street plant will be run by electricity, but as it is over  $3\frac{1}{2}$  miles from the electric station, and is very large, having an average load of 1,000 horse-power, the advantages of the change would be greatly reduced.

Along with the extensions of the various electric lines will come the application of the railway current to the lighting and power supply of all the barns. Besides the

the other load is lightest and when it can be most conveniently taken care of.

The new electric lines, when completed, will comprise in all 130 miles of road, and it is calculated that 300 motor cars will ultimately be needed. The territory covered by the system and its relation to the electric station can be best seen by the accompanying map.

The electric station, which should be visited by every

MAP OF CHICAGO CITY RAILWAY SYSTEM.

repair shop at State and Twenty-first streets, there are six barns. At five of these there are from one to four car elevators. In all there are eleven elevators. Two 50-horse-power motors will be installed for each elevator. At present, steam engines are in use at the barns, each running several hundred feet of line shafting. The expensiveness of small steam plants is well known, and the aggregate saving along this line will be considerable. The lighting and power load will come at a time when

electric railway man coming to Chicago, is a model of neatness and good engineering. It is a station in which no extravagant expenditures have been made, but it has always been the policy of the City Railway management to omit nothing which will add to the economy and reliability of its plants. The station is a one story building, 35 feet high and 130 by 147 feet. The boiler room is 57 by 130 feet and has space for 14 Mohr water tube boilers, one-half of which are now in place. The coal is

EXTERIOR OF ELECTRIC STATION.

INTERIOR OF ELECTRIC STATION.

delivered in the cable plant across the alley, at which place it is loaded into dump cars and lifted to an elevated tramway, which crosses the alley and runs above the boilers of the electric plant, where it is dumped into the bins or hoppers feeding the mechanical stokers. The engine room has space for five units, of which two are installed. Each unit consists of a pair of Wheelock, simple engines, connected by a Hoadley rope drive to a jack shaft. On each end of this shaft is a clutch for throwing in a 700-horse-power Westinghouse four-pole generator. The ultimate capacity of the station is thus 7,000-horse-power, which is ample to drive the whole system, cables and all, if it is decided to do so. The switchboard bus bars are calculated for 10,000 amperes. The switchboard is the Westinghouse standard, but ammeters will be put in the feeder circuits when more machinery is put in. The plant gives employment to 20 men, whose work is divided into three shifts. The usual force at any one time is three in the coal room and four in the engine room. The oil bill of the station is very low, not exceeding \$5 per month. Cylinder oil is used throughout—first on the bearings and then in the cylinders. For feeding the boilers, an exhaust injector is used the greater part of the time. The station is well suited to become the “heart” of a great street railway system. The apparatus and its arrangement has given so nearly perfect satisfaction that there is little reason for a change of plans in enlarging the station. Mr. Hill’s stations are always well planned and well

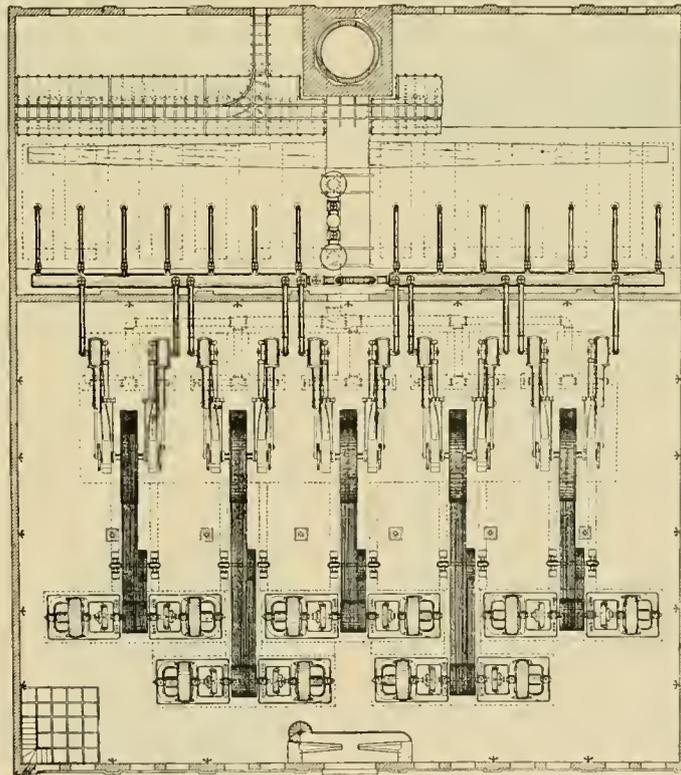

taken care of. If more electric railway stations were as well planned and cared for, the standard of street railway power plants would be materially raised. The visitor to this station can hardly realize that he is in a power plant. Everything is as neat and clean as a parlor and the Wabash avenue front has a well kept lawn.

Simplicity, uniformity and cleanliness are the rules throughout the plant and nothing that is out of order is allowed to remain so long. The company keeps a wrecking gang of six men who are experts in repairing and overhauling heavy machinery. They are employed among the several plants before mentioned and all troubles receive immediate attention.

It is Mr. Hill’s idea that this arrangement of driving several cable plants from one electric station can be used to great advantage when, as in several cities the grades are too steep to be practicable or economical for electric traction, and where several separate small cable plants have to be maintained. A great saving could be effected by having but one steam plant and running the cables by electric motors, which require very little attendance or space. If the road operates both electric and cable lines

the advantage is still more pronounced. The entire street railway world will be deeply interested in this radical and unique departure of the City Railway, and awaits with interest the further details.

THE Chicago City Railway Company will open bids on electrical equipment for its new lines, August 28.

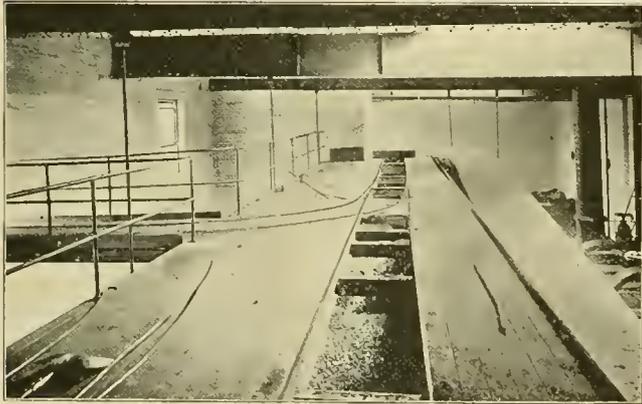

PLAN OF ELECTRIC STATION.

## ELECTRIC RAILWAY WORK IN CHICAGO.

As noted in the two last two issues of the REVIEW, Chicago is destined to have within its confines several hundred miles of electric railway lines, and to be one of the great electric railway centers of the world. The cable has borne a noble part in the matter of Chicago's rapid development, but now, outlying districts less thickly populated are to be served by the electric current, and the buzz of the trolley is to be heard far and wide—north, west and south.

To begin with, the North Halsted street line is in operation and North Shore cars connect with the cable. The North and West Chicago electric lines are being ably directed by John R. Chapman, formerly of Grand Rapids, Mich., who has temporary offices at 544 North Clark

ABOVE THE COAL BINS—ELECTRIC STATION CHICAGO CITY RAILWAY.

street. Mr. Chapman says that the railroad tie up has done great harm to progress on his lines, delaying not only the rails and poles expected, but the engines as well, so that affairs are almost at a stand still. The delay gives time, however, for the close study and calculation of feeder systems and consideration of supplies. On Milwaukee, Lincoln and Elston avenues, rails have been bonded and wire strung, but it is doubtful if cars will be run for several months. Larrabee, Sedgwick and other streets are in statu quo, waiting for supplies. Fifteen miles of the Milwaukee avenue and Lincoln avenue lines will be operated from the North Shore power house. The location of the new power house for the remaining lines will be on Roscoe, at the river. The West Side lines are hardly begun, but fifty-nine miles of double track are to be operated. Van Buren street is the most important of these lines permitted to use the trolley. Engineer S. Potis and his corps have their hands full of plans for power houses and line work for the west and northwest lines.

The West Side power house at Washington boulevard and Western avenue will ultimately accommodate five 2,000 and one 1,000-horse-power generators. The Roscoe power house of the North Side lines will call for 2,800 horse-power of generators. Siemens-Halske direct connected will be used. This power house will operate

all North Chicago lines and all West Chicago lines north of North avenue.

## CHICAGO CITY.

The city council, after a painful delay, has finally granted the Chicago City Railway, rights for electric lines on numerous streets, and preparations are in progress to begin the beginning of these important additions to rapid transit service. The Chicago city ordinance calls for lines on Twenty-sixth, Thirty-first, Thirty-ninth, Fifty-first, Sixty-ninth, Seventy-ninth streets, Archer avenue from the river to Thirty-eighth street, thence on Thirty-eighth street to the terminus; Forty-third street from the Illinois Central tracks to State street, thence to Root street and thence to the terminus; Halsted street, Wentworth avenue and Ashland avenue, from Archer avenue to the termini; Hanover, Butler and Wallace streets, where tracks are now laid; State street from Sixty-third to Vincennes avenue, thence on Vincennes avenue to the terminus. The special ordinance covers Sixty-third street from Cottage Grove avenue to State street; Wallace street from Thirty-ninth to Root; Halsted street from Sixty-ninth to Summit, thence on Summit to Eighty-seventh; Center avenue from Forty-seventh to Sixty-third; also, permission to lay a conduit in Twenty-first street from State street to Cottage Grove avenue. The company has qualified and the Halsted street line is now under reconstruction. Bids have been asked for all the material to be required in the reconstruction of the lines. These will be opened August 28 and will be decided soon. Construction will then go on immediately.

## SOUTH CAROLINA, WHERE THE POLES COME FROM.

W. F. Murphy, E. E., and J. H. Bruning, M. E., are two enterprising young men, who live in Charleston, S. C., and make excellent use of the great wealth of timber which this region affords, by giving to the street railway men of the country excellent pole material. The por-

J. H. BRUNING.

W. F. MURPHY.

traits of the two gentlemen are given herewith, and their field of operation shown in the view of the magnificent forests.

Exceptional shipping facilities are afforded for the transferring of the product, by reason of the situation of the city of Charleston on the seaboard and at the conflu-

ence of the Cooper and the Ashley rivers. Charleston itself has 60,000 inhabitants and is an important port.

The two rivers mentioned flow through a remarkably rich timber region and their shores are lined for miles with immense forests of long leaf pine and with cedar. Besides this an inexhaustible supply of oak and cypress comes from the Santee swamp, a vast area, lying 50 miles from Charleston. The life of cypress timber is much longer than that of cedar and it is free from knots

SCENE IN THE SANTEE SWAMPS.

and of great strength, at the same time being very rigid. It will be readily seen that with such a supply of desirable timber and such good shipping facilities for all northern points, that South Carolina timber may soon be as well known in street railway work as it is in numerous other branches of industry.

The firm of Murphy & Bruning is thoroughly alive to the needs of the street railway fraternity.

L. S. BOOMER, 647 Rookery, Chicago, has taken the Chicago agency for the Ellis Manufacturing Company.

If you are going to the Atlanta convention it is well to arrange sleeping car space. The Big Four and the Queen & Crescent routes are the popular ones out of Chicago. That's the way the crowd will go. Write J. C. Tucker, 234 Clark street, Chicago, for sleeping car berths.

CHAS. COOPER, of C. & G. Cooper & Company, the well-known engine builders of Mt. Vernon, O., mourns the loss of his wife who died last month. On July 27 his only son and child died at the Thousand Islands, whither he had gone to make a short visit on his way home from college. All the many friends of Mr. Cooper sympathize with him in these two sad bereavements.

W. J. COOK, of the McGuire Manufacturing Company, reports matters flourishing and a shop full of orders. A recent feature of the business that is pleasing to the company, was an unsolicited order for 50 trucks from a well-known eastern road now using a large number of McGuire trucks on two previous orders. The company has now 500 trucks in hand or to be delivered within the near future.

THE Siemens & Halske Electric Company has erected large direct coupled railroad generators for use in the United States and Canada, as follows: Garden City Construction Company, (North Chicago lines), four of 620 horse-power; West Chicago Street Railroad, three of 2,000 horse-power and one of 1,000; Nassau Electric Railway, of Brooklyn, N. Y., three of 667 horse-power; Toronto Street Railway, two of 1,400 horse-power; City Railway, Dayton, O., three of 400 horse-power; Ringing Rocks Street Railway, of Pottstown, Pa., two of 135 horse-power; Cincinnati Street Railway, one of 650 horse-power.

THE Southern Railway Company, the Piedmont air line, runs elegantly equipped trains with sleeping and dining cars through to Atlanta and New Orleans every day in the year. With quick time and elegant equipment, it offers to street railway men of the east a direct and pleasant trip to the Atlanta convention next October. On October 15 it will run an elegantly equipped vestibuled special from New York, touching Washington, Baltimore and points south. R. D. Carpenter, 271 Broadway, New York, F. B. Price, 32 South Third street, Philadelphia, L. S. Brown, Washington, and G. R. Needham, 106 E. German street, Baltimore, will furnish information and rates.

THE Kuhlman Car Company, Cleveland, O., is finishing seven cars for the Berea Street Railway. They are 28-foot, closed bodies, with cross seats. All are finished in mahogany, vestibuled and equipped with Stanwood steps and Dorner & Dutton improved trucks. Fulton Foundry patent draw bars are used. They are elegant specimens of the car builder's art and fully up to the well-known high standard of the Kuhlman works. The Kuhlman Company has just received an order for seven cars for the Cleveland Electric Railway Company. These will be 32 feet long, closed bodies, with doors at the ends next to the outside steps, and also provided with side doors, wide aisles and doors on the side of the car. These cars will also have cross seats, vestibuled in front.

A. E. BAKER, the bright young assistant secretary of the Baltimore Car Wheel Company, writes us from Charleroi, Belgium, that his European trip has been a combination of business and pleasure and that his second month on the continent has been very profitable. He will return about September 1. Mr. Baker is thoroughly alive to every detail of his chosen work, as well as to the more æsthetic incident of foreign travel.

## HALF FARES.

Interesting Bits of Information from All Parts of the Country,  
Boiled Down for Busy Readers.

THE Technic Electrical Works of Philadelphia have put upon the market an improved rail bond.

WHILE a scow loaded with 125 tons of rail for the new Perrysburg electric railway was being unloaded it sank with nearly its entire load.

IT is reported by the Detroit, Mich., News, that Detroit has 10,000 bicycles, which knock out 20,000 street railway fares every fine day.

ENSIGN BROWN, late counsel for the Youngstown, O., Street Railway Company, was arrested July 27 by Manager Anderson, who alleges embezzlement.

MILWAUKEE'S coroner found that June deaths by accident fall under the following heads: Drowned, 23; suicides, 6; street railway accidents, 2; total, 31.

AT Paterson, N. J., a "street car party" was recently run into by a steam train on the Paterson Railway Company's tracks. No one was seriously injured.

SEVERAL classes of the National School of Electricity have been organized among the motormen and shop men of the street railway companies in some cities.

JUNE 9, the Evanston line of the North Chicago Street Railroad Company was first operated by electricity from Clark street limits to the North Shore southern terminus.

DURING the late strike the Twin City Rapid Transit Company, of Minneapolis and St. Paul, was compelled to use cord wood, no oil, which is the ordinary fuel, being obtainable.

THE South Chicago City Railway is using oil fuel, and Superintendent W. A. Rowe reports it cheaper than coal, even when coal is at ordinary low prices. The station is located near a pipe line.

THE awful effects of the Brooklyn trolley has the last straw added to it by the New York Journal, which says: "All the back alleys in Brooklyn will soon have trolley lines in them, and the clothes lines and the tom cats will have to go."

THE Lincoln Street Railway Company, of Lincoln, Neb., gets \$42.75 per mile per year for carrying mails, and, as nearly as possible, twenty miles are in this service, the revenue from this source is nearly \$900 a year. The postoffice department wants the service extended.

THE Atchison, Kan., Globe, is getting a national reputation for its bright paragraphs. One recently read as

follows: "When the last rail of the Atchison electrical street railway is laid, a golden spike valued at \$80 will be driven, with appropriate ceremonies. But it will not be pulled out as soon as the crowd disappears as was done in Leavenworth. It will be left there, and the first man to claim it may have it. That's the sort of town Atchison is.

THEY have to pay for it now in Blankville. At least the Blankville Blinker says:

"After ten o'clock in the evening, when the street Car Co. has to keep extra cars and men out late at night, after dances, theaters, etc., the street car fare will be ten cents."

A FEW sympathisers of the Chicago strikers have refused to ride in the Tiffin, O., Electric Street Railway Company's double-decked car, because it was made by the Pullman Company, but the car still runs, and Mr. Pullman up to date has not signified his sorrow at the insult to the company's car.

A PLUCKY young woman recently kept her head during a street railway grade runaway at Alliance, O., and saved the lives of the passengers. Her name is Rena Conn, a book-keeper. The motorman when he found his car going down hill at too great speed immediately lost his nerve and deserted his post. Then Miss Conn jumped to the brake, told the passengers to keep quiet, and saved the day and the car. She is the heroine of the hour and rightfully so.

PLANS for the Hestonville, Mantua & Fairmount Passenger Railway Company are prepared. The building will be in the style of the Italian Renaissance. The ground dimensions are 113x150 feet. The main front, on Callowhill street, will be of Hummelstown brown stone base and Pompeian brick, with red Maynard sandstone and terra cotta trimmings above. The smoke stack will be 160 feet high. The entire structure will be of fireproof materials, and will contain four Green-Corliss engines of 1,000 horse-power, and four batteries of Babcock & Wilcox boilers. It is intended to use only three engines and three batteries of boilers at present, keeping one set in reserve. The cost is placed, with machinery, at \$250,000.

IF, from statistics, an equation could be framed, it would be found that human life is held in highest estimate in France, followed by the eastern part of the United States, England, Germany, Holland, Ireland and Norway, in the order named. The ratios of accidental deaths to the 10,000, from all causes, are as follows: England and Scotland, 30; Ireland, 18; France, 15; Germany, 16; Russia, 6; Austria, 10; Italy, 5; Switzerland, 28; Spain, 7; Denmark, 12; the United States, 40. The United States has the smallest number of homicides and suicides in proportion to its population, which brings down the equation premised in this note. Familiarity with new systems of traction, manufacture, etc., reduces that death rate from these causes very rapidly.

PERSONALS.

THOMAS M. SAYRE, superintendent of the Consolidated Traction Company, of Jersey City, N. J., died recently.

CLARENCE CHASE, of Kansas City, Mo., has accepted the secretaryship of the Mobile, Ala., Electric Railway Company.

JOHN E. McVEY, has been elected secretary of the Youngstown, O., Street Railway Company. Mr. McVey is a prominent attorney.

E. P. Shaw, Jr., has been made manager of the Pawcatuck Valley Railway Company. He has appointed H. W. Tracy superintendent.

F. A. SOULE, so well known to Chicagoans through his connection with the Jefferson & Urban Rapid Transit franchise of last year, is dead.

JILSON J. COLEMAN, general manager of the Lehigh, Pa., Traction Company, owned by the Johnsons, has been transferred to the Johnson lines in Brooklyn.

RUSSELL B. HARRISON, of Terre Haute, Ind., the enterprising and thoroughly alive president of the street railway company, paid the REVIEW a call recently.

WM. RAMSEY, general superintendent of the Federal Street & Pleasant Valley Passenger Railway Company of Allegheny, Pa., is in southern California for his health.

THE new superintendent of the Newark, N. J., Traction Company, is J. L. Quigg, formerly superintendent of the western division of the New York & New England Railroad.

LEO DAFT, the well-known electrical and mechanical engineer of the state of Washington, recently took a trip up Mount Ranier, where he spent 26 hours at an altitude of 14,400 feet.

WILLIAM J. RICHARDSON has resigned the secretaryship of the Atlantic Avenue Railway Company and has gone to Europe with his family. He will attend the International Street Railway Association at Cologne.

CHIEF ENGINEER POWERS, of the Elkhart-Goshen, Ind., street railway, has been made superintendent of the line. President Burns has bought General Electric generators and a Bates Machine Company's engine from Joliet, Ill.

B. F. HARRIS, Jr., president of the Urbana and Champaign, Ill., Street Railway Company, was a recent caller. Mr. Harris' brilliant success in his street railway business leads one to suppose him at least 40 years of age, but he isn't.

HENRY G. ISSERTEL, E. E., is located at 39-41 Cortlandt street, New York City, representing the H. W. Johns Manufacturing Company, the Bernstein Electric

Company and the Iona Manufacturing Company, Boston. Mr. Issertel was formerly the manager of the Railway department of Alexander, Barney & Chapin. His many friends wish him the best of fortune in his new connection.

A NEW GAME.

What the ordinary American youth will not think of is not worth the while of any one to cogitate upon. The cable system furnishes him endless amusement when he attaches tin cans, cats or puppy dogs to the endless rope and watches the unfortunate beasts in their mad gallop against time. The electric railway gives full play to his energetic researches in applied electricity, and horse cars are useful in many ways as modes of surreptitious conveyance. Besides the horses may be scared by fire-crackers and torpedoes.

The safety fender is the latest addition to his list of playthings, and the various inventors of successful fenders do not know the joy of the gamin's heart as he finds use for this article.

In the center of the city is where they get the most fun out of this new game. Here the cars move slowly and they can easily step upon the guard and squat down out of reach of the motorman. It is the fact that they are practically out of reach, yet actually in danger, that makes this new sport particularly attractive to the boy, and particularly aggravating to the motorman. The motorman's life becomes even more of a burden with the fender than without, and the agile street arabs need no coaching as to the best methods of making the driver's misery profound.

THE Big Four will take many delegates to the Atlanta convention as far as Cincinnati, where all streams will join in the river of delegates that will take the Q. & C. route.

ONE OF MANY.—As he settled himself in the car his face turned ashen gray, a choking sound came from his throat, and with a shout of "Stop the car! Stop the car! For the love of Moses, stop the car!" he bolted into the street, knocked over a newsboy, eluded the grasp of several bystanders and ran plump into a policeman's arms. "What d'ye mane by this," growled the officer of the law, as the crowd began to gather about the agitated man. "Are yez crazy or drunk, or been stalin' something? I think I'll run yez in just for luck." The pale face of the hunted one grew paler as he gasped: "Don't do that, officer, if you want my veneration and prayers; I've forgot to get Mary's curling irons and the store shuts in five minutes;" and the policeman, who was a married man, dropped his grasp and said, "Poor fellow."

Street Car Passenger—"I have paid my fare."

Conductor—"I don't recollect it."

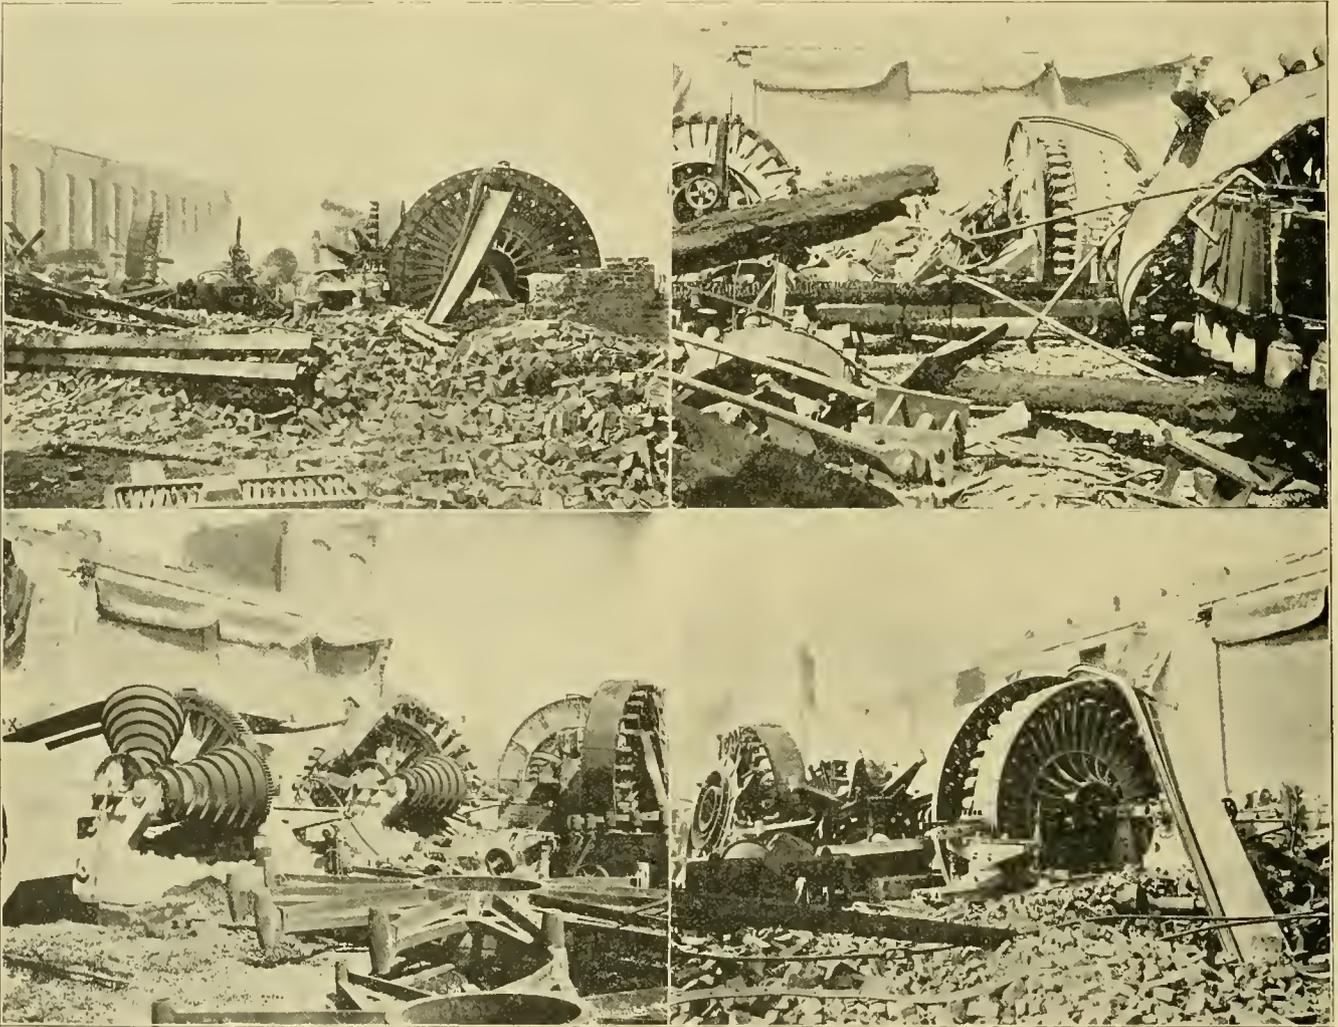

Passenger—"And you won't re-collect it, either."

### SIEMENS-HALSKE FACTORY AT CHICAGO BURNS.

The heaviest fire loss known in the annals of electric manufacturing, occurred on the night of August 1, when the magnificent plant of the Siemens-Halske Company of America was completely destroyed, entailing a net loss of \$350,000. This fine manufactory was situated in the "lumber district" of Chicago, on the corner of Blue Island avenue and Wood street. About six o'clock p. m.

of glazed marble and slate and fused wire. The works ordinarily employed about 2,500 men in all departments, and even during the slack time gave work to 500 or 600 mechanics.

The small engraving upon page 465 shows the remains of the Lake Erie 250-horse-power vertical engine, which was direct coupled to dynamos of a similar capacity. To the left is a 150-horse-power Williams engine, belted to a Siemens-Halske dynamo. Just back of the Erie engine and to the left, may be seen the ruin of a very elaborate

VIEWS OF INTERIOR OF SIEMENS HALSKE FACTORY AFTER THE GREAT FIRE.

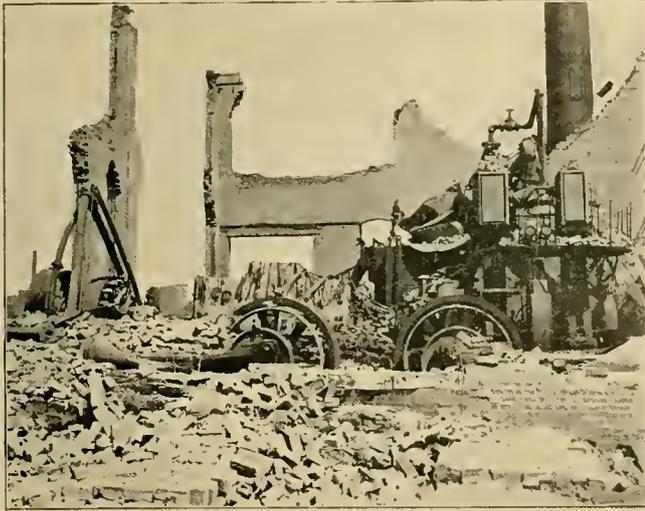

the fire started in the heart of the lumber yards, and by nine o'clock the reflection on the clouds heralded the destruction of \$2,000,000 worth of property. The magnificent city fire department, fire boats and all, was powerless, except as it could restrain the flames from adjacent property.

Before morning the great brick structure, which contained the expensive manufacturing machinery of the Siemens-Halske, as well as many thousands of dollars worth of goods in various stages of completion, were totally destroyed, as our engravings show more eloquently than words. The large work for Brooklyn, Toronto, and other street railway plants was reduced to a mass

switch board, designed by the company to illustrate their 2, 3, and 5 wire systems. It was used practically for electric light, but was placed to illustrate power use as well. It cost \$4,000. In the foreground may be seen the ruins of two 150-horse-power Ide engines, which had been set up for the purpose of directly connecting dynamos to drive the Chicago General Street Railway.

The REVIEW's special artist obtained also views of the shops, four of which are grouped in the large engraving. The upper pair displays the large dynamos, almost ready for shipment to Toronto. The right hand view shows one Toronto dynamo, or rather the ruins, ready for shipment, and to the back its brother, still on the big lathe.

The left hand view shows next the wall the Metropolitan dynamo, and to the right another view of the Toronto dynamo. In the background is a dismantled Morgan traveling crane. The two lower views are from photo-

REMAINS OF ENGINES—GREAT SIEMENS-HALSKE FIRE.

graphs, showing side elevations of the Toronto dynamos and a better view of the lathe, said to have been the largest in this country. The total value of the plant is placed at \$500,000, and the insurance amounted to \$150,000.

The double engraving shows another victim of the great fire, the foundry of the Wells-French Company. The loss on this was about \$100,000, well insured. The cupolas stand grim and lonely in the background. They were used to heat, and a little thing like the present fire did not hurt them. The completed wheels are shown in the foreground.

The day following the fire, the Siemens-Halske Company began operations in the Wells-French shops, and is ready to get out work and receive orders as usual. The company will at once occupy the Grant Locomotive Works plant.

ANOTHER FIRE AT PEORIA, ILL.

Peoria, Ill., is a chronic sufferer from street railway fires. The last one, on July 27, licked up the West Bluff barn of the Central Railway Company, together with thirty old cars, and smacked its lips for more. The loss was about three thousand dollars; well insured. This fire, as well as several other Peoria blazes recently, are thought to be the work of incendiaries.

At Newark, N. J., on July 27, the Bloomfield car barns of the Consolidated Traction Company burned. The loss was \$40,000. Six horse cars were burned and thirty saved. The building was eighteen years old and covered one and a half acres of ground.

WHITE-CROSBY'S PRIZE.

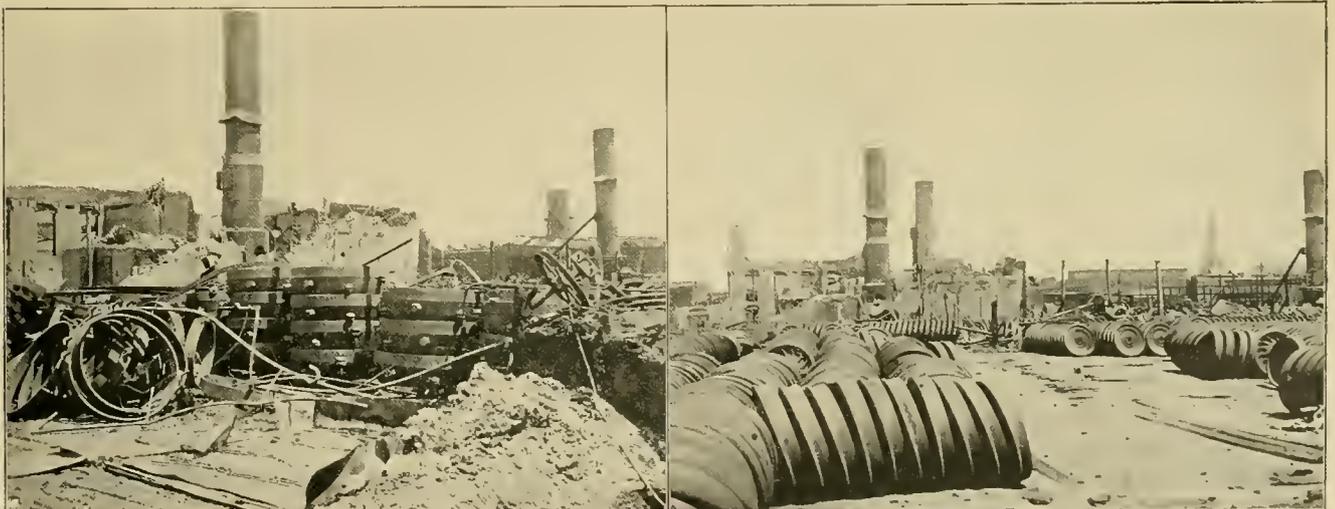

The prizes offered by the White-Crosby Company, of Baltimore, for car barn plans, have been awarded as follows:

- First prize, \$100, to M. D. Pratt, Engineer, Pennsylvania Steel Company, Steelton, Pa.
- Second prize, \$50, to D. B. Banks, Engineer, Baltimore Traction Company, Baltimore, Md.
- Third prize, \$25, to J. H. Bickford, Salem, Mass.
- Fourth prize, \$5, to F. J. Tone, Pittsburg, Pa.
- Fifth prize, \$5, to William P. Anderson, Baltimore, Md.
- Sixth prize, \$5, to W. Nelson Smith, New Orleans, La.
- Seventh prize, \$5, to A. S. Krotz, Springfield, Ohio.
- Eighth prize, \$5, to J. S. Hill, Lafayette Ind.

The J. H. Bickford plans were given third place on general merit, the design submitted by him being for a much larger car barn than the one called for.

A FUNERAL CAR COMPANY.

A new company in Buffalo has been organized to institute a new cemetery of 200 acres. Adjacent land will be made into a park with street railway connections. A funeral car will be run to the cemetery. Chas. F. Molly, of Bethlehem, Pa., is president, and T. O. Frierson is general manager of the company.

RUINS OF THE WELLS-FRENCH FOUNDRY.

## ELECTRIC CAR HEATING.

BY W. S. HADAWAY, JR.

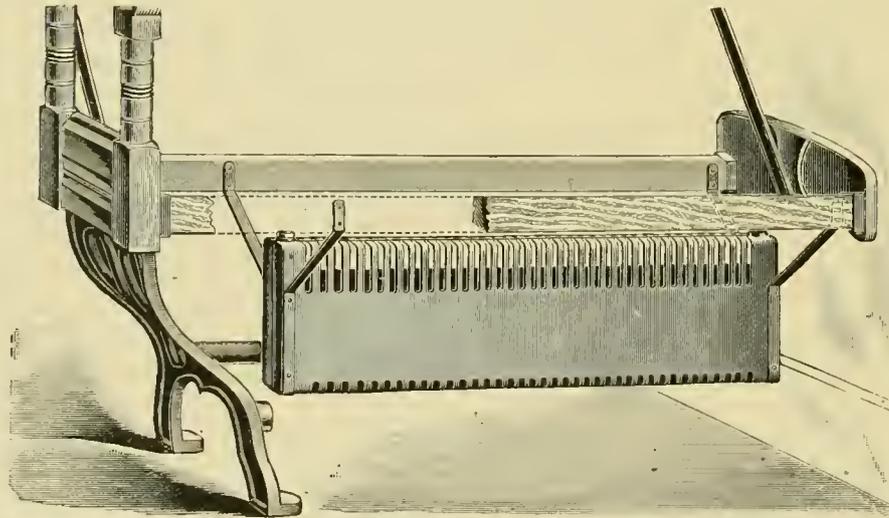

There are many theoretical and practical considerations upon which electric car heating by electricity may be urged. Questions of economy are not the only considerations in the car heating problem, but sanitary reasons as well.

The price of electricity varies greatly in different localities, according to the size of the road, cost of coal, labor, etc., so that figures obtained from the cost of operating one road cannot be used in figuring the cost of heating by electricity in general. The only fair basis of comparison is from average figures, and not extreme figures. It has been found in actual practice, this practice including several hundred cars, that 100 watts are sufficient to warm 30 cubic feet of space in an average well built twenty foot car, having from 100 to 125 square feet glass area and a monitor roof with windows of moderate tight-

vection from one point only, as the space to be heated is comparatively large, a small boiler can be successfully employed, distributing the heat through pipes, by either steam or hot water, but preferably the latter. The relatively small size of the car, however, permits the use of stoves or heat storage systems, and these, consequently, have been largely resorted to.

There are two forms of electric heaters by which an equable distribution of heat can be effected. First: By radiation from a heated surface in which convection currents enter to some degree. Second: By direct air heaters or registers in which little or no radiating surface is offered, the hot air arising from the heater and setting up air currents which circulate about and thus distribute the heat.

The forms of electric car heaters so far proposed are heaters by simple resistance, so that the form of heater to be chosen is dependent upon its durability, first cost and manner of distributing heat throughout the car. During the past winter the opportunity was again taken

HEATER ADAPTED TO CROSS SEAT CAR.

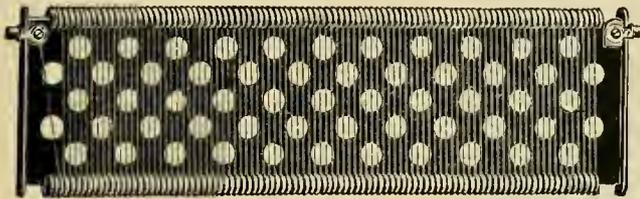

ness. This value does not apply to extreme northern latitudes and is a representative value for the southern New England and central states. The value for the northern latitudes can be computed from the foregoing figures by comparing the weather extremes in the two cases.

Carrying out the value given in the preceding paragraph, we find that in a twenty foot car in latitudes stated, 3,000 watt hours, or 4 horse-power hours, sufficient to allow for weather extremes; and the average running value will be determined by the severity of the season, exposure to winds, average running speeds and what may be generally termed local conditions. The practical application of heating in cars is substantially the same problem as offered in conservatory heating, with the disadvantages of the car in motion and many loose fitting windows and doors, and the advantage of a considerably decreased proportionate glass area. In practice, no competent heat engineer would attempt to heat a conservatory by distributing the heat by direct radiation or con-

advantage of to make an exhaustive study of electric heaters in actual use on cars equipped by the Central Electric Heating Company, of New York, and the New England Electric Heating Company, of Boston, and valuable data was obtained. These tests were with a thermometer on the front end of the car and one on the rear end of the car, each about 5 feet 6 inches from the platform floor. The inside temperatures were obtained by placing one thermometer on the inside of the front end and one on the inside of the rear end, and two thermometers on opposite sides, but equi-distant between the two ends. These two intermediate thermometers were varied in position, being attached part of the time to the window frames and part of the time to the straps and at a height to which persons of average size would feel the temperature most keenly, viz., at the back of the neck. These tests were carried on with heaters of four distributing points and of six distributing points, and of radiating surface distributed uniformly throughout the length of the car. It was found that the electric

heaters successfully warmed all portions of the car, and that the distribution of warm air was far superior to the distribution attained in cars heated by stoves which were run on neighboring lines. There is no doubt that the popular verdict is very strongly in favor of the electric heater.

As regards the bare cost of operation, every railway

manager can figure for himself on the data given. A case in point of a road figuring its power at \$2.00 per horse-power per month, shows the operating cost of the heater to be 27 cents per day when run at maximum heat, but that on an average the cost is less than 20 cents a day by reason of the full heat not being needed all the time. There are instances where it is claimed that electric heaters are operated more cheaply than stoves could

be, and it is apparent from the excellent results obtained in practice that the cost of operation of electric heaters is not as serious a problem as it has appeared to be, especially as it has been found in actual practice that the fares obtained from the space appropriated by the coal stove fully compensates for the cost of running an electric heater.

As to the sanitary aspect, the least value placed by experts upon the air capacity per person per minute for ventilation is thirty cubic feet. The average 20-foot car contains 900 cubic feet of air, and carries from twenty-five to thirty persons, thus making the proper change of air about once per minute. No street car is thus changed, except by introduction of quantities of cold air when the doors are opened at intervals. If, as in electric heating, a source of heat is placed near the doors, to cause warm air, heated either by radiation or convection, to rise with the cold air, the air is tempered to a considerable extent, and in practice this is found to be an essential feature of the electric heater.

The cleanliness of the heated air of an electric heater is to be also urged in its favor, the air not being heated at the expense of noxious gases.

The items of space occupied, cleanliness, freedom from damage to car, and from carrying in coal and taking out

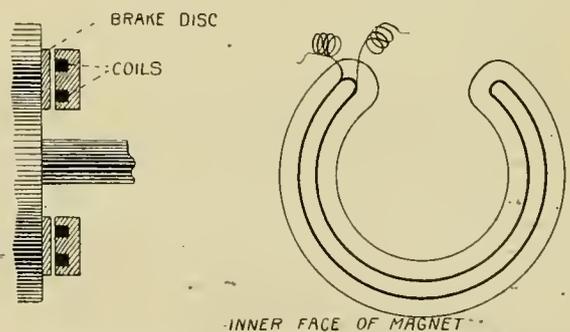

of ashes, and generally decreased depreciation, are strong factors in favor of the electric heater. We thus see that in practice there is no reason why electric heaters cannot be successfully operated.

The fact that makes it profitable to operate street cars by electricity than by other methods of propulsion, also makes it possible to heat the cars by electricity. Long continued heavy loads, with load lines of moderate maxima and minima, renders the cost of the power to street railroads a comparatively small one, and while the transformations through which the heat energy passes before its expenditure in useful work are many, the prerequisites outside of cost which the electric heater is called upon to fulfill warrants its use.

### THE SPERRY ELECTRIC BRAKE IN CHICAGO.

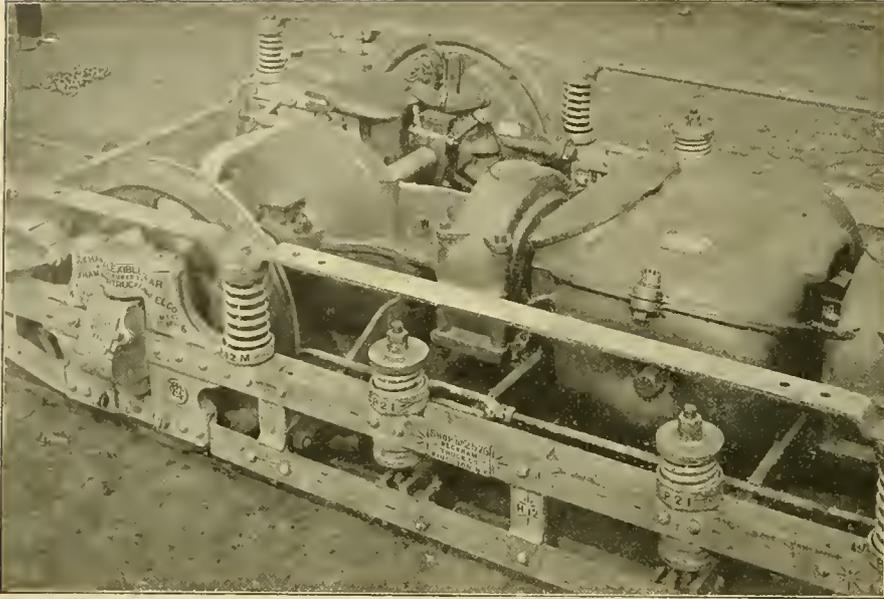

Probably the most important improvement in braking apparatus that has been made since the introduction of the air brake, is the electric brake, which has recently been perfected by E. A. Sperry, of the Sperry Electric Railway Company, Cleveland. This brake may now be considered as beyond the experimental stage, which is more than can be said in regard to other electric brakes for use on trolley roads, with the exception of the expedient in use at Sioux City, of turning the motor into a generator. The Sperry brake has been in practical service for some time, at Cleveland, Philadelphia and Waterbury, Conn. One has just been put on the Twenty-second street electric line of Chicago, by R. L. Caldwell, who represents the Sperry Company.

The Sperry brake consists, in brief, of a magnetic clutch, operated by current furnished by the motor acting as a generator. To provide for the electric brake, one wheel on each axle is cast with a flat disc, which is polished on its surface and against which the magnet acts.

The magnet is C shaped and has an internal coil, as shown in the engraving. It is made C shaped and not a ring so that it can be taken off the axle.

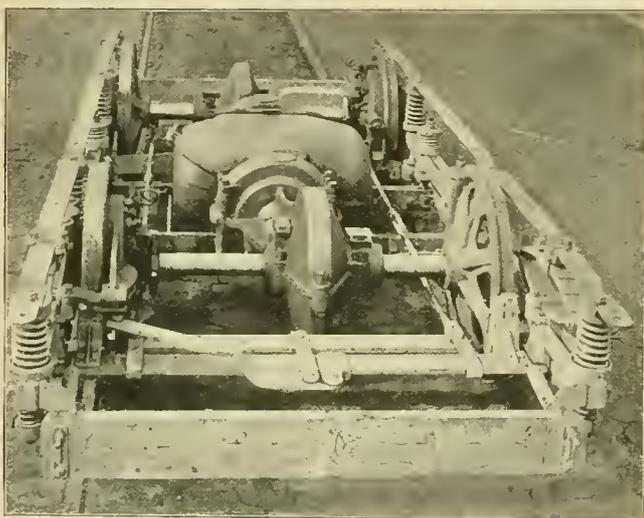

The method of operation is as follows: Both brake and controller are worked by the same handle. Suppose a car to be running with the current on and a stop is to be made. The handle is thrown to the "off" position, and when it strikes the "off" position it throws a switch, which cuts off the trolley current and makes connections, so

DETAIL OF BRAKE.

that when the handle is put on the first point of the controller, the motor, brake magnets and about eighteen ohms resistance are placed in series with each other. The motor "builds up" immediately, and sends a current through the brake magnets and resistance. The less the resistance in circuit the harder the brake is applied, so that this can be regulated entirely by the controller handle. When the controller is connected as a brake, and is thrown back to the "off" position, it trips a switch, which throws in the trolley current and makes it again an ordinary controller. In other words, every other time the handle is on the "off" position it becomes wired as a brake and every other time as a controller. The simplicity and practical efficiency of this arrangement is too obvious to need comment.

With this brake it is impossible to slip the wheels for more than an instant, as the moment the wheels stop the motor stops generating current. The stops made with this brake are remarkably quick and smooth, as the

END VIEW OF TRUCK WITH BRAKE.

correct braking principle is applied, of making the hardest application at high speed and automatically reducing it as the speed falls.

The brake is very simple and entirely independent of the trolley current. It introduces very little additional complication in the wiring of a car, as the same rheostat is used in the brake circuit and for starting. The rheostat required is a little higher resistance than the usual one, as it requires about 18 ohms to cut the current down enough to apply the brake easily. As the brake is operated with so small a current there is very little strain on the motor or rheostat. In regard to the wear on the magnet and disc, there is reason to believe that it will be very slight, as a large part of the breaking force is magnetism and not friction and the surfaces have graphite lubrication. The controller box, which is the ordinary size, has an indicator which shows whether the switch is turned to the controller or brake positions. The brake is made for every day use, and is as thoroughly practical a device as the modern railway motor. It can make emergency stops with a minimum of shock, and the service stops are remarkably quick and smooth.

Why go to the sea shore for a vacation trip, when within a night's ride of business the vacationist may find flesh, fish, fowl, boating, and all sorts of healthful recreation among the lovely little resorts reached by the Wisconsin Central Railroad? Even within three hours' ride of Chicago the busy man may find health giving breezes, lakes full of fish and woods full of game. Near Chicago are: Gray's Lake station, with nine ponds accessible; Lake Villa, with an attractive resort; Fox Lake, so well known for beauty, and half a hundred other lovely spots; or if wild scenery is wished, a few hours longer takes the tourist into the most savage of mountains and forests in upper Wisconsin and eastern Minnesota. The Wisconsin Central railroad offices, 204 Clark street, Chicago, will send on application a beautifully illustrated book upon the subject.

The Genett Air Brake Company, of New York, has sold, during the first half of August, air brakes for motor and trail cars to the following roads: Athol, Mass.; Lawrence, Mass.; Lowell, Mass.; Newport, R. I.; New Haven, Conn.; Easton, Pa., and is commissioning brakes on the New Orleans Traction Company's lines, the Lynn & Boston Railway, and the Atlantic Avenue Railroad Company, Boston. The company, under General Manager E. J. Wessels, is pushing its sales into foreign countries also and good reports of its efficiency come from all quarters.

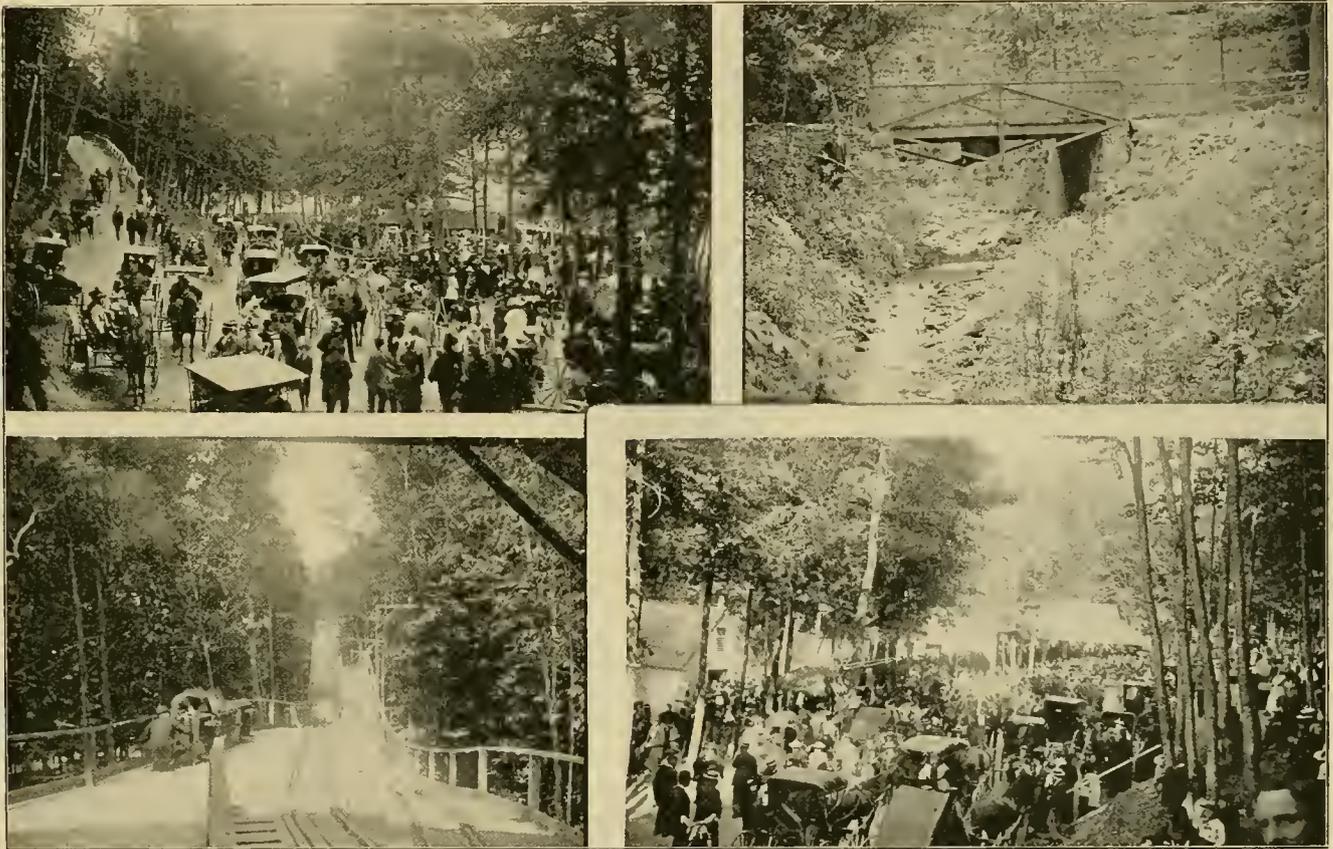

MAGNIFICENT PLEASURE RESORT OF THE BINGHAMTON, N. Y., RAILROAD COMPANY.

The 37,000 inhabitants of Binghamton, Broome County, New York, in no wise want for a healthful, beautiful and diverting resort, where holidays and hot evenings may be spent and where the toilers of the week may find rest and pleasure on Sundays. Not only is opportunity of a resort opened, but the Binghamton Railroad Company offers to the prospective pleasure seeker a cheap, rapid and comfortable means of getting to it.

Ross Park, which is the playground for all of Binghamton, and even of the surrounding towns, is situated

of the city of Binghamton, with men and means at its command.

The union and sequence of efforts of the original workers and the later commissioners have made Ross Park a combination of lovely natural effects, chastened and cultured by the hand and mind of man. The hills and dales have been softened by landscape gardening, chasms and gullies have been bridged and filled, and driveways have opened up the innermost recesses to the fancy of the thousands of daily visitors. The natural forest, Pennsylvanian in character, has been properly

SCENES IN ROSS PARK.

at the extreme south end of the city and covers 100 acres of diversified land. The site was originally presented to the city by Erastus Ross, after whom it was named Ross Park. This was many years ago, before Binghamton became the thriving manufacturing center of Southern New York and before wealth and money had gathered at this bend of the Susquehannah river. The first improvements, therefore, were not the result of special taxation or of large gifts, but the free will offering of personal efforts on the part of the citizens, each public-spirited man adding his own labor to that of his neighbor that posterity might enjoy the beauty and pleasure of which they were deprived. The institution is now governed by a board of park commissioners

thinned where necessity required, and rustic seats and bowers made from the felled timber. Around the crests of hills, roads and paths have been driven and foot passages made an endless labyrinth for the mooning lovers and the more staid fresh air seekers of older growth. The natural wildness of the place has not been vitiated by the designers of the thoroughfares, but rather enhanced. Scattered about at convenient intervals may be found seats, tables and covered platforms, for the use of picnickers and pleasure seekers, while swings and springs are not wanting. The older trees are carefully trimmed and the newer ones planted at proper intervals, so that for endless years to come, that Utopian race which will at some future date inhabit our country may

give thanks to the foresight of the present commissioners of Ross Park.

Besides the numerous foot paths, the beautiful carriage drives through the most interesting part of the park bring out many fine equipages on pleasant days, which add materially to the vivacity of the scene. The carriage entrance to the park is guarded by two heavy brick pillars.

Five years ago the amusement privileges of Ross Park were leased to the Binghamton Railroad Company, and it is now provided with all varieties of outdoor recreations, refreshment stands, merry-go-rounds, and similar innocent pleasures. One of the prominent diversions is a switch-back, represented in our engraving. Besides these material ministrations, the æsthetic nature is served with music "from gay to grave, from lively to severe," on every afternoon and evening of the week, with a more pretentious concert on Sunday afternoons. The best of order is preserved upon the grounds and upon the cars which land the greater number of visitors at the park gates.

The records show that during the season, which begins about May 15, never less than 1,000 people a day fre-

quent the park, and upon a large number of special occasions 20,000 have gathered there. The average attendance is 3,000.

The surrounding towns and villages bring in large numbers of picnickers, so that excursions into Binghamton always augment the park attendance.

The present general manager of the Binghamton Railroad Company and the Park Amusement Company is J. P. E. Clark, whose portrait we are glad to present to our readers. Mr. Clark is a young man of boundless energy, great executive ability and business tact. He was born at Troy, N. Y., in 1858, and has been engaged in his present function five years. The other officers of the company are: G. T. Rogers, president, and John B. Rogers, treasurer, both gentlemen of business ability and enterprise, as their

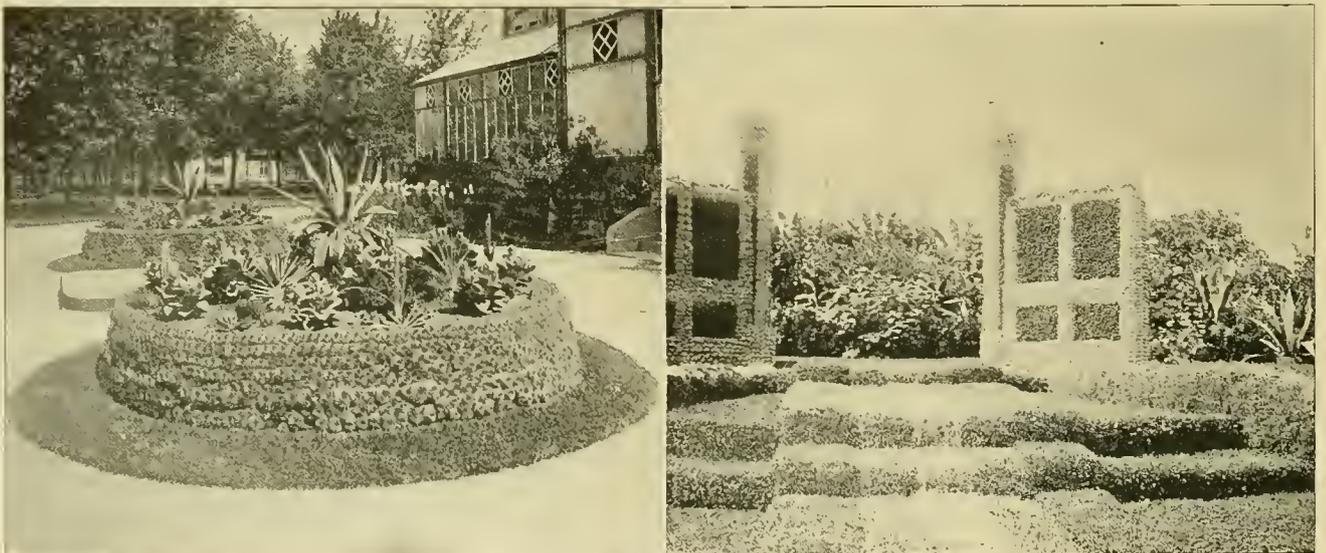

excellent street railway system attests.

J. P. E. CLARK.

#### WASHINGTON PARK, CHICAGO.

While Lincoln Park on the North Side is the most pretentious of Chicago's breathing spaces, Washington Park at Fifty-fifth street on the South Side has many attendants on Sundays, evenings and holidays. The

WASHINGTON PARK, CHICAGO—SEEN FROM CITY RAILWAY CABLE LINE.

landscape gardening of the South park system is all that can be desired, both as regards quantity and quality. The artificial ponds, the trees and most of all the magnificent parterres give the eye and mind the greatest pleasures. Several notable works of art are observable at Washington Park, namely, the flower clock in the form of a sun dial and the gates ajar.

The Sunday, evening and holiday traffic on the various lines of the Chicago City Railway is largely augmented during the summer by these attractions.

THE Calcutta, India, tramways, show a credit balance of \$34,865 for 1893, and a dividend of 2 per cent. was recommended.

### THE SITUATION IN DETROIT.

Readers of the REVIEW have from time to time been informed of the progress, or rather lack of progress, in the street railway controversy in Detroit. We have also shown what an unreasonable and personally prejudiced mayor can do in the prevention of official power. Mayor Pingree has personally prevented Detroit from securing the advantages and enhanced real estate values which the intended construction of additional electric lines would have made possible long months since. We cannot better portray the present situation than to quote an editorial in a recent issue of the Detroit News, which, under the heading "A Severe Blow to Detroit," reads as follows:

"For three years the people of the city of Detroit have been engaged in a calamitous litigation affecting the title to the street railway properties in this city. That litigation has been conducted with the view simple to secure to the people the benefit of lower street railway fares than they had hitherto and do now enjoy. It was started at a time when the city was in the enjoyment of the lowest street railway fares that are afforded in any city in the United States. For two years and a half of this period there was absolutely no bona fide proposal received from responsible capital to undertake the purchase and operation of the properties involved in the controversy. Within the past six months negotiations were begun in good faith, looking to the settlement of the question upon terms that were vastly more favorable than any sober-minded citizen of Detroit had ventured to hope for when the litigation was commenced. These negotiations culminated in a proposal from a competent representative of abundant capital, to give the city the terms it was seeking and to immediately begin the reconstruction of the properties for the introduction of mechanical motive power, provided the new arrangement as to fares should be postponed for the period of thirty months. The acceptance of these proposals was delayed until the federal court, which was considering the equities of the city's case, had heard the argument on the matter and had indicated, apparently, its opinion that the city was in the wrong in its contentions. So far as the decision of that court can be anticipated it is going to be adverse to the city.

Even the prospect of such a decision did not shake the purpose of the gentlemen who were offering these terms. They were still willing to treat. From being a proponent of settlement the mayor suddenly became its adversary. In an official communication to the council he charged fraud to the representatives of the new capital; men whom he had himself invited into the controversy, who met his terms, who agreed to take an ordinance more generous to the city than he had himself put into writing and insisted that the council should pass, and whose negotiations, so far as the public is informed, were almost wholly with him and with his coterie. This declaration has been followed by a new step. The capitalists whom he introduced to the deal have purchased the railway properties and withdrawn all their offers of cheap fares. They are content with the present ordinance. The city must offer hereafter. They will not ask. With the prospective decision of the court they have the upper hand. With many franchises running from five to nine years, they can afford to wait. No one else can get in until the town regains its reason.

This is a sorrowful outcome of what promised to be a most favorable settlement. By dint of denunciation for fraud, Hazen S. Pingree has driven away the negotiators, while they in the meantime have purchased the property and will proceed to bide their time. He has put the employment of the idle labor of this town out of the question for the present year.

The spirit which Hazen S. Pingree, George Beck, Charles H. Buhner, John C. Bleil and Walter H. Coots displayed in this unhappily ended negotiation is not the spirit that has built up this town. It is not the spirit of Joy, of McMillan, of Dwyer, of O'Brien, of Schmidt, of Scotten, or of any of the great builders of whom the town is proud. The town must bide its day to rebuke it, unfortunately all too long, but when it does rebuke, it should make its sentiments plain and incapable of equivocal interpretation."

### HANDLING HALF FARES.

How to take care of half fares so as to prevent knocking down by conductors, is a troublesome question. In fact, the roads that are not troubled with the half fare system may consider themselves very fortunate. Probably the majority of roads make a practice of having the conductors ring up half fares as full fares, making a separate account of the half fares received in their daily report. With this system there is always of course plenty of chance for dishonesty. However, by comparing runs and averaging up, an approximate check can be put on the men. J. F. Lardner, secretary of the Davenport & Rock Island Railway, says that they have very little trouble in keeping returns fairly correct in this way: They sell children's 10-ride tickets for 25 cents. These are punched but not rung up by the conductors. When children's fares are paid in cash they are three cents.

The Omaha Railway sells 15 children's tickets for 50 cents. They are rung up as full fares, but have never

been extensive enough to bother Secretary Goodrich much.

About the best plan that has appeared yet is that used by the Pueblo City Railway, for the particulars of which we are indebted to Superintendent W. A. Martin. Cash half fares are sold in the shape of tickets good for two rides. For the first ride the conductor simply punches the ticket. For the second he takes it up and rings up a fare. A 20-ride commutation ticket is also sold for 50 cents, which is punched by the conductor without ringing up a fare. In this system there is no chance for dishonesty, other than the orthodox kind of failing to ring fares. Each ring on the register calls for a full fare. The round trip ticket is based on the same principle as similar tickets on steam roads.

### A TALL CHIMNEY AT TORONTO.

The Toronto Railway now claims the tallest chimney in Canada. It is 250 feet high and has been building since March of this year. Excavations were made to the depth of 18 feet, at which point solid rock was struck. The concrete foundation, 40 feet square, was built on this. The foundation was tapered up until it stood 24 feet

TALLEST CHIMNEY IN CANADA.

square at the surface of the ground and the chimney proper was then begun. The first 50 feet of the chimney is square. The top is capped with cast iron and is 18 feet 3 inches in diameter. The inside diameter of the chimney is 12 feet. Up to a height of 75 feet there is a special cavity lined with fire brick. A ladder made of U shaped irons runs clear to the top. The ends of these irons are anchored in the brick. It is intended that the ascent shall be made inside the ladder. The chimney is designed to carry smoke from 10,000 horse-power of boilers. Its building was superintended by Jas. Hill, of Toronto.

THE first section of the Douglas & Laxey Coast electric tramway was commissioned May 10.

### INDIANA'S NEW LINE.

J. J. Burns, of Chicago, has purchased of Hatch & Chadwick, the street railway of Goshen, Ind., and franchises in Elkhart county, Ind. Mr. Burns has also purchased the Elkhart Street Railway, of Elkhart, and organized the Indiana Electric Railway Company, of which he is president and general manager, and to which he will soon transfer all of the property above mentioned.

It is Mr. Burns' intention to complete the now partly constructed line in Goshen, and to rebuild and re-equip the Elkhart line. The contract for this work has been let to W. W. Hatch, of Kankakee, Ill., who will commence the work as soon as the material can be gotten on the ground. The rails have already been bought and are now being shipped by the Illinois Steel Company.

The track in Goshen, constructed last summer by Hatch & Chadwick, is of the most improved type. Mr. Burns realizes the importance of first-class construction and the use of the latest appliances, and it is his intention to make this system one of the best in the state.

### THAT IDEAL METHOD.

The daily papers of Boston and other cities, with the advantages of rapid surface transit, can not cease from the wail for elevated railways. "They are ideal," say the papers.

New York citizens, however, seem to be of another mind, and as they have had experience with both methods their opinions are worth something at least. The test of transit is the using, and by that test we judge. A recent report from New York says that train after train has been taken off by the Manhattan elevated. The last great reduction was the cessation of seven trains on the Third avenue branch. The size of the trains is also reduced. This makes a total of fourteen trains and denotes a serious loss of traffic. The total loss of passengers is said to have amounted to 52,000 a day, while on the contrary the cable cars are crowded and the patrons seem satisfied that their progress is just as fast and the trains more available. In Brooklyn the same holds good, as an article in a recent REVIEW stated. Verily, Philadelphia and Boston will do well to "let well enough alone" and not sigh for some enterprising citizen to enter into losing competition with popular and sufficient surface rapid transit.

BETTER THE LATTER.—The wealthy uncle was talking over the prospects of his nephew with the lad's mother.

"How is he doing in his studies?"

"Very well. He is very accomplished. He shows great talent for music, and his manner is so haughty, his music teacher thinks he will become a conductor."

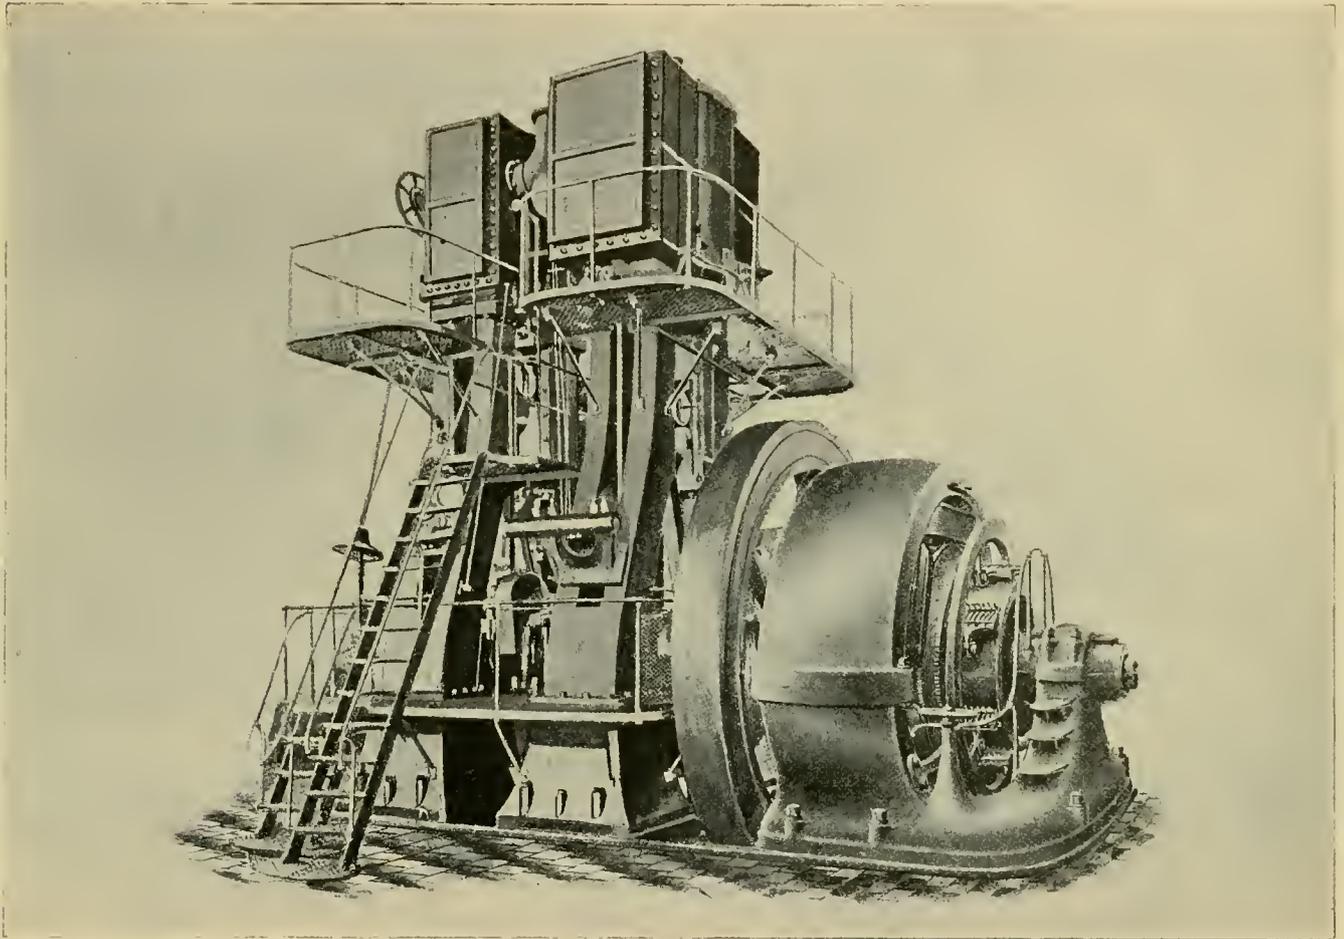

"Ah, indeed! Orchestra or tramcar?"

—Tit-Bits.

### THE LARGE WALKER GENERATORS.

Dynamo design is by no means as uncertain an operation as it was a few years ago. The properties which go to make the success of machines of this class are now well known, and the large direct current generators of the Walker Manufacturing Company are designed with an aim to combine all those features. The frames of these machines are cast in only two pieces, except on the larger sizes. The upper half is the yoke with the poles and the lower half the same with the base and bearing

combination of mica and a fibrous material. The armature when running has a strong current of air circulating through it. The slots are such shape that no binding wires are required. The bearings are unusually long and the shaft is also larger than is customary. The field coils are machine wound and waterproof covered. The shunt and series coils are on independent spools. The field cores are laminated iron cast in the yoke. Machines can be over compounded to any amount up to 20 per cent. The bearings are ball and socket, self oiling.

THE WALKER DIRECT-CONNECTED RAILWAY GENERATOR.

standards. The armature is of proportionally large diameter and is of low resistance, with ample cooling surface. It will temporarily stand an overload of 50 per cent without injury or sparking. It is a slotted drum built up from the best quality of annealed iron. The plates are annealed a second time after being punched, and are insulated with a thin coating of enamel. They are compressed into a solid core by a hydraulic pressure of 100 tons. In the smaller machines the windings consist of heavy copper wires, so arranged that none cross within an inch of each other. There are no joints except at the commutator. In the larger machines flat bars are used. The winding is two-path. The insulation is a

W. E. MUIR, formerly of the Point Defiance, Tacoma & Edison Railway, and now general manager of the Hammond, Whiting & East Chicago Electric Railway, reports the road to be doing remarkably well and paying all operating expenses and fixed charges. The line was but recently taken out of the hands of a receiver. A 300-horse-power Corliss engine and generator will soon be added to the station, and the unexpectedly large traffic can then be better taken care of. The completion of the line to the terminus of the South Chicago City Railway was an important step and showed conclusively that the road was destined to become a large and important system.

### THE BARMEN ELECTRIC RACK RAILWAY.

The well known centers of German industry, Barmen and Elberfeld, are surrounded by magnificent natural scenery, forest clad hills and highland. For many years, however, it has been a difficult proceeding to enjoy these natural advantages on account of the lack of proper cheap transportation. Gravity railways and steam rack roads were out of the question, and the inhabitants had about settled back to await the advent of flying machines when the enterprising electrical firm of Siemens & Halske came forward with a proposition for an electrical

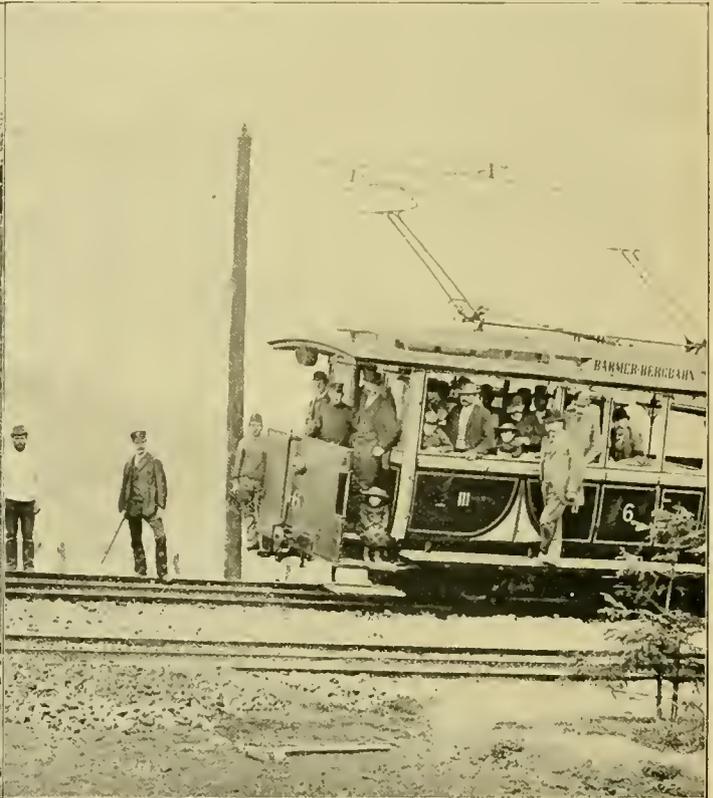

The upper terminus is near the Toelle Tower on the summit. This we show in the distance in our engraving. Here, also, it connects with a narrow gauge steam line, which in turn connects with another railroad leading to numerous popular resorts.

The total length of the line is one mile and the total rise is 550 feet. The mean grade is thus ten per cent with ascents as steep as 1 in 5.4 meters and 1 in 7.2. The curves are all of long radius, the sharpest measuring 500 feet. Besides the termini there are two intermediate stops.

The gauge of the track is 39.36 inches and the line is

ON THE LINE, SHOWING TRACK AND RACK—BARMEN.

TROLLEY FRAME DEVICE—BARMEN.

rack railway, which was accepted by the Barmen Mountain Railway Company.

The difficulties of the situation will be readily appreciated by a glance at the profile of the proposed line, the grades of which are totally prohibitive of ordinary methods.

The line begins in the center of Barmen, at a terminal station on the Cleferstrasse. Immediately on emerging from a car barn the cars cross the right of way of the Bergisch-Markische State Railway, on an iron bridge of 65-foot span, 30 feet wide. From the bridge the line passes into Kampstrasse on the level. Then it ascends the steep grade of Luisenstrasse, which rises one in five and four-tenths. The line crosses in this route the Gewerbschulstrasse and also the Lichtenplatzerstrasse on the level and then enters the forest at the top of the hill.

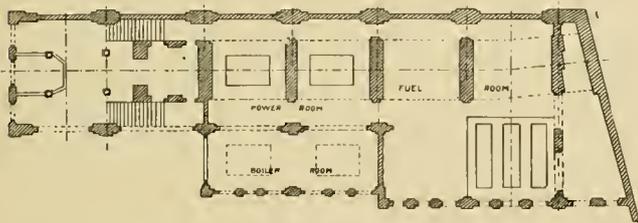

double tracked. The rack rail is centered between the track rails. It is of the Riggerbach pattern with  $3\frac{1}{2}$  inch teeth pitched 3 inches apart; each section is 10 feet long. The track rail is flat, except at street intersections. The rails are bedded on iron ties, spaced 40 inches from center to center, and to prevent sliding on the steep grades they are secured to foot plates the entire length, and the ties at intervals of 50 or 60 yards are anchored to concrete foundations.

The cars are 26 feet over all and are divided into four compartments. The inner two being entered from the side, as with ordinary European steam cars, while the outer two are approached by platforms, as in American practice. The two axles of each car are provided with toothed gears that mesh with the rack. Two thirty-six-horse-power motors are attached to each axle. Beside

the ordinary hand brake, an automatic device brakes the car when it exceeds 6 feet per second velocity. The idea is that of a powerful, stretched spring, which is released by a centrifugal governor which throws on the brake at once. A friction safety brake is also in vogue. This

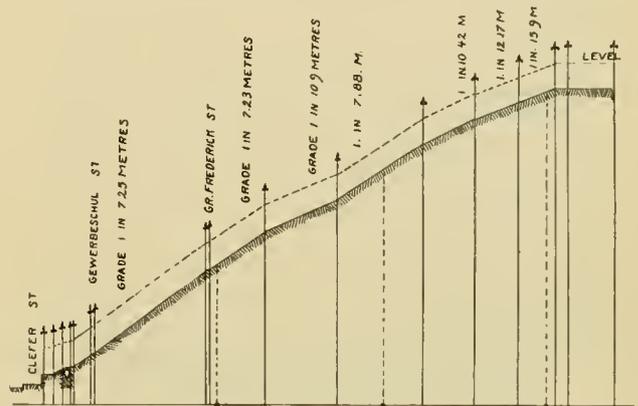

boilers, with a total heating surface of 1,800 square feet each supply steam at 140 pounds pressure. One is held always in reserve. The station is constructed with a capacity of triplicating the plant when it shall become necessary. Two city electric railway lines will be operated from this plant at no very distant future time, besides which the station will supply power for light and factory purposes in Barmen.

At the Barmen terminal is an automatic transfer table operated electrically. The overhead construction is neatly and strongly arranged. The trolley wire is supported by side poles or from buildings, at a height of 16 feet above the ground. Steel tubular poles are used in the down town districts and wooden poles in outlying

places. The trolley contact is of a unique style, as shown in the engraving. It consists of two oblong metal frames, producing a positive sliding contact. These are mounted on the car roof in a similar manner to our trolley poles, and are considered efficient and durable. Besides its merits as an electrical plant of high order, the Barmen Mountain Railway has an unique fame as the only electrical rack railway in the world, and the Siemens & Halske Company has every reason to be pleased with its successful operation.

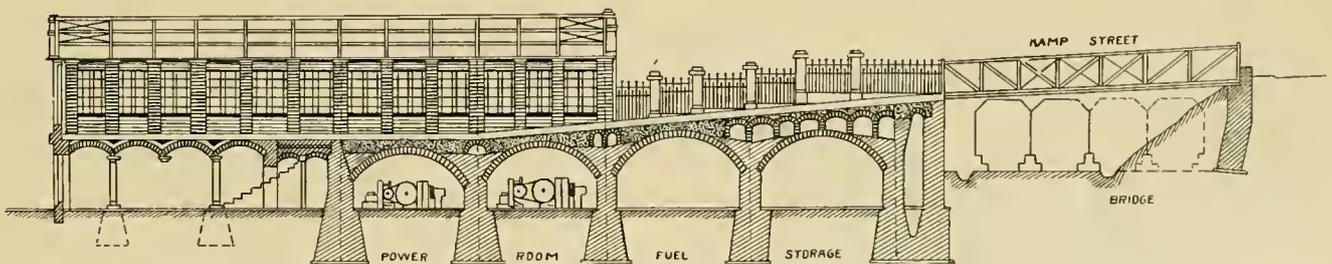

The engravings we are enabled to present by kindness of the Chicago representative of the Siemens & Halske interests in America.

ated underneath the platforms and rails, see engraving. Here are two compound, condensing steam engines, running at 165 r. p. m., driving Siemens generators direct. The engines are of 250-horse-power. Three water tube

The Kansas City Railway Company, Kansas City, Mo., has an elegant summer resort called Washington Park. A bathing beach and a dancing pavilion are among the attractions.

## TRANSFERS ON THE CHICAGO CITY RAILWAY.

If all the troubles that transfers give to the street railway manager could be written in a book, the volume would be a big one and the story therein calculated to draw tears from a wooden Indian.

Leon Jewell, the superintendent of time tables for the Chicago City Railway, is the man on that system who wrestles with the transfer and pass problem, and just recently he has put in force a new style of transfer, a few specimens of which we represent.

On the Chicago City Railway there are 75 points of transference of passengers, besides which emergency and car to car exigencies call for special rules.

The transfers and rules are all printed by the company

ods of the transferring conductor and the care to be exercised by him to protect the company's interest from any unscrupulous individual who might wish to do fraud, are such as are suggested universally in similar cases. These are arranged in a small book of 40 pages, convenient for the vest pocket, and no excuse is allowed for ignorance of them on the part of the conductor.

In case of dispute as to lapsed transfers, if there exists any doubt in the mind of the conductor that the issuing conductor might have made an error, he shall take the passenger's name and address, save out the challenged transfer, and report the whole proceeding to the office.

The book also contains the official time tables of the first and last cars and the leaving time of all night cars on the system.

It was a heavy duty to rearrange this great transfer system, and Mr. Jewell is to be congratulated upon the efficiency of the work.

## THE LIGHT THAT FAILED.

As we have so often had occasion to remark, it is the little details of management that go to make a perfect, popular system. Good cars, good track, good motive power and polite employes are necessary, but not a few, having qualified in these respects, fail to carry the good work to out its completeness.

Cars should not only be sufficiently light that the conductor may be able to determine a counterfeit ten dollar bill from a lead nickel, but should enable passengers to read, and read with comfort and without endangering their eyesight. On this point the New York World forcibly comments as follows:

"The Broadway cable cars are so well lighted at night that passengers can read their newspapers with ease and comfort.

The cars of the elevated railroad company are so dimly lighted that most people cannot read at all in them, while those who do must secure particular seats and subject their specially good eyes to a dangerous strain.

That it also diverts thousands of passengers from the elevated to the surface lines is certain. If the managers doubt this they will find the fact unmistakably recorded in their own traffic reports and those of the better surface lines. Their own reports show a considerable loss of traffic during the last three months, while those of the Broadway road exhibit a marked gain. There can be no doubt that between Forty-second street and the City Hall the great majority of passengers to whom a choice between these two lines is open choose the cable cars.

Thus the lack of proper illumination is costing the elevated people really more than the proper lighting would. If the company were under control of an alert and judicious business man this consideration alone would be conclusive. But the elevated roads are under control of two men, one of whom is too old, the other too young, and both too stingy to look favorably upon improvements that cost money.

on its own press and at its own printing office, an institution that has been of very great service in the economy of the plant and management. This printing office was first established by the editor of the REVIEW, then secretary of the company. Here, also, are printed general orders, maps, and other reading matter used by the company.

On one transfer slip the word "cash" will be noticed. This denotes the fact that a second transfer may be issued from it, same as a cash fare.

The great number of transfer points necessitates special rules for the guidance of conductors as to time and place of transfer. These, of course, are governed by local conditions and are not therefore of general interest enough to recapitulate. The general rules governing the meth-

LEAVENWORTH'S LINE.

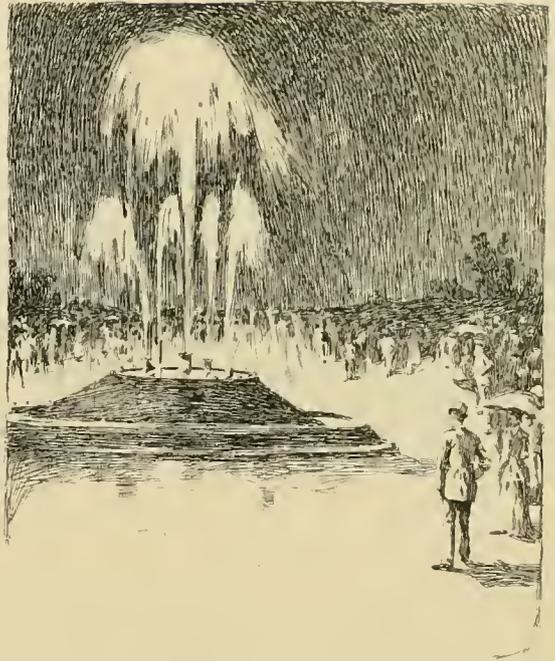

The Paying Electric Railway of Historic Leavenworth—Salt Sea Baths of an Inland Town—The Men Who Made the Line.

On the afternoon of July 18, a distinguished party of the honored citizens of Leavenworth, Kas., gathered at Tanner's park, in that city, to participate in the ceremony of driving the golden spike that denoted the completion of the Leavenworth Electric Railway. They also incidentally paid their respects to the promoters and builders of the line, the brothers, Newman and Louis M. Erb, who, in the face of opposition, discouragement and difficulty, have succeeded in putting into operation one of the most complete of western electric railway systems.

Sixty-seven years ago, when Col. Leavenworth selected the site for the outposts of civilization, he showed both his appreciation of natural advantages as well as a deep consideration for posterity, by settling his troops on the Missouri river, in a high and healthful land, of commanding position. Besides its strategic value and the fertility of the soil, the place was directly in the line of all the plains traffic.

Since that time some 22,000 other people have considered Leavenworth as the only place worth living in, and its population has enjoyed, as time has progressed, all the latest and best things, æsthetic and physical, except one, and that the Erb brothers have supplied to a queen's taste.

Eleven years ago, Tom Stivers secured a franchise for a horse line, and, enterprising man that he was, bonded the two strips of rails and a few bobtail cars for four times their most extravagant valuation. The result was ruin and gnashing of teeth to the bondholders, annoyance to the citizens and detriment to the town. Six years

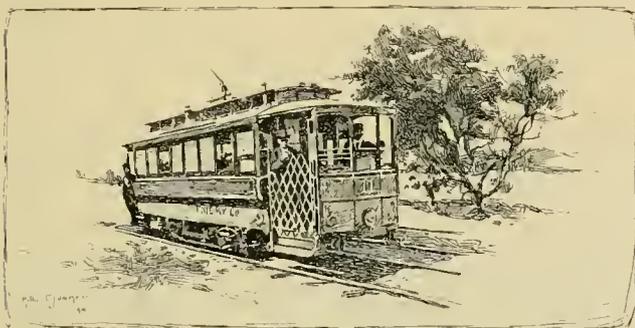

THE ELECTRIC FOUNTAIN.

secretary and treasurer, J. P. Edrington; general manager, Louis M. Erb. The line includes thirteen miles of track of standard gauge, with maximum grades of three per cent. The rail, with the exception of one mile of Johnson girder, is 60-pound Illinois Steel Company's T. The road-bed is substantial and well constructed.

The rolling stock consists of eighteen handsome cars, made by Stephenson, of New York, and the American Car Company, of St. Louis. All cars have 5-foot platforms, 20-foot bodies and are thirty feet over all. Our engraving shows a representative car, and it goes without saying, that the two companies named as builders never put out anything but first-class vehicles. The trucks were made by the Peckham Motor Truck and Wheel Company, which fact insures all Leavenworthians an easy, joltless ride. Two 25-horse-power General Electric motors are under each car.

The power station is 50x150 feet in dimensions and contains two engines, one a 200 horse-power, made by the Ball Engine Company, of Erie, Pa., and one 400,

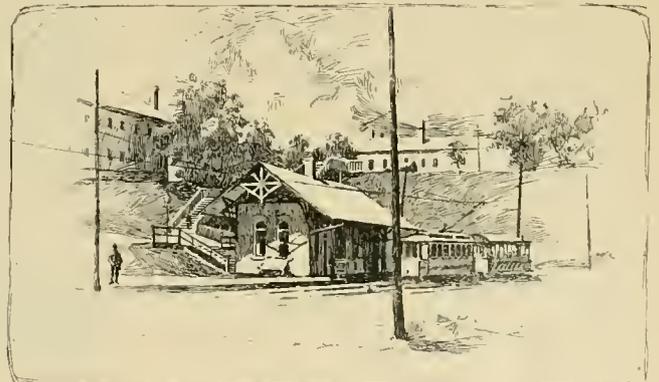

VESTIBULED CAR.

ago a dummy line was built to the fort, which is very close to the town, but the service was neither pleasant nor profitable. Then an affable young man came forward with a compressed air scheme, which finally collapsed for lack of wind, and the dummy line and horse line went into the receiver's hands—Newman Erb.

Mr. Erb, after considerable difficulty, obtained a fair and honorable franchise, and the result is told in the story of the golden spike and the plaudits of the citizens.

The company was reorganized July 1, 1894, with the following officers: President, Newman Erb, New York;

STREET CAR DEPOT.

KEELEY GRADUATES PARADE.

built at Sioux City. Both do excellent service. Six boilers, aggregating 750 horse-power, furnish steam. They bear the name plate of S. Freeman & Sons, Racine, Wis. Berryman's feed water heaters are in vogue and four General Electric dynamos, aggregating 425 horse-power, complete the list of the standard equipment of this excellent station.

#### THE TRAFFIC.

Leavenworth city, as has been stated, has a population of 22,000, and a progressive and liberal population it is. Besides this, directly north of the city and connected with it by the electric service, is the military reservation, which contains nearly 7,000 acres of beautifully improved land and a contingent of two thousand or more United States regular soldiers. The buildings on the reservation are all substantial stone structures. The fort, as it is popularly called, is also an important military school and hospital. There are a number of important buildings on the reservation, and a magnificent statue of the late General Grant. The fort also contains an additional 1,000 men, who do not ride on the street cars, for why, they are incarcerated in the military prison. These are employed in making shoes, brooms, etc., and in working upon the grounds. Leavenworth owes much prestige to the fort, as well as considerable commercial benefit.

On the south of the city, also connected with the railway system, is the western branch of the National Soldiers' Home. An average of 2,500 veterans of the civil war are here maintained. The old soldiers work or play, as they choose, and have much greater latitude than the contingent at the fort, so that the street railway profits considerably by their excursions down town. One of the interesting incidents of the home's life is the parade of the Keeley cure brigade. These are headed by Col. Smith, the governor of the home, who is also a Keeleyite. The

grounds and surroundings of the veterans' last home are exceedingly beautiful, while the buildings are tasteful and commodious. Lake Jeannette, on the grounds, is a beautiful little sheet of water, and General Manager Erb has added to the grounds a modern electric fountain, a sketch of which we show. It is the only specimen of this kind of work in that section of the country, and besides ministering to the veterans' pleasure, is the object of many pilgrimages of the townspeople to the home. Thus the resorts afforded by national enterprise are the fort and the home. The fort's dress parade, every evening, with band concerts in fine weather, is a very profitable affair for the street railway company, as well as a constant delight to the citizens, while after night the electric fountain is always sure of a large number of visitors. The cost of the fountain to the railway company was \$15,000, and Mr. Erb's generosity is greatly appreciated by the people in general and the inmates of the home in particular.

As a commercial point the

#### CITY OF LEAVENWORTH

has considerable importance on account of the cheap coal found in the vicinity. This makes it naturally a desirable manufacturing point. The main establishments are stove works, bridge works, wagon and buggy factories, linseed oil mills, flour mills, machine works and brick yards. In relation to the latter it may be said that their quality is excellent for all purposes and the city paving is mainly done in brick. The town is surrounded by hills of fine limestone, which makes a strong impression upon the architecture of the city and gives opportunity for local architects to express their ideas with greater fullness than is possible to their brethren of less favored places.

The coal wealth of the city employs 1,100 men in five different mines, and no doubt further developments will greatly increase the importance of the Leavenworth coal fields.

It is to one of the coal mine shafts that the street rail-

U. S. TROOPS ON PARADE.

INTERIOR OF NATATORIUM.

way is accidentally indebted for an absolutely unique method of inducing travel.

It had been noticed ever since the beginning of mining operations in Leavenworth that the coal diggers and others employed in the mines had immunity from rheumatism. An investigation of the matter by physicians and chemists showed that the cause was undoubtedly the presence of salt water in the mines, mixed, as is natural under these circumstances, with other mineral substances of therapeutic virtue. In one shaft the flow of salt water was so great as to require a large pump to keep the mine in condition to be operated.

The idea of utilizing this wealth of mineral water as a bath was often thought of, but its distance from the city made it impossible for the great majority of the citizens to derive benefit from the healing flow.

When the electric railway became assured, however, the Leavenworth Coal Company took immediate steps to improve the facilities for bathing, and erected a bathing pavilion of the form shown in our engraving. The cars come within a thousand feet of the building, and a broad walk leads to the natatorium door. The interior of the natatorium is shown in our engraving. The pool is 25x

retiring rooms and shower baths are provided for the comfort of patrons. The shower bath is as essential as at Salt Lake, since the Leavenworth bath contains only five per cent less salt than that water, and sulphur and other minerals in solution added to the salt. Four large arc lamps light the pool and a springboard is provided for the use of the lovers of aquatic ground and lofty tumbling. Hanging rings and a traveling crane arrangement are at the disposal of the timid bathers who wish to learn to swim. The traveling crane runs north and south the length of the tank and has suspended from it a leather loop for the support of the learner. Competent attendants and special watchmen guard the safety and morale of the place. The pumps which raise the water from the mine shaft to the pool have a flow of 28,000 gallons a day.

The curative powers of the water act upon rheumatic and dermatic diseases, as well as upon lesser affections of humanity in general.

As many as four hundred persons a day patronize the natatorium, and the success of the enterprise has already prompted the promoters to double the capacity of the tank, to accommodate the increased number of visitors. The

NATATORIUM—EXTERIOR VIEW.

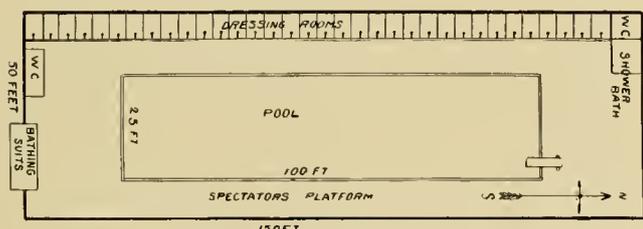

cost of the present plant is \$5,000, upon which sum a handsome profit has been realized by the nominal charges for the privilege of the place. The street railway company owns no stock in the natatorium, but reaps sufficient profit from the traffic thereto induced.

THE ERB BROTHERS.

The account of the success of the Leavenworth Electric Railway would not be complete without particular mention of the two gentlemen through whose financial strength and business foresight it has been made possible.

President Newman Erb is a prominent New York capitalist, interested in a number of other successful western enterprises. He is a fine judge of properties and a sound man in every respect.

General Manager Louis M. Erb, to whom the town of Leavenworth is directly indebted for its fine electric railway system, is a man of ripe railroad experience, having passed eleven years as general claim agent and tax commissioner for the Kansas City, Wyandotte & Northwestern, and in the claim department of the Southern Pacific Railroad.

PLAN OF NATATORIUM.

100 feet in dimensions and slopes down to a depth of seven feet six inches. At the south end, near the entrance, is a bathing suit booth, where these useful and necessary garments may be obtained for a trifling sum. On the west side of the pool are ranged thirty-four dressing rooms, each lighted by an incandescent lamp. Opposite the dressing rooms, on the east side of the pool, is a spectator's gallery and railing. The necessary closets and

Mr. Erb is a native Kansan, having been born at Eudora, forty miles from Kansas City. He is apparently about thirty-five years of age, of a thoroughly business make up, affable, courteous and obliging. He is a tremendously energetic worker and capable of carrying any affair through seemingly insurmountable difficulties. Mr. Erb built the thirteen and one-half miles of his electric railway

NEWMAN ERB,  
President.

LOUIS M. ERB,  
General Manager.

in three months and made it one of the most substantial roadbeds in the west. En route he passed through three and one-half miles of concrete paving. Mr. Erb has every confidence in the future of Leavenworth and the city is to be congratulated on having for the manager of its rapid transit system so progressive and thoroughly alive man as Mr. Erb.

THE DEADLY LIGHTNING.

A government publication places the deaths by lightning in the United States for 1893 at 209 and in 1892 at 251. In the eight years to 1893, 3,516 fires were caused by lightning. In Massachusetts the following tabulation shows the year, number killed by lightning, and the fires from the same cause:

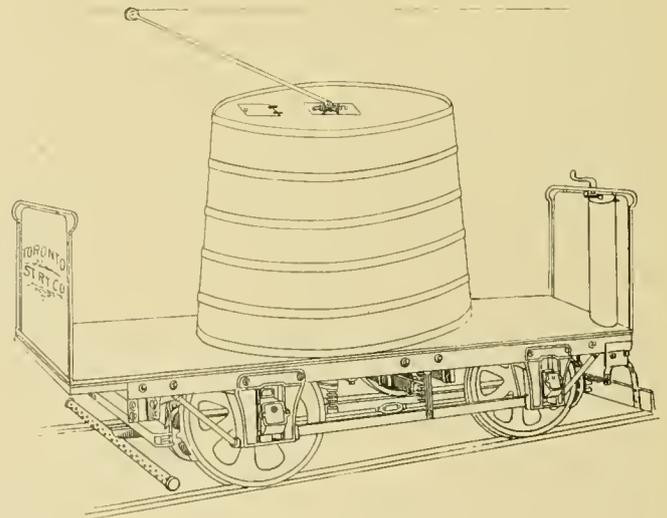

| Year. | No. Killed. | Fires Caused. | Year. | No. Killed. | Fires Caused. | Year. | No. Killed. | Fires Caused. |
|-------|-------------|---------------|-------|-------------|---------------|-------|-------------|---------------|
| 1892  | 10          | 65            | 1891  | —           | 31            | 1890  | 6           | 45            |
| 1889  | 4           | 25            | 1888  | 3           | 42            | 1887  | 1           | 47            |
| 1886  | 7           | 28            | 1885  | 4           | 37            | 1884  | 3           | 29            |

It will thus be seen that although the number of deaths and fires by lightning has not decreased, there seems to be no regular increment of the danger. In 1884 there were three deaths and 29 fires, in 1887 one death and 47 fires, while in 1891 there were no deaths, but 31 fires. We do not argue that these figures prove absolutely the fact, but they tend to disprove the assertion that the increased mileage of electric street railways' wires and tracks is responsible for the lightning that from time to time kills cows and ignites haystacks many miles from an electric railway track.

The year 1893 was singularly free from destruction of life and property by fire, although the official reports have not yet been published. It seems therefore that the ancient superstition relative to the conductivity of rails and wires as a path for thunderstorms must pass it into the limbo of exploded popular opinions, where may be found the deadly trolley fabrication and the car starter idea.

STREET RAILWAY SPRINKLING AGAIN.

Each season sees an increase in the number of companies which follow the excellent practice of running a sprinkling car. It not only helps the power station, but helps the pocket book, if the property holders along the route do their share toward paying for the comfort of having a dustless street. The Toronto Railway Company is in the business this season with three sprinklers built in the company's barns. They have tanks holding from 2,800 to 3,000 gallons of water, and when filled will sprinkle about ten miles of single track without refilling. At first the sprinkler was arranged to sprinkle both tracks at once, but it was found that in the down town sections where the headway of the cars is in some instances 15 seconds or less, it was necessary to shut off when passing motors on the opposite track, which left dry spots every few feet. Now only one track is sprinkled at a time, and it does the work better and is not much more expensive, for although the mileage is doubled, the increased speed which can be made when sprinkling one track almost makes up the difference. The city gives the water free, and has made arrangements for filling by placing large hydrants at the ends of the street railway

THE TORONTO SPRINKLER.

lines. The tank can be filled from these in about five minutes. The sprinklers do not impede ordinary traffic much, as they start in ahead of the regular passenger cars at the ends of the lines.

There are over 80 miles of track to sprinkle at present, and 65 cents a mile per day is received from the property owners along the lines for the service of four sprinklings a day. The width of street sprinkled is 16½ feet. The one sprinkler which was in use before the two others were finished ran from 150 to 160 miles per day and made a gross income of \$25 per day.

At Champaign, Ill., a sprinkler is also in use by the street railway, and it has proved to be very popular with the public

The Chicago City Railway has for a number of years made a practice of sprinkling parts of its cable lines with

tanks hitched on behind trailers on the regular cable trains. They sprinkle only about 6 inches outside of the rails of a single track. One man constitutes the crew, his principal duty being to shut off the water when the train stops for passengers.

---

### TRANSPORTING FIRE APPARATUS ON ELECTRIC RAILWAYS.

---

In our July issue, reference was made to the plan of George B. Grant, of Lynn, Mass., for carrying fire brigades and apparatus on electric lines. While at first the plan would seem very limited in application, it appears very much more important when it is understood under what local conditions it is proposed to inaugurate the scheme.

That part of Massachusetts surrounding Boston is very thickly populated and the numerous small towns are all connected by the electric railway, making communication very easy. Very often a fire will get beyond the control of the department of one of these municipalities and aid is asked from adjoining towns. For example, Lynn is about ten miles from Boston, and whenever a company is called from Lynn to aid some brigade in the outlying districts of Boston, four or more horses are sent with an engine and a like number with the hose carriage. The men, with the exception of the driver, are sent on a train. Sometimes they can catch a train that enables them to reach their apparatus at a favorable time, but very often they do not. Salem, Mass., has a car on the steam road ready at all times for out-of-town calls. It has usually so happened that whenever they are asked for assistance they have arrived at the city calling for help in good season, but have been unable to unload because they were side-tracked in some inconvenient place and had not their horses with them.

It is now plain with what advantage the electric road can be used in this service. With such a network of electric road as exists around Boston and will exist soon around all other large cities, it is possible to land fire apparatus within a very short distance from any large fire. Assistance is not asked until a fire has covered a territory near which there must be several electric lines. Wherever there is enough property to make a serious fire electric roads will be found. Mr. Grant's plan is to have a double truck car with a 3-inch plank floor laid on 8x8 stringers. The sides would be closed and the ends built so that when let down they would act as skids or inclined planes. When the car was wanted the horses could pull the engine on the car and the ends would be closed. At the destination the other end would be let down and the horses would be able to start immediately with the engine. The engine and horses would weigh about six tons. The car would need to be twenty-seven feet long, not including platforms at the ends. The car could be electrically equipped, but Mr. Grant's intention was to have this car towed by a motor car, in which the fire company would ride. This would keep the men

with the apparatus. A spur track could be run from the engine house to the street railroad and the car stored there.

The committee of the Lynn fire department, which considered the matter, decided against the idea on account of cost, liability to frighten horses and improbability of being able to make much faster time than with horses. The first reason will hardly hold water, in view of the simplicity of the car proposed. It certainly would not frighten horses more than an ordinary electric car or a fire engine on the street. As to speed there is no doubt but that better time could be made between villages with the car, unless some new breed of horses has been discovered that can haul an engine along a country road at twenty or thirty miles an hour. If a blockade occurs in crowded districts it is but the work of a moment to unload the engine and take it the rest of the way with the horses. Although Mr. Grant's scheme was not favorably received at its first proposal, it will probably ultimately be adopted in the end, as are all other good ideas.

---

### FAMILY OUTINGS.

---

The Citizens' Street Railway Company, of Muncie, Ind., advertises an unique method of inducing travel in connection with a resort. The daily papers bear the following notice: "The Citizens' Street Railway will give a family outing, Wednesday, July 11, at West Side Park. One fare, 5 cents, will take you from your homes and return; tickets good from 7 a. m. to 10 p. m. Children under two years of age carried free. The park is fitted with swings, row boats, seats and other improvements."

---

### A MEAN ADVANTAGE.

---

A young man and a young woman changed from a Belt Line to a Fourteenth street car at the avenue, Washington, and sat in one of the seats in the first car. He was carrying an overcoat and a satchel and was evidently going away. She wore a shirt waist and dark skirt, as if starting out on a shopping expedition. Just before they reached Sixth street he leaned over her and said quietly, so quietly that only the Post reporter back of them could hear: "I am going to kiss you good-by when I leave the car."

"Oh, please don't," she said appealingly; "not before all these people."

But he was decided and said persistently: "Yes, I shall; so raise your veil. If you try to resist people will see it and wonder about you, and they will look at you all the way up town after I get off."

She glanced up shyly and then slowly raised her veil. He bent over her and kissed her and no one in the car looked up. A few people wondered why she was so anxious to show the diamond ring on her left hand, but nobody but the reporter appreciated the fact that she was trying to justify the kissing by means of an engagement ring.

## STREET RAILROADING IN THE

## EARLY DAYS

There is one serious objection to history, from a newspaper standpoint. Nobody can make history out of the whole cloth and have humanity hold any great respect for his understanding for any length of time. History is unfortunately a matter of growth, and it can not be hastened by artificial methods. Hence, heretofore, history as applied to street railways, would have been only a description of contemporaneous events, not history in the proper acceptance of the term. Street railways have not, until within the last few years, been capable of producing a history of themselves. Events, however, of the past six years, and notably of the last four annual cycles, have made it possible to relate stories of "ye olden tyme," of those blissful, happy, even days of horse cars, when street railway men were known as "hoss-car drivers," and "passengers per oat-power" was a jibe of the daily press.

*Tempora mutantur et nos mutamur in illis.*

Street railroad men are now known as rapid transit magnates, commanders of the destinies of cities and the inhabitants thereof, street railway bonds are quoted in Wall street, and the real estate individual seeks upon his bended knees the favor of a word as to where "that new line is to run." Poetic retribution has come upon the daily press, and the playful remarks as to oats and hay have become an unearthly howl against the "octopus," accompanied by an itching palm for one-dollar-a-line locals and passes to "our young men."

So geht es weiter.

History of street railways has thus become a fact. Electricity and cable traction has wrought the change, and the last few years has seen the emancipation of "that noble animal, the horse," and the harnessing of the occult power of Steam, and its child Electricity, to the uses of mankind.

It will not therefore be uninteresting to trace in a few cities the rise of rapid transit, and place in a monument of type the glory of the early struggle of what the most eminent political economists declare to be the salvation of the centers of civilization, the cities, and the savior is rapid transit.

It is the purpose, therefore, of the REVIEW, from time to time to spread upon its pages the story of the fight for rapid transit against the ignorance of hoi polloi and the venality of the patres urbis.

The first that comes to our hand is the story of how

ROCHESTER, N. Y.,

fought its way from horse to electricity.

The beginning in Rochester was the organization of the Rochester City & Brighton Railroad Company, which was legally launched in June, 1862, to construct,

operate and maintain a street railroad in the city of Rochester, and with tracks out to Brighton, a small village, about two miles east of the city. It was, however, over twenty-five years later before the road was built to Brighton, and then by a different route than that originally intended. This was the result of an injunction obtained by Mr. John Craig, a property owner on the avenue leading out in that direction. The case of John Craig vs. The Rochester City & Brighton Railroad Company stands to-day as the law in certain cases where the line of the street is not mentioned as the boundary of the lot. At that time there was no law except the General Railroad act, under which a street railroad could be built. It was not until 1884 that the first street railway act was passed. The first officers of the company were Wm. Kidd, president; H. S. Allis, treasurer, and William F. Holmes, secretary. The stockholders were mainly residents of Rochester, but about one third of the capital invested was from New York City and vicinity. The original directors were: Wm. Kidd, H. S. Allis, Lewis Seyle, P. Berry, L. Ward Clarke, H. A. Palmer and Daniel Warner, of Rochester; Nelson Randall, of Homer, N. Y.; Edward R. Phelps, of New York City; Albert H. Hagar, of Brooklyn; John Butler, Jr., of Tarrytown, N. Y.; Thos. T. Davis, of Syracuse, and Thomas J. Barr of New York City.

Much difficulty was experienced in getting started and in the construction of the road, as at that time street cars were a new institution, and but few of the larger of the eastern cities had any street railways in operation.

After various trials and tribulations, and by dint of laying track on legal holidays and Sundays, to avoid injunction, nine miles of single track were laid by 1865.

The original capital stock of the road was \$200,000, with an issue of \$50,000 in bonds. The first mileage was laid by Tenbrook, Booth & Co., contractors, who took part of their pay in stocks and bonds. The receipts in 1865 amounted to \$53,000, with operating expenses at \$65,000. Its early history was similar to that in many other cities of that time, and in 1868, having defaulted on its interest and having so far proved a losing investment, the road was sold by the sheriff to C. B. Woodworth, for \$45,000. A new company was formed, and the road was reorganized completely and put upon a paying basis.

From 1865 to 1889 (when the road was sold to a syndicate of capitalists from Pittsburg, Philadelphia and New York), it was under the ownership and management of the same officers, with the exception of one or two years in the commencement, viz., Patrick Barry, president; C. B. Woodworth, treasurer; C. C. Woodworth secretary, and Thomas J. Brower, superintendent.

The system was operated by horses until 1890, when electric power was introduced, a proposition which had been under the consideration of the former owners.

During the earlier period, from 1862 to 1868, the operation of a street railroad was not the systematic matter of the present day, the result of long years of experience. With single tracks and turnouts, it was impossible to run very closely to schedule time, and the frequent delays destroyed the efficiency of the service. The era of improvement having begun, the matter of following it up with the increase and betterment was part of the spirit of electrical progress until, today, in the confines of the corporate name of the Rochester Railway Company, there are seventy-five miles of electric track, three hundred cars and a capitalization of \$5,000,000.

The secretary of the reorganized company, and a man foremost in the early development of electric traction, to whom we are indebted for the above facts, was

CHAUNCEY C. WOODWORTH,

whose ability has been rewarded with comfortable retirement and enjoyment of the fruits of his foresight and diligence.

Mr. Woodworth was born at Rochester in 1843, and has always been a loyal citizen of that city. He was graduated at old Williams in 1864 and entered business with his father immediately thereafter, until the connection alluded to previously with the Rochester City & Brighton Railroad Company.

As secretary of the corporation he remained twenty years in street railway work.

"I was one of the small number of street railway men," says Mr. Woodworth, "which went down to Boston some ten or twelve years ago and organized the American Street Railway Association. (It was thirteen years ago. The first meeting was held at Boston December 12, 1882.—ED.)

"The prime movers in forming the Association were: Messrs. Lettell, then of Louisville; Watson, of Buffalo; Cleminshaw, of Troy; George B. Kerper, of Cincinnati; Walsh, of St. Louis; Clegg, of Dayton, Ohio; Tom Johnson, then of Indianapolis, who brought along with him a piece of the since famous girder rail, which was shown, and looked at by the others with no little curiosity. Longstreet, of Providence, and Holmes, of Pittsburgh, were also a part of the "Old Guard." Walter Jones, of Troy, was one of the active members of the party, all of whom were somewhat anxious to see with what welcome the party, which had a private

car, would be welcomed in Boston by the street railway men there.

"The meeting was called at the appointed time, and the Boston men were a little wary at first, standing around the door to see what kind of men would assemble at this convention. They soon came in, however, and took an active part in the proceedings, and the matter assumed shape as the different eastern cities were represented. It was one of the most interesting meetings the association ever held. Calvin Richards, of the then Metropolitan Railway Company, and Mr. Rugg, of the Highland Railway Company and others, of Boston, joined in the spirit of the occasion, so that at the end the Boston street railways gave the delegates an elegant banquet at Young's Hotel. The Hon. Moody Merrill was the chairman of the convention, and Messrs. Woodworth, of Rochester, and Clegg, of Dayton, O., were the secretaries of the meeting. Two days were spent in organizing and adopting a constitution and by-laws."

After the sale of his interests in the Rochester Railway to the present syndicate, Mr. Woodworth joined Henry A. Everett, of Cleveland, in the purchase of the Toronto, Ontario, railway, which interest was two years later sold to Mr. Everett. Since then Mr. Woodworth retired from active business, but not from active interest in American street railways and the American Street Railway Association.

Mr. Woodworth's many friends will be pleased to see the excellent likeness of him which we present upon this page.

CHAUNCEY C. WOODWORTH.

THE Consolidated Street Railway of Cincinnati, O., is building a large addition to the Walnut Hills power house, to furnish the power to the Norwood line and the cross town line, now receiving their electricity from the Hunt street plant. The new building is 50 by 70 feet, one story of about thirty feet. The plant will contain two 1,000-horse-power Hamilton-Corliss engines, to run four 500-horse-power electric generators. There will be three additional boilers with the Jones underfeed stokers. The cost of the building and fittings will reach \$100,000. The Eighth street electric plant, to be erected at Depot street, near Eighth, will cost \$200,000. It will have four 1,000-horse-power engines and eight 500-horse-power electric generators and seven large boilers, furnishing 500-horse-power of steam each. The boilers will be heated by forced draft.

## TRAMWAYS INSTITUTE MEETING.

A general meeting of the Tramways Institute of Great Britain was held July 5, at the Holburn restaurant, London. The election resulted in the choice of W. J. Carruthers Wain as president for another year. A paper was read entitled "The Soulerin Brake." This brake is designed for trains and is hardly applicable to English tramways at present.

T. Arnall, C. E., of Birmingham, read a paper on "Permanent Way Repairs," which was of practical value, and was followed by an animated discussion, we are reminded that our English friends are about in the position in which we were some eight years ago by the presence on the program of two paper relating to the care of horses. Only

one of these was read, however. It was entitled "Patent Food for Horses," by F. Stiel. The question of "Roller Bearings for Tramcars" was discussed at length by F. Purdon. He stated in introduction that the cyclist, who has been put in much the same position as a horse, but who has the advantage of being able to speak and demand alleviation, very soon discovered the advantages to be derived from roller bearings, and the universal adoption of ball bearings for cycles is the result. The ball bearing, however, admirable as it is for the light weights carried on the cycle, has never succeeded under heavy loads, owing mainly to the fact that all the weight is carried by only one or two balls at any moment of time, and the balls only touch the races or ball paths on a point, the result being that either the balls crush or the races are indented.

The conditions of a good roller bearing are severe. Sufficient bearing in lineal inches must be provided to bear the weight. The rollers must not move laterally and must remain exactly parallel with the journal. The rollers must not grind against one another, as balls in a ball bearing, and no sliding or scrubbing must take place between any parts of the device. The journal must not move laterally under the load, as this would set up a spiral movement of the rollers. Mr. Purdon describes a bearing which he says fulfills these conditions. A table was given, showing the results of tests on starting effort and ease of traction with cars having plain and roller bearings. It was found that it took less than one-sixth the amount of horizontal effort to start the roller bearings than it did the plain. For the ease of running test, cars were let run down a grade onto a level, the distance run being noted. The results were found in favor of the roller bearing in the same proportion as before, viz., 6.39 to 1.

To test the wearing qualities of the device a car was put on the Morecambe road in February, 1894, where it ran 3,000 miles without perceptible wear. Holroyd

Smith, engineer of the Blackpool corporation electric tramways, then became interested in the bearing and a set was put on an electric car for the purpose of comparing with other cars as to current consumption. Mr. Smith reported that the current consumption was fully thirty per cent less with the roller-bearing car, and roller bearings have been ordered by the directors for two new cars now being built. The cost of the bearing is \$50 a pair, but this might be reduced for large quantities.

## TIPPING OF WOODEN BLOCK PAVEMENT.

The new bridge over the Elbe river at Magdeburg, Germany, has a roadway about 26 feet wide, with two street railway tracks in the center. The pavement consists of pine blocks 4.4 inch high and 3.2 inch wide, laid on a bed of 0.8 inch of asphalt. Owing to the presence of the railway, the travel over the bridge on each side was entirely in one direction, and the wear on the pavement was very great. After the blocks had been down five years a careful examination of them was made, and it was found that on the rising and level pavement the sides of the blocks which the wheels passed over first were not worn at all, but were pressed from 0.5 to 0.6 inch into the asphalt. The wear had taken place on the further side. On the falling part of the carriage-way on each side of the bridge the wear had been the opposite. The explanation offered is that the friction of the wheels shoved the blocks in the opposite direction to that of the vehicle, and the traffic was heavy enough to make this shoving of enough force to produce the results noticed.

## THOMAS NEVINS.

The principal in the late purchase of the Detroit street railways, so much and so long before the public eye, is an Irish contractor, of Orange, N. J. Four million dollars cash was the purchase price, with \$4,250,000 in bonds. An English corporation was also making a bid, but it was out manoeuvred by the Jersey Irishman. Thomas Nevins was born in Trim, County Meath, Ireland, and came to this country a penniless boy. While in Ireland, his great admiration was a beautiful estate with an old castle attachment, and he vowed if he ever got rich that estate should be his. He returned to Ireland last spring and bought it for \$300,000, and is now one of Meath's land magnates. Mr. Nevins made his millions as a contractor, working hard, early and late, for the success he has attained.

As in Chicago and other cities wherever the cable railway goes, it influences the naming of various small businesses. In New York this result can be seen along Third avenue and up in Harlem, where there are now a number of "cable" saloons, cheap restaurants and small shops. On the Bowery there is a "Cable Clothing Company."

## EX-PRESIDENT HARRISON ON THE INDIANAPOLIS FRANCHISE.

Citizens' Street Railway Company vs. the City Railway Company,  
No. 8866 Chancery.

The litigation of the franchise of the Citizens' Street Railway Company, of Indianapolis, has attracted national attention, and has involved upon both sides of the question some of the best legal talent of the country.

The present owners of the franchise, Murry A. Verner and H. S. McKee, the well known Pittsburg Street Railway men, contend that the franchise under which the Citizens' Street Railway is operated, is perpetual, while the city claims that the 30-year right expired January last (1894). The amount invested in the plant is somewhat in excess of \$5,000,000. The company's point in the matter is that the ordinance under which the system was inaugurated is simply permissive of the occupancy of the streets, but the right to perpetual occupation was derived from the State.

A competing company, known as the City Street Railway Company, claims the right to now occupy the streets under recently granted franchises, and merely asks the present company to remove 108 miles of track or be forced to sell out to the competitor. The animus of the case is, of course, the competing company, which is to profit in the matter, and however hidden this idea may be, the logic of events displays it clearly.

The McKee-Verner syndicate fights the case with a determination born of the knowledge of the immense loss, and are "thrice armed" because their quarrel is just.

Ex-President Harrison was one of the learned counsel employed, and his argument before Judges Wood and Baker, sitting as a district court, is not only a departure from the leading of his colleagues but a brilliant effort from a legal standpoint. Mr. Harrison's argument lasted four hours, and the fact that his fee was \$25,000 has attracted great attention in lay circles, although the results involved, in comparison, make it none too great.

General Harrison began by following the history of the Citizens' Street Railway system since its foundation in 1864, its growth and the introduction of electric traction. One point to be noted is that the present system occupies many miles of track under franchises which were originally granted from suburban towns now incorporated in the city boundaries, and many country roads which formerly the county granted rights over, are now in the city. Thus, although the franchises of the original citizens should be forfeited, no power could touch these others, and it is manifestly wrong to take a part or leave a part of the system useless by reason of forfeiting its connections. The counsel said:

"If the contention of our adversaries prevails we have a broken, disjointed series of tracks, the right to operate which is terminal at different times, and a system which fails entirely of the public purpose for which it was created. I am not intending now, however, to present an

argument, but simply to get before the court some facts which may illustrate the results of this construction or that of the laws under consideration.

The construction of these tracks has involved the expenditure of a very large amount of money—several millions of dollars. I do not know whether the total cost is disclosed in the evidence, but, in the very nature of things, it is a vast sum of money. The next fact I desire to state in this connection is that in connection with the construction and use of these lines, urban and suburban, there has grown up a public necessity that their use shall be continued and uninterrupted. The extensions of these lines are either upon the lines of the extension of the city, answering a demand for such service, or they are anticipatory of such a demand."

General Harrison also bore upon the manifest injustice to the citizens of destroying for a time the rapid transit facilities of Indianapolis, and referred to the great strike, when the courts were applied to for a receiver, in order to get facilities, and argued that the building of a new system of 108 miles out of hand would be an impossibility in a short enough time to still keep the city moving.

The counsel says further:

"Our position has been perverted to be a claim perpetually to exercise the right to operate cars on these streets without the imposition of any further reasonable regulations. That is not true. Our contention simply has been and is, that, under the law, the city council of Indianapolis is not vested with the power to prescribe such regulations, and especially any regulation that shall terminate our right to use the streets. In the State it exists; it exists so amply that we are not to construe it out of the law, but to keep it there. Not a power with limitations, but an ample, full, sovereign power to deal with the corporation."

What does a transfer from one company to another fairly involve? If the legislature had contemplated such a transfer what provision would have been made? Why, that the company having these structures in the streets should have its property appraised by some appropriate judicial process, and that, under a law providing for it, it should transfer its powers and its property to some one else. I call your Honors' attention to the fact that no provision is made in any law of the State of Indiana for any assessment of the value of the property. I ask your Honors to note the absence of such a provision and its result; for surely we will not impute to the legislature the intention that the property of one corporation thus located in the streets of a city shall be transferred, as the attempt has been made here, to another corporation, and the profit of this looting divided between the new corporation and the city. I will undertake to demonstrate to your Honors that is precisely what this speculative charter, that is represented by the defendant, means; that the street railway track of the present company is to be appropriated by the new company without compensation, and that the tribute from its tolls which this new company pays into the city treasury is a division of the profits made by the transaction.

I will show your Honors as I progress, that this negotiation bears on its face the confession of the city that it was dealing with a matter that it had no right to deal with, and that it took bonds from this new company—making an agreement almost champertous\* in its nature—that it would indemnify the city for any damages and would conduct the suit that was to destroy our rights at its own expense. How is this transfer to be brought about? Have we the right to take up our tracks? Judge Selden announced, in a case in New York (*People v. O'Brien*, 111 N. Y., 1), in support of his conclusion, that the franchise was perpetual; that these structures, when thus imbedded in the streets, became a part of the street and could not be removed. The most onerous method that can be adopted as against the public in the conduct of street railway companies is to attempt to enforce this idea of a limited term of years. If I construct a railway track in the city of Indianapolis and am limited to a term of thirty years, and at the end of that time must leave my expenditure in tracks to the city, what follows? I must, during these thirty years, levy such exactions on the public as will pay the interest upon my investment and pay the investment back in full before the end of the thirty years. Nobody would build a street railway unless he could do that. So that the public is burdened by every such successive limitation. The grantees of the franchise must not only get an annual interest on their investment, but must be able each year to make such contributions to the sinking fund as will discharge the whole investment before the end of the term. Now, if we are not entitled to take up these tracks, these gentlemen propose to enter into the occupation of them.

The defendants' (City Company) situation may be briefly stated. It is that it has no investment except in lawyers' fees—no investment of any sort but the cost of litigation.

General Harrison also clearly showed in several instances that the defendant company, the City Railway Company, expected from the outcome of the suit to force the Citizens' Company to sell at a low price, just enough above the price of scrap, to make it worth the while of the City Company to buy it, thus practically losing to the Citizens' any right to recover a first cost. He also asserted that no statutory provisions existed for the sale of property under such circumstances.

Judge Wood asked the question as to the precedent in the books as to sale of property under such circumstances and as to the action of court of chancery.

GENERAL HARRISON: "I desire to add to what I said orally this fuller answer to the query of Judge Woods:

If, under the statute, our right to operate a street railway is derived from the city, and was lawfully limited to a period of thirty years, upon what theory of equity jurisdiction can the court extend our rights to a longer

\*CHAMPERTY.—The prosecution or defense of a suit, whether by furnishing money or personal service, by one who has no legitimate claim therein, in consideration of an agreement that he shall receive, in event of success, a share of the matter in suit. From early times this has been considered an offense and punishable.

period? Surely, there is no such power. Now, unless our right to continue in the use of these tracks can be held in exercise by the court beyond the limited time, we can get no value of them, save, first, by finding a buyer who can use them as they lie, or by taking them up and selling the material. The first value cannot be secured unless there is competition between persons having the right to use the tracks; but this court cannot open such competition unless it has power to control the legislative discretion of the board of works and the city council; and without such power how can this court restrain those bodies from giving to a new company the right to place tracks just where our unused tracks are. To protect our values you must not only prevent the use of our tracks by others, but you must prevent the city from requiring us to remove them. For, if we have only the right to remove them, or if we may be compelled to remove them, the scrap heap value only is left to us. You must not only say that no other company shall use our tracks without a valued compensation, but you must say in effect that it must use them; for, if they are not compelled to take and use them we remain as fully as ever in their power. In the Detroit case cited in the argument, Judge Taft held that as the law of Michigan limited the corporate life of street railways to fifty years, a city grant or license to use the streets, which went beyond the corporate life, was void, because there was no corporation to exercise it. The results were so disastrous and inequitable that when he fully realized them he suspended the final decree and appealed to the parties to make a compromise. He saw no way of escape through any power of the chancellor. But here your Honors have only to hold that the legislature of Indiana did not fall into the absurdity of attempting to provide for a perpetual public use through corporations having term limits as to the discharge of that use, and without making any provision for turning over, upon fair terms, to a successor, the appliances and structures necessary to the continued discharge of the use. Property rights, the public use, and the fullest control of the corporation are all secured by this construction.

\* \* \* \* \*

If a use that is perpetual, and a use that is developed by use, and becomes more imperative and necessary, is to be cut off, we had better not have instituted the corporate agency at all. There has been an enormous development since 1861; these street railways—as do the complainant's tracks—now connect towns. Our tracks connect West Indianapolis, Haughville, North Indianapolis, Irvington and adjacent towns, with the city of Indianapolis. Yet, some question has been made by our opponents as to whether this was a public use. My friend, Mr. Butler, said the other day that it was not. I said to him jocularly, when we adjourned, that I would suggest to Mr. Mason to instruct his conductor, when Mr. Butler attempted to take a car downtown after his lunch, to tell him he could not ride, that he would not carry him; and after he had walked down to the court-room I then wanted to hear him again on the question whether this company was discharging a public use, and whether

anybody who paid his fare and behaved himself had not a right to ride in these cars, just as on the Vandalia railroad. There can be no question about that. They are railways, and not simply as they have developed, city railways, but railways connecting adjacent towns. They are roads for the carrying of passengers and their ordinary baggage; and any citizen has a right, upon paying the fare, to ride upon them. I do not need to stop here to cite authorities to that; Mr. Winter has done that. In the State of New York, street railway companies were first organized, as I understand, under a general law providing for the organization of railways. Again, it has been held in Iowa that the general railroad law as to condemnations applied to street railways. In another case it is held that the law as to the consolidation of railway companies, so described, applied to street railways. But I should waste your Honors' time and my own, I think, if I talked any further upon the question whether this corporation discharges a public use; whether it is a public carrier of passengers and bound to carry any person who offers himself at the right place and pays the lawful fare. Now, that being so, what has been the policy of our State with reference to such corporations? Why, if your Honors please, steam railways—which, as I have said, are so much like these that the courts make them one in the interpretation of statutes that use the general term “railways,” unless there are exclusive words—are declared to be perpetual. Does any one suppose that anybody, anyhow, would be permitted, in any agreement they might make with one of the steam railways, to insert a limitation that would break one of these through lines of railroad communicating between city and city? The State has made such corporations and their operation perpetual; and upon the theory that I spoke of, that they are to discharge a perpetual public use. The court will hold these corporations in due subjection to the law. They are to go on forever, because these towns are to go on forever; because business is to be done forever; because our people will be called from place to place by their pleasures, necessities or business forever. Now, this policy is not limited to railroads, though a railroad policy is all we need here. Every corporation in this State, so far as I have been able to find or now remember, except telephone companies, nearly all, at least, discharging a public use, have been granted perpetual life and operation, either expressly or by the failure to impose any limitation.

So argued Mr. Harrison that the analogy was perfect as necessary and no provision had been made by legislature for fixing the value of a street railway line thus to be sold, or even to lead to the winding up of the affairs of the company.

GENERAL HARRISON: “What kind of a city franchise to operate is one that has no validity at all except at the will of the State? I am discussing the question whether the legislature has given the power to the city to grant a franchise; and my argument is that it has not given the city the right to secure us the right to use the streets for an hour. My argument is that the legislature

granted the operating franchise, and not the city. The full power of amendment and repeal reserved to the State shows that it was not intended that the city should deal with the question of time at all. The power to grant a franchise implies power to make it good, according to the terms of the grant.

Now, if the intention of the legislature had been that this operating franchise should continue for such length of time as the several cities in which these corporations were organized might determine, can anybody tell me why the legislature did not say so? Why wasn't it said? Why were our adversaries left to all this toilsome effort to deduce that meaning?

In fact, the city ordinance was regulative. Once a road is built, it passes out of the power of the city, with no provisions for the limitations of the franchise.

In closing the case General Harrison said:

“Now, if your Honors please, I do not know that I can add anything to what I have said, either to add force or clearness to the propositions upon which I rest this case; and if your Honors will permit me to summarize a little I will close.

We have here a great investment; we have here a great system serving a public use, so necessary to the health, convenience and comfort of the citizens of Indianapolis that its stoppage for twenty-four hours is a calamity. We have here a corporation endowed by the State with the power continuously to serve that use and one which is thoroughly regulated by the State and may have any further burdens placed upon it that are suitable and reasonable. We have here a statute giving that corporation perpetuity. Any life short of that is a life shorter than the purposes for which it was created. It is an untimely end if it leaves the use unserved. We have here a proposition to cut off this use suddenly and effectually, and to turn over this property to a corporation that has manifestly been organized upon the theory that there was a carcass to be divided; that we had in the streets tracks that we could not get out of them, and that we must either part with the property by contract for a song or they would take and use it for nothing. Unless they are to take and use these tracks, a most distressing, inconvenient and unfortunate interval must elapse between the taking up of our tracks and the laying down of theirs.

And all this is deduced from a statute that has conferred upon the city a power to consent to three definite things. I know your Honors' familiarity with these terms. You never can construe “operation” to be included in any one of them. The distinction is sharp and clear; the statute must be rewritten to accomplish their purpose. Our interpretation of the statute gives full effect to every word used and provides for this use a company equipped to discharge it, subject to every reasonable limitation and duty that shall compel it to serve the public in the most efficient manner. Your Honors are invited to legislate; not to construe, but to legislate, and for the accomplishment of such purposes as I have inadequately and without passion attempted to describe.

And now, if your Honors please, I hope that in this discussion I have made good the purpose with which I started, and have not brought into it any suggestion that is not worthy to go with your Honors into the chamber of judgment, where the rights of my clients are to be decreed.

I am sorry that we have occupied for so long the attention of the court, and that, while these matters, wholly between parties, have been under discussion, other matters, involving large and exigent public interests, have also claimed your attention; that your minds have been distracted and your time somewhat withdrawn by events involving the peace and good order of the communities in which your Honors serve as judges. And yet, what a fine tribute to our institutions it is that, while these things are going on and mobs are threatening a few cities, the great, deep current, the peaceful, forceful flow of our civil order, is not staid for one moment; but the courts are administering the law between those who have invoked its aid, and the general peace of the Nation is scarcely ruffled."

The points made in the support of the contention of the company are regarded as specially strong and the people wonder that the idea never presented itself before. When the privilege was granted it was believed that a limitation had been placed upon it, and in all transfers, until the last, the purchasers supposed they were buying a limited right to the occupancy of the streets. Every company has, therefore, endeavored to get an extension from the city council, and this has long been an issue in local politics, to say nothing of the liability and the corruption of the town officials. When the Chicago capitalists bought it they held out as an inducement that the system would be changed to electric traction, and did change several lines. The public sentiment, headed by a newspaper howl, was against it, and nothing of additional rights were brought forward. Legal counsel was sought by the McKee-Verner syndicate, and Harrison, Miller & Elam, of Indianapolis, opined that the franchise was perpetual. The ex-president was thus brought forward in the case to defend his opinion.

The matter will ultimately go to the United States Supreme Court, and the decision will be watched with great interest, as many companies have obtained what are at present believed to be limited charters, and the case will have more or less significant bearing upon all.

### STREET RAILWAY ETIQUETTE.

The officials of the North Hudson Railway Company were surprised to learn that it was one of the unwritten laws of their road that a conductor should treat his driver or motorman at the end of each trip, says the New York Sun. The company had two objections to this custom. One was that it injured the discipline of the road, and the other was a suspicion that the expense was in fact borne by the company. The consequence was an order that any employe caught drinking while on duty should be discharged.

### FIVE WORRIES IN THE LIFE OF A CONDUCTOR.

There once was a young college freak  
Whose transfer was punched on the cheek  
Without a mustache,  
It made him so brash  
That he hit the conduc. on the beak.

A spinster of forty would take  
The cars for a ride to the lake;  
She asked for a transfer.  
The conductor made answer  
With one of the earliest date.

This "con" of Tom Lowry's one day  
Punched the nose of an innocent jay.  
Who easily saw,  
When he took it to law,  
As a crop it was better than hay.

At the end of the last weary mile  
Those sweet angel faces still smile,  
He is haunted by "mugs"  
And worried by thugs,  
So he rests "in the traces" awhile.

But at length he is driven to folly  
And quietly slips off life's trolley,  
And on that far shore  
He is met at the door  
By the angels who make things more jolly.

—Minneapolis Journal.

OUT OF SIGHT.—A rural visitor, after watching the New York cable cars for some time, finally volunteered this information to his friend: "Kain't ye see, b'gosh? Them things goes jist the same as the canal boats, only they ain't no room for the horses t' go on top, so they has 'em go in under th' road, an' when the feller at th' handles wants ter have th' gol durned machine go ahead he jist pulls on them 'ere things jist the th' same as th' reins used t' be, an' th' horses in under minds it and goes ahead."

### ANOTHER LIE NAILED.

The enterprising daily press has a story in the plates to the effect that the Binghamton Railroad Company, of Binghamton, N. Y., decorates with crape every car that in any wise contributes to a fatality.

General Manager J. P. E. Clark writes us that the item is the outgrowth of the imagination of some funny editor of a neighboring village.

"The employes of this company," says Mr. Clark, "have been granted the privilege of decorating the cars with emblems of mourning upon the occasion of the death of associate motormen and conductors. We allow this, as we believe it to be for the best interest of our road to create a bond of sympathy and good-fellowship between the employes of the company, and I am pleased to say that this feeling exists among our attaches. In case of trouble, severe illness or death in the family of any actively engaged employe, his associates come promptly to his assistance, a sentiment that we endeavor to stimulate."

### TESTING EYESIGHT OF MOTORMEN.

A few weeks ago a largely quoted item of general interest in the daily press was the testing of the eyesight of motormen on the lines of the Consolidated Traction Company, of Jersey City, N. J.

That good eyesight is as prime a requisite as a cool head is acknowledged, but few companies have taken the trouble to ascertain the capabilities of their motormen in this regard. The nerve and self possession of an employe can be tested only by real experience, while eyesight is simply a matter of trial at any time. The steam engineer has, perhaps, less need of perfect eyesight than a motorman of a city line, whose judgment of distances within a foot may mean damages or no damages to the company employing him. Then, too, the steam-road man has long stretches of track, where only the most ordinary care need be exercised in watching for trouble, whereas the motorman's longest clear run is a few hundred feet, with a criminally careless public crossing and re-crossing the line of traffic and swarms of daring children and foolish youths, making life one constant stretch of nerve. The eye of the motorman must therefore, be as nearly normal as possible.

General Manager Young, of the Jersey City Consolidated Traction Company, in view of the necessities of public safety, engaged a well-known firm of oculists to test the eyes of the employes. The tests were for diagnosing cases of myopia (near sightedness), hypermetropia (far-sightedness), astigmatism (indistinct vision), and color blindness. The oculists, A. Walter & Son, send Manager Young the following report:

"We have examined the eyes of 125 motormen in your employ, and find one case of myopia, and one cataract. One hundred and twenty-three had perfect sight and were given proper certificates after a rigid examination."

The tests show an unusual number of perfect eyes out of a given number, and without doubt Jersey City passengers will feel safer now when traveling in the cars or on the streets.

### HOW TO REACH ATLANTA AND THE AMERICAN ASSOCIATION.

The attendance on the Atlanta convention of the American Street Railway Association, to be held October 17, 18, 19, will be without doubt very large.

The city of Atlanta is one of the most pleasant, live and progressive towns in the south, and at no other place could the convention be more certain of a cordial welcome, such as only the hospitable south can offer. The advantages of Atlanta are many, but in none of them is it more marked than for the fact that to reach it affords a picturesque and interesting trip, neither tiresome nor too long.

The run from Cincinnati, over the Queen & Crescent Route, is one of great interest, and the ride is made on trains than which no more luxurious and elegant are found anywhere. The line lies through the famous meadows and woodlands of central Kentucky, where the people are widely hospitable, where live stock famed the world over is produced, and where the small cities of the "Blue Grass" are both picturesque and well-to-do. South of this the Cumberland plateau, with its coal mines and iron furnaces, furnishes the traveler with contrasting scenes. After passing Harriman the roads leads down the Tennessee Valley, past the famous battlefields into Chattanooga, and under the brow of Lookout Mountain. Leaving Cincinnati at 8 p. m. daily, the Queen & Crescent runs a solid vestibuled train to Atlanta without change, the entire train from mail car to sleepers going through direct to Atlanta. The train leaving Cincinnati at 8:30 a. m. daily, runs solid to Chattanooga, where direct connections are made for Atlanta.

From Chattanooga south these trains run over the tracks of E. T. V. & Ga. Ry. This route from Cincinnati is the only one offering a service of solid vestibuled trains, besides it is more than 100 miles shorter than any other line.

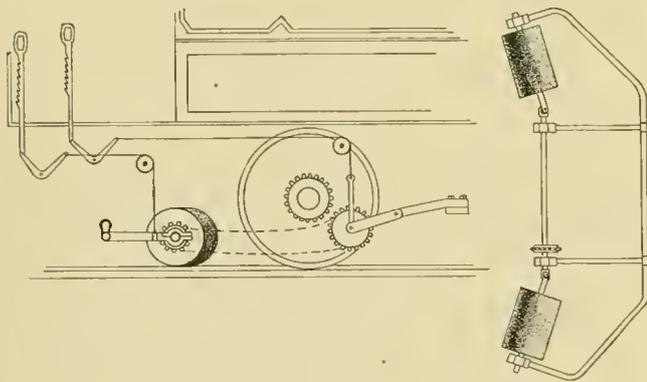

In Chicago the Q. & C. representative, W. A. Beckler, has his headquarters, 111 Adams street, and will be glad to afford any information or extend any courtesy to delegates or supply men.

W. C. Rinearson, general passenger agent, Cincinnati, will also be pleased to give any desired information or assistance.

THEY will all have to come to it finally. Electric traction is the only savior of non-dividend paying lines. The Compagnie Generale Francaise de Tramways, whose annual meeting took place recently in Paris, states that it has been compelled to substitute mechanical (electrical) traction for horse haulage at Havre, Marseilles, Nancy, and Genoa.

### A REVOLVING TRACK BROOM.

A revolving track broom, designed by G. J. Smith, master mechanic of the South Covington & Cincinnati Street Railway, has had a 30-day trial and has proved a practical success. As shown in a plan view in Figure 1, the frame is made of gas pipe, with bearings for the broom axles on the end. Motion is transmitted by a sprocket chain to the main axle which is connected through universal couplings to the broom axles at each end. The chain is driven by a sprocket wheel on the axle, and is thrown in and out of gear by an idler sprocket wheel just back of the axles. The brooms can be lifted  $5\frac{1}{2}$  inches above the rail. Everything is operated from

the front platform, as is shown in Figure 2. The brooms are 15 inches in diameter and 1 foot long. They are of steel wire with hubs of hickory 4 inches in diameter and 14 inches long with an iron band at the ends. The brooms revolve about  $1\frac{1}{2}$  times to one revolution of the car wheels. The driving sprocket wheel on the car axle is split, and cast in such shape that it takes the place of the axle collar which holds the motor in place. The use of the idler is necessary, not only to give the right direction of rotation to the brooms, but to throw them out of gear when not in use. A few cars equipped in this way and run with the brooms down for a trip or two on each route every day will help out the coal pile considerably.

### THE SOUTH STAFFORDSHIRE ELECTRIC TRAMWAY.

Alfred Dickinson, electrical engineer of the South Staffordshire, England, electric lines, recently gave an account of them and their performance before the Institution of Electrical Engineers.

The cost of running and repairs on the road is 8.12 cents a car mile, which is about the lowest figure yet attained in England for any kind of traction. This road, it will be remembered, is one of the only two electric roads in England. The one at Leeds is span wire construction after the American plan. The one at South Staffordshire, however, is on a very novel system, devised by Mr. Dickinson, and described in the REVIEW of

December, 1892. The trolley wire is not strung directly over the track, but along the side of the street on side pole brackets. The trolley pole is of a kind which will follow the wire when it is several feet away from the center line of the track.

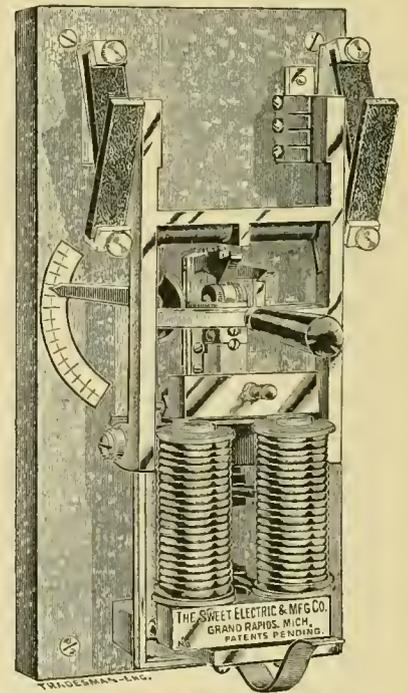

### A ROPE WITH A RECORD.

Our readers will remember the engraving presented a few months ago of the Lang lay rope of the North Chicago Street Railroad Company, which ran ninety-eight days in the loop and through the tunnel at La Salle street. Another rope of the same make was taken out of service May 9 after eighty-eight days' run. The latter was a  $1\frac{3}{8}$ -inch cable, six strands, ten wires over seven, with a length of 9,760 feet.

The tunnel loop has four severe curves and carries all of the North Chicago trains around the loop. These cables were made by the well-known firm of George Cradock & Co., of England, and have given the buyers entire satisfaction.

### THE SWEET "LIMIT" SWITCH.

This circuit breaker is manufactured by the Sweet Electric & Manufacturing Company, of Grand Rapids, Michigan, and it is made adaptable to all circuits and locations, whether on the station switch-board, on building and motor circuits, or on a car. Its adjustment depends on the distance of the armature from the magnets, the pull on the armature being the same for one ampere as for five hundred. The arc is broken between carbons, the motion of which is very rapid at the time of breaking. The sensitiveness of the device is dependent on its excellent mechanical and electrical construction. The Sweet Electric & Manufacturing Company is having flattering success in placing it on the market, and owing to the general unreliability of fuses it will probably find a great demand for the switch.

THE last horse car at Reading, Pa., was taken off June 27. The entire 30 miles of the Reading Traction Company's road is now operated electrically.

**THE INTERNATIONAL TRAMWAY UNION.**

The eighth annual assembly of the International Tramway Union will convene at Cologne, Germany, August 21, 22, 23 and 24. The exercises and discussions will be held in the hall Isabella, 29-33 Martin strasse, Cologne.

On Sunday, August 19, the clans will begin to gather, and at 8 o'clock in the evening the committee on credentials will hold forth. The next day an excursion to Remscheid and to Barmen-Elberfeld will be made, the party returning to Cologne in the evening.

The first session of the congress will occur Tuesday, the twenty-first, when general business will be transacted and the discussion of papers on permanent way and on metal ties.

Paving will also be discussed in connection with the latter subject. M. Fischer-Dick, of the Grand Tramway Company of Berlin, will report on the latter subject. At this session M. A. Moyaux, of Brussels, a prominent manager of Italian lines, will lead a discussion on passenger and freight traffic, including methods of inducing travel. Different kinds of tickets will also be considered.

All sessions begin at 8:30 a. m. and last to 12:30, and the afternoons will be spent in visiting plants and in social communion.

Wednesday will be devoted to electric traction, the most of the discussion pertaining to elementary subjects. M. P. Van Vloten, engineer, Brussels, will lead this meeting.

On Thursday, the twenty-third, horse-traction will have the floor, and the nourishment of horses (nourriture des chevaux) will be discussed by M. Baillet, manager of the tramways of the department of the North, Lille.

Car lighting and heating and the discussion of various steam and gas motors will occupy the twenty-fourth, finished by a business session and a banquet.

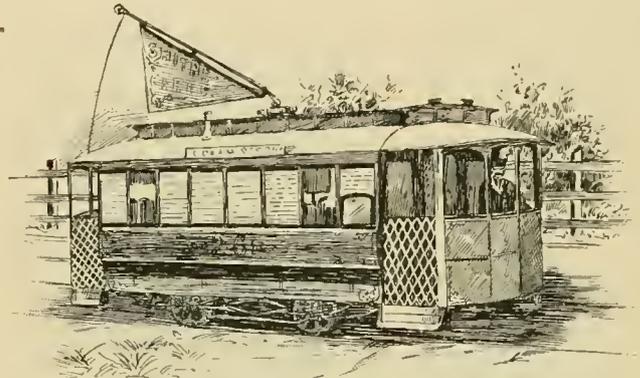

August 25 will be devoted to excursions to Dortmund-Hoerde and to Ruhrort-Essen, and at 9:03 Sunday morning those who are at liberty will depart to the World's Fair at Brussels.

**WHAT WE HAVE ALWAYS SAID.**

"There is no use in our trying to compete with the trolley lines," said a railroad man the other day to a reporter of the Philadelphia Record, as he glanced ruefully over some figures, which showed a decrease of \$40 a day in his company's receipts from suburban travel on a branch line since the opening of a trolley road. "We have to give too much to our patrons," he continued. "We provide handsome terminals, fine suburban stations, heat, water, light and a seat for every passenger, while the trolley lines furnish almost nothing but transportation. They furnish no stations; crowd the passengers in, so that many have no seat, and in that way manage to make money. We can't do things that way, and so I see no money for us in trying to compete with the trolleys. Of course, they can't touch us on long distance traveling, but in the near future I expect to see them absorb a large amount of our suburban travel."

**A NOVEL ADVERTISEMENT.**

The accompanying sketch shows how Smith's Coolerine is advertised in Houston, Tex. The banner is made of light wood, covered with canvas and properly lettered. It is then fastened to the trolley pole as indi-

cated. President McKinney, of the Houston City Railway, writes us that the scheme was very effective, and netted the company \$75 a month for its use on all forty-seven cars. Mr. McKinney improved upon the Denver idea in making the banner.

**RECEIVER FOR THE MADISON, WISCONSIN, RAILWAY.**

The situation at Madison, Wisconsin, is not unlike that of several other places of about the same population, and is due not altogether to a depression in business, but partly to an over issue of bonds and stock. Madison is a beautiful city of about 15,000 inhabitants, and while not a manufacturing place is, as is well known, an educational center, which in times of business depression is really in favor of the road, as riding is less affected than in industrial towns. The road is stocked for \$75,000 and bonded for \$150,000, which is largely in excess of what the property should properly be called upon to stand, as it includes but eight miles of track, on which are operated eight motor cars. Necessary extensions that had to be made during the past year, and a large amount of paving which the city required the company to do, contributed to the result. Earnings last year are reported to be \$41,000, and \$225,000 securities are more than a property which could be duplicated for probably less than \$150,000 should be called upon to support. Track, rolling stock and motive power are all reported to be in excellent condition.

LONDON, ENGLAND, is to have a new electric railway. Work on a line between the city and Waterloo station has been commenced by the contractors, John Mowlem & Co., of Grosvenor Wharf, Westminster.

A CARDIFF company has gained the tender for working the Newport, England, tramways at a figure of \$9,300.

## ELECTRIC JOURNALISM IN ITALY.

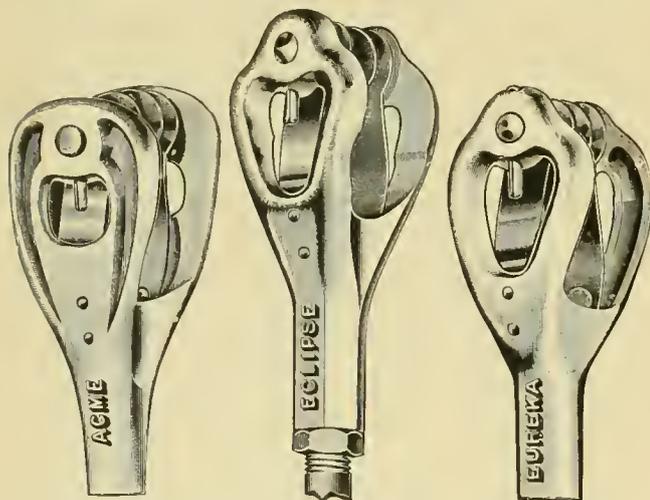

We are glad to be able to present to our readers this month a portrait of Dr. Angelo Banti, the distinguished Italian electrical authority, and the editor of that bright review *L'Electricista*. Dr. Banti sends the REVIEW a copy of his brochure on *Electric Motors with Rotating Magnetic Fields*, a book of 82 pages, 7½ by 10 inches, and one of the finest specimens of European typography which it has been our pleasure to behold. It is divided into seventeen chapters. It reviews the history of polyphase transmission in a masterly manner, and describes the principal installations of this type in the last detail. It is eminently a scholarly production, and while not profusely illustrated, the text is elucidated by many diagrams and a few engravings. The book comes from the Elzevir press, Rome.

DR. BANTI.

## IMPROVEMENTS IN NUTTALL DEVICES.

The R. D. Nuttall Company, of Allegheny, Pa., has made some important improvements in its extensively used trolley base, and has also introduced a new steel

pole, malleable and brass harps, and brass trolley wheels. The foot of the new trolley base has been made stronger and arranged to catch any surplus oil that may drip from the swivel. The swivel pin has been enlarged, both in diameter of pin and diameter of shoulder. Where chains were formerly used, solid rods have been put in, as chains

were found to stretch. Two short springs, 9⅝ inches long, are now used in place of one 19¼ inches, as it was found that short springs could be tempered better than long ones. The pole has been made much stiffer and but little heavier than the former pole. It is a seamless steel tube, having a continuous taper from 1½ inches at the large end to 1⅛ at the small end. This pole was designed especially to overcome the difficulty sometimes experienced with very low trolley wires, of having the pole bend so that it strikes the wire. The Acme, Eureka and Eclipse harps, in brass or malleable iron, are all designed to avoid any chance of catching on the wire, as they have no projections. There is ample clearance for the wheel on the sides of the harp and the contact springs are so buried that it is almost impossible to cut them. The U shaped groove in the shank is to insure a clearance between the harp and wire when the pole is horizontal.

## CAPTAIN ALLEN TINDOLPH.

Captain Allen Tindolph, president of the Vincennes Street Railway Company, of Vincennes, Ind., died July 27, after a long and painful sickness, at the age of 52.

Captain Tindolph was one of the most prominent and public spirited citizens of Vincennes and was engaged in many enterprises. He was born in Crawford county, Illinois, in 1842, but emigrated to Texas with his family in 1858. The family returned to Crawford county in 1860 and young Tindolph completed his education by a business course in Chicago. During this time Mr. Tindolph not only was required to sustain himself, but the younger members of a large family. His first business, properly speaking, was as a Wabash river pilot, from which position he rose to be captain and owner of a boat. For twenty-five years he made steamboating on the Wabash his life-work, and acquired a large fleet—the best on the river. During this time his home was at Vincennes, and the captain with his fleet did, perhaps, more to bring the town into prominence than any one man. He retired from active work in 1889 and assumed the postmastership of Vincennes. He was also made president of the Second National bank and of the Street Railway Company, in which he was a prominent owner.

Captain Tindolph left a widow, two sons, and a daughter to mourn his loss. One of the sons, Frank Tindolph, is superintendent of the Vincennes Street Railway. A large circle of friends and every citizen of his city regret his loss as that of a public-spirited, Christian gentleman.

A SOUVENIR of Portland and its suburbs has been issued by the Portland, Me., Railroad Company, according to a plan outlined in the REVIEW some time ago. It contains fine half-tone engravings of the principal buildings and points of interest, and a well written account of them and how they may be reached by the street railway. It can not fail to attract strangers who are staying in the city and be a great help to them and accordingly to the railway.

## EMERGENCY AND WRECK WAGON SYSTEMS.

### II.

The wreck wagons of the Metropolitan Traction Company's system, in New York, are made by Gleason & Bailey, of Seneca Falls, New York, and are similar in construction to the patented fire insurance patrol wagons built by the same company, and in service for the Board of Underwriters of New York. Unlike an ordinary wagon, the men enter from both rear and sides, instead of from the end of the body of the wagon only. The seat runs the length of the center of the wagon, and the men ride back to back. This leaves room for a more spacious tool box under the seats. Under this long box is a false bottom, forming a long locker for carrying poles or any long tools. Back of the driver's seat are wrought iron saddles with straps for holding horse blankets. A locomotive swinging alarm bell is hung under the foot board. The foot piece of brake extends across the foot board, so that the driver can work it from either side or with both feet. The front wheels are 3 feet 2 inches in diameter, and the rear 4 feet 2 inches, with  $2\frac{1}{2}$  by  $\frac{3}{4}$  inch overlapping round edge steel tires. The axles are  $2\frac{1}{4}$  inch, having bronze nuts, secured by a linch pin, as is the regulation style of the New York fire department.

The springs are extra oil tempered, and made up for the purpose in strict proportion to the load to be carried. The body of the wagon is 11 feet 8 inches long, 5 feet 4 inches wide, and 19 inches deep. Over all wheels there are substantial metal mud fenders, and handsome brass hand railings surmount the wagon body. The steps are all covered with corrugated rubber matting. Bulls eye tubular lanterns, with patent wind shields, are hung on either side of the seat. These lanterns are provided with non-heating handles, so that they can be taken off the wagon and used around the wreck. Nearly every feature in the equipment of these wagons is novel and designed specially for the service.

Each wagon has, besides the other wrecking tools, eight pairs of shear legs, for elevating the hose over the track in case of fire. The guys for these shear legs are attached either to lamp posts or to iron pins driven into the pavement.

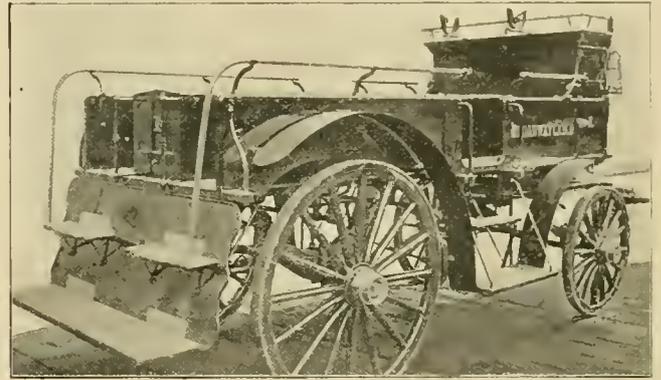

On electric roads the requirements are somewhat different, as the trolley wires require a good share of the attention. It is also generally possible to get cars around a blockade by another route, whereas this is impossible with the cable. Therefore the electric road systems have to be planned with special reference to electrical troubles, and special attention must be given to fires.

The Brooklyn, N. Y., system has fire alarm strikers at all of its emergency wagon stations, and whenever an alarm turned in shows that the fire is in a place where it affects the trolley or feeder system, the wagon makes the run and takes position inside the fire lines, ready to follow instructions from the proper fire department authorities if it is necessary to remove or cut out wires. If the

fire is a large one the general office is informed and an officer of the road at once proceeds to the fire and takes charge of the cars. The superintendent of the line department visits the fire in case his services are needed.

The territory covered by the West End Street Railway, of Boston, is divided into six emergency districts. The emergency crews are a part of the line construction and maintenance department, and are under the immediate charge of the superintendent of that department. The crew consists usually of a foreman and four men, conveniently located in quarters especially arranged for their occupancy. They are on duty day and night.

The equipment at each station consists of a pair of horses, suspended harnesses, tower and emergency

BROADWAY WRECK WAGON.

wagons, and all the necessary tools for the work of repair or removal of overhead lines, and the handling of disabled cars. A fire alarm tapper and telephone are located at each station, and the crews respond to all fire alarms and to telephone calls for any trouble with lines or equipment within their respective districts. Each man wears a numbered badge, in order that he may be distinguished from the employes of other electric companies. In addition they must wear the fire department badge. In the event of large fires, one or more crews are called from other districts to assist the crew in that district. Crews at fires are under the orders of the fire department officers.

The organization has done excellent service and is on the scene almost as soon as the fire department. General Manager C. S. Sergeant is certainly to be congratulated on having arranged so efficient a system. The men are especially selected for this duty, and carefully instructed regarding the methods of emergency work.

The Terre Haute Street Railway makes a practice of sending out a special car with hose jumpers to put on the track in case of fire. In a small place this is practical and generally quicker than sending a wagon.

It seems to be a doubtful honor to be a Milwaukee alderman, at least the News of that city says: "Pay your way when you ride on the street cars and be a man, even if only an alderman. There is no office so lowly that dignity cannot be added to it by the uprightness of the occupant."

## TIME TABLES AND TRAIN SCHEDULES.

How the Great West End System Gives Bostonese Cars on Time.  
The Complete System of John H. Hildreth.

PART II.

The mileage of the West End street railway of Boston, within its corporate name, includes nearly 300 miles of line and operates more than 2,000 cars. To keep these vehicles at a proper distance, and to regulate their speed and headway, is the duty of the Department of Routes and Time Tables, of which John H. Hildreth is the superintendent.

It was premised in our previous article (see June STREET RAILWAY REVIEW, pages 340-341) that three propositions are found upon which the constructor of the time table must build his work. They are, namely:

1. Justice to the public—frequent cars at rush hours and on holidays, and convenient intervals, neither too long nor too short, at other times.
2. Justice to the employes, that hours of labor may be as consecutive as possible, and equally distributed as to length of time.
3. Justice to the company, that no unnecessary cars be run, and that the maximum passengers may be car-

J. H. HILDRETH.

is operated under the division system, as in steam road practice, and thus the duties are divided and the immense system more easily managed, both as regards discipline and mechanical operation.

It is the local condition that governs so largely the arrangement of time tables, and Boston is no exception to this rule. It is Mr. Hildreth's experience that special time tables should be run on holidays, a different schedule for each one, as on no two such days is traffic found to be the same. While the same number of trips might suffice, they require an entirely different arrangement to bring about satisfactory results.

"It may not be a fact in all larger cities," says Mr. Hildreth, "but in Boston the street railway passenger traffic varies from day to day on some lines to such an extent as to require special treatment." The time table on these lines is not reconstructed each day in its entirety, but the "quick" headway (see below) is shifted an hour or so either way, morning or evening, as the business indicates. To this phase of car movement particular attention is devoted, as it often saves the running of extra trips. For heavy traffic lines a "pleasant" and a "stormy weather" table are provided, with the trips so arranged in the early part of the day, that a swing from one table to another can be readily made. To predict what the weather for the next day will be is often beyond the capabilities of the signal service of the United States government, to say nothing of the superintendent's less scientific methods. Even in the same day local weather changes, such as a shower, thunderstorm, or veering of

ried, comfortably, of course, with the minimum number of cars.

Mr. Hildreth in his arrangement of time tables follows this general rule, which may be stated.

"Let enough trips be incorporated in the time table to arrange for ordinary traffic, leaving to the different division superintendents and the foremen and starters immediately under them, the responsibility of retaining at their several headquarters a sufficient force of conductors and motormen to operate under telephonic direction from the Time Table Department, necessary additional trips for extraordinary occasions."

It may be stated en passant that the West End system

the wind may completely disarrange the best laid plans of superintendents. The time table shown herewith, scheduled for the Harvard Square-City Point line, is designed to be elastic enough to cover this daily change. It consists in reality of two tables. No. 1 is practically a ten minute service; No. 2, combined with No. 1, makes a five-minute headway, beginning at 10:59 A. M. after 12:56 up to and including the 7:46 P. M. trip, by changing the starting time of No. 1 to the threes, a three-minute service is obtained as the two tables merge. Having the headway changed at different times during the day, and arranged on distinct time tables, is advantageous to the men as well, because when once their day's work has begun

they are reasonably sure of finishing out, and are not therefore subject to the inconvenience of receiving part of a day's compensation, which would naturally be the result if all trips were arranged on one table and then left to the superintendent to reduce the trips in event of unfavorable weather. In computing time tables, the terms "running" or "quick" and "allowed time" are

10:05; 10:20; 10:35; 10:50; 11:05; 11:35 A. M.; 12:05; 12:35; 1:05; 1:20; 1:35; 1:50; 2:05; 2:20; 2:35; 2:50; 3:05; 3:20; 3:35; 3:50; 4:05; 4:20; 4:35; 4:50; 5:05; 5:20; 5:35; 6:05; 6:35; 7:05; 7:35; 8:05; 8:35; 9:05; 9:35; 10:05; 10:35 P. M. These put into a time table would appear as below in the Medford Square line. The "running time" is one hour and eighteen minutes; the

used. The latter averages about ten minutes more per trip than the former, and is used to cover any ordinary delay to which the car's passage may be subject in a congested street. In computing platform work this is included, except on last trips, when "running time" only is allowed.

So much for generalities.

As to the mechanical means employed, the basis of all

"allowed time," one hour and thirty to one hour and forty minutes. The car house is situated a quarter of a mile from the terminus, and the men in commencing their day's work either pull out a car or swing to one outward bound at the car house. Ten hours' duty done in twelve consecutive hours is supposed to constitute a day's work. It is, of course, impossible to reach the exact limit on very many lines, but the one represented is a fair illus-

NOTE: FIGURES ENCLOSED THUS [ ] DENOTES STARTING TIME FROM OTHER END

calculations, as everywhere, is the trip sheet. By this observation it is determined what headway is required on the line.

Let it be assumed that the following trips are needed: Starting at 6:05, 6:20; 6:35; 6:50; 7:05; 7:20; 7:35; 7:50; 8:05; 8:20; 8:35; 8:50; 9:05; 9:20; 9:35; 9:50;

tration. It furnishes a full day's work to nine crews, eight regulars and one regular extra.

If it is desired to make the headway on this line more frequent, it may be done by adding two extra trips per hour. It is as tabulated a fifteen minute headway in the morning up to 10:05; by the addition of two trips an

hour, the headway is reduced to ten minutes, or the 6:05 train starts at 6:05, the 6:20 at 6:15, the extra at 6:25, the 6:35 at 6:35, the 6:50 at 6:45, the second extra at 6:55, the 7:05 at 7:05 and so on until the line is sufficiently supplied. On reducing the headway the process is reversed.

The time tables for each division are thus framed and alterable by the rules set forth. The tables for the entire system are printed, by the way, in the employes' organ, the Echo, mention of which has been made in these columns.

THE HOFFMAN BONDING DEVICES.

The patents on a number of important bonding devices have been obtained by A. Hoffman, of the Milwaukee Street Railway. Mr. Hoffman has had the satisfaction of seeing his bonds adopted by the Milwaukee Company and of having numerous inquiries from other companies. He is now ready to sell the right of manufacturing these devices to companies wishing to use them. They can be made with the ordinary facilities at hand in any street railway town.

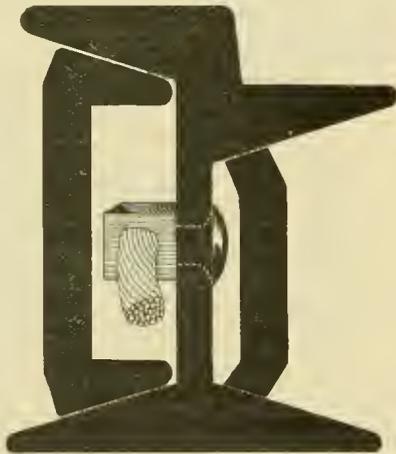

FIG. 1.

The patents cover the use of a fish plate covering the bond wire. The new form of angle bar recommended for this purpose (Figures 1 and 2) is as strong as the ordinary form and costs only five cents more.

It can be made adaptable to any kind of rail.

Its use is not restricted to Mr. Hoffman's bonds, as rights to use it with any bond will be granted. It protects the bond from mechanical injury, keeps it from contact with the soil, and most important of all enables the use of a very short bond. This latter point may be

FIG. 2.

the source of quite a saving in copper where heavy bonding is necessary. If desired, the space between the angle bar and rail may be filled with pitch. The Hoffman bond for heavy work is the result of a discovery

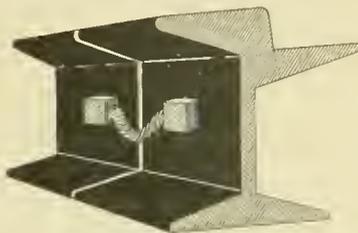

FIG. 3.

by Mr. Hoffman of a method of casting copper so as to

be able to cast copper rivets to the ends of flexible cable. These rivets are pure copper. In putting them in, the hole in the rail web should always be countersunk, as

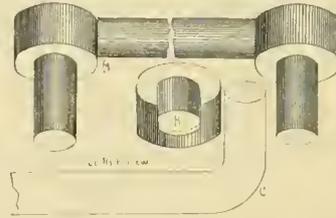

FIG. 4.

riveting can not be done well except in a countersunk hole. For lighter bonding the one in use at LaCrosse and described by us last year was devised. It consists of a single piece of wire bent at right angles at the ends and passed through

a brass washer to which it is soldered and which forms a shoulder so that the bond can be riveted.

SOME VERSE ON THE BOSTON SCHEMES.

[We beg the Boston Post's pardon for slightly altering the last two lines of the following production. Meigs' scheme is an elevated; the subway is the "popular" idea, and of Boynton's bicycle everybody knows. Ed.]

ELEVATED.

Will you walk onto my terrace?  
Said Joe Meigs unto the Sub;  
'Tis the queerest iron terrace  
You'll find in all the Hub.  
The way into my terrace  
Is up a winding stair,  
And I'll show you rapid transit  
A whirling through the air.

SUBWAY.

Will you come into my cavern?  
Said the subway to Mr. Meigs;  
'Tis the smoothest all-round cavern  
Ever went without its legs.  
The way into my cavern  
Is down a winding stair,  
And I'll show you rapid transit  
'Neath the city's thoroughfare.

BICYCLE.

Will you get on to my cycle?  
Said Herr Boynton to his pals;  
'Tis the swiftest, cutest cycle,  
It will beat Niagara Falls.  
And you can mount my cycle  
Without a winding stair,  
And I'll show you rapid transit  
With a minimum of scare.

WEST END.

Will you walk into my office?  
Said the West End to the rest;  
I am not a railroad novice,  
And I'll treat you to my best.  
See, it matters not at all  
Whether one or 'tother win,  
For unless we carry all  
We'll be roasted for the sin.

A STREET railway rate war is in progress at Savannah, Ga. The City & Suburban Railway cutting rates to 1 cent, 1 1/2 cents and 3 cents a mile, according to distance. George Parsons, of New York, is owner of the lines, and wishes to compel the purchase of the property by the Electric Railway Company. Ad interim, both roads lose money and nobody walks anywhere.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Guard Wires to Protect Wires of Telephone Companies.*

A telephone company doing an established business, and having its wires strung in the streets, by license of the city, may have *mandamus* to a street car company thereafter licensed to use electric power on the same streets, to obey an ordinance requiring it to string guard wires to its trolley wire, in places where it must cross other wires, so as to prevent damage by its breakage, on a showing that relator is in special danger as to the life of its servants and the integrity of its property in case of such breakage, that breakage cannot be prevented altogether and that guard wires are the approved and only safeguard therefor.

In the opinion the Court said:

We are of the opinion that the facts set out in the relation are sufficient to entitle the relator company to the remedy asked for. The telephone company occupied the streets of the city with its poles and wires, and was in the safe and successful prosecution of its business, under the authority of law and "by the permission, consent and approval" of the City of Janesville. The defendant company afterwards sets its poles and extends its wires along the same streets, so that its lines frequently cross the lines of the relator, and in such near contact as to endanger the persons in its employment, and its property, and threaten the destruction of its business. Relator's wires are up in the streets, bearing sufficient electrical power to make telephonic communications, and the defendant crosses them in many places with its wires, bearing electrical power sufficient to propel the cars upon its street railway; and the first storm that comes may blow down the poles and wires of the relator and its wires come in contact with the wires of the defendant where they cross each other, and become charged with its dangerous currents of electricity, set fire to the buildings in which the telephone instruments are used, and injure other property, and the persons employed in the "Exchange" and other places, so as to endanger or destroy the business of the relator. Ought not the defendant to be compelled to adopt the above safeguards to prevent this threatened mischief or to withdraw its lines from the vicinity of the relator's wires?

Section seven of the ordinance of the city, dated October 10, 1892, imposes this duty upon the company using this "electrical power system" in all cases, and requires it to apply such safeguards, under a penalty.

It is claimed that said ordinance has only future operation or effect. In application to the case, section seven of that ordinance provided: "Whenever it shall be necessary to cross \* \* \* telephone line or lines or any wires used," etc. Has it not been necessary for the defendant company to cross these telephone wires or lines of the relator since the passage of the ordinance, and is it not now necessary to do so? Then the ordinance by its terms is applicable to this case. The ordinance is made to regulate existing things, and things which continue to exist, as the wires of the defendant cross the wires of the relator. Whenever at any time wires so cross, this safeguard must be applied. The ordinance

has a present and future effect. It is said these wires crossed before the ordinance was passed. This is true,—and they have continued to cross ever since, in violation of the ordinance. The ordinance does not prohibit the crossing of such wires. It provides the remedy for it as an existing evil, and requires safeguards to be so placed as to avoid the danger to person and property. It is not retroactive in any sense. First.—The ordinance is reasonable because it requires that to be done which in law and good conscience the defendant ought to do for the protection of the relator, whose established business it has endangered and disturbed. Second.—It is clearly sustained under the police power of the city.

There can be no question, at this late day, but that our municipal corporations may make all reasonable regulations for the location and use of electric wires in the streets, and require all reasonable safeguards for the same. The question is virtually so settled in this state by our own decisions. The relator is entitled to sue out the writ of *mandamus* to compel the defendant to properly place such guard wires as the proper safeguard in such a case to protect its rights and safety. The relator is especially interested in the defendant's performance of this public duty. It is admitted to be true that such guard wires so placed are the very best and most approved method of safeguard in such case. This then is a clear legal right to be enforced by *mandamus*. There is no adequate remedy in such a case except by the writ of *mandamus* to compel the respondent company to do what it is clearly right for it to do—and that the relator has the right to compel it to do. The penalty enforced would not cure the mischief.

It is said that no such damages have yet accrued. The relation very clearly shows that such damage is imminent and threatening, and the danger is all the time present. This might be sufficient ground for an injunction to restrain the defendant from crossing the wires of the relator with its wires—a much more violent remedy. The relator does not seek to prohibit such crossings, but only to make them safe. The relator is conducting its telephone business under constant fear and apprehension. Must it wait until the full extent of the apprehended consequences have been realized? The remedy sought is clearly the proper one.

(Supreme Court of Wisconsin. State ex rel Wisconsin Telephone Company vs. Janesville Street Railway Company, 57 Northwestern Reporter 970.)

*Electric Cars—Injury to Passengers by Electric Shock.*

In an action for personal injuries resulting from an electric shock, caused by contact with defendant's street car while alighting therefrom, evidence that the car was so charged with electricity as to injure a person by contact with any part, establishes a *prima facie* case of negligence.

It was proper to ask a witness, who testified that electricity could not be transmitted to a trail car in such quantities as to cause personal injuries, whether the metal railings around all of defendant's cars were not blistered by leakage of electricity; such questions not being objectionable as not being limited to the car by which plaintiff was injured and about the time of the accident, when the witness testified that he did not know of the injury till the day after it happened, or what caused the injury.

Colorado Court of Appeals. Denver Tramway Company vs. Reid, 35 Pacific Reporter, 269.

*Boy Riding on Platform at Invitation of Motorman.—Ejection by Conductor.*

The jury found specially that plaintiff had been injured by the wheels of defendant's electric car, that with other boys he went on said car by invitation of the motorman; that the conductor did not warn them off till after the car was in motion; that he used force, whereby plaintiff lost his hold and fell from the car; that the boys did not go on the car without leave after the same was in motion; that plaintiff was ten years and ten months old at the time, and under the circumstances, was not guilty of negligence proximately contributing to the injury. The complaint alleged that when plaintiff fell the car was going at a high rate of speed, and the court entered judgment for plaintiff, "all of the allegations of fact in the complaint herein, beyond those covered by the said special verdict, having been proved to be true by the undisputed evidence on the trial." *Held*, that the judgment was supported by the special verdict and findings, though the verdict did not specifically find defendant's negligence.

The complaint alleged that defendant's electric car was in charge of a motorman on the front platform, and a conductor; that the motormen had been used to permit boys of plaintiff's age (11) to ride on the front platforms and steps to a certain switch "for the purpose of inducing such boys to turn said switch" for said motormen; that while the car was stopped at a corner, plaintiff, with the permission of a motorman, "in pursuance of the custom mentioned," stepped on the lower front step for the purpose of riding to said switch. *Held*, that the complaint alleged no purpose of plaintiff to aid in operating the railway such as to make him a volunteer fellow-servant of the conductor.

Supreme Court of Wisconsin. Hart vs. West Side Railroad Company. 57 Northwestern Reporter, 91.

*Action by Mother for Causing Death of Son—Evidence of Inexperience of Person Killed—Gates on Platforms.*

The fact that the passenger killed had never before ridden upon an electric car was admissible in evidence, as tending to illustrate the cause of his failure to alight in safety; familiarity with this mode of transportation would qualify him to see and appreciate danger which he would not be likely to observe if he was wholly without experience. With experience, he might be chargeable with fault; without it, with none.

Although there may be no negligence whatever in the failure of an electric street railway company to have gates on the platforms of its cars for the purpose of

guarding against accidents to passengers, by preventing them from leaving the cars on the side next to the parallel track of the same company in the street, yet when the company has such gates on the platforms of its cars, not to keep them closed may or may not be negligence in a given instance, and this is a question of fact for the jury.

When a car stops because of an obstruction on the street, and not to afford any passenger an opportunity for getting off, the company is not responsible for the safety of the place as one for getting off, whether the car, at the time the passenger undertakes to do so, was in motion or at rest, the conductor not seeing the passenger or being aware of his purpose at the time the attempt to get off is made.

(Supreme Court of Georgia. Augusta R. Co. vs. Glover, 18 Southeastern Reporter 406.)

*Action for Personal Injury—Defective Street—Duty of Street Car Company to Repair.*

Appellee sued for injury sustained in consequence of defective condition of a street crossing at a place where two streets cross each other, along one of which streets the track of the appellant lay. It is familiar law in this state that the repairing of streets in a city is the duty of the city.

If a corporation accepts a grant from a city of the right to use the street in a special manner, and the grant is burdened with a duty, which it neglects, and injury results, the corporation would, no doubt, be responsible for the consequences of neglect of that duty; but for mere non-repair of a street in which it has a special privilege, it is not liable simply because it has such special privilege.

(Illinois Appellate Court. Rockford City Railway Company vs. Matthews, 50 Illinois Appellate 267.)

*Wagon on Street Car Track—Failure to Turn Out—Collision.*

Plaintiff driving in his wagon in a broad street, with his high wheels in defendant's street car track, was met and run into by a car. *Held*, that the Court properly charged that the car driver had a right to assume that plaintiff would turn out in time, but that if plaintiff failed so to do, and the car driver saw it, he must do what he could to stop his car and warn plaintiff off.

(Supreme Judicial Court of Massachusetts. Glazebrook vs. West End Street Railway Company. 35 Northeastern Reporter 553.)

*Person Injured by Iron Falling from Trolley Pole—Presumption of Negligence.*

In an action against a street railway company for personal injury, it was undisputed that an iron ear, which connected the trolley wire with a guy, broke and fell on plaintiff's head. There was no other evidence that the accident was caused by defendant's negligence. *Held*, that an instruction which recited the manner of the accident and asserted that, if nothing else appeared, the jury should find that defendant was negligent, was proper, and was not misleading, where the jury was further instructed to consider all the evidence.

(Supreme Judicial Court of Massachusetts. Uggla vs. West End St. Ry. Co., 35 Northeastern Reporter 1126.)

A STREET RAILWAY BAGGAGE SYSTEM.

Manager Mackenzie, of the Niagara Falls, Park & River Railway Company, of Niagara Falls, Canada, with his usual enterprise, has instituted a baggage car service on this interesting line. In form it is simply a box car appropriately lettered, and equipped with one motor. It

is run following the regular train which connects with the boat at Queenston for Toronto, and at Slater's Point for Buffalo.

All baggage is marked with label shown herewith. No other blank forms are used, and no receipts are given or taken.

A TRANSFORMATION SCENE.

Within the next few months the Limits station of the North Chicago Street Railroad Company will be so thoroughly changed that its old friends will scarcely recognize it. To begin with, the North Shore electric cars now connect at the barn, turning in at Dewey court and making a loop through and between the buildings. A new waiting room, or rather transfer room, has been built at this corner and before many days a substantial roof will cover the loop and the pavement in front of the building. An ornamental porch will probably be extended the whole length of the station and concrete walks will be added. The horse barns, of course, will be finally relegated to the dear, dead past, and 160 animals turned over to the peddler and the farmer. The Evanston Avenue horse line has call for but few cars, as the North Shore electric trains run north on Halsted to Evanston avenue, thus completing the line to Evanston from the Limits Station without change. The transfer arrangement, of course, is not in vogue on the Evanston electrics.

INFORMATION WANTED.

A Spokane, Wash., subscriber, writes for information as to enameling iron. He wishes the names of plants doing this business, books treating upon the subject and any information that may be afforded upon the process or material.

IN A STREET CAR.

But a feeble, bent old lady,  
With a faded, wrinkled face,  
Who along the car peered dimly  
To obtain a vacant place.  
Yet, as if with pulse electric,  
Instantly upon his feet  
Every man arose, to give her  
With a smile his empty seat

Kindly glances rested on her;  
Kindly hands were ready there  
To support her should she need it.  
For her soft and snowy hair  
Seemed an aureole of glory  
To those care encumbered men,  
As the mother love within them  
Woke to consciousness again.

Ah, there's nothing half so holy  
In this world of sin and woe  
As the love that blessed our childhood  
In the years of Long Ago;  
And a common chord of feeling  
Linked together man with man  
When the thought of home and mother  
Through that crowd of strangers ran.  
—Helen Chauncey, in Harper's Bazaar.

WATT-HOURS PER CAR MILE.

The accompanying table shows the consumption of power in watt-hours per car mile of motor cars under several conditions. They are not to be taken as in any sense comparative or as representing the average performance of any of the motors mentioned. They are simply the results of tests which have appeared in the REVIEW at different times, figured out in watt-hours per car mile. This way of expressing results is likely to be common in the future, on account of the increasing use of the Thomson recording wattmeters, made especially for testing street railway motors. It is really the only way of expressing the practical commercial efficiency of a motor. In making comparisons it is necessary that the speed, track and motorman be the same in all cases. Wattmeters are valuable chiefly as time savers, as they give the same results as ammeter and voltmeter readings, without requiring any calculation. In order to get the same results with ammeter and voltmeter as with a wattmeter, the voltmeter readings taken when the current is off must be discarded.

|   | Condition of tracks. | Average distance between stops. | Weight motor car. | Watt-hours per car mile. | Average Speed. |
|---|----------------------|---------------------------------|-------------------|--------------------------|----------------|
| Two No. 3 Westinghouse motors, one trailer. | Good                 | .43 mi.                         | 7½ tons           | 1,101                    | 8.6            |
| " " " " " two "                             | Dry                  | " "                             | " "               | 1,207                    | 6.3            |
| " " " " " "                                 | " "                  | .43 "                           | 7½ "              | 1,286                    | 6.5            |
| Sperry bevel gear motor, alone              | Greasy               | .60 "                           | 6 "               | 1,160                    | 10.0           |
| " " " " " "                                 | " "                  | .60 "                           | 6½ "              | 1,179                    | 10.0           |
| One No. 3 Westinghouse motor, alone         | " "                  | .60 "                           | 7½ "              | 1,233                    | 12.0           |
| Two " " " " " "                             | " "                  | .60 "                           | 7½ "              | 810                      | 10.0           |

The Coventry, England, tramways will probably be worked electrically, the Electric & General Contract Corporation having accepted the town's proposition.

## ALLEN S. DEXTER.

The new sales agent for the safety clutch brake, of Philadelphia, has been known to the majority of street railway men of Chicago and the northwest as the manager for that section of the Binghamton Oil Refining Company.

Allen S. Dexter was born at Albany, New York, and received both his general and business education at that city's schools. His first active business relations were with the drug trade in Albany, afterwards removing to Des Moines, Iowa, in the same line.

A. S. DEXTER.

Just after the Chicago fire, of 1871, Mr. Dexter came to this city, and after a year's recreation, entered into the western management of the Binghamton Oil Refining Company,

where he has since remained. His present quarters are at 70 West Lake street, and his telephone number is Main 1645.

Mr. Dexter has assumed the salesmanship of the Safety Brake as a side line for his usual business, and since both for fuel oil and lubricants he meets street railway men, the safety brake is a consonant adjunct. The best that can be wished Mr. Dexter is that the safety brake specialty may grow to the success that his other connection has attained.

## ONE ON THE CONDUCTOR.

It was on a Cottage Grove trailer, and the blue coated executive of the car having made his collections was desperately attempting to flirt with a pretty girl whose curly head appeared from the second story window of an adjoining flat. Suddenly he was aroused to a sense of duty. His eagle eye caught a violation of the rule posted at the front of the car. In a moment he stood at the end of a middle seat and accosted a Hibernian gentleman who held an unlighted cigar in his mouth.

"Mustn't smoke here. 'Gainst rule," said the conductor.

"Who's smokin'?" replied the passenger.

"Well, you've got a cigar in your mouth."

"So have oi got fate in me shoes but oi'm not walkin'," was the retort, and the conductor dropped off the car and waited for the rear end to catch up with him, while the passengers all smiled a wicked little smile.

THE new board of rapid transit commission for New York has adopted the plans for an underground system has laid out by their predecessors. They then adjourned until September 25. This action was taken to bring the question of the city's construction of a rapid transit system before the voters at the election in November.

## PENNSYLVANIA ASSOCIATION.

The executive committee of the Pennsylvania Street Railway Association met July 28. There were present: Robert E. Wright, Allentown; B. F. Meyers, Harrisburg. William Lanious, York; S. P. Light, Lebanon, and Richmond L. Jones, Reading.

The meeting was held at the offices of the Reading Traction Company, and preliminaries were arranged for an extensive meeting September 5, 6 and 7, at Reading. The headquarters will be the Neversink Mountain Hotel, and a large attendance is expected. An invitation is to be extended to all supply houses to send representatives and make a display of goods and specialties. The headquarters hotel is capable of accommodating several hundred guests.

## THE MAINE STATE ASSOCIATION.

The Street Railway Association of the State of Maine will hold its midsummer meeting August 16, at 10 o'clock a. m. at Rockland.

The Maine Central Railroad has courteously tendered the association a special car, which will leave the Union station, Portland, Wednesday, August 15, at 1:20 a. m.

The Rockland, Thomaston & Camden Street Railway Company has arranged for a dinner for the brethren at the adjournment of the session. A number of the delegates will remain in Rockland over the sixteenth and take a steamer trip up the river to Bangor, reaching that city on the seventeenth, and going thence to Waterville.

Several important questions are to be discussed relative to legislative treatment of street railways, and an enthusiastic and largely-attended meeting is looked for.

The officers of the association are: W. R. Wood, Portland, president; E. A. Newman, secretary and treasurer.

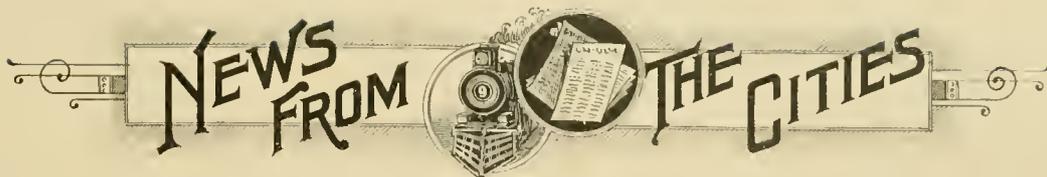

## ST. LOUIS RETURNS.

The usual quarterly report of the St. Louis street railroads has been published. The figures are as follows:

|                                    | Trips.    | Passengers. |
|------------------------------------|-----------|-------------|
| Baden and St. Louis .....          | 5,520     | 69,232      |
| Cass Avenue and Fair Grounds ..... | 171,288   | 2,477,947   |
| Citizens' .....                    | 141,768   | 1,907,237   |
| Jefferson Avenue .....             | 22,691    | 363,584     |
| Lindell .....                      | 314,848   | 4,165,553   |
| Missouri .....                     | 285,482   | 3,688,242   |
| Peoples' .....                     | 49,686    | 1,032,051   |
| St. Louis .....                    | 175,696   | 2,730,126   |
| St. Louis & Suburban .....         | 32,500    | 2,083,361   |
| Southern Electric .....            | 78,260    | 1,169,245   |
| Union Depot .....                  | 155,682   | 4,787,032   |
| Totals .....                       | 1,433,421 | 24,773,660  |

For the same period last year the totals were: Trips, 1,625,799; passengers, 26,186,742. This discrepancy of 2,000,000 is accounted for by the hard times of the last quarter and the shutting down of the factories.

J. M'ADAM & Co. have undertaken the \$100,000 extension of the Aberdeen, Scotland, tramways.

### Alabama.

BIRMINGHAM, ALA.—The Highland avenue & Belt Railroad wants a franchise for extensions and will probably get it.

### California.

SAN FRANCISCO, CAL.—Ground has been broken for the Page Street electric line of the Market Street Railway Company.

SAN FRANCISCO, CAL.—Col. F. H. Meyers, vice-president of the Alameda, Oakland & Piedmont Street Railway Company, Oakland, is dead.

OAKLAND, CAL.—G. K. Edwards, assistant superintendent of the San Leandro electric line, has resigned, and James Baker has been appointed his successor. Mr. Edwards was banqueted by his former associates.

SAN FRANCISCO, CAL.—A deed of trust issued by the Market Street Railway Company to the Union Trust Company of San Francisco has been filed. It is given to secure issue of \$17,500,000 bonds, which will be issued to pay off individual indebtedness of the several lines recently combined.

OAKLAND, CAL.—The rolling stock and personal property of the Piedmont Cable Railway Company has been sold at sheriff's sale on \$19,028 judgment in favor of the Oregon Improvement Company. John L. Howard, of the Improvement Company, bought nearly everything. The road is now operated by cars leased from Howard.

### Canada

QUEBEC, CAN.—C. St. Michel, president of the Quebec street railway, died July 23, at the age of 83.

HAMILTON, ONT.—The Hamilton & Dundas Dummy line will probably re-equip with electricity. C. J. Myles is lessee of the line and B. B. Osler is president.

TORONTO, CAN.—D. G. Stephenson, president of the Toronto & Scarboro Electric Railway, has disappeared. He was prominent in all public affairs and greatly trusted. His liabilities amount to \$50,000.

VANCOUVER, B. C.—New Westminster & Vancouver Tramway Company elects: President, David Oppenheimer; vice-president, B. Douglas; directors, J. A. Webster, Isaac Oppenheimer, and E. A. Wyld; secretary-treasurer, B. N. Smith.

NIAGARA FALLS, CAN.—The Niagara Falls, Wesley Park & Clifton Street Railway has been sold for \$25,000. The new owners of the road are Alexander Manning, ex-mayor of Toronto, Senator Aikins, Col. C. S. Gzowski, James A. Lowell, M. P., W. M. German, M. P., and others. Alexander Manning and Senator Aikins are the provisional president and vice-president respectively of the new company. The line will be changed to electricity as soon as possible.

### Chicago.

CHICAGO.—The city council passes ordinance for extension of L line from Market street to Wabash avenue, via Lake street.

CHICAGO.—The county commissioners are considering a franchise for an electric railway line between West Pullman and Morgan Park. The company is to be called the Morgan Park Electric Railway Company, for 20 years.

CHICAGO.—The Northern Electric Railway, which has a franchise for four miles of electric road from West Forty-seventh and Lake streets to Cragin, wishes proposals on entire equipment. Address Paul Dickenson, 68 Churchill street, Chicago.

CHICAGO.—T. Hackworth Young, manager of the railway department of the Transportation building of the World's Fair is dead. Mr. Young will be pleasantly remembered by all street railway exhibitors as a fair minded and accommodating gentleman.

CHICAGO.—The Chicago & Suburban Electric Elevated Railway Company is incorporated by J. M. Hannahs, Albert Wahl, F. W. Wolf, C. R. Matson, Benezette Williams and Michael W. Ryan—all well known men. The company wants to build an elevated loop through the center of the city.

CHICAGO.—The Yerkes syndicate has placed \$18,000,000 mortgage<sup>s</sup> running to the Illinois Trust & Savings Bank. Of this, \$15,000,000 is on the property of the Northwestern Elevated; \$1,000,000 on the North Chicago Electric Railway Company, and \$2,000,000 on all the property of the Chicago Electric Transit Company. It is given out that electricity will be used on the new L.

CHICAGO.—The Lake Street L Company will soon make a new issue of bonds to take care of \$1,200,000 floating debt. Work has started on the Humboldt Park extension.

The bonds of the Englewood & Chicago Street Railway are offered for sale with stock bonus. They are first mortgage 20-year sixes, registered with the Equitable Trust Company.

CHICAGO.—A. G. Goodman is said to be president of the Central Rapid Transit Company, and Z. S. Cornell, secretary.

CHICAGO.—The North Side Electric Street Railway ordinance is returned without signature by Mayor Hopkins. The mayor's suggestions for amendments were adopted and the ordinance re passed.

CHICAGO.—The Englewood & Chicago Electric Railway Company expects to have its main line to Morgan Park finished by winter time. The power house will be at Vincennes road and 87th street, and will cost \$100,000. The capital stock of the company is \$1,000,000 and the bond issue is \$2,500,000. The officers are W. H. Comstock, president; A. J. Whipple, vice-president, and F. E. Elder, secretary. Offices in New York Life building.

CHICAGO.—On August 20 the Chicago General Street Railway, 1032 Lawndale avenue, Chicago, will receive separate bids for: Two 450-horse-power Corliss engines; two 300 k. w. generators; three 200 horse-power boilers. These supplies to be set on proper foundations by the manufacturer. One engine, one generator and two boilers are desired for immediate delivery, the other unit to be delivered by May 1, 1895. The proposals will be considered with reference to: 1, quality and quantity of necessary attachments and fixtures; 2, place of delivery; 3, guarantee as to operation and repairs; 4, price; 5, efficiency. Proposals may be sent by mail or express to C. L. Bonney and should be marked boilers, engines or generators, as the case may be. An award will be made on such proposals as soon as the same may be considered. The prices should be made net to the company without commissions or expenses to outside agents.

### Colorado.

COLORADO SPRINGS, COLO.—The Colorado Springs Rapid Transit Company brings suit in federal court against the General Electric Company for \$20,000 damages, alleging failure of machinery.

DENVER, COL.—Organized: The Traction Construction Company, with headquarters in Denver and branch offices in New York City and Chicago, by Geo. E. B. Hart, William B. Dowd, both of New York City, and Henry A. Kirkham, of Denver, to build, construct and operate street railways, tramways, electrical and cable railways, with a capital of \$50,000.

### Connecticut.

HARTFORD, CONN.—The Hartford, Manchester & Rockville Tramway Company met at the office of M. S. Chapman and resolved to build the line.

NEW HAVEN, CONN.—Dovey & Company, limited, of Philadelphia, been given contract for completely rebuilding and extending and elec-

trically equipping the New Haven & Centerville Street Railway. A large car barn, but no power house, is to be built. The officers of the company which now owns the road are: J. Newton Pierpont, president, and W. M. Allyn, secretary. The stock is owned chiefly by E. J. Moore & Co., bankers, of Philadelphia, and Thomas C. Barr, the well-known street railroad magnate. There was an attempt about a year ago to bond the road for \$700,000, before it had been transferred by Cornelius Pierpont, its former owner, who received \$225,000 for it.

### District of Columbia.

WASHINGTON, D. C.—E. Saxton has been awarded the contract to build the cable line for the Columbia Railway Company. The cost will be \$600,000, and work will begin September 1.

WASHINGTON, D. C.—Metropolitan Railroad Company elects W. J. Stephenson as president; A. A. Wilson, vice-president; William J. Wilson, secretary and treasurer, and William E. Lowry, superintendent.

WASHINGTON, D. C.—W. F. Baker, of the Columbia Railway Company, notifies the commissioners that he is about to change the motive power of his line to cable. Plans and specifications are filed at the District building.

WASHINGTON, D. C.—The Chevy Chase & Kensington, Electric Railway Company has been organized to build from the terminus of the Rock Creek Electric Railway to Kensington. The officers are: Oliver R. Harr, president; Alfred Ray, vice president; W. Henry Walker, secretary and treasurer. Board of directors: Redford W. Walker, Reuben B. Dietrich, August Burgdorff, Oliver R. Harr, W. Henry Walker, Alfred Ray, Thomas R. Martin, William H. Mannakee, Alfonso Hart, Alexander M. Proctor and C. Parker Jones.

### Florida.

TAMPA, FLA.—John Jay Philbrick has gone to New York to close the deal with E. H. Gato for the Key West Street Railway.

KEY WEST, FLA.—Philbrick, Allen and others have been granted an electric franchise. Engineer C. Caves, of New York, will draw plans and specifications.

### Georgia.

ROME, GA.—Rome Electric Railway has been bought at Sheriff's sale, by Captain John J. Seay, for \$31,600. The line will be rehabilitated and operated.

COLUMBUS, GA.—S. A. Carter, president of the North Highland Street Railway Company, has been enjoined by the Columbus Street Railway Company against building parallel tracks.

### Illinois.

ALTON, ILL.—J. H. White has resigned the secretaryship of the Street Railway Company.

PEKIN, ILL.—A. F. Lee is local representative of a company that wishes to build a line here.

GALESBURG, ILL.—Judd Seacord is elected superintendent of the street railway and Henry Arnold assistant.

CHICAGO, ILL.—The Cicero & Proviso Street Railway Company ask a franchise through River Forest for 20 years.

MT. CARROLL, ILL.—McCarroll city council grants C. P. Woodworth a franchise for electric light plant for ten years.

PARIS, ILL.—Frank Fairbanks, of Terre Haute, Ind, is negotiating for the construction of a line here. Paris capital is also interested.

GALESBURG, ILL.—Street Railway Company elects: President, Robert Chappell; vice-president, O. F. Price; treasurer, W. Seacord; secretary, Henry Arnold.

WARSAW, ILL.—It is proposed by J. C. Hubinger, a capitalist of Keokuk, to extend his electric street car system to that city, and also to Carthage and Nauvoo, Ill. The plan is to cross the Mississippi by means of a high bridge at Keokuk, but Warsaw capitalists will use their influence to have the bridge built at this point, as a bridge charter has been secured.

SPRINGFIELD, ILL.—Organized: The Citizens' Electric Company, a \$60,000, by John McCreery, Fred A. Buck, L. H. Coleman, P. W. Harts and E. A. Wilson.

### Indiana.

TERRE HAUTE, IND.—It is proposed to extend the street railway to Highland Lawn Cemetery.

RICHMOND, IND.—Numerous cases are now pending against the Richmond Street Railway Company, alleging fraud against the promoters of the line.

MUNCIE, IND.—Chas. B. McCulloch, of Boston, has been granted franchises for electric railway to connect Red Key and Dunkirk villages near here. The line will be 3½ miles long and an electric light station will also be built.

NEW ALBANY, IND.—Louisville, Ky., and New Albany citizens are agitating the question of a new electric railway, and eastern capital has been invited to view the ground. The Commercial Club, of New Albany, is at the head of the matter.

HAMMOND, IND.—Telford Burnham and Rand, McNally & Company, project a new electric railway from this town to Chicago. Work will begin early next month. The proposed route is from the state line through West Hammond and Burnham, thence connecting with the Calumet electric line at 104th street.

SHELBYVILLE, IND.—The Shelbyville Mutual Telephone Company is incorporated at \$10,000, and has received a fifty year franchise from the city. The officers are: S. B. Morris, President; G. C. Pratt, vice-president; John C. De Perez, treasurer; John D. Pugh, secretary, and Chas. C. Caldwell, electrician. The construction and purchasing agent is Mr. Caldwell.

WASHINGTON, IND.—The following company is incorporated: The Washington Street Railway Company, of Washington, Daviess county, with a capital stock of \$50,000. The directors are Louis C. Fritch, W. W. Peabody, Jr., Ira G. Rawn and D. D. Carothers all of Cincinnati; William R. Gardiner and Charles G. Gardiner, of Washington. L. C. Fritch, of Cincinnati, and W. N. McMahan, of Washington, each has twenty-five shares, while the others have ten shares each.

### Iowa.

FORT DODGE, IA.—The electric railway franchise was voted to the local syndicate.

DUBUQUE, IOWA.—J. A. Rhomburg, of the Street Railway Company, will extend his line to Sageville (six miles) and make a summer resort.

SIoux CITY, IOWA.—John Peirce is after the Covington & South Sioux City Street Railway Company to add to the Consolidated system.

SIoux CITY, IA.—John Peirce has made an offer for the Leeds Electric Railway that will probably be accepted. The line will be extended and improved.

SIoux CITY, IA.—Hugh McMillan has begun suit against the Sioux City & Leeds Electric Railway Company to recover \$255.20 on account owing to the Detroit Electric Company.

SIoux CITY, IOWA.—John Peirce, of the Sioux City Street Railway Company, has secured control of the Riverside Street Railway. The new management will be called the City & Suburban and will not extend at present.

IOWA CITY, IA.—T. L. Seevers, of Oskaloosa, Ia., is planning an electric railway here. He is manager of the Muscatine Street Railway. A committee of Iowa City business men will look up the matter. They are: S. D. Cook, Lovell Swisher, C. S. Welch, C. F. Lovelace, and P. J. Regan.

### Kansas.

ATCHISON, KAN.—St. Louis Trust Company has filed a foreclosure suit against the Atchison Electric Street Railway & Electric Light Company, for a \$9,000 mortgage. A new company has been formed by Atchison capitalists by which the business of both concerns will be continued.

**KANSAS CITY, KAN.**—The Metropolitan Company asks for a franchise permitting it to connect its Chelsea Park line with the cable. This will complete a belt line.

**PITTSBURG, KAN.**—Chartered: The Pittsburg, Frontenac & Suburban Electric Railway Company, of Pittsburg. The capital stock of the concern is \$75,000. The directors are Samnel Barrett, Robert Robyn and A. L. Chaplin, of Pittsburg, L. M. Bedell, E. W. Minturn and Carl J. Simons, of Chetopa, and Robert Simons, of Westchester, Pa.

## Louisiana.

**NEW ORLEANS, LA.**—The council committee on street railways grants St. Charles Street Railroad Company right to use electricity. Similar action was taken upon a resolution authorizing the Orleans Street Railroad Company to use electricity as a motive power on the route it operates.

## Maine.

**LEWISTON, ME.**—N. O. Pope, New York, has bought the Lewiston & Auburn Horse Railway and will immediately change it to electric-ity.

## Maryland.

**BALTIMORE, MD.**—President Bowie, of the City Passenger Railway Company, says he will buy open cars for next year.

**RANDALLSTOWN, MD.**—The Randallstown, Harrisonville & Granite Rapid Transit Company has organized and elected officers as follows: President, Edward S. W. Choate; vice-president, Geo. E. Lynch; secretary, Dr. Henry J. Hebb; treasurer, Judge James W. Offut; solicitor, Z. Howard Isaac; directors, the above officers and R. P. Choate, Albert Webber, Aaron Weber, Henry C. Luttgerding. The company is negotiating with James G. Floyd, agent of the Barrows Electric Railway Company, to put in that elevated system.

**TANEYTOWN, MD.**—A meeting has been held here to get a permanent organization for the Baltimore-Gettysburg electric railway. A H. Zollickoffer was made president. The executive committee appointed is as follows: A. H. Zollickoffer, Dr. George T. Motter, Ed E. Reindollar, George H. Birnir, Dr. C. W. Weaver, P. M. Weist, of Taneytown; A. J. Lightner and Judson Hill Harney, John McFadden, of Philadelphia, Pa.; Dr. J. J. Weaver, Jr. and Ed. G. Gilbert, of Uniontown. Governor Brown has promised to meet the committee at an early date to consult with them.

## Massachusetts.

**ATTLEBORO, MASS.**—All legal action in the Attleboro, North Attleboro & Wrentham street railway matter has been postponed for an indefinite time.

**ATTLEBORO, MASS.**—The Attleboro, North Attleboro & Wrentham Street Railway has passed into the hands of the Union Traction Company, of Providence, R. I.

**BROCTON, MASS.**—The West Side Street Railway Company is organized at \$50,000 to build five miles of electric railway. The following will act as a board of directors until others are legally chosen by the corporation: J. C. Snow, J. E. Carr, P. K. Bacon, H. F. Woodward, Albert Barrows, A. B. Hastings and Edwin Keith.

**WEYMOUTH, MASS.**—A movement is on foot to build an electric line four miles long. The capital stock will be \$40,000 and the principal stockholders are Representative John Kelley, Judge James H. Flint, John W. Carey, H. F. Perry, F. A. Sulis, Francis Ambler, E. W. Hunt, A. M. Bachelder, and Thomas T. Bailey. It is intended to run cars by November 1.

**BOSTON, MASS.**—Boston Elevated Railway Company elect the following officers: President, General Charles A. Whittier; vice-president, George H. Towle; clerk of corporation, Fred C. Patch; treasurer, George A. Carney, Lowell, treasurer of the Lowell Institution for Savings; general counsel, Willard Howland; chief engineer, J. V. Meigs; consulting engineer, General Herman Haupt. They will build the new Meigs' system.

**BOSTON, MASS.**—Chartered: The Athol & Orange Street Railway Company. The road is to be run from the fair grounds in Athol to the square in Orange. The company is capitalized at \$60,000. The incor-

porators are E. R. McPherson, of Cambridge; C. H. Utley, of Brookline; John McPherson, of Medford; J. R. Nickerson, of Dorchester; F. O. Squire, of Arlington; J. Granville Young, of Boston; N. Sumner Myrick, of Boston; J. Albert Brackett, of Boston; W. B. Ferguson, of Malden; J. G. Shaw, of Newburyport; G. A. Butman, of Malden; T. H. Goodspeed, of Athol; Lucien Lord, of Athol; and J. W. Wheeler, of Orange. Of these, N. Sumner Myrick, of Boston, represents 586 shares and the others one each. The directors are: E. R. McPherson, W. B. Ferguson, N. Sumner Myrick, T. H. Goodspeed, Lucien Lord and J. W. Wheeler.

## Michigan.

**COLDWATER, MICH.**—It is proposed by solid citizens to build an electric railway to Union City via Girard.

**GRAND HAVEN, MICH.**—Chicago men are trying to get a line of electric railway built to Spring Lake and Highland Park. Water power is to be used.

**DETROIT, MICH.**—The old Detroit City Railway Company has filed a renewal of its \$1,000,000 chattel mortgage to Sidney D. Miller and Chas. M. Swift, trustees, with unpaid interest from July 1, 1892.

**ANN ARBOR, MICH.**—The Ann Arbor Street Railway Company has called a meeting of its stockholders for August 16, to elect directors and arrange with eastern parties to put the road into operation at once.

## Minnesota.

**WINONA, MINN.**—C. M. Putnam has resigned as superintendent of the street railway. He has not decided as to his future plans. Mr. Putnam has been here two years and is an efficient man.

**STILLWATER, MINN.**—Formal articles of incorporation have been filed by the Stillwater Electric Railway Company. The capital stock is \$75,000. The officers are Allen Curtis, president; E. P. Motley, vice-president; G. E. Waring, treasurer, all of Boston, and John C. Nethaway, of Stillwater, secretary.

## Missouri.

**KANSAS CITY, MO.**—J. J. Michael and Ferd Heim, Jr., ask for an electric franchise on the old Fifth Street Dummy line.

**LEXINGTON, MO.**—Joseph Tribble, who has bought the street railway line, will improve and extend it under his personal supervision.

**HANNIBAL, MO.**—The council grants the Street Railway Company right to extend to Frytown, a suburb. Work will begin at once.

**KANSAS CITY, MO.**—Judge Henry grants Receiver Robert Gillam, of the Northeast Electric Railway, right to issue receiver's certificates to buy equipment. Ten car bodies are wanted.

**ST. LOUIS, MO.**—After two years of hard fighting the South St. Louis electric line has succeeded in getting a bill through the council permitting an extension of its line to Cass avenue. For this privilege, however, the road is asked to pay the city \$10,000 per annum, or more by several hundred dollars than the syndicate pays for its five lines of street railroads.

## New Jersey.

**NEWARK, N. J.**—The board of works commissioners recommend passage of an ordinance compelling use of life guards on all electric cars on or before October 1.

**NEWARK, N. J.**—The Bloomfield car stables of the Consolidated Traction Company burned July 27. Loss is estimated at \$40,000. Six horse cars were burned and 30 were saved. The building covered 1½ acres and was 18 years old.

**ATLANTIC CITY, N. J.**—The promoters of the new electric railway are: L. C. Albertson, president; I. G. Adams, treasurer, and Joseph Thompson, secretary and solicitor. The directors are: L. C. Albertson, I. G. Adams, Joseph Thompson, John J. Gardner, Frank C. Somers, C. L. Cole and C. J. Adams. The corporate title of the company is the Atlantic City Street Railroad Company.

**RED BANK, N. J.**—The Monmouth Electric Traction Company has filed certificate of incorporation at Freehold. The incorporators are William W. Conover, Daniel H. Applegate, Charles B. Parsons, J. Enright, Jr., William T. Parker, Robert Avery, J. W. Robinson, George W. Palmer and Thomas R. Wooley. The capital stock is \$300,000, and it is proposed to build and equip a street railroad from Red Bank to Long Branch and return, making a circuit. The exact route has not as yet been decided upon.

**TRENTON, N. J.**—Certificate of incorporation has issued for the New York & Philadelphia Traction Company, capitalized at \$10,000,000. The plan is to build trunk lines to connect existing lines between the cities named. The New Jersey end of the enterprise will be built, operated and managed by two corporations. The Central Jersey Traction Company, with a capital of \$500,000, and headquarters at 2 Wall street, New York, and the New York & Philadelphia Traction Company, with the general office at Trenton. The officers and directors of the first named company are: President, Frank A. Macgowan, of Trenton; vice-president, ex-Sheriff E. W. Hine, of Newark; secretary, J. H. Baldwin, of Newark; treasurer, J. Darrah, of Trenton; directors, D. K. Bane of New York; W. H. Skirm, of Trenton; J. B. Reall, of Bloomfield, and J. C. McNaughton, of Philadelphia. This company is already incorporated. Mr. Macgowan is president of the New York & Philadelphia Traction Company, while the directors are said to comprise some of the best known capitalists and railroad men in New Jersey, New York and Philadelphia. The road will be built in sections, work to begin at half a dozen points, including Trenton.

### New York.

**WAVERLY, N. Y.**—The Waverly, Soyre & Athens Street Railway is in successful operation between the towns mentioned.

**SYRACUSE, N. Y.**—The Consolidated Electric Railway franchise has been extended to September 17, when the matter will be settled.

**NEW YORK CITY**—Coney Island & Brooklyn Railroad Company wants permission to change motive power from horse to electricity.

**HOMER, N. Y.**—A franchise has been granted to the Cortlandt & Homer Street Railway to run its lines by electricity. Work will begin at once.

**SYRACUSE, N. Y.**—“The syndicate,” says W. W. Kimball, “will build a new power house very soon. Work on the Solvay extension will begin at once.”

**NEW YORK CITY.**—The Metropolitan Traction Company has gained permission to build a crosstown line, a South Fifth avenue line giving rights through Broome, Sullivan and Watt streets.

**SCHENECTADY, N. Y.**—H. S. Cooper, general manager of the Schenectady Street Railway Company, is in the market for a good rail saw and a good track drill, both for use on old rails in place.

**LOCKPORT, N. Y.**—F. H. Reed, Wendell Goodman, president of the Lock City Electric Railway Company, and A. E. Wadratt are here trying to arrange for the completion of the electric railway.

**BUFFALO, N. Y.**—The New Buffalo, Kenmore and Tonawanda Electric Railway has begun operations. The officers of the company are D. F. Calahan, president; N. E. Mack, vice-president; G. H. Frost, secretary.

**BUFFALO, N. Y.**—The West Side Pleasure Railway, of Buffalo, is organized to build a switchback road at Elmwood and Forest avenues. J. C. Dick, of Pittsburg, is manager, and A. F. Schwerd, of Allegheny, is half owner. A pavilion, electric plant, cars, etc., are to be bought.

**UTICA, N. Y.**—The Utica Belt Line Street Railway has been reorganized by electing the following officers: President, John W. Boyle; vice-president, James T. Gardiner; treasurer, Charles W. Mather; secretary, Edw. Bushinger; executive committee, John W. Boyle, Charles W. Mather, James T. Gardiner. The line will be improved and extended immediately.

**YONKERS, N. Y.**—Incorporated: The North & South Electric Railway Company, to construct a street surface road about five miles in length in Yonkers, the northern terminus to be in the vicinity of Shonnard Place and North Broadway, and the southern terminus to be

the southern boundary of the city of Yonkers on South Broadway. The capital is \$50,000, and directors, William Delavan Baldwin, S. T. Hubbard, John C. Shotts, and T. H. Silkman, of Yonkers, and others.

### North Carolina.

**RALEIGH, N. C.**—The purchasers of the Raleigh Street Railway have obtained deed from the U. S. circuit court and elect officers as follows: President, Alf A. Thompson; vice-president, Dr. V. E. Turner; secretary and treasurer, T. H. Briggs; attorney, R. T. Gray; directors, A. A. Thompson, J. H. McAden, Julian S. Carr, V. E. Turner, J. H. Cutler, A. B. Andrews, Julius Lewis, Rev. B. Smedes and J. A. Jones. The capital stock will be \$25,000. The question of routes, extensions and electric lighting will be conducted at future meetings.

### Ohio.

**MARIETTA, O.**—This town wants a street railway and will entertain propositions. Good field.

**GEORGETOWN, O.**—Local capitalists are organizing a company to build a street railway to Higginsport.

**MT. VERNON, O.**—D. K. Bird, secretary of the Street Railway Company, was slightly injured by a fall from a train.

**DELAWARE, O.**—The city council grants street railway company a franchise on various streets for extension of the system.

**YOUNGSTOWN, O.**—The street railway officials call upon the city authorities for protection and will operate with non-union men.

**YOUNGSTOWN, O.**—The rumor that Manager A. A. Anderson is to resign is branded as false by the president of the company.

**WARREN, O.**—The franchise for the Warren-Sharon Electric line, last year granted to A. B. Mannix and associates, has lapsed by reason of the holders failing to do the requisite amount of construction work.

**COLUMBUS, O.**—The Buckeye Park Street Railway Company applies for a franchise to county commissioners. The incorporators are: Messrs' James H. Anderson, C. B. Cowan, DeWitt C. Jones, T. J. Keating, Geo. L. Converse, R. R. Dubois and Wm. H. Simonton. The capital stock is \$100,000, divided into shares of \$100 each.

**UPPER SANDUSKY, O.**—The Sandusky Valley Electric Railway Company is chartered. The projected line is to begin at Marion, Marion county, running to Upper Sandusky, Wyandot county; Tiffin, in Seneca county; Fremont, in Sandusky county, to Port Clinton, Ottawa county. The incorporators are John Q. Werick, R. R. Dumm, Frank E. Dumm, Gottlieb H. Roppold and Thomas Carroll.

**TOLEDO, O.**—N. B. Ream, of Chicago, and Parks Foster, of Elyria, O., have entered a combination. The belt line between Maumee and Toledo has been subdivided, Ream getting  $7\frac{1}{2}$  and Foster  $13\frac{1}{2}$  of the 21 miles of track. The belt is to be completed by August 1. The Foster line, called the Toledo & Maumee, has purchased the remains of the Tillotson material to use in the line. Bert Foster is appointed general manager of the new line. The Consolidated (Ream's line) is to furnish power at a stipulated price. Cars have been bought.

**TIFFIN, O.**—Three street railways of Tiffin embraced in the Tiffin Consolidated and the Interurban Consolidated have gone into the hands of Mesheck Frost, as receiver. The assets are \$150,000 and the liabilities will likely exceed that figure. The appointment of a receiver was made by Judge Norris, in the suit of the Cambria Iron Company, to secure a claim of \$5,000, but this was merely a form, as the Consolidated, since it failed to float its \$300,000 of bonds in New York City, is hopelessly involved, and the only way out of the difficulty is the sale of all their roads.

### Pennsylvania.

**MIDDLETOWN, PA.**—The East Harrisburg Railway Company has gained right of way between Highspire and Middletown.

**LANCASTER, PA.**—Members of the Hubley Manufacturing Company of Lancaster, Pa., have the contract for the Lancaster & Lilitz line.

**EDINBURGH, PA.**—C. S. Curtice, of Portland, N. Y., and other capitalists are working toward the new line between Edinburg and Erie.

**PITTSBURG, PA.**—The Interurban Rapid Transit Company has offices at 101 Fifth avenue and \$1,000,000 capital stock to exploit the Barrows Elevated Railway.

**PHILADELPHIA, PA.**—Plans for power house of the Nestonville, Mantua & Fairmount Passenger Railway are approved, and contract awarded to Charles McCaul, of 10 North Eleventh street.

**JENKINTON, PA.**—The Philadelphia, Cheltenham & Willow Grove Electric Railway Company has awarded contracts for its line from Rising Sun to Jenkinton, to William Wharton, Jr., of Philadelphia.

**POTTSVILLE, PA.**—The new officers of the Schuylkill Electric Railway Company are: President, C. H. Barret; treasurer, W. A. Barret, both of the Car Equipment Company, Philadelphia. J. B. Stuart is superintendent.

**PHILLIPSBURG, PA.**—Chas. A. Bragg, of Philadelphia, incorporates the Clearfield Traction Company, of this place. Directors are A. Markle, Henry Dryfuss, Hazleton; John G. Platt, Phillipsburg; George R. Bedford, Wilkesbarre; C. A. Bragg, Philadelphia.

**SCRANTON, PA.**—Scranton & North End Street Railway is granted a charter. Those interested are: L. Ammerman, Lieut. Governor L. A. Watres, H. H. Archer, P. S. Page and R. C. Adams. Eight miles will be built and cars will be run by November 1. It will connect several towns.

**PITTSBURG, PA.**—The Pitcairn, Wilmerding & Braddock Street Railway is capitalized at \$21,000 to build 3½ miles in the points named. W. J. Kline, of Greensburg, is president; the directors are W. J. Kline and Amos B. Kline, Greensburg; John S. Stewart, N. Versailles township; George W. Borrichlow, George C. Garber and H. L. Castle, Pittsburg.

**PITTSBURG, PA.**—The Homestead Street Railway Company has awarded contract for the building of the line to the New York Electrical Construction & Engineering Company. The officers of the railway are: J. C. Whitta, of Beaver Falls, president; J. B. Stone, Esq., secretary; C. H. Bentel, treasurer; C. A. Danals, general manager and superintendent

## Rhode Island.

**PAWTUCKET, R. I.**—The City Council orders fenders for the street railway, and attach a penalty for non-use.

**WOONSOCKET, R. I.**—The Woonsocket Street Railway voluntarily advances wages, restoring a cut to old tariff. New lines are planned for the near future.

## Tennessee.

**NASHVILLE, TENN.**—The Nashville Street Railway files deed by which it acquires the Maplewood Suburban Street Railway Company.

**WINCHESTER, TENN.**—Dr. B. G. Slaughter says that the contract for the Winchester Point Rock & Tennessee River electric railway has been let by J. Luttrell Murphy, Monadnock Building, Chicago, to Braeey Bro, McNair & Co., Monadnock Building, Chicago.

**CHATTANOOGA, TENN.**—Ex-President W. T. Adams, of the Chattanooga Electric Railway Company, has been relieved of his bond and Samuel Divine, appointed by Judge Key last week as permanent receiver of the company, will take charge of the lines. Mr. Adams will return to his former home at Corinth, Miss., and reassume charge of his property, the W. T. Adams Machine Company.

## Texas.

**BEAUMONT, TEX.**—The street railway was sold at public out cry to Albert Seal for \$400.

**SAN ANTONIO, TEX.**—Organized: The Manufacturers' Transportation Company, of San Antonio, for the purpose of constructing and operating a street railway for the transportation of freight. Capital stock, \$50,000. Incorporators—Charles Hugo, Philipp Carl, Geo Kalteyer and others.

**DALLAS, TEX.**—John Gill and W. H. Blackford, of Baltimore, Md., decide to ask the Farmers' Loan & Trust Company, of New York, to apply for a receiver for the Dallas Street Railway Company.

## Utah.

**SALT LAKE CITY, UTAH.**—The Salt Lake City Railway Company will extend to Calder's Park.

**SALT LAKE CITY, UTAH.**—Special order of the county court extends the franchises of the Rapid Transit Company fifty years, from January 1, 1894.

## Virginia.

**DANVILLE, VA.**—The Danville Street Railway Company will extend its tracks to Neapolis, across the Dan River.

## Washington.

**TACOMA, WASH.**—A "district organizer" of the Association of Street Railway Employes of America is trying to effect a branch of the union here.

**SEATTLE, WASH.**—M. F. Backus, receiver of the Ranier Power & Electric Railway Company, reports for the six months ending June 30, 1894: Net loss, railway department, \$4,056; gross earnings, \$3,819.

**SEATTLE, WASH.**—Fred E. Sander brings suit against the Seattle City Railway Company and A. G. Haas, receiver, to compel the honoring of a life pass for himself and family. The judge decides that the passes are valid.

## West Virginia.

**WHEELING, W. VA.**—Wm. Erskine has resigned the presidency of the Wheeling Railway Company, being succeeded by A. B. Champion.

**WHEELING, W. VA.**—A. M. Jolly has resigned his position as general manager of the Wheeling street railway, and W. S. Wright, who had accepted the position as mechanical engineer at the company's barns has been appointed to fill the vacancy.

## Wisconsin.

**FOND DU LAC, WIS.**—The Fond du Lac Light, Power & Railway Company has shut down its street railway business and discharged all employes. President DeCelle says lack of patronage is the cause. The equipment will be sold.

**MADISON, WIS.**—Judge Siebecker has appointed Col. Webster H. Moore, of Beloit, receiver of the Madison Street Railway Company, on the application of the Four Lakes Light & Power Company, which was furnishing power for the line.

**RACINE, WIS.**—C. H. Holmes, president and treasurer of the Belle City Street Railway Company, has transferred all of his interest in the road to Jackson I. Case, and Mr. Case in turn transferred all of his interest in the Green Bay (Wis.) Electric Road to Mr. Holmes. The latter gentleman will go to Green Bay and manage the road. The value of the Racine road is \$250,000, and the Green Bay road \$150,000.

## Custer's Last Battlefield.

A visit to this spot, which is now a National Cemetery, is extremely interesting. Here, seventeen years ago, General Custer and five companies of the Seventh U. S. Cavalry, numbering over 200 officers and men, were cut to pieces by the Sioux Indians and allied tribes under Sitting Bull. The battlefield, the valley of the Little Big Horn, located some forty odd miles south of Custer, Montana, a station reached by stage. If you will write Chas F. Fee, St. Paul, Minnesota, inclosing four cents in postage, he will send you a handsomely illustrated 100 page book, free of charge, in which you will find a graphic account of the sad catastrophe which overtook the brave Custer and his followers in the valley of the Little Big Horn, in June, '76.

## STREET RAILWAY PATENTS.

ISSUED JULY 3, 1894.

|   |         |
|---|---------|
| Electric railway car truck. Francis O. Blackwell, assignor to the Thomson-Houston Electric Company, of Connecticut.....   | 522,189 |
| Wire support for overhead electric railways. Arthur W. Jones, Boston, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut.....  | 522,216 |
| Trolley car. Herbert J. Lycett, Bryn Mawr, assignor to John A. Brill, Philadelphia, Pa.....   | 522,224 |
| Rail joint and bond for electric railways. Julius Meyer, New York, N. Y.....  | 522,349 |
| Suspension clip for trolley wires. William F. D. Crane, East Orange, N. J., assignor to the Johns Pratt Company, Hartford, Conn.....  | 522,362 |
| Electric railway supply circuit. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, Conn.....  | 522,374 |
| Electric railway switch and trolley. Frederick S. Perrin, Lynn, Mass., assignor of three-fourths to William B. Baldwin, New York, George Fink, Jersey City, N. J., and Anthony F. Buchenberger, Brooklyn, N. Y..... | 522,388 |
| Conduit electric railway. John H. Tyrrell, New York, N. Y.....  | 522,440 |
| Electric railway conduit. Albert T. Fay, Minneapolis, Minn.....   | 522,460 |
| Conduit for trolley arms. Albert T. Fay, Minneapolis, Minn.....   | 522,461 |
| Electric automatic circuit breaker. Carl W. Larson, Lynn, assignor one half to August Langell, Boston, Mass.....  | 522,527 |
| Car fender and brake. Henry Maass, Jersey City, N. J.....   | 522,530 |
| Trolley wheel. Charles E. Bostwick, Du Bois, Pa., assignor one half to G. E. Grier, James W. Grier, and John C. Grier, same place.....  | 522,550 |

ISSUED JULY 10, 1894.

|   |         |
|---|---------|
| Gear casing for railway motors. Norman C. Bassett, Lynn, Mass., assignor to the Thomson-Houston Electric Company of Connecticut.....          | 522,579 |
| Controller for electric motors. John B. Blood, Lynn, assignor to the General Electric Company, Boston, Mass.....                              | 522,581 |
| Roller bearing. Frank S. Church, Detroit, Mich., assignor one-half to W. Fitz Hugh Edwards, same place.....                                   | 522,648 |

## DIED IN A GOOD CAUSE.

MRS. EINSTEIN. "Mein Gott, Isaak, Mein Gott, poor little Abraham was kilt."

ISAAC. "Himmel, Rachel, how was dot happens, mine poor boy?"

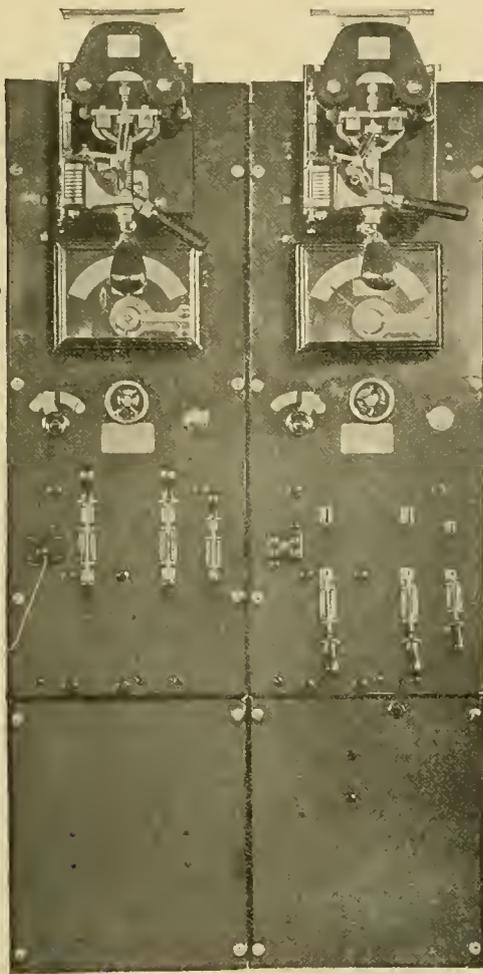

MRS. E. "On dose electric cars, Isaak."

MR. E. (joyfully). "Gott pless dat poy, he always did have a goot head, he knew his poor fader could collect damages."

THEY met in a Madison avenue car, and when she entered he closed the serious looking legal volume with which he had been beguiling the tedious ride uptown, so that the title was visible—somebody's "New York Digest." After a few casual remarks the young woman's eye lighted upon this legend on the back of the calf-bound volume. "Why," she said in surprise, "I didn't know you were studying medicine. I thought you were reading law!"

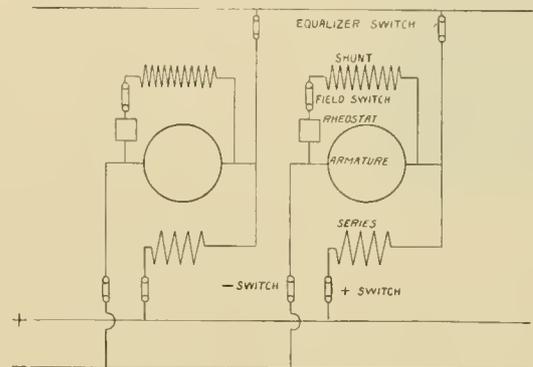

**GENERAL ELECTRIC GENERATOR PANEL.**

The General Electric Company has made some important changes recently on its switchboard apparatus. The new feeder panel was shown in these columns some time ago, and the accompanying engraving is of the new generator switchboard panel. A radical change over the old style is the doing away with three-pole switches. The general principle of the connection of the new panel can be seen in the accompanying diagram. The main positive and negative switches and the field switch are on the switchboard panel, while the equalizer switch

is on the machine. Thus the necessity of running the equalizer to the switchboard is avoided. In throwing in a generator the equalizer and main positive switches are first closed. This connects the series coil of the new generator in parallel with the series coils of all the other machines connected to the bus bars. The shunt field switch is then closed and the voltage brought up until it is the same as that on the bus bars. The negative switch is then closed, thereby throwing the generator in. One of the great advantages of this method is that the series field windings are thrown into action before the machine is connected in. Consequently the voltage of the machine before it is thrown in will vary as does the voltage of the main bus bars. This is a decided help to

the operator, especially if the voltage on the bus bars varies rapidly. These panels are wired up at the factory, so that they are easily installed at the station. All the panels made by this company are of a uniform height. In addition to the main and field switches, the panel contains a double-pole voltmeter plug, a lighting switch, an ammeter, circuit breaker and lightning arrester. The circuit breaker has a main contact in shunt with a smaller contact working within a magnetic blow-out. The main

WIRING SCHEME OF PANEL.

contact is opened first. The lightning arrester has two carbon points (one of which is grounded) in the field of an iron clad electro-magnet.

The new panels are known as type "K," and are made in capacities of from 200 to 3,000 amperes.

**CHICAGO GENERAL STREET RAILWAY COMPANY PRIZES.**

In May, the Chicago General Street Railway Company, through the STREET RAILWAY REVIEW, invited drawings and specifications of a model plant for the use of forty cars, giving dimensions of the prospective site on which the buildings would be placed, and offered a first prize of \$100; second prize, \$75; third prize, \$50, and fourth prize, \$25. The selection was recently made by which the first prize was awarded to J. R. Cravath, electrical editor of the STREET RAILWAY REVIEW; second prize to Caywood & Ritter, contracting engineers, Chicago; third prize to A. S. Krotz, engineer, Springfield, O.; fourth prize to E. W. Goss, superintendent of the Amesbury Electric Light, Heat and Power Company, Amesbury, Mass.

None of the plans selected will be used in full, but ideas will be adopted from each. The site selected for the new power plant is a four-acre lot, corner of Kedzie avenue and Thirty-first street. It is expected that a car-shed 125 by 300, engine room 100 by 100, and boiler room 100 by 60, will be constructed this fall, the other buildings to follow as rapidly as the work will permit. The operation of the present lines will be under the management of the president, L. McGann, and the superintendent, W. F. Brennan, while C. L. Bonney, vice-president, will have charge of the constructing of the new lines and power plant.

## THE ELLIS MANUFACTURING COMPANY.

Within the past two months there has arisen a new star in the street railway firmament which shines for all, but particularly for the buyers of electric car trucks. The home of the Ellis Manufacturing Company is at No.

HARVEY ELLIS.

218 South Fourth street, Philadelphia, and its officers are, Harvey Ellis, president, and Joel C. Hancock, secretary and treasurer. The product to be handled is the Hansell equalizing motor truck, an engraving of which is shown herewith. The prominent and novel feature of the Hansell truck is the equalizing beam outside the journals, supporting an elliptic and spiral spring. It is the intent of this construction to obtain the full benefit of both springs, as well as to take up whatever oscillation there may be. The makers of the truck claim, however, that they prevent the cause of oscillation, as nearly as is possible, by cushioning the journals with two strong spiral

springs over each journal box. The spring base is proportioned and constructed on the cantilever principle, with a view of distributing throughout the entire car body and truck the load at any one point.

The truck frame is strongly constructed and composed of but few parts, with these few easily accessible. The spring base may be adapted to any length of car body by simply lengthening the equalizing beam and stiffening the spiral springs on the inner ends of the beams. In this lies their claim that the Hansell truck has the longest spring base of any truck on the market. The truck is composed entirely of steel, with no rivets and as few bolts as possible. This arrangement, of course, contributes to the strength and inflexibility of the truck structure. To recapitulate the claims, they are: Freedom from oscillation; elimination of the cause of oscillation; few parts and easily accessible; economy of maintenance; strength and durability of truck frame.

As to the accessories, there is a powerful brake of great leverage capacity, with positive and simultaneous action on all brake shoes. The wheels and axles are easily and quickly removable by taking out one bolt under each journal. The journal boxes are of the M.

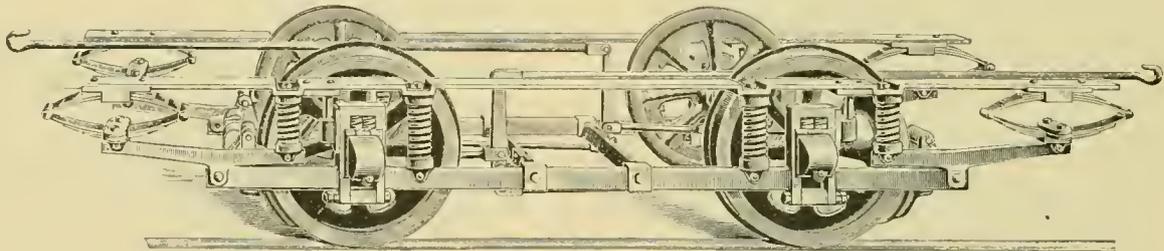

C. B. pattern, which has had so long and satisfactory service, dust proof, and adapted for oil or grease.

Another feature is the separation of the plunger bolt from the inside of the spiral spring. This permits of repairs to either, with least possible loss of time, the journal yoke being broad and giving broad guide surfaces to the journal box. Taking all in all, the Ellis Company has a reliable truck, for which it does not claim cheapness as a chief charm, but rather good material and good workmanship, with the intent of supplying satisfactory service to its patrons.

A word as to the personnel of the company will not be out of place at this point and we take pleasure in introducing the two chief officers.

Harvey Ellis, the president of the company, is well known to the majority of street railway men in his 18 years' connection with the Cambria Iron Company. Mr. Ellis has occupied various responsible positions with the Cambria, both at the works and in the Philadelphia offices, and latterly was assistant treasurer. He is a gentleman of more than ordinary business worth and executive talent.

Joel C. Hancock, the secretary and treasurer of the Ellis Company, is another old Cambria man of many

THE HANSELL TRUCK.

years' standing. Prior to this connection he was with the Pennsylvania Railroad Company, where he has had a complete and valuable experience in railroad work. His genial personality and thorough knowledge of details makes him an efficient business man as well as a desirable acquaintance.

JOEL C. HANCOCK.

The Pittsburg and southern sales agents of the Ellis Company are S. P. S. Ellis and Mr. Minnegrode, two familiar names of successful salesmen.

Both gentlemen are of the type of salesmen that not only are able to get a customer, but retain him afterwards.

At Bridgeport, Conn., July 26, a regular war was waged between the New York, New Haven & Hartford Street Railway Company and the Bridgeport Traction Company employes over a railroad crossing. Steam and water were the weapons, and 5,000 people watched the fun. Injunctions finally caused a cessation of hostilities.

THE Card Electric Company, of Mansfield, O., finds business very satisfactory.

HENRY ELLIOTT, of the Elliott Frog & Switch Company of St. Louis, has gone abroad on a five months' trip.

THE Westinghouse Electric and Manufacturing Company has sold the Hartford Street Railway Company forty car equipments.

THE R. A. Crawford Manufacturing Company, Pittsburg, has sent 50 additional fenders to the New Orleans, La., Traction Company.

THE American Car Company, of St. Louis, has recently taken an order for 25 cars from the Union Depot Railroad Company of St. Louis.

E. F. DEWITT & Co., of Lansinburgh, N. Y., number among late orders the equipment of 200 electric traction cars of Philadelphia with the common sense sand box.

JOSEPH T. SKERRITT has resigned the superintendency of the Brigantine Transit Company of Atlantic City, N. J. His address is now 226 Atlantic avenue, Atlantic City.

J. G. GUSTIN & Co., of Chicago, are busy as possible filling orders for the Hercules trolley clamp. Duplicate orders attest to the esteem in which street railway men hold this excellent device.

THE Adams Boiler Company, Cleveland, has just sold a 500 horse-power boiler to the Richmond Railway and Electric Company, of Richmond, Va., which will be shipped and installed at once.

THE McLean Armature Works, Chicago, report a first-class repair business in all departments. The company has lately added a department for the manufacture of electroliers and combination fixtures.

EDWARD CALDWELL has assumed a nominal editorship on the Street Railway Journal staff. J. W. Dickerson now takes full editorial charge of the Gazette branch of this enterprising publishing company.

THE Pettingill-Andrews Company of Boston has installed Frank X. Cicott as manager of its New York office, at 39-41 Cortlandt street. Mr. Cicott is manager of the railway department of the company as well.

JOHN CRILLY, 123 California street, San Francisco, reports the sale of a Peckham 6 D. truck to the Alameda, Oakland & Piedmont Electric Railway Company. Mr. Crilly is unusually successful this season in his business.

THE summer girl in her bathing dress,  
They say is a vision of loveliness,  
But it isn't the dress that makes the hit  
When she shows herself, but the lack of it.

—New York Press.

THE American Carbon Company, of Dayton, O., is experimenting with motor brushes and will soon put a superior carbon brush on the street railway market. Manager Dickey, of the company, is an eminently practical man.

THE Ball Engine Company reports a large number of engines as being shipped from the Ball works to fields of usefulness in the electric light and power line. Nearly 2,000 horse-power is the aggregate, ranging from 80 to 300 horse-power.

R. L. CALDWELL, formerly with the Short Electric Railway Company, is now with the Sperry Company and is at present looking after the interests of that concern on the Chicago General Street Railway, which is equipped with Sperry motors.

MANAGER J. S. SPEER, of the Partridge Carbon Company, Sandusky, O., reports the factory running at full time, with plenty of orders on hand. The carbon brushes still continue to give the best of results, and to spread their fame throughout the trade.

THE National Telephone Manufacturing Company, of Boston, has just received an order for 1,000 receiver and transmitter telephones for use in the new Hotel Majestic, New York City. This order speaks well for the efficiency and popularity of the National Telephone.

REGER & ATWATER, 214 Pine street, San Francisco, Cal., have taken the Pacific coast agency for A. O. Schoonmaker, 158 Williams street, New York, and will carry a full stock of his well-known mica, both cut and uncut and stamped for segments and rheostats. They can fill all coast orders with dispatch and accuracy.

THE Bemis Car Box Company of Springfield, Mass., among recent orders chronicle the following: 50 trucks for the Electric Traction Company, Philadelphia; 25 for the Hestonville, Mantua & Fairmount, Philadelphia; 30 for the Fairhaven & Westville Company, of New Haven, Conn.; 180 for the Third avenue cable of New York City.

J. M. DENNISTON having relinquished the R. D. Nuttall agency for Chicago and the Northwest, the company has appointed Garson Myers, of the Standard Railway Supply Company, to represent these well known specialties. Mr. Myers is too well known to the trade to require further mention, and the Nuttall specialties are worthy of his efforts.

THE Keithley rail bond is being put in by the North and the West Chicago Street Railroads. The Chicago City and the North Shore street railways have already adopted it, and the bond business booms a pace. Washburn & Moen, 107 Lake street, Chicago, are manufacturers and agents. Mr. Keithley is spending the summer on Staten Island.

LEE & COLLINS, Medinah Temple, Chicago, is the habitation and name of a new supply company carrying electric light and battery specialties. C. E. Lee, the senior partner, is a well-known salesman, and L. W. Collins is extensively acquainted with all branches of the trade as an electrical journalist of wide range and ability. We are sorry to lose him.

THE Railway Department of the Wallace Electric Company has been kept quite busy notwithstanding the dull times. The combination pole bracket, which affords a flexible support for the insulator, is meeting with a ready sale and with success. The various devices for overhead construction handled by the company are well received by superintendents.

J. A. WILLIAMS & Co., Utica, N. Y., and Chicago, have been appointed as one of the agents of the United States Headlight Company of Utica. The new agents will carry a full line of locomotive, electric, cable, motor car and other headlights in standard styles and sizes, from which assortment the purchaser may have his order filled with neatness and dispatch.

THE Ellis Manufacturing Company, of 218 South Fourth street, Philadelphia, which is so actively pushing the Hansell electric equalizing truck, advises us that it is negotiating with a number of representative commission men in the trade to act as local selling agents, and that it has not closed finally for all places and will be glad to enter into correspondence with desirable parties.

THE St. Louis Railway Company, of St. Louis, Mo., has placed an order with the Berlin Iron Bridge Company, of East Berlin, Conn., for its new car barn. The building will be 64 feet wide and 185 feet long, with brick walls and a roof of the Berlin Iron Bridge Company's patent anti-condensation corrugated iron. There will be no wood work in the building whatsoever.

THE Lewis & Fowler Manufacturing Company, of Brooklyn, N. Y., is doing its accustomed large business. The company reports gratifying sales of the Acme car jack and the Lewis & Fowler fare register. A recent car order was for five open cars for the South Jersey Street Railway Company of Point Pleasant, N. J. They are mounted on Peckham trucks and are driven by Westinghouse motors.

H. J. WIGHTMAN & Co. have removed their offices to the Schimpff building, 414 Spruce street, Scranton, Pa.

In their new quarters they have increased facilities and conveniences, and are prepared to execute all orders with promptness. The Wightman line of street railway material is a specialty in which they take much pride, and an invitation is extended every one to visit and inspect the stock.

DOVEY & COMPANY, of Philadelphia, the well known contractors, have been awarded the contract for completely rebuilding, electrically equipping, and extending the New Haven & Centerville Street Railway, New Haven, Conn. The manager of the company is John S. Dovey, and S. A. Coleman is the engineer. The road is to use 70-pound rail, and is to be completed within three months. Power will be rented at present.

THREE of the largest leather belts in the Dominion were ordered some time ago by the Montreal, Ont., Street Railway Company, for its new power house on William street. The order was placed with the J. C. McLaren Belting Company. One of the belts is already set and the second has been exhibited through the streets. The third is in course of construction. They are one hundred and forty feet long and fifty-four inches wide and are made of three-ply English oak-tanned leather. Each belt weighs 2,150 pounds.

W. R. GARTON, the bright electrician and well-known inventor of the Garton lightning arrester, has accepted the management of the recently organized railway department of the Central Electric Company, Chicago. Mr. Garton's peculiar fitness for the position is acknowledged both by his business ability and his electrical knowledge, not saying anything of his being a pleasant gentleman and a hustler. Mr. Garton retains his interest in the well-known arrester to which his name is given, but his duties with the Central will consume all his activities.

W. R. GARTON.

THE Mather Electric Company, of Manchester, Conn., reports signs of improvement in its electrical business, now having on hand more work than at any other time for the last eighteen months. The recent sales of its standard belted, and also of its new direct connected apparatus for lighting work, have been very large, necessitating a large addition to the working force in the works at Manchester. It also reports a very good business throughout the western and central states, in which territory J. Holt Gates, of 1140 Monadnock Building, Chicago, is the well-known representative.

THE well known cedar-pole firm, W. C. Sterling & Son, of Monroe, Mich., has just received at their yards at Monroe, a large raft of cedar poles from the north, and expect two more during the summer. One crib in the next raft will be over 400 feet long, the longest that has ever come down the lakes, and contain about 6,000

poles. The Monroe yard is one of the largest in the world, and is well known all over the country. From this yard shipments are made to all points in the United States, and all material in the line of cedar that is used in the construction of electric light, railway, telegraph or telephone lines is manufactured and furnished.

EDWARD F. AUSTIN, the Pittsburg representative of the W. A. Green automatic cut-off engine, manufactured by the Altoona Manufacturing Company, of Altoona, Pa., reports a flourishing business. The following recent instalments of the Green engines are noted: 50-horse-power to drive a 500-light Westinghouse dynamo in Christ's M. E. Church, Pittsburg; 80-horse-power engine at the New Castle, Pa., Car Manufacturing Company's plant; one 150-horse-power to run the electric cranes at Jones & Laughlins' works, Pittsburg; 150-horse-power in Watson Mining & Manufacturing Company's plant, at Monongahela City, Pa., and several smaller machines in office buildings of Pittsburg. Mr. Austin's untiring efforts have resulted in great popularity of the excellent Green engine in this part of Pennsylvania.

HENRY P. MERRIAM, master mechanic of the Albany, N. Y., Railway Company, writes of the New Process Rawhide Company's rawhide pinions as follows:

"Regarding the two rawhide pinions sent us on trial, I can say that they were put on a car running on State street hill soon after your last call at Albany, and have been running every day since. I have examined them frequently, and they appear to be good for some time longer. The cast iron gears put on at the same time are as good as new. The result has been a great surprise to me. The bill for the two pinions has been approved and entered for payment."

The hill mentioned is a very steep and difficult grade, and the good words for the New Process pinion should rejoice the heart of President Meacham and his confreres.

FISHER & PORTER, 1025 Monadnock block, report the installation of two 80-horse-power M. A. Green engines in the Leland Hotel, where they are running two National dynamos for incandescent lighting. They have sold one 150-horse-power M. A. Green engine to the Freeport Electric Company, of Freeport, Ill., for electric street railway work, and one 300-horse-power Improved Green engine to the Hammond, Whiting & East Chicago Electric Railroad Company, at East Chicago, Ind. Messrs. Fisher & Porter are western representatives of the Altoona Manufacturing Company, building the M. A. Green engine, and of the Providence Steam Engine Company, building the "Improved Green" engine, and say that the works of both companies are running full time, and that they see prospects ahead for a good business.

CLARENCE P. KLINE, late superintendent of the Kansas City, Kan., division of the Metropolitan cable line, has been made superintendent of the Kansas City, Mo., elevated. Mr. Kline has been in the employ of the Metropolitan company for six years. He began as a

gripman on one of the company's cars, and afterward became superintendent of the Twelfth street line, which position he held for three years, afterward taking charge of the Kansas City, Kan., division. He is only 27 years of age. He was born in Scioto, McDonough county, Ill., and has been in the Kansas Cities about ten years. The position made vacant by the promotion of Mr. Kline will be filled by J. F. Voris, who is at present assistant superintendent of the Kansas City, Kan., division of the Metropolitan cable line. He has been with the company several years.

ROBINSON & TROUTMAN, of 1309 Chamber of Commerce building, Chicago, are now western agents for the Buckeye engine, of Salem, Ohio. H. E. Troutman, who

H. E. TROUTMAN.

comes to the western office from Pittsburg, is a thorough engineer, and a most affable gentleman. The first fruits of the new arrangement since June, are: 150-horse-power, to the City Electric Light & Power Company, Danville; 300-horse-power, to the Danville Gas, Electric Light & Street Railway Company, Danville, Ill.; 100-horse-power complete plant to the town of Goodland, Ind. H. E. Troutman, the younger of the representatives, is a Pittsburger of long standing and an engine man of ten years' experience. He is young in years, but old in experience, having passed eight years with the Taylor Engine Company before his present connection with the Buckeye.

THE Bass Foundry & Machine Company, of Ft. Wayne, Indiana, has been doing a magnificent business of late. For the New Castle, Pa., Wire Nail Company, the Bass engineers have just installed a tandem, compound, condensing Corliss engine, with high pressure cylinder of 36 inches diameter, low pressure 70 inches and stroke 60 inches. The driving pulley is 25 feet in diameter, 9-foot face and grooved for 32 two-inch ropes. The engine is rated at 2,000 horse-power. It is a magnificent piece of mechanism and the company says it is probably the largest tandem engine ever built in this country. The Bass Company has a national fame for large work and this last performance keeps up its reputation. Salesman P. F. Leech, of the Bass Company's wheel department, reports a flourishing business both in cushion and cast iron wheels. The Ft. Wayne, Chicago and St. Louis concerns have plenty to do. Recent orders from electric railways are: 100 (steel) for the Electric Traction Company, Philadelphia; 180 (cast iron) wheels for a well-known car builder; 1,200 for the New Orleans, La., City & Lake Railway; 380 for the Cincinnati Consolidated; 100 to the Toledo Consolidated; 100 to the Akron & Zanesville Railway, and a large number of smaller orders. The Bass Company is about to establish another factory at Lenore, Tenn., to supply the southern and southwestern territory.

## A QUEER CROSSING.

One of the most remarkable temporary crossings ever used by street railway lines is now in existence at the intersection of Blue Island avenue and Twenty-second street, Chicago. The Blue Island avenue cable has been laid for some time and last spring the electric line of the Chicago General Street Railway was built on Twenty-second street, but owing to the usual crossing troubles between rival corporations no crossing was laid, and the electric line was obliged to make a transfer across the cable tracks. One night, Superintendent Brennan, of the electric line, had occasion to run some cars over the crossing on the pavement, as this was the only way to get cars from one division of the road to the other. Contrary to expectations, it was found that the cars did not cant or slew around on striking the cable rail, but went over the cable tracks in very nearly a straight course. The angle of crossing is approximately 60 degrees. The

cable road is on a curve of very long radius. The straight course kept by the cars when nothing was present to prevent slewing encouraged Mr. Brennan to put in the temporary crossing, of which a plan drawing is here shown. It has been in service for over two months, with cars

crossing it every five minutes and oftener. In that time not a car has run off the track at this crossing. This record seems nothing short of marvelous, considering how good the chances seem to be for a derailment. When the crossing was being put down several people thought that Mr. Brennan's mind was affected, but they have all disappeared since. In laying the crossing, planks were substituted for the paving between and near the cable tracks, and on these planks were spiked the replacing frogs and short sections of tram rail shown in the sketch. On account of the curve on the cable road, man-hole plates cover one-half of the space between the cable rails. Across these plates the cars of the electric line run on their flanges. At first the cars would get somewhat out of line and be brought back by the replacing frogs, but now the flanges have cut grooves so that the replacing frogs are hardly necessary.

A STUPENDOUS scheme to connect England and France by an electric railway is suggested by Sir Edward Reed, an English engineer. He would build a metallic channel on the sea bottom. The cost is estimated at \$75,000,000 and it will require five years to build.

## CHICAGO LAKE STREET "L" ELECTION.

The Lake street elevated railway, under the management of the new owners, elects the following directors: B. E. Sunny, of the General Electric Company; A. P. Richardson, of New York; Solomon Sturges, Jr., of the Northwestern National Bank, Chicago; A. S. Littlefield, of the American Railway Construction Company, and D. H. Louderback. The four old directors who did not resign are John A. Roche, John H. Witbeck, Clarence A. Knight and William Zeigler.

## UTICA BELT LINE REORGANIZES.

After a number of unsuccessful attempts, the Utica Belt Line has effected a reorganization. By order of court, the bondholders having previously agreed to the proposition, a meeting was called, at which 1,500 shares of stock were represented. A board of directors was

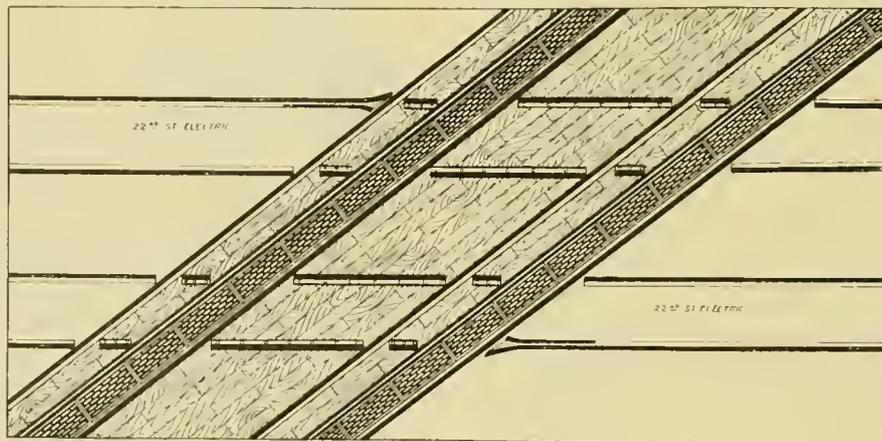

elected, which in turn chose the following officers: President, John W. Boyle; vice-president, James T. Gardiner; treasurer, Charles W. Mather; secretary, Edward Bushinger; executive committee, John W. Boyle, Charles W. Mather, James T. Gardiner.

The receiver has been discharged and the new management entered upon its work. Money will be expended to bring the line to proper condition for economical operation.

## COMMONWEALERS AS AN ATTRACTION.

Here is an idea for other enterprising managers. The commonweal army of tramps, under "General" Jeffries, recently reached Bay City, Mich., and after being break-fasted promised to proceed, but the enterprising management of the Bay Cities Consolidated Street Railway Company evolved the brilliant idea of taking the whole array to Wenona Beach over Sunday. So in the afternoon the 'wealers were loaded on to seven cars and with a brass band accompaniment were taken to the resort. The next day, Sunday, everybody in the Bay Cities went to see the sight and many shekels went into the company's coffers; but the citizens were angry all the same, although the authorities protested all they could.

THE Allgemeine Elektrizitäts Gesellschaft has acquired the Bucher concession for electric tramways at Genoa, for \$240,000. Part of the line is already built.

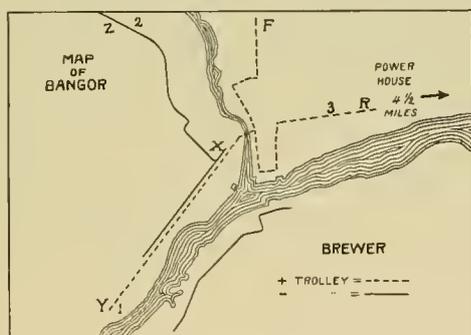

"A queer crossing."

THE THREE WIRE TROLLEY SYSTEM  
AT BANGOR, ME.

By J. G. Carroll, Superintendent Bangor Public Works Company.

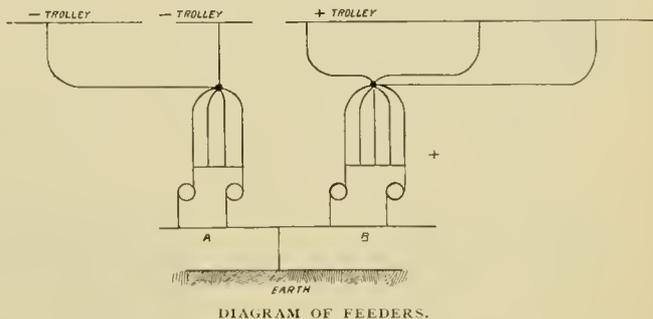

Having noticed an article in one of the electrical journals suggesting the feasibility of operating an electric railway by the three wire system, I became much interested, particularly as the road I am connected with has been using that method for some three years. The article stated that such method was possible or practicable only on double track road. I will endeavor to make clear how it is possible to operate a single track road by such methods. In the first place our power plant being situated  $4\frac{1}{2}$  miles from the nearest point of the road, it was necessary that some means be devised to avoid the enormous expense that would be incurred in getting the copper wire necessary to have a metallic circuit. We tried in the first place to get a ground return by putting copper ground plates in the river at different points along our route and at the power station, but to no purpose. A portion of our line  $2\frac{1}{2}$  miles long situated in the city of Brewer is connected at each hydrant with the rail, and as we operate the water system of that city, and the pumping station is in the same building as the railway power plant, this gives us a good return when needed. But operating as we do now by the three wire system, this is unnecessary when in balance. We have 7.74 miles of single track with seven turnouts. The rail is 35-pound, one-half tram and the balance T. The system consists of two distinct roads, one in the city of Brewer about  $2\frac{1}{2}$  miles long and the other in Bangor,  $5\frac{1}{4}$  miles. By reference to the map it will be seen that there is no connection between the two. The rails are

bonded at the joints with No. 4 copper bonds and connected at each joint with a supplementary No. 4 copper wire.

Our power plant consists of four Thomson-Houston generators, driven by four Holmes turbine wheels of 120 horse-power each. Our equipment consists of two F-30 motors under each car. We operate in regular service nine motor cars, and nearly every week day run three additional motor cars, drawing three trail cars. We connect our generators as in Fig. 1, each two machines being connected in multiple. For convenience we will call two machines on one side A and the other two B.

The positive side of group A is connected to earth and the negative of B to earth; the positive of B to line and the negative of A to line. From B is run a main composed of five No. 0 wires and from A is run a main of four No. 0 wires. The mains terminate at a point near the center of the city and three feeders are run from B to different points along the positive trolley wire, while two feeders are run from A to the two sections of negative trolley wire indicated by the map. It will be seen that there are two trolley wires from X to Y. From one of these a branch runs to Z. The wires from X to Y are of different polarity, and of course carefully insulated

from each other. The use of two wires does away with the use of overhead frogs at turnouts and serves another important purpose in the balancing of the system, which will be explained later.

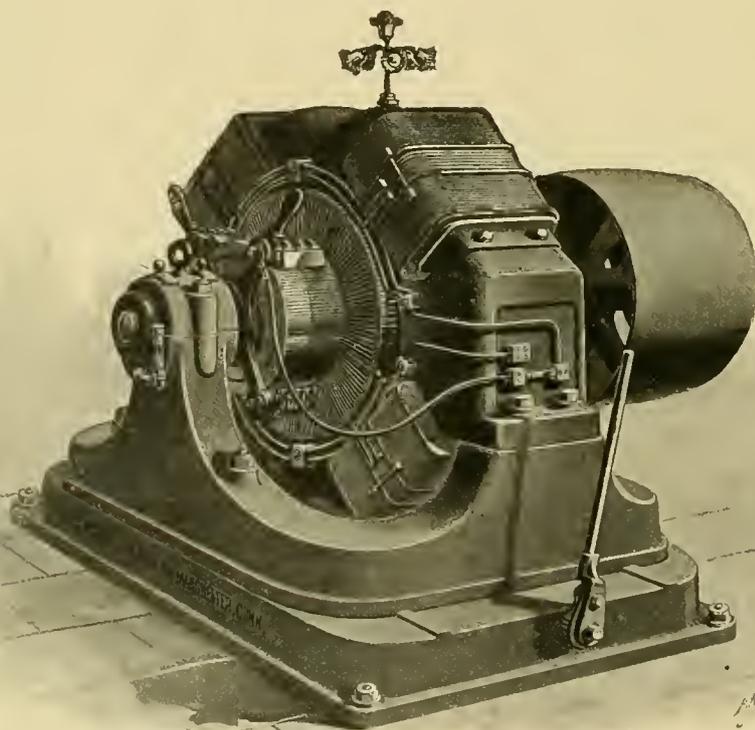

In order to operate successfully the load on each side must be equal or nearly so. This we accomplish in the following manner: Our time table and turnouts are so arranged as to admit of a 15 minute schedule. Every 15 minutes four cars are at X and at the same time three are at the ends of the routes 1, 2 and 3. This applies to the Bangor divisions. At the same time two cars are at the ends of the line on the Brewer division. In operation one car bound from X to Z takes the negative wire. One car bound from X to Y takes the positive wire. One car is bound from X to F and one from X to R on the positive side. This arrangement gives us five cars on the positive side and four on the negative. As long as this balance is maintained, everything runs smoothly. In putting on extra cars we have occasion to run them only from Y, which is a point opposite the fair grounds to X, which is the business center of the city. By making these extra cars, use alternate wires; this balance is still maintained. We have a number of heavy grades and short curves. In fact, there is scarcely a level piece of track in Bangor. For instance, on the Pearl street line we have a grade of 6 per cent for 200 feet; on Main street one of 8 per cent for 100 feet; on Olive street one of seven per cent and two of 5 per cent; on Center street one of 8 per cent for 200 feet; and in Brewer four of 6 per cent, one of which is 500 feet long.

The one bad feature of this system is that in case of a generator getting disabled we are out of balance by having two machines on one side and one on the other. This we intend to remedy by having a spare generator ready to put in on either side, as may be necessary.

## THE MATHER GENERATORS.

The Mather Electric Company, of Manchester, Conn., has been giving special attention to large railway generators since its re-organization, and now has a type which differs somewhat in appearance from the majority of multipolar railway machines, but which is thoroughly efficient and reliable. The fields are in four pieces, which are bolted together and are entirely separate from the frame. This makes the taking apart and putting together of a generator very easy. They give nominally 500 volts, but can be raised to 600.

The brushes when once adjusted need no changes for any variation of load. The bearings are self-oiling and self-aligning. The bearing supports and bed plate

THE MATHER GENERATOR.

are all cast in one piece. The winding of the armature is such that the wires at the end are not overlapped and bunched, but stand out from the core and from each other, so that there is free circulation of air around every conductor. No wires with a high difference of potential are near each other. The makers say that the fields are stronger with relation to the armature than is the usual practice, which is given as the reason of the fixed position of the points of commutation under variations of load. A radically novel point in construction is the use of the fields made entirely of cast steel instead of laminated iron cast into a cast iron yoke. This is along the line of the recent improvements in street railway motors.

THE interest in the evening newspaper increases in proportion to the plainness of the woman who is standing in the street car.

## A TANGIBLE TERROR.

"I'm not afraid," the youngster said,  
"Of any bogy man;  
I don't believe that he exists—  
So prove it if you can."

And then the nurse's ready wit  
A deal of trouble saved;  
"The trolley car will catch you, sir,"  
She said. And he behaved.

—Indianapolis Journal.

GAY old Mr. Gormley, of New York, has reached the age of 104 and just suffered his first street railway accident. His shoulder was broken, but the bone knit again and Mr. Gormley says he is good for another hundred years.

B. J. ARNOLD has removed his offices from the fourth floor to room 576 of the Rookery, Chicago.

AN old colored woman, once the nurse of a prominent Chicagoan, was invited by her former ward to spend the last days of her life in the Lake city. Aunt Jennie duly arrived and was met by the gentleman, who had to make a few purchases on the way home. The old woman was much interested in the cash conveyors as they skimmed back and forth from the cashier's desk, propelled by the clerk's lever. Arriving outside, her attention was attracted by a passing cable train, which greatly increased her astonishment. "Wonderful, isn't it, Aunt Jennie?" remarked the man, as he noted her interest in the train. "'Deed it am, Massa Chawles," she responded, still having the cash conveyors in mind. "Mus' 'a been a powahful push dey gib dem cahs to make 'em go so fast an' keep a-goin' so long."

THE STEEL MOTOR.

For several years the Steel Motor Company, of Cleveland, has been engaged in the manufacture of repair parts for all the existing makes of motors, and now is on the market with a motor of its own. It has, of course, been in an excellent position to observe the undesirable features in present types, and has, accordingly avoided them as much as possible in its own motor. The designers have tried to produce a substantial motor of few parts, simple in construction, and with

The series parallel controller used with this equipment is known as "Type C." It has a novel arrangement whereby a single motion of the reversing lever to a point indicated, converts it into a multiple controller, after the old style. This, in connection with the double fuse box contained in the controller, makes it possible to cut out either motor in a few seconds without leaving the platform. In addition to the regular discs separating the contacts, vulcabeston guards are inserted between them. These guards are hinged at the side of the controller, so as to be readily thrown back when the jacket is opened.

VIEWS IN THE FACTORY OF THE STEEL MOTOR COMPANY, CLEVELAND.

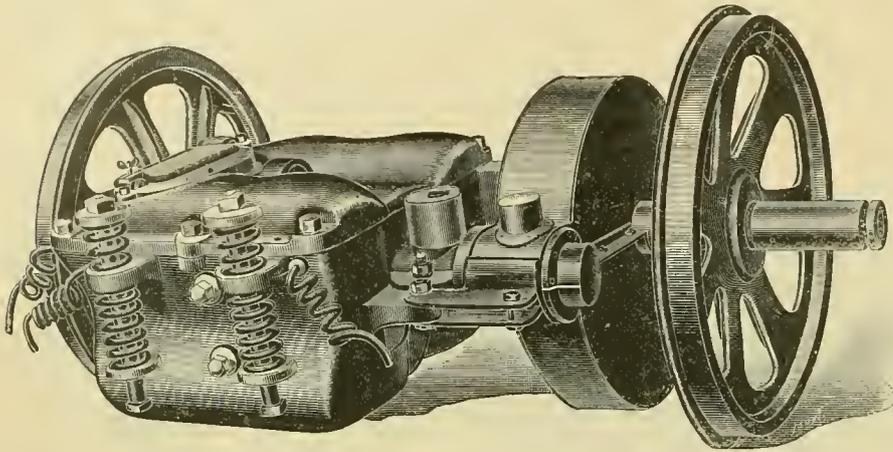

all parts which require renewal, of great wearing surface, but cheaply replaced. The company claims it to be the lightest motor per horse-power actually delivered to the axle of any in use.

The armature is drum type, and contains ninety-nine coils wound in slots, the wire being carried well below the surface of the core; ample provision is made for perfect insulation.

The fields are wound on metal shells, thoroughly insulated, and by an ingenious arrangement of the pole pieces, the armature or either of the fields can be removed independent of the others.

The manufacturers have not pushed the sale of this motor until recently, preferring to await the test of actual service before advertising it extensively. They have now been running two years on difficult roads, and have proved themselves durable and efficient. The Cleveland Electric Railway is running 100, and 120 have been ordered by the Nassau Electric Company, of Brooklyn, N. Y. A fourth order has been completed, for the Allentown & Lehigh Valley Traction Company, which has eighty in use. There are also a large number on smaller roads over the country. This company is the successor of the Johnson Electric Company, of Cleveland.

A. L. Johnson is the president, and Samuel Harris general manager. Both of these men are of long experience in the street railway business, and patrons of the company can have every assurance that its affairs are not in

novice hands. The well equipped factories, of which views are here presented, are now very much crowded filling orders, and are obliged to run two nights of every week.

THE Baltimore, Md., Traction Company will soon begin the construction of an electric line through South Baltimore, and President Brown intends to connect Baltimore and Gettysburg, Pa., by building a trolley line through Westminster and other towns of western Maryland.

THE Reis Electric Specialty Company, of Baltimore, Md., for which a receiver has been appointed, has filed a deed of trust for the benefit of its creditors, in compliance with an order issued from Circuit Court No. 2. Bernard Wiesenfeld and Sylvanus Hayes Lauchheimer, who were appointed receivers, qualified in the sum of \$15,000 each.

THE Stanwood Manufacturing Company of Chicago has a shop full of repair work and finds this season a most profitable one on account of the economy practiced by street railways in all quarters. Repair work in every department is on the increase, and the Stanwood methods and reputation for good work are keeping old and adding new clients.

THE Randallstown, Md., Rapid Transit Company has been reorganized and will construct an electric line from Randallstown, Md., to Pikesville, Md. The president is Dr. H. J. Hebb, and the secretary and treasurer is James G. Floyd, of Baltimore, the agent of the Barrow elevated railway system. These, with E. S. W. Choate, Aaron Weber, of Baltimore county, and Thomas Barker, B. G. Underwood and W. H. Tylee, all of Massachusetts, and representing the Northern syndicate which has combined with the Baltimore county people for the construction of the road, were elected officers.

## NEW PUBLICATIONS.

'ROUND AND THROUGH THE WORLD is a neat little brochure, is by J. G. Pangborn, director of the railway department of the Field Museum, giving the itinerary of the commission which is about to start for a trip around the world, investigating the transportation facilities of the various countries of the world. The trip will take two years and the commission will consist of Major Pangborn, a mechanical expert, a navy officer, a draughtsman and artist, a photographer, and a stenographer. They travel in the interests of the museum.

THE Westinghouse catalogue Number 64, treats of the Westinghouse stopper lamp, the lamp which lit the World's Fair and which broke the monopoly which was at one time threatened. They are now better prepared to meet orders than formerly.

## TRAVEL ON A FOUR-MILE ROAD.

It seems to be the fate of Chicago roads that they shall carry passengers, and carry them in great abundance. The Twenty-second street electric line, owned by the Chicago General Street Railway, is a good example of this. The line is purely a local one and runs from the Twenty-second street bridge west to Lawndale. It does not give transfers to lines running down town, although it connects with several. The east end of the route is through a lumber and factory district and the west end a suburban residence territory. The accompanying table shows the traffic for the weeks beginning each quarter during the year ending June 30, 1894. During the first two-thirds of the year only about two miles were laid and horses were used until November, 1893.

|                               |                 |
|-------------------------------|-----------------|
| Week ending July 8, 1893..... | 352 passengers. |
| " " Oct 7, " .....            | 855 "           |
| " " Jan. 6, 1894.....         | 4,073 "         |
| " " Apr. 7, " .....           | 9,916 "         |

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW.

269 Dearborn Street, Chicago.

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4.                      SEPTEMBER 15, 1894.                      NO. 9.

J. A. CRILLY, Hartford, writes us the scheme of telephoning from electric cars in motion, as exploited in the eastern papers, is an unadulterated fake.

AS USUAL, in this our annual pre-convention number, we have given considerable space to a description and illustration of the principal points of interest, both along the route to and at the convention city. Our readers are thus in advance fully posted as to the city they will visit, and go prepared to know the gentlemen they are to meet but have never seen, as well as to be fully posted on the history and present resources of Atlanta.

WE inaugurate, this month, a new department, which, as its head implies, is devoted exclusive to power house matters. The engineer, the fireman, and the electrician will all find practical subjects discussed by practical men, in a simple and practical style, and we feel sure it will be found of equal value to the manager and builder of machinery as well. We specially invite the boys in the power house to contribute freely to this, their especial department of the REVIEW.

CONVENTIONS multiply—Ohio, New York, Pennsylvania, Maine, Connecticut, and now the Michiganders. State conventions are, in many respects, most excellent affairs and capable of much good. We believe, however, that if they were held in the winter, spring or summer,

it would be better than to crowd them all into the month next preceeding the annual of the American, especially as in some states the meeting takes the best part of three days. Why not change the date?

A NEW scheme for preventing accidents is proposed by some scintillating intellect masked as "H. T. C.," through the columns of the Cleveland, O., Leader, who says: "Since women nearly always are cumbered with packages, and use their right hands regardless in getting on or off cars, let the cars be run on the left instead of the right hand track, so obliging passengers to get off on the left side of the car, and making it natural and easy for both men and women to seize a grab handle for that purpose with the right hand, and alight face forward." Now, H. T. C., why not amputate the offending member. It would be much easier and cheaper.

THE supply men are hustling to present an unusually complete and attractive exhibit at Atlanta, and deserve a liberal share of the time of the visiting delegates. The expense and time necessary to provide this most valuable department of the meeting is much greater than the visitor in the rush and excitement of the meeting is apt to realize, and we thus early bespeak for the supplyman, who is ever the life of the convention, the considerate attention and a reasonable portion of the managers' time. We suggest that all who can do so arrange to reach Atlanta Tuesday noon, at the latest, which will give an extra half day for the inspection of displays.

WE recently had the opportunity of looking over the expenses of a small electric road operating from five to seven cars over a level track, and were agreeably surprised on finding that the cost of operating was only a trifle over 13 cents per car mile; and this, too, in spite of the fact that the wages paid conductors and motormen were very high, and the price of coal was over \$2 per ton. This figure includes all expenses but fixed charges. The road is a new one and the maintenance account is, of course, low, but as the equipment is first class in every respect, it is not unreasonable to suppose that the present expenses will be raised very little for several years to come. Such a low figure is one that could not have been obtained a few years ago, even from a large system, and the fact that a small road, not under the most favorable conditions, can now do so well, is the most positive and gratifying evidence that can be obtained of the substantial progress that has been made in electric railroading within the past few years.

AND next month the convention! It seems scarcely two months since the departing echoes of our partings at Milwaukee died away, and now we catch the welcome voices of Atlanta hosts, bidding welcome the whole street railway world. Everything has been done, all arrangements made, and the well-known hospitality of Atlanta is freely tendered. The street railway fraternity should make an extra effort to turn out in full force and express by an

overwhelming attendance their appreciation of this most kind invitation. That the meeting will be the most largely attended of any yet held, all signs indicate; and in value of papers to be presented, excursions to be enjoyed and exhibits to inspect, the thirteenth annual promises to be a record breaker. For the first time the convention journeys to the far South, and, as it will, probably, in the usual order of selection, choose some eastern meeting place for next year, the chance is one to visit this beautiful country which may not occur again in several years. Let everybody then, with everybody's wife, and his superintendents and managers, and just as many others as can be spared, stick a few stakes of variety in the monotonous rush trips of life, and breath another air and get some new ideas in this, the great opportunity of the whole year.

THE acts of violence and the misdemeanors committed by the strikers at San Antonio, last month, have aroused no little public indignation, in all parts of the law abiding South. The failure of the San Antonio authorities to quell the riot, and to prevent the wanton destruction of property by the mob of employes and their coadjutors, has called forth from all sides the severest censure. Municipal misrule seems not to be confined to Youngstown, Ohio, and Chicago, but that fact is no excuse for the violation of pledges of office in even the smallest hamlet in the country. The city authorities of Youngstown have done more by their inaction and cowardly indifference to injure the city than years of hard times or any amount of severe fire losses. With San Antonio the same proposition holds true. If these cities expect to become centers of manufacturing or any other industry, protection must be guaranteed against mob violence, and this protection ultimately resides in the citizens.

MORE good than a week's vacation does it do the electric railway man to peruse the following words of wisdom from the St. Louis Republic, which most pointedly rebukes an eastern mossback:

"In a recent issue of a New York paper, a half page of presumably valuable space was devoted to an attack on the trolley car idea. A sensational writer went into spasms over a speed of 16 miles an hour in the suburbs, employing the following humorously vague sentence:

'Onward with noise and dust, and the wild clangor of the alarm bell ringing out on the night air, we plunged, ever forward.'

"In the name of all the superb trolley cars of this city, that put us into our homes in half the time formerly employed, did this writer expect to plunge any way but forward? Did he want a reverse motion or did he think that it is within the line of the motorman's duty to experiment with the aeroplane idea?

"Such sensational nonsense as this is ever to be found in the Eastern papers. Some of these editors ought to come into the West and learn of the comforts of the street railroad system, chiefly of the trolley car brand, that we have here in this city of biggest and best of things.

"The trolley cars of St. Louis are not deadly, and the service that they offer is well nigh perfect. A car may kill a man if he lies down on the track and gets run over; but even if he were foolish enough to do such a thing, the chances are that the motorman would stop the car before harm was done.

"The Mississippi River and the Atlantic Ocean are dangerous things, but they have their uses. Everything is dangerous to people who don't use eyes and sense. The trolley is much less dangerous than buggy horses. The East will shiver a year over dreaded dangers and then drop into the procession."

SOME day, if we ever get time, we are going to write a book on the "History of Home Made Engineering." The usual charge of consulting and supervising engineers is from 2½ to 3½ per cent of the cost of a plant. How on earth street railway officers who don't know a separator from a circuit breaker expect to save this amount by doing their own engineering we cannot see. When, as is sometimes the case on large systems, the men in the regular employ of the company are as competent as any outsiders that could be hired, and have in addition an intimate knowledge of the special needs of the road, it is undoubtedly better not to employ outside engineers. There are very few places where this is true, and the majority of roads will get "salted" if they try to do their own engineering. The number that have "salted" themselves in this way is too numerous to count. We heard the familiar old story over again the other day. Some relative of one of the officers, (not an engineer), made a general lay out of what was wanted for a new plant. The contracts were let to different makers to put in the machinery as best they could, and finally the contract was let to a firm of plumbers to put in the piping according to their own plans. The plumbers did not know enough to make the piping plans themselves, so they hired another firm to draw the plans for them. The result can be imagined, a plant that is a cross between a junk shop and a saw mill. The company now wishes it had hired a responsible head for its construction, and admits that money would be saved by it.

THE most noticeable point in the street railway practice of Atlanta, is the large amount of material that is manufactured by the Consolidated Street Railway Company for home consumption. The local conditions which bring about home made supplies, are first, the great distance to the manufacturing centers and the proximity to raw material. It would be altogether a hazardous proceeding for a northern and western street railway company to make an attempt at supplying its own car wheels, trolley wheels, gears, pinions, etc. While it might stimulate invention, there is no question that the product at best would be more clumsy and less efficient than the professionally made article. There is perhaps an excuse for the manufacture of some of the above named articles in the far south, but why, ye supply men, is this thus? If there is a discrepancy in freight rates, would not it be entirely proper to bring the matter to the attention of the railroad powers that be. If freight can not be arranged, a little money and management, consolidated with some already established southern manufacturing enterprise, ought to return good interest in the investment. The future of street railways in the south is a wide one. Already several new enterprises are entering the land to possess it, and Florida, Georgia, Alabama, South Carolina, Mississippi and Louisiana, are rapidly getting to the front. It is not a far fetched opinion that a little money judiciously invested in connection with established machine shops would be of advantage.

### THIRD ANNUAL MEETING PENNSYLVANIA STATE ASSOCIATION.

The third annual gathering of this association occurred in Reading, at the Neversink Hotel, and occupied two days, September 5th and 6th. It was the most largely attended of any of the state meetings, and the only event to mar the pleasure of the gathering was the recent death of its president, R. H. Rhoades. The president's address was delivered by Vice-President R. E. Wright, of the Allentown and Bethlehem Rapid Transit Company, and two papers were presented—one "The Perfection of Street Railway Motors," by Lincoln Nissley, general manager Citizens' Passenger Railway, Harrisburg, and "Power Stations," by L. H. McIntire, general manager of the People's Traction Company, Philadelphia. Those subjects were discussed by a large number of members. In the evening, a concert was tendered the delegates by the Reading Traction Company, and Thursday morning was devoted to the inspection of the exhibits at Metropolitan Hall. In the afternoon, a very delightful excursion was made over the Mountain Gravity Road, and later in the day another trip was taken over the Neversink Mountain. The hosts of the convention left nothing undone to contribute to the pleasure of their visitors, and both from a business and social standpoint, the meeting was the most successful in the history of the association. The following officers were elected for the ensuing year:

President, John A. Rigg, Reading.  
 First vice-president, Robert E. Wright, Allentown.  
 Second vice-president, G. A. Greenwood, Pittsburg.  
 Secretary, S. P. Light, Lebanon.  
 Treasurer, W. H. Lanius, York.  
 Executive committee: Chris. L. Magee, Pittsburg; B. F. Myers, Harrisburg, and J. J. Patterson, Lancaster.

#### THE SUPPLY CONTINGENT.

The supply men were fully represented, and the largest display ever accorded a state convention was very much in evidence throughout the convention. The newspapers and street railway magazines were also present by representative. Among the supply men present were: C. P. Breeze, Philadelphia, of the Walker Manufacturing Company, Cleveland; C. W. Bragg, Philadelphia, of the Westinghouse Manufacturing Company, Pittsburg; Newton Clark, representing the old reliable Smith, of New York; E. F. DeWitt, of DeWitt & Co., Lansingburg, N. Y.; Harvey Ellis, of the Ellis Manufacturing Company, Philadelphia; Arthur W. Field, Boston, in the interest of Peckham's trucks; W. F. Forby, of the Okonite Company, New York; John M. Field, of the Berlin Iron Bridge Company, East Berlin, Conn; G. H. Fisher, of Philadelphia, representing C. A. Schieren & Co.; L. R. Faugh, of A. Whitney & Sons, Philadelphia; A. T. Gahagan, of Warren, Webster & Company, Cambridge, N. J.; R. S. Jerome, Central Electric Heating Company, New York; E. J. Lawless, New York agent of the American Car Company; John F. Ostrom, Philadelphia, of the Pennsylvania Steel Company; H. N. Ransom, Consolidated Car Heating Company, Albany, N. Y.; J. K. Randenbush, Eureka Sand Box Company, Lebanon, Pa.; A. C. Vosburgh, New Process Rawhide Company, Syracuse, N. Y.; H. E. Webb, Pittsburg, of the Solar Carbon Company; Jay Wiley, of the Western Electric Company, New York, and H. C. Kellogg, of Alfred F. Moore. The newspaper men were F. S. Kenfield, of the REVIEW; J. W. Nagle, the Car, Philadelphia; J. W. Dickerson, of the Street Railway Gazette, and H. W. Blake, of the Street Railway Journal, New York.

Insulated electric wire manufacturers came from the Philadelphia office: Theodore Mace, Philadelphia salesman for J. A. Roebling's Sons; C. E. Barrett, of Hale & Kilburn Manufacturing Company, Philadelphia; W. C. Jennings, of the Fairbanks Company, Philadelphia.

#### THE EXHIBITS.

Metropolitan Hall was nicely decorated and contained the following exhibits:

The General Electric Company showed two G. E. 800 motors on a Peckham truck with a type K controller, together with a line of overhead supplies and accessories. H. J. Crowley, D. L. Huntington and R. E. Moore were present.

E. F. De Witt & Co., of Lansingburg, N. Y., showed their well-known sand box now in use on forty roads.

The Berlin Iron Bridge Company illustrated the anti-condensation roof lining so well known.

Chas. A. Schieren & Co. had as usual a fine display of belting.

The Hubley Manufacturing Company of Lancaster had a fitting display of overhead material and a new car brake handle.

The Western Electric Company showed a full line of elegant overhead material.

C. G. Smith, of New York, made a beautiful display of all sorts of light.

The Safety Clutch Brake Company, of Philadelphia, had an operative exhibit of its excellent brake.

A. Whitney & Sons, of Philadelphia, showed a fine lot of car wheels.

The Mark Railway Equipment Company, of Chicago, displayed track construction.

Macan & Co., agents of the Magnesite Sectional Covering Company, Ambler, Pa., had a fine exhibit.

The Eureka Sand Box Company, of Lebanon, Pa., showed an operative sand-box.

The Okonite Company, New York, distributed Okonite pocket books.

The Consolidated Car Heating Company, Albany, N. Y., had an extensive exhibit that attracted great attention.

Warren, Webster & Co., Camden, N. J., showed how feed water should be heated and purified a la Webster.

In the Hubley exhibit was also shown the Johnson rail bond made by John A. Roebling's Sons Company, of Trenton, N. J.

The Brooklyn Car & Veneer Works, of Brooklyn, N. Y., showed a full line of railway car wood work in charge of W. B. Le Van, Jr., and S. P. Ferner.

The Storm Manufacturing Company, of Newark, N. J., makes the H. & C. sleet cutting trolley wheel, of which John H. Graham & Co., 113 Chambers street, New York, are sole sales agents. C. A. Hoagland was in charge. Lack of space forbids the mention in particular of a large number of other exhibits which were both interesting to themselves and nicely arranged. The association is to be congratulated upon its very successful convention and its efficient and zealous officers and directors, both past and present.

#### NEW PUBLICATIONS.

THE Babcock & Wilcox Company, 29 Cortlandt street, N. Y., has issued its Twenty-eighth edition of "Steam." This book is published in English, German and French. It has become a standard work, the publishers say, in nearly all of the schools of technical engineering in this country.

THE Engineering Society of the University of Michigan, is out with its magazine, "The Technic '94." It contains several interesting articles.

CATALOG No. 67 of the Westinghouse Electric & Manufacturing Company, Pittsburg, Pa., treats of multipolar generators and motors from  $\frac{3}{4}$ -horse-power up.

LIPPINCOTT'S MAGAZINE, for September, has a novel which deals with the philanthropic work of the Salvation Army. "Captain Molly," by Mary A. Dennison. The other features are up to the standard of the magazine.

THE railway department of the Central Electric Heating Company, 26-28 Cortlandt street, New York City, has issued Catalog No. 2, showing its American electric heating system.

THE verbatim report of the twelfth annual meeting of the American Street Railway Association, held at Milwaukee, October 18 and 19, 1893, has reached us. The book contains 210 pages, and is embellished with a steel engraving of President D. F. Longstreet.

POOR'S MANUAL, for 1894, being the twenty-seventh annual edition, has been issued. The department of street surface railways has statements of the history, mileage, equipment, operators, income and capital accounts, directors, officers, etc., of the street railway systems and traction companies of the fifty leading cities of the United States. There

is also an exhaustive treatment of the city and suburban tramways of Massachusetts, New York and Pennsylvania. The high standard and accuracy of the information contained in Poor's Manual is conceded by all who are familiar with the work.

### THE WESTERN ELECTRIC IN THE RAILWAY FIELD.

No one who has known anything of electrical progress is ignorant of the rapid strides made by the Western Electric Company, of New York and Chicago. It is now rated among the largest electrical houses in the world, and stands high in popular favor. The

WESTERN ELECTRIC COMPANY'S BUILDING.

most enduring monument that it has erected, other, of course, than its reputation for good goods and square dealing, is its New York building at the corner of James and Greenwich streets, represented in the accompanying engraving. Here the policy of the company and its dependencies is shaped and the larger business transacted.

Recently, the Western Electric has entered the electric railway supply field, and has placed in stock a complete line of overhead materials of all kinds. The new goods will be in every point up to the standard of the company's other specialities. Three distinct lines of materials will be carried, namely, the cap and cone, the West End, and the Western Electric types. In addition to this, there will also be carried a stock of tools, construction material, testing instruments and car, station, and workmen's supplies. By this arrangement any construction or railway company may buy of one firm all things necessary except dynamos and motors.

All of the Western Electric material will be fully guaranteed and of the highest quality of material and workmanship. In fact, the reputation of the house is to be sustained in the railway field, and this requires all that a guarantee implies both as regards quality and finish.

The Western Electric type of hanger is a modification of the West End and fully described elsewhere in a separate article that deserves particular attention, as it also details a new section insulator and insulated cross-over. The company has in press a railway supply catalog of 110 pages, which will be sent to street railway men on demand. It will also illustrate the repair parts, construction material and tool station supplies, and the three lines of overhead materials indicated. It will be a handsome affair, as befits the company in whose interests it is issued.

The headquarters of the railway department are in New York, and are conducted under the able direction of E. M. Scribner, assisted by Jay Wiley.

### PRAIRIE CHICKENS.

Recent reports received by the Chicago, Milwaukee & St. Paul Railway, from stations in the prairie chicken country of Minnesota and South Dakota, all indicate a prospect of the best hunting for years. Chickens are very plenty and in fine condition. Duck shooting prospects are also good.

Full information can be had by addressing Ticket Agent of Chicago, Milwaukee & St. Paul Railway, 207 Clark street, Chicago.

### CHEAP EXCURSIONS.

On October 9, 1894, the North-Western Line will sell home-seekers' excursion tickets to points in northwestern Iowa, western Minnesota, North Dakota, South Dakota, Manitoba, Nebraska, Colorado, Wyoming, Utah, Idaho and Montana, at exceedingly low rates for the round trip. These tickets will be good for return passage within twenty days from date of sale and will allow stop-over privileges on going trip in territory to which tickets are sold. For tickets and full information apply to agents Chicago & North Western Railway.

## PERSONAL.

SAMUEL J. WICK, of the Electric Railway Equipment Company, of Cincinnati, was in Chicago recently.

C. R. MARCHANT, business manager of the Manufacturers Record of Baltimore gave the REVIEW a call this month.

J. G. CARROLL, of the Bangor, Me., Public Works Company, is reconstructing the Ann Arbor Street Railway.

GENERAL MANAGER JOHN YOUNG, of the Glasgow, Scotland, tramways, writes that the reports of carrying city refuse on the line of the tramway are untrue.

W. F. MILLHOLLAND, secretary and treasurer of the Citizens' Street Railroad Company, of Indianapolis, made a welcome visit at the REVIEW office recently.

ALEXANDER VON SIEMENS, of Siemens Brothers & Co., London, was a visitor in Chicago during July, and the guest of O. W. Meysenburg, president of the Siemens-Halske of America.

CHARLES GROVER was recently appointed electrical engineer of both the Metropolitan and Elevated Railways, of Kansas City. He has been connected with the Metropolitan for some time.

EVERETT K. DAY, formerly of the Mousam River Railroad, of Sanford, Me., is now superintendent of the Pawcatuck Valley Street Railway, at Westerly, R. I., a thriving summer resort road.

HENRY G. ISSERTEL has accepted the position of electrical engineer and general sales agent for the electrical department of the H. W. Johns Manufacturing Company. He has already closed several large contracts for trolley line materials.

J. K. URIE has resigned the management of the Austin, Tex., Rapid Transit Company, and has assumed the superintendency of the Galveston City Railway. Mr. Urie is one of the foremost street railway men in the South, and Galveston is to be congratulated.

A. M. JOLLY, who recently retired from the position of general manager of the Wheeling Railway Company to look after his former street railway interests at Beaver Falls, Pa., was agreeably surprised a short time before he left, by a party of his employes who stormed and captured his residence, and presented him with a silver dinner set.

"WHAT is your line of business?" whispered the editor to a man he was about to introduce to Northern capitalists.

"I drives a buss," huskily came the reply.

"Here, gentlemen," continued the editor, "is Mr. Jones, one of the moving spirits of our city."

## OBITUARY

PAYSON K. ANDREWS.

Payson K. Andrews, Chicago representative of the American Car Company, died at his home in this city, August 22, of heart disease.

There was no better known or better liked man in the supply trade than Mr. Andrews, and his death is deeply regretted by his very many friends, in and out of the trade. Since 1882 he has been a familiar figure at street railway conventions. He was born in Massachusetts, and after serving an apprenticeship in steam engine building, went on the road for various firms in the supply business.

P. K. ANDREWS.

For a long time he represented the Brill Company in the west. "Pay," as the fraternity loved to call him, was of a quiet, unassuming disposition, but possessed many rare qualities, and a man who loved his home. He was generous to a fault, of a most kindly nature and genial disposition, and always an active but honored competitor in business matters. It was a sincerely sad company of railway men who attended the funeral services, and each felt the loss of a personal friend. The remains were taken to Andover, Mass.

WILLIAM J. STEPHENSON,

the president of the Metropolitan Railway Company, of Washington, D. C., died August 31, at the age of 53.

Mr. Stephenson, who was first vice-president of the American Street Railway Association, was born in Washington, and a steam railroad man by education. His managerial ability was unusual, and his investments in street railway securities particularly fortunate. He owned stock in the belt line, the Columbia Street Railway, and the Metropolitan. Of the Columbia line he was manager, and of the Metropolitan the president, since last July.

Mr. Stephenson was an indefatigable worker, a genial friend, and devoted to enterprises having the public weal in view. He was a prominent mason, and past master of Dawson lodge, and past eminent commander of the Washington Commandery of Knights Templar.

GEORGE B. SHAW,

well known to the electrical fraternity as connected with the National Electric Manufacturing Company, and as manager of the Ansonia Entertainment Club during the World's Fair, died August 27, at the age of 40. Mr. Shaw was several times returned to Congress by the Republicans of the Seventh district of Wisconsin, and was made supreme chancellor of the world of the Knights of Pythias, in July, 1890. He was a brilliant man, of great promise, and his death is regretted by a very large circle of friends.

## DEATH OF WALLACE H. DODGE.

Wallace H. Dodge, founder and president of the Dodge Manufacturing Company, Mishawaka, Ind., died September 10, at his home. In 1889 he returned from Europe, where he went as delegate of the Society of American Engineers, with an attack of inflammation of the bowels, from which he never fully recovered. He was born in Mishawaka, in 1849, and all his life was spent there. He began business in his father's hardware store, and later engaged in manufacturing. In 1881, in connection with George Phillion, he made some wood split pulleys, and from this beginning the Dodge Manufacturing Company, the largest manufacturer of wood split pulleys in the world, sprung and its product is sold in nearly all parts of the world.

---

**HALF FARES.**

Interesting Bits of Information from All Parts of the Country,  
Boiled Down for Busy Readers.

A HEAD collision on the electric lines, at Whiting, Ind., occurred during a dense fog, killing one and injuring eight persons.

IN a collision of an electric car on the Cicero & Proviso line, this city, with a steam locomotive, Motorman John Briggs was killed and the street car wrecked.

THE Street Railway and Electrical Reporter, after reporting for two consecutive issues, has gone bust. It's hard to fill a long-felt want which is neither long nor felt.

G. VAN GINKEL, the prominent street railway capitalist, who was interested in the roads at Des Moines, Ia., Brazil, Ind., and elsewhere, was struck blind on the streets of Des Moines, September 17.

THE Newark Consolidated Street Railway Company recently sold its surplus horse flesh to the number of 500 head. The horses brought from \$15 to \$50. Farmers and peddlers were the main purchasers.

THE unfortunate San Francisco & San Mateo Electric line has had another runaway, this time its handsome funeral car. The car was on return trip from the cemetery, and the accident furnished one or two fatalities.

WELLINGTON ADAMS, in his suit against the General Electric Company for infringement of railway patents, received an adverse decision from Judge Hallett in the district court at St. Louis, September 17. The case will be appealed.

THE Indianapolis & Broad Ripple Rapid Transit Company, of which R. C. Light is president, and William Bosson, secretary and treasurer, began running cars September 14. The road gives every evidence of a prosperous career, and the promoters, among whom R. C. Light was chief, are to be congratulated.

THE San Antonio, Tex., Street Railway Company reports the following list of officers: President, W. H. Weiss; vice-president, T. C. Frost; D. D. Willis, superintendent, and Frederick Bolton, assistant superintendent.

OCTOBER 1 is the date set for the emancipation of all the remaining car horses in Cincinnati. How to get rid of the old horse cars, is a question that is bothering the management. Some are being sold for children's playhouses and summer kitchens.

THE Chicago City Railway has distributed a pocket card, asking the co-operation of patrons to prevent the "hitching on" evil. The request is made that papers be purchased before getting on the cars and not on the cars. On August 18 twenty-five boys were arrested for "hitching on."

PRESIDENT H. H. VREELAND brands as false the report that the Metropolitan Street Railway Company is about to put uniformed newsboys on the trains of the Metropolitan Traction Company's cable lines in New York. Some wise correspondent has spread far and wide the information that this was to be done.

JUDGE SWAN, of the United States Circuit Court, at Detroit, in a decision rendered August 21, denied the motion for a rehearing in the Cody patent case, thereby affirming a previous decision of the same court in favor of the Consolidated Car-Heating Company, of Albany, N. Y.

THE power house which is to run the electric locomotives in the Baltimore belt tunnel of the Baltimore & Ohio Railroad will be built at the south end of the tunnel on South Howard Street. The capacity will be 12,000 horse-power, and the generators are being built by the General Electric Company.

JOHN OLIPIANT, JR., superintendent of the Calumet Electric Railway, of this city, has compiled and issued one of the most compact and useful guides to "Points of Interest" on his line that we have seen. It contains a good map, time tables, and notes on pleasure resort points, and makes prominent their motto: "A pleasure ride of 40 miles for 20 cents."

THE formation of a Canadian Street Railway Association is being discussed by the brethren across the line. The plan would seem an excellent one, as owing to the latitude and municipal and other purely local features, there are many matters of considerable importance to Canadian managers which are not of sufficient importance to command the time of the American Association.

A SINGULAR accident befell a Brooklyn bridge cable car on August 4. The rear truck of the rear car of the train of four, jumped the track and mounted the guard rail. The car body fell off from the truck and rested partly on the rail and partly on the road below. The forward truck kept the track, but the rear one turned a

summersault and landed bottom up on the masonry at the side. A broken side bearing falling on the track is said by the press to have been the cause of the accident.

A PENNSYLVANIA judge has ruled that, while county commissioners have authority to grant electric railway franchises over county roads, they may not give such consent as to bridges along these same highways. The good judge is away off, as higher decisions already establish the fact that once the bridge is built and used, it is just as much a public highway as any other portion of the road.

THE annual meeting of the Ohio State Tramway Association will be held on Wednesday, September 26, at Toledo, O. The meeting will be called at the Beebe House, and if the delegates are in the city early enough arrangements may be made to hold the meeting upon a boat running to the Islands, which trip can be made probably, with the return, in one day. The secretary, J. B. Hanna, of Cleveland, or A. E. Lang, president of the Toledo Consolidated, will be in charge of affairs.

SUCCEEDS W. J. STEPHENSON.

Samuel L. Phillips has been elected president of the Metropolitan Railroad Company, Washington, D. C., succeeding William J. Stephenson, deceased. Mr. Phillips entered on his duties September 15. He was at one time a leading member of the Washington bar, but about twenty-five years ago his private affairs demanded so much of his attention that he gave up his practice to supervise matters in which his capital was invested.

SAMUEL L. PHILLIPS.

His first venture in the street railway field was as president of the Third Avenue line in New York City, which was \$400,000 in debt. Under his administration dividends began. Mr. Phillips was also president of the Washington and Georgetown line, Washington, D. C. Although he has been in the harness only a short time, the results of his administration are being felt. He first relieved conductors from the duty of washing car windows, placing a man at each end of the line for that work.

Mr. Phillips says the road will soon be equipped with the best underground electric system that can be procured, regardless of cost. He is investigating thoroughly all systems, and is ready to invest in everything that will improve the equipment of the line, and will soon fit the cars with fenders. New cars are in the barns ready for use in the winter season. From this showing it would seem that the presence of the new president is a great acquisition to the Metropolitan Company.

A WATERMELON FESTIVAL IN ALABAMA.

J. B. McClary, superintendent of the Birmingham Railway & Electric Company, of Birmingham, Ala., kindly sends the accompanying unique advertisement of

MOONLIGHT  
WATERMELON FEAST,

W. H. LANE

Given away by LANE BROS., at Lanesville near Thrash Station on Ensley Dummy line Every Thursday night that the moon shines the feast will begin at 8 p. m., and last until midnight.

J. H. LANE.

NOW IS THE TIME

Young ladies and gentlemen to have all the fun you are looking for at Lanesville where the fine fresh watermelons are cut every Thursday night that the moon shines.

THE WATERMELON FEAST

Is the town talk. I believe all the ministers of the city go out. Lanesville is the proper place to go for pleasure. Everything is handy and in first class style and best of all, the very best order is observed.

OH, YES!

I've just found out why so many people go aboard the Ensley Dummy every pretty moonlight night. I could have told you long ago that every Thursday night that the moon shows her face, the Lane Bros. give a watermelon feast to us. You can see the many beautiful lights from the Dummy.

(OVER.)

a park for colored people, established by two wealthy negroes, on one of the lines of the electric railway. As to the watermelon feature, the public may well smile, while as an artistic and literary gem, it certainly is worthy of record.

GUARD AND SCREEN ATTACHMENTS FOR WINDOWS.

Theophile Euphrat, Darien, Connecticut, has recently secured patents for guard and screen attachments, which can be adjusted or applied to old as well as new windows. "It prevents persons from falling out of windows, and thieves from breaking in," says the inventor, "and can be adapted to private houses, offices, etc., and keeps out insects as well as larger bodies." The screen and guard can be used separately or together, and in whatever position the window may be when opened, the opening is protected by the screen.

THE Montreal Street Railway Company has not as yet arranged for street railway postal service. "It will probably not be adopted this year," says Manager G. C. Cunningham.

### MICHIGANDERS MONKEY WITH A KENTUCKY BUZZ-SAW.

And as the Buzz-Saw was on the Right Track they are  
Worsted.

Considerable interest was created in street railway circles by a one-sided report sent out by an unregenerate Associated Press correspondent at Benton Harbor, Michigan, stating that W. Worth Bean, the president of the St. Joe & Benton Harbor Street Railway, had gone gunning for city officials on Sunday morning and deliberately shot one of the city aldermen.

Notwithstanding the outrageous warping of facts as sent out, the members of the great street railway fraternity of the country were not deceived as to the position of President Bean, and expected that when the truth was known his action would be found a warranted one. Such has been the outcome. The story is a long one, but interesting, and in a few brief words may be stated thus:

Five years ago, Mr. Bean purchased the few rails and one or two rattle traps, in which the St. Joe people were given a half-mile shake for five cents, and at once set to work to create both a business and a road. He connected the two cities, extended lines in both, installed a first-class electric system, put on new cars, ran them at a loss for a while in order to give a first-class service, ran his cars early and late to connect with lake steamers, increased the value of other people's real estate by thousands of dollars, installed one of the most extensive lighting systems in Michigan, and all this without a dollar of local aid. He had faith in the enterprise, and the towns, which was more than most people who knew the situation, had, and confidence in his own ability to earn success. So, single handed and alone, he worked nights and days (and Sundays, we guess), and has been running on easy street for some time.

But all the way he has had to fight the old foggy ideas of an aggregation of moss backs, veritable dogs in the St. Joe manger. The issue last made was an attempt to break faith with Mr. Bean by two granger members of the council who are on the street committee, by insisting on cedar block paving instead of 3-inch plank, as ordered by the city, and this without law or even resolution of council. Mr. Bean refused. At 4 o'clock Sunday morning the street committee, with three policemen and thirty laborers, proceeded to destroy the track. Mr. Bean appealed to the sheriff, who immediately formed an armed posse, taking Mr. Bean as one. The defense boarded a car, accompanied by Mrs. Bean, who is a no small command herself, and the little army of seven were quickly on the field of action. While the sheriff was endeavoring to make the rioters desist from further destruction of the track, the hammer of Mr. Bean's gun caught on the car gate, and its contents were discharged, two of the shot finding a stopping place in the leg of one of the aforesaid aldermen. It was purely accidental, as has been conclusively proved; and had Mr. Bean been

ordered by the sheriff to fire, would surely have placed the entire load where it belonged. We believe that he was fully justified in defending his property, and, if anything, did less than any man under similar circumstances is justified in protecting his hard earned property. To the credit of the citizens be it said their sympathies are for the railroad.

Mr. Bean is an earnest, progressive man; was one of the earliest members of the American Street Railway Association, and has served it as vice-president and member of executive committee more than once. His friends will be glad of the chance to congratulate him at Atlanta, on having "met the enemy and they are his."

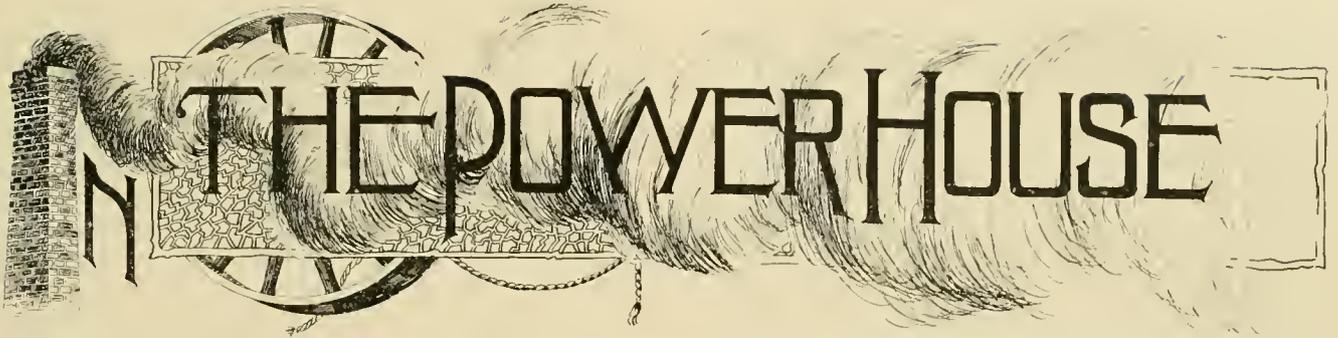

### THE HEILMANN SYSTEM.

There is quite a diversity of opinion to be noted in perusing our foreign exchanges as to the merits and possible future of the Heilmann system of electric propulsion, which was recently described in these columns. The majority, however, strongly incline to the belief that the generation of electricity on the car propelling it has no wide or practical future. As a sample of this latter class of writers, we quote the following from an editorial in the Pall Mall Gazette, which says:

"The so-called electric locomotive which has just made satisfactory public trials in France, is not likely to revolutionize the methods of railway traction in this country. The new machine is indeed scarcely to be described as an 'electric' engine, for though the power is applied through the medium of a dynamo, a boiler and a high-pressure steam engine are essential parts of the appliance. There can, of course, be no gain in power by utilizing the force of the steam engine indirectly; on the contrary, there is a distinct loss though a very small one. The size and weight of the locomotive are exceptional, and there is no evidence as yet that its hauling power is remarkable. The speed is high, but not higher than that of an ordinary express engine. Indeed the chief advantages which appear to be claimed for the French locomotive are greater smoothness of running, and consequently less wear and tear to the rails; and that the driver, being absolved from the charge of the steam engine, can give his undivided attention to the observation of signals and the running of the train. But this seems a small gain in exchange for the complication of the steam engine and the electric engine carried on the same platform."

The REVIEW is firmly of opinion that the tendency will be more and more to a utilization of electric power generated in one central station for an increasingly large territory, and that the car will receive its current through direct connection at all times with the station.

THE general manager of one of the most successful roads in New York, in renewing his subscription, says: "We enclose check for renewal of subscription, and wish we could invest all our \$2.00's as well!"

# IN THE POWER HOUSE

*This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances, are expected to give their views and experiences on subjects within the range of the department.*

At last America is to have an electric railway station with a storage battery as an adjunct. The Merrill Railway and Lighting Company, of which R. Weidauer is president, and E. S. King secretary, is to be congratulated on the move it is making, and we are sure all will wish for the success of the undertaking and watch with interest for the results. Mr. King's article, elsewhere in this department, gives some of the details of the installation.

\* \* \*

How many engineers know how much their coal and power house expenses amount to per car mile, and how much a horse-power-hour costs at their power house? There are plenty of men who think they have "pretty neat little plants" and can "make about as good a record as the next fellow," but when it comes to actual figures there is a sudden discovery that they do not know much about the performance either of their own or other plants. Those who belong to this class had better take measures to get out of it as quick as they can.

\* \* \*

It is not often that a clutch in breaking, does as much damage as did the one at New Orleans in the Louisiana electric light plant, August 28. The plant runs the Canal and Claibourne Railway lines, and the accident caused the shutting off of the railway current for several hours. The breaking clutch wrecked nearly everything in the vicinity, and even went through a brick wall.

\* \* \*

SOME people seem to be incapable of grasping the fact that the world moves, and engineering practice goes along with it. A company four years ago, built a station of 150 horse-power, using 60 kilowatt generators. Shortly after, it built a slightly larger station with 100 kilowatt generators. The last station it built was of 1,600 horse-power capacity, and, although it was of good design otherwise, the generators are all only 125 kilowatt. It is needless to say that it is not a very efficient station, as compared with what it might have been, had the designers been a little progressive in their ideas. The centralizing of power in large units can be overdone, but

the economical advantages of a large plant are lost if the units are not made proportional to the size of the plant.

\* \* \*

It now seems very likely that before long several railway stations will put in batteries to steady the load on generating machinery and take care of extreme variations. The plant about to be installed at Merrill, Wis., will do several varieties of work, but the advantages would be just as pronounced with a railway station pure and simple. Such use of batteries in railway stations has been talked of in this country for several years, but it was left to Zurich, Switzerland, to try the first experiment along this line. The reason for the slowness of this country in adopting this method is partly in the fact that it is the smallest stations that suffer most from load variations, and such stations are not as independent in practice as the larger plants. The main reason, however, is the uncertainty as to the life of the batteries and a general indefiniteness as to the saving that will be effected. This reason is now no more, as we learn that a certain storage battery company is prepared to make an offer to any railway company that is as definite as can be desired. The proposition is about as follows: Suppose, for example, a road is going to be put in a plant with a maximum capacity of 500-horse-power. Its average load will be about 250-horse-power, and if a battery is used, only 250-horse-power of engines, dynamos and boilers will have to be installed, the rest being taken care of by the storage battery. The battery company proposes to install the 250-horse-power battery for the same money that it would cost to put in an additional first-class steam plant with triple expansion engines to take care of the load were the battery not used. This proposition includes the switchboard and all the regulating appliances for the battery. It is further proposed to maintain the battery for 10 per cent of its first cost, and if the maintenance bill runs below 10 per cent to give the railway company the benefit of it. This is certainly a definite enough offer and guarantee. Now comes the question of the operative economy of the proposed plan. As to first cost there would be no difference if the steam plant was triple expansion in both cases. The maintenance will also be about the same, although the engines in the battery plant ought not to require as many repairs as the others because they work under a steady load. However, machinery is now made so that it will stand the hard knocks of railway work, and the main advantages of the battery will have to be counted

in the saving that will be brought about by giving the engines and dynamos a steady load and allowing them to be entirely shut down during hours when the load is very light. The results of various tests on different roads shows that engines on a street railway load are about 30 per cent less efficient than if on a constant load. Whatever the engines used, therefore, it is safe to count on a saving of 30 per cent in power generation. Against this there is a loss of about 20 per cent of the power that goes through the batteries. Counting roughly that one-half of the output goes through the batteries, this would mean a loss of 10 per cent or one-third of the 30 per cent saving. The storage battery plant, according to this approximate figuring, would therefore have an efficiency 20 per cent higher than the corresponding ordinary steam plant. Although the first cost is not as low as we had been formerly led to expect, this 20 per cent saving in operation is worth trying for, and it is not unlikely that some additional plants will before long install storage batteries. It is also very probable that when it comes to actual business the battery company might better its offer, so as to make a double inducement to install such a plant.

\* \* \*

An explosion of natural gas under the boilers of the West Washington street power house of the Citizens Street Railroad of Indianapolis, on August, 31, did some damage and caused the temporary shutting down of the plant. It occurred at a most unfortunate time, as the traffic for the first half of September is the heaviest of the year. General Manager T. H. McLean, and his right hand man H. B. Niles, the electrical engineer, had been working hard getting this new power plant in condition for the September rush, and were just congratulating themselves on having gotten things into comfortable shape, when the crash came, which sent away for a time all dreams of rest. The load was taken care of by the other power plant of the company, so that the service was impaired very little. A REVIEW representative was in the boiler room at the time of the explosion, and with several others had a narrow escape. Mr. Egan the chief engineer, and a gas inspector, were standing with the REVIEW man in front of the two 750 horse-power Zell water tube boilers with which the power-house is now equipped. When the report came, the three men in front of the boilers concluded that it was not wise to wait there for further developments and started for a door at the other end of the room. "The REVIEW always leads," and this was no exception, as the REVIEW man had the start and kept it to the finish, with the two others close behind. The wisdom of the policy of retreat was afterward fully demonstrated, as the three men would surely have been severely injured had there been an instant's hesitation, for another explosion closely following the first brought down the iron doors and a pile of brick in front of the boilers where the three men were standing. For a few seconds the wreck was an ugly looking pile, as the gas, before it was turned off, flamed up through the ruined

boiler settings, but an absolutely fireproof building prevented a fire. A good idea of the damage done can be got from the accompanying engraving, from a photograph taken by C. D. Jenney, of the Jenney Motor Company, which shows the exterior of the power house the next morning. The wreck which has been cleared away is seen at the left. The setting of the adjoining boiler and the piping were wrecked so that the plant had to be shut down. No one was seriously hurt. The explosion was of course caused by gas collected under the boilers. It could collect there from only two causes—leaks in the pipes under the boilers or a flow of more gas than there was oxygen of the air present to burn. The fact of a previous momentary increase in the gas pressure makes the

NATURAL GAS EXPLOSION, INDIANAPOLIS.

latter look like the probable cause, although as far as we know, the engineer had from previous experience no reason for supposing that the usual air supply was not sufficient to burn the volume of gas which would flow at the full pressure available under the boilers. The full pressure is supposed to be used when required. The gas inspector had daily visited the station to take readings under the same conditions as when the explosion took place. The explosion occurred on Friday at 4 p. m., and the entire plant was started Monday at 11 a. m. The boilers were reset and piping and building repaired in that time. It was wonderfully quick work, as the night of the explosion it looked as if a week would not be sufficient to repair the damage.

#### Suggestions on Live Subjects.

BY GEORGE H. LEONARD, NEWTON & BOSTON STREET RAILWAY.

In relation to the much discussed question of high and low speed engines, I think that 300 horse-power, or above, should be slow speed compound condensing. Sizes between 300 and 100 horse-power should be high-speed compound condensing, and those under 100 horse-power, simple high speed. All should be direct connected, as I

do not believe in rope or belt drive when it can be avoided. The great objection to direct connected generators has been the idea that short circuits are more liable to break the engine, but the safety devices of to-day do away with all danger. I do not think a slow-speed engine smaller than 150 horse-power can be used to advantage in a railway power station. Plants of less than 1,000 horse-power can not afford to use mechanical stokers, but I think that they are an advantage for plants of 1000-horse-power and over. Water tube boilers are better for use with water that scales than return flue, if you have a spare boiler, as every station should have. I do not think the return flue boiler is "in it" to-day. The best place to feed a boiler is in the top of the shell, running the pipe the length of the boiler inside. I write the above because I would like to get the views of other street railway engineers on the same subjects. Among other things I would like to hear the best way to heat feed water when condensing engines are used, as this is an important factor in some power plants.

\* \* \*

#### Storage Batteries for Central Station Work, at Merrill, Wis.

BY E. S. KING, SECRETARY MERRILL RAILWAY & LIGHTING COMPANY.

We have placed a contract with Electric Storage Battery Company, of Philadelphia, manufacturer of the Chloride Accumulator, for 240 cells, type "F," 11 plates to each cell, with maximum capacity of 100 amperes per element, for four hours discharge, normal capacity, 50 amperes discharge of ten hours duration. Our object in making this purchase is to equalize the voltage upon our trolley line during the day, and assist us in furnishing electric lights during the period of heavy load at night.

We operate 1,000 16-candle-power lights, and one railway generator of 50 kilowatt capacity, with water power, using two turbine wheels of about equal capacity, one for lighting, the other for the railway generator. We have ascertained that the railway generator would not require, for operation of the two cars we regularly run over our track of a little less than two miles, an average of more than 15 horse-power, but as now operated, the load changes from "no load" to 50 or 60 horse-power quite frequently, and causes the voltage to vary from 300 to 520, according as the load is heavy or light. This prevents us giving satisfactory motor service, and we consider it detrimental to our car motors. It also prevents us connecting the two water wheels during the period when the electric lighting load is heaviest, and getting the benefit of the surplus capacity of the wheel operating the street railway generator, which is greatly needed to assist the electric light wheel, especially when the water is below the ordinary stage. The changes of load on the street railway affecting the speed of the wheel enough to make the difference in voltage cited above, would affect the speed of both wheels when connected, although to less extent.

Our plan is to connect the 240 cells, in series, to the

generator during the day, and operate the same under a constant load, a little greater than the average load required on trolley, thereby keeping the battery fully charged; and at night, when help is needed for electric lighting, the battery to be disconnected from generator and connected with the three wire lighting system, two groups, of sixty cells each, on each side, aiding the lighting dynamos, to the extent of about 800 lights, for the period of heavy load.

We feel confident that the battery will have such an equalizing effect upon the pressure to be maintained on the electric light wires, that if necessary, the wheel operating the railway generator can be then connected with the one operating the light dynamos, without detrimental effect, giving the surplus power of that wheel which we are now unable to use. In addition to these benefits, we will make considerable saving in another way. We hire steam power, at the west end of our city, to operate 500 16-candle-power lights, in addition to the other lights mentioned, for the reason that the water power is not sufficient when water is at a low stage, and the further reason that the center of this lighting is at a considerable distance from the water power, and with our system the loss in distribution is considerable, and the difficulty of equalizing pressure great. With the increased power derived from this battery, and having it located at our car house, within one-fourth of a mile of the center of the west end lighting, we will be enabled to discontinue the use of this steam power, and furnish lighting at that end of the city from our water power, with the aid of the battery, and give a perfectly satisfactory light. In fact, we have every reason to believe that lights operated in connection with a storage battery, in this manner, will be as near perfect as electric lighting can possibly be. Operating in this way we will save the charges now paid for steam power, and the other expense incurred in this station. The advantages are constant load on generator; equal voltage on trolley, which allows us to give motor service therefrom; obtaining all of the power of our two water wheels when needed; a more equal voltage on our lighting mains; an increased capacity for lighting, which can be added to from time to time by purchase of new batteries; saving the expense now incurred at west end for power; making it possible to run the street railway for several hours from battery alone, when necessary that generator or wheel be stopped. In fact, it may be to our interest to run the street railway regularly for a part of each day from battery alone, saving some in labor charges.

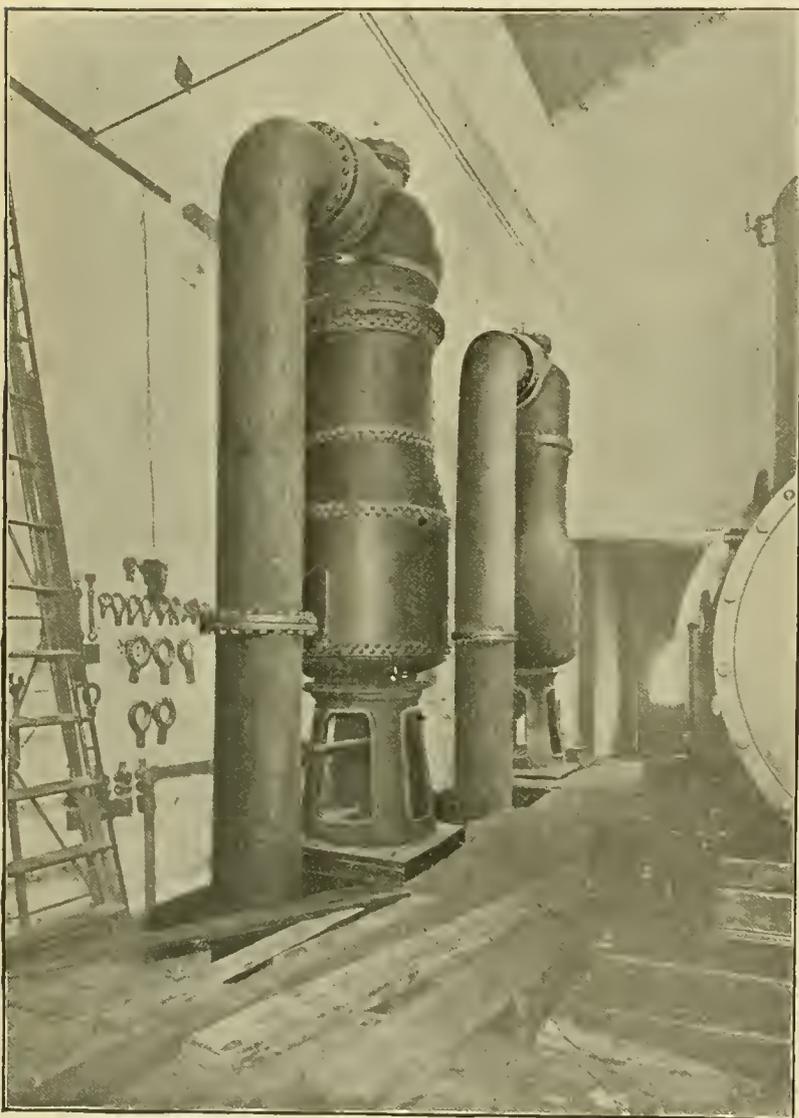

It is guaranteed that the cost of maintenance of battery shall not exceed 10 per cent of the list price of same, for a period of ten years, with the assurance that in all probability it will cost much less. Special guarantees were given us by the Electric Storage Company, as the installation will probably be the first in this country applied to railway work. In order to properly operate our lights we had to adopt something of this kind, or build a steam plant, which as we are situated we could not do, in connection with the water power we now use,

and we would lose all the advantage derived from cheap power if the latter plan was adopted. The cost of battery is much less (60 per cent) than the steam plant necessary for our use would have been, and the operating expense, including maintenance of water power and storage less than \$3,800 per year, while steam power would cost us probably \$10,000 per year.

#### Big Stratton Separators for Philadelphia.

Six Stratton Separators, of the size shown in the engraving, are being put in the Philadelphia Traction

BIG STRATTON SEPARATORS FOR PHILADELPHIA

Company's plant at Thirteenth and Mount Vernon streets. The large separators and feed water heaters of the Goubert Manufacturing Company are famous for their size and number, but this latest installation exceeds both in individual size and aggregate number all previous ones made by this company. Two of the separators in this station are 18-inch, two 16-inch and two 8-inch.

One of the 18-inch separators is in the foreground of the engraving. The principle of this separator is that of imparting a rotative motion to the steam, so that all the heavy liquid particles acquire a centrifugal force and are projected to the outside of the current. The apparatus consists of a vertical cylinder with an internal central pipe extending from the top downward, for about half the cylinder's height, so that there is an annular space between the two. The steam is admitted near the top of the annular space and leaves the separator from the top of the inner pipe. The current of steam on entering is deflected by a curved partition, and is thrown so that it whirls around the cylinder while descending the annular space and the water particles are thrown against the outer walls of the separator. A thin sheet of water is continually running down the inside of the outer shell. The steam, now in a dry condition, passes up the inner tube and on to the engine. The lower part of the separator is enlarged to form a receiver for the water that falls, and is provided with a drip pipe and with a glass gauge for showing the level of the water in the separator. The Goubert Manufacturing Company has also supplied these separators to the amount of 12,000 horse-power to the new plant of the Philadelphia Traction Company.

#### ANOTHER SAN FRANCISCO LINE ABSORBED.

The Market Street Railway Company, San Francisco, has bought the Metropolitan Railway. The capital stock is \$1,000,000; first mortgage bonds authorized, \$250,000, of which \$200,000 have been issued. There is also a slight floating indebtedness. The road has been put under the management of the Market Street Company by the appointment of M. D. Stein, as manager, and the election of N. T. Smith, treasurer, and J. L. Willcutt, secretary. It is a double track road, five miles long, and is the second electric railroad put in operation in the city, having been running since October 20, 1892, the first being the San Francisco & San Mateo Railway, which was opened for travel April 26, 1892.

The Metropolitan is a first-class road, and well equipped in every respect. It runs from the junction of Market, Powell and Eddy streets, through the central portion of the city in a general westerly direction to the Stanyan street entrance to Golden Gate Park, with a branch from the junction of Page and Clayton streets to a southerly entrance to the park at Ninth avenue. The purchase of this company makes twelve companies in the Market street system.

H. N. HURT, superintendent of the Atlanta Consolidated Street Railway, has resigned.

## EN ROUTE TO ATLANTA.

The visitor to the convention will in all probabilities pass the first twelve hours of his pilgrimage in sleep. And let the writer add it is better so, since the day following will need a rested body and mind to enjoy the experiences and scenery in store. The comforts of the elegant sleeping cars of the Monon and Big Four routes will thus be appreciated from Chicago to Cincinnati.

On arriving at the Queen City, all the separate parties may be gathered together for the daylight trip through the most beautiful of southern scenery, over the Queen & Crescent's magnificent and expensive roadbed, with vestibuled cars to match.

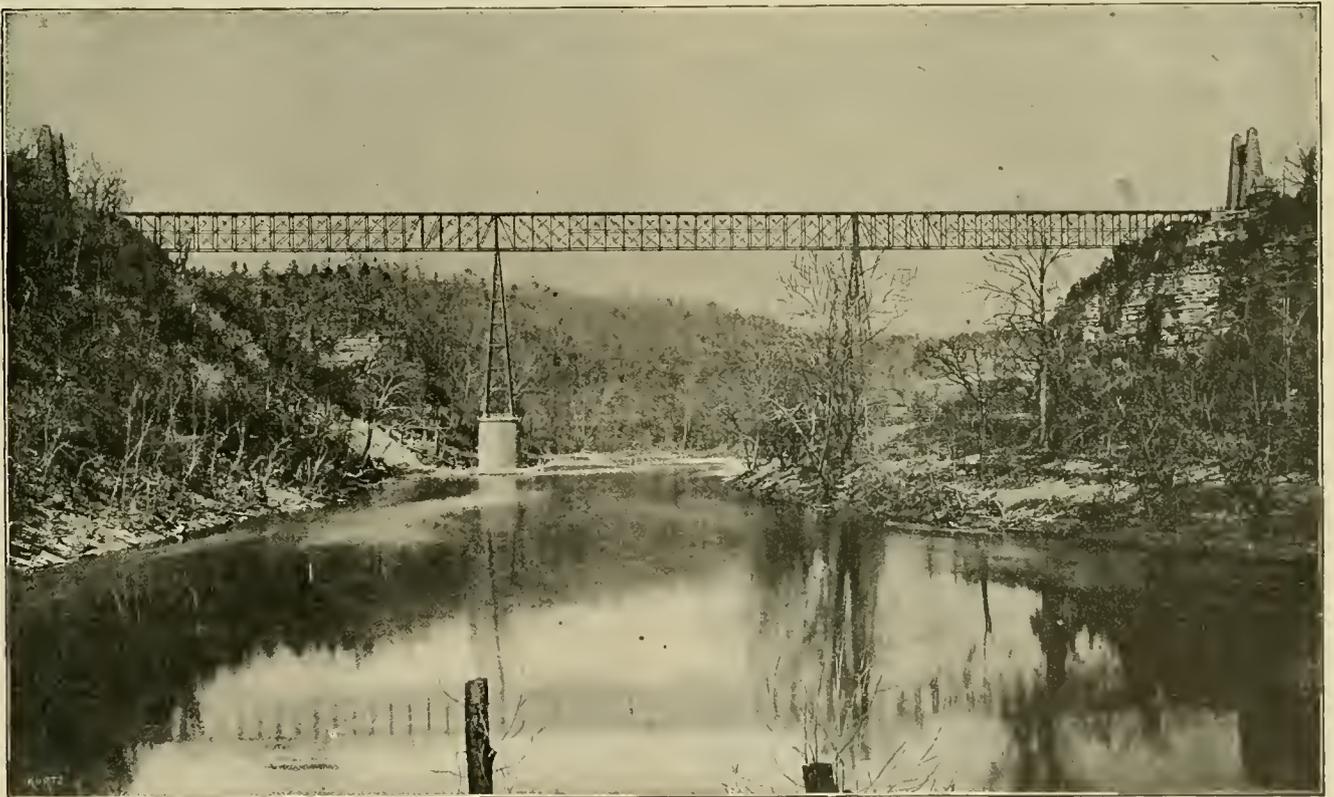

On crossing the sluggish Ohio, the traveler finds himself almost instantly in a new realm. The aspect of the country changes somewhat, but the principal change is in the people and scenes along the line. It is old Kentucky. Speeding through the magnificent rolling blue grass country, the traveler soon finds himself in the foothills of the Cumberland Mountains, and over the rivers and through the tunnels toward the highlands of Tennessee. All along the line the magnificent vistas are opened up. Crossing the Kentucky River on the High Bridge and the north and the south forks of the Cumberland, glimpses of the loveliest nooks almost impel the tourist to stop off at the next station and plunge into the woods with rod and gun as his only companions. To the left of the track now comes the rounded, wooded domes of King's Mountain, Science Hill, and others of the lower

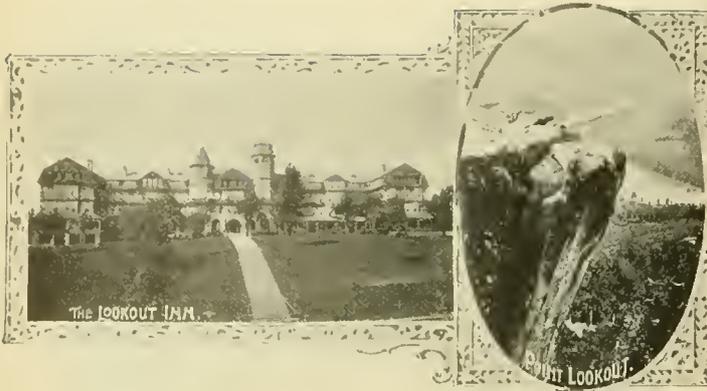

SCENE FROM THE TRAIN.

hills of the Cumberlands, which reach their greatest altitude in Missionary Ridge and Lookout Mountain.

At the Emory Gap history begins to assert itself, and the grounds and woods bring up memories of the late war when Emory Gap was the pathway of contending armies. Delicious trout streams and tall pine trees and thickly wooded hills appeal to the aesthete and the sportsman, while the pure, clear air is a balm to lungs filled with city smoke. To the right of the train is Walden's ridge, which stretches down to Chattanooga with occasional spurs of local fame. To the right of the train may be seen coal and coke industries and iron furnaces in full blast. It is now about dusk, and the sun shining into the clouds above Walden's ridge give an eerie glamour to the scene of peace and quietness. At one point a deserted

HIGH BRIDGE OVER THE KENTUCKY RIVER.

boom town may be seen with a street railway road bed overgrown with grass and weeds.

Night begins to fall upon the scene, and Chattanooga is reached in darkness. The train plunges on, and by the next morning the delegates will be greeted by the local committee in Atlanta.

On the return trip, a stop will be made at Chattanooga to enable the visitors to view that beautiful town, famous for its historic interest, its natural scenery and its commercial importance. The receiver and manager of the Chattanooga Electric Railway, S. W. Devine, and the genial general superintendent, W. S. McCall, will show the city and its environs to the visitors. The Chattanooga Electric Railway was organized in 1888. It has 32 miles of track and 32 motor cars and 5 trailers. Stephenson cars are in the majority, and Edison electrical equipment is used throughout. Beck, and Armington & Sims engines of 550-horse-power make the power equipment, in company with the Taylor and the Walsh & Weidner boilers of 600-horse-hower.

One of the principal lines runs to Lookout Mountain and another along Missionary Ridge. The cars and the incline carry the tourist to the top of Lookout Mountain, where a beautiful view may be had of all the varied scenery.

It will be worth the trip to the summit to gain the general view and the particular points of historic interest so vividly portrayed in the histories.

LOOKOUT MOUNTAIN.

## NEW SUPERINTENDENT AT SACRAMENTO.

The Central Electric Railway of Sacramento, owned by the Electric Power and Light Company, is a center of interest now, because engaged in a plan to transmit its power, from a water power at Folsom, 20 miles from Sacramento. T. A. W. Shock is the new superintendent, and his work on the transmission plant will afford him great opportunities.

Mr. Shock is a graduate of the U. S. Naval Academy at Annapolis. For several years he was connected with various electrical concerns, and finally became engineer for the General Electric Company, at Portland, Ore. Here he had charge of railway construction and power

VALLEY OF THE KENTUCKY RIVER.

transmission, so that by education and experience, he is fitted for the recently assumed position. Fuel for running the steam plant at present costs \$6 per ton at Sacramento. Only a part of the transmitted power will be used for the railway. The balance will be taken by lighting, stationary motors and heating. Of stationary motors there are already 3,000 horse-power in this climate, while electric heating is especially popular in this climate, because it does away with the needless heavy fires for cooking and for morning and evening heating.

A HOLY howl arises from Westerly, R. I., where the electric cars have so affected the river traffic that the largest of two steamers which have daily plied on the Pawcatuck for the past two weeks will be taken off the route.

THE XIIIth ANNUAL CONVENTION OF THE AMERICAN STREET RAILWAY ASSOCIATION.

EXPOSITION BUILDING, WHERE CONVENTION WILL BE HELD.

On Wednesday, October 17, 1894, President Henry C. Payne, of Milwaukee, will call to order the first session of the thirteenth annual convention of the American Street Railway Association, in Machinery Hall of the Piedmont Exposition, Atlanta, Ga.

The occasion will be noteworthy, from the fact that the city of Atlanta is the smallest that has ever entertained the association, and that this is the farthest south that the association has gone to hold its sessions, but it is, without the least tremor or apprehension on the part of any one, that the street railway men of the country place their convention and annual good time into the hands of the brightest, most modern and most hospitable of southern cities.

The association will be warmly welcomed by the citizens of Atlanta, and at no time in the history of the organization has the general public taken so warm an interest in the affair.

The following table shows the history of the association at a glance:

| PLACE.               | PRESIDENT.                | YEAR. | NUMBER MEMBERS.** |
|----------------------|---------------------------|-------|-------------------|
| 1 Boston .....       | Hon. Moody Merrill* ..... | 1882  | 24                |
| 2 Chicago .....      | H. H. Littell.....        | 1883  | 62                |
| 3 New York .....     | Wm. H. Hazard .....       | 1884  | 102               |
| 4 St. Louis .....    | Calvin A. Richards† ..... | 1885  | 123               |
| 5 Cincinnati .....   | Julius Walsh .....        | 1886  | 140               |
| 6 Philadelphia ..... | Thos. W. Ackley†.....     | 1887  | 152               |
| 7 Washington .....   | Chas. B. Holmes.....      | 1888  | 157               |
| 8 Minneapolis .....  | Geo. B. Kerper .....      | 1889  | 161               |
| 9 Buffalo.....       | Thos. Lowry.....          | 1890  | 173               |
| 10 Pittsburg.....    | Henry M. Watson.....      | 1891  | 184               |
| 11 Cleveland .....   | John G. Holmes.....       | 1892  | 204               |
| 12 Milwaukee .....   | D. F. Longstreet.....     | 1893  | 197               |

\* Chairman of the organization. † Deceased. \*\* Companies only.

It may be stated that the last year's loss of membership is entirely due to the consolidations effected during the year 1893, in New York, New Jersey, Pennsylvania and Ohio, particularly.

For the session of 1894, the following is the program, subject to the changes noticed later:

**CAN THE T RAIL BE SATISFACTORILY USED IN PAVED STREETS?**

Joel Hurt, president Atlanta Consolidated Street Railway, Atlanta, Ga.; S. Hendrie, manager Wyandotte & Detroit River Railway, Detroit, Mich.; H. J. Crowley, engineer Atlanta Consolidated Street Railway, Atlanta, Ga.

**CITY AND SUBURBAN ELECTRIC RAILWAYS.**

E. C. Foster, superintendent Lynn & Boston Railroad, Boston, Mass.

**MAIL, EXPRESS AND FREIGHT SERVICE ON STREET RAILWAYS.**

R. McCulloch, electrical engineer, Citizens' Railway, St. Louis.

**BEST METHOD OF TREATING ACCIDENTS AND COMPLAINTS.**

John B. Parsons, general manager West Chicago Street Railroad Company, Chicago.

**STREET CAR WHEELS AND AXLES.**

D. S. Cook, electrical engineer, Trenton Passenger Railway Company, Trenton, N. J.

**TRANSFER AND COMMUTATION.**

Rodney Curtis, president Denver Tramways Company, Denver, Col.

**TRAIL CONSTRUCTION OF THE TERRE HAUTE ELECTRIC RAILWAY COMPANY, TERRE HAUTE, IND.**

M. F. Burke, superintendent Terre Haute Street Railway Company Terre Haute, Ind.

**A STANDARD FORM FOR ACCOUNTS FOR STREET RAILWAYS.**

H. I. Bettis, New York

The report on "street car wheels and axles" will be presented by another person, as Mr. Cook has been ill for some time and has resigned his position. President Rodney Curtis will be detained by business at Denver, and his thesis will be read by another.

President Russell B. Harrison, of the Terre Haute Electric Railway, will present the paper on the T rail construction at Terre Haute.

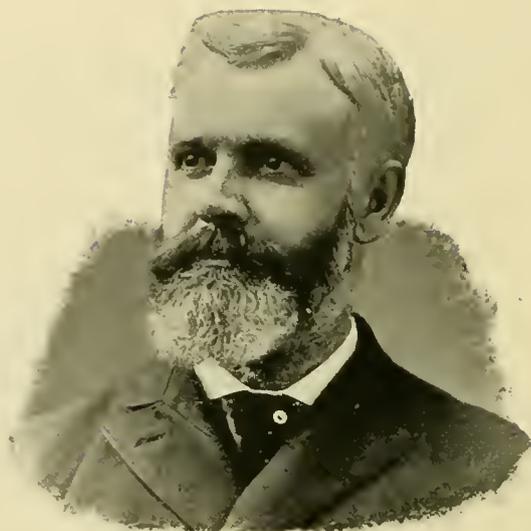

The subjects are all fresh and interesting and will have deserved attention.

The local committee has arranged, subject to change, the following plan of entertainment:

WEDNESDAY EVENING.—A reception at the Capital City Club. The club will extend its courtesies to all the gentlemen in attendance.

HENRY C. PAYNE, PRESIDENT.

WILLIAM J. RICHARDSON, SECRETARY.

T. H. MCLEAN.

J. R. CHAPMAN.

E. S. GOODRICH.

W. Y. SOPER.

LEWIS PERRINE.

THURSDAY EVENING.—The banquet, probably at the Capital City Club; if not there, at the Aragon Hotel.

FRIDAY.—The visitors will be treated to a typical Georgia barbeque, at Stone Mountain. The latter is the piece de resistance, and nothing the committee could afford will give more pleasure.

The ladies will be taken in charge and personally conducted to the salient points of interest about the city.

#### THE OFFICERS AND COMMITTEES.

The officers and executive committee of the American Association for 1893-94 are:

Henry C. Payne, president, Milwaukee, Wis.  
 Wm. J. Richardson, secretary and treasurer, Brooklyn, N. Y.  
 W. J. Stephenson, first vice-president, Washington D. C.  
 J. R. Chapman, second vice-president, Chicago.  
 Lewis Perrine, third vice-president, Trenton, N. J.  
 Executive committee: D. F. Longstreet, Denver, Col; T. H.

McLean, Indianapolis, Ind; Ed. Whittacre, W. Y. Soper, Ottawa, Ont., and E. S. Goodrich, Hartford, Conn.

It is with great regret that the news of the death of Vice-President Stephenson has been received.

The local committee consists of the following Atlanta gentlemen, named under their respective sub-committees:

HOTEL.—Wm. W. Kingston, Walter M. Kelley, S. W. Trawick, E. P. Thomas, A. F. Giles.

EXHIBITS.—N. W. L. Brown, Walter M. Kelley, Dana R. Bullen, W. W. Kingston.

TRANSPORTATION.—W. M. Kelley, J. H. Allen.

ENTERTAINMENT.—R. J. Lowry, J. Carroll Payne, T. K. Glenn, W. W. Kingston, Henry Inman, J. W. English, Jr., Livingston Mims, H. N. Hurt.

BANQUET.—H. E. W. Palmer, J. Carroll Payne, E. Woodruff, R. J. Lowry, Henry Jackson, T. B. Felder, Jr., Livingston Mims.

EXCURSION.—W. M. Kelley, E. Woodruff, H. N. Hurt.

FINANCE.—E. Woodruff, R. J. Lowry, T. B. Felder, Jr., Jas. W. English, Jr., W. C. Sanders

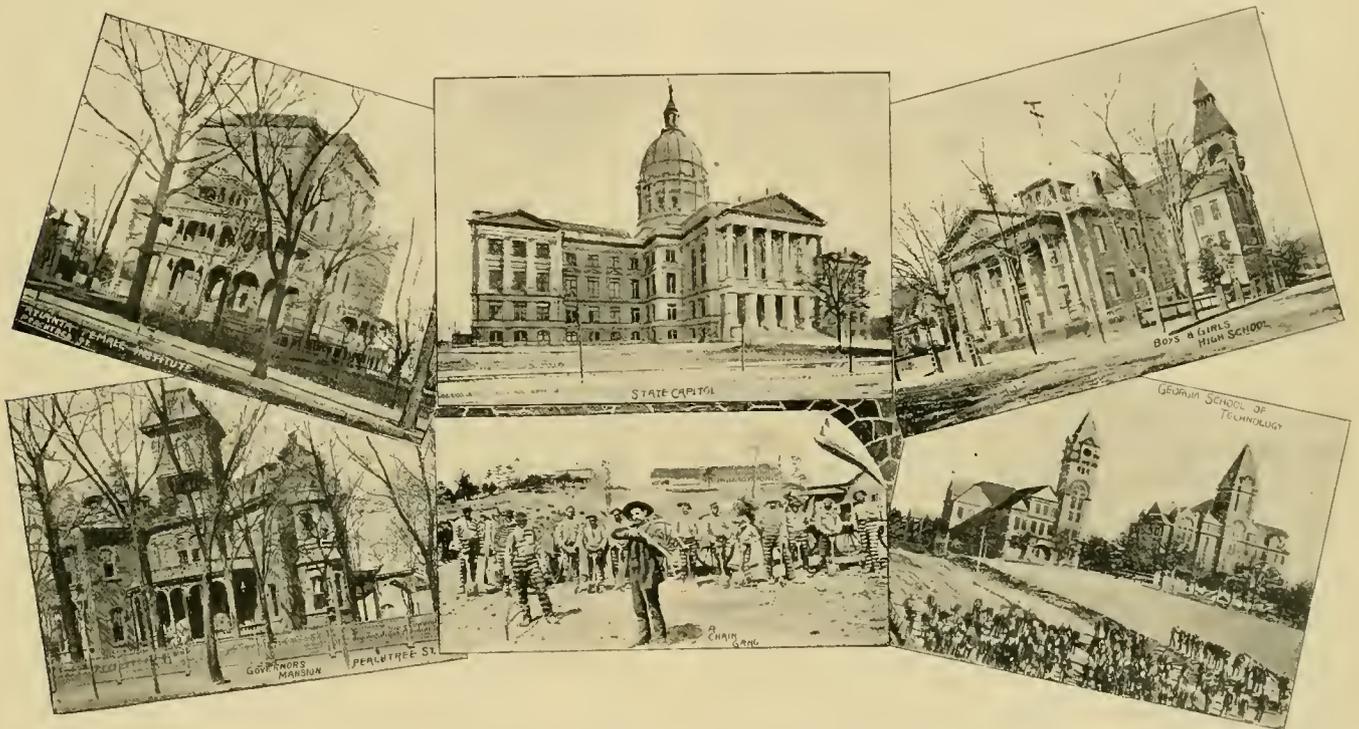

## ATLANTA, GEORGIA.

Gate City of the Southland's Realm,—Of Commerce, Art and Politics, the Helm.—Homes of Her Men—  
Growth of Her Chivalry—And all the Visitor Will Care to See.—The Healthful Heights—The  
Works of Public Use—And all the Lessons Which from These Deduce—Yet  
Should the Doubter Say, "Can these Things Be?"—Our Only  
Answer Is, "To Go and See."

It is the stern decree of the shadowy and uncertain Fate that moulds the destinies of cities that where Fate wills must the city build. So was it with Atlanta, whose founders fifty years ago treading the cowpath, now Peach-tree street, little thought that from beneath their footsteps would spring marts of trade and palaces

Why do the pampered settlements with every opportunity for growth dwindle and die in spite of the heroic

to the Atlantic and west to Gulf, and, where the waters divide, there is the division station of commerce. The elevation of the city at the tracks of the Union depot is reckoned at 1,050, although several points in the city are from 50 to 100 feet higher. With the exception of Denver it is rated as having the greatest elevation of any city of approximate size in the United States

efforts of their founders? Why has every large city moved its base of development from the spot designated by reasoning and learned men and settled along the cow-path or in the marsh? We do not, nor do the real estate men, know. Atlanta is no exception to this vagary of growth, for it resolutely moved away from Decatur to grow to lusty strength, while Decatur is now satisfied to be a suburb of it. The city of Atlanta is situated in latitude 33° 45' 19" north and in longitude 84° 23' 10" west of Greenwich. Located on a spur of the Blue Ridge mountains where the mighty procession of the Alleghenies converge and radiate into ridges of moderate height, suitable for agriculture or residence, Atlanta has reared itself to become the gateway city of the south, the eye and ear and nerve center of the empire of the southeast. It is seven miles northeast of the Chattahoochee river, and on the southernmost crest of the Chattahoochee ridge, which divides the waters which flows east

With this great natural advantage, coupled with its central location, it is not to be wondered at that Atlanta has become what it is.

The great transportation systems centering at Atlanta are: The Richmond & Danville (Piedmont Air Line), the Georgia, the Central, and the Georgia, Carolina & Northern connect her with the Middle Northern, the Northern, and the New England states; the Western & Atlantic, the East Tennessee, Virginia & Georgia (Southern Railway) give passage to the Allegheny, the Rocky Mountain, and great lakes region; the Central, the Atlanta & West Point, the Atlanta & Florida, and the Southern reach the South Atlantic and Gulf states, while the Georgia Pacific and the Atlanta & West Point lead to the great Transcontinental systems. As far back as 1845 John C. Calhoun predicted Atlanta would be the distributing point of the southeast.

In 1836 one family populated Atlanta, and ran the

town at its own sweet will. It was the Ivy family. O poetic chance, has not the Ivy spread, and driven out the Cherokee Indian, and luxuriated into a noble plant! In 1836 the Western & Atlantic Railroad made the Ivy homestead its terminus, and the station was promptly called Terminus. In 1842 Terminus had six houses, and began to assume metropolitan airs.

In 1843 Terminus applied for a charter and incorporated as Marthasville. The village began to grow, and in 1844 the 200 citizens began to call the place Atlanta, which was ratified by legislature in 1847. In 1845 the first newspaper was started and named the Luminary. It shone six months and went into eclipse.

Atlanta passed its early youth after the usual fashion of growing towns everywhere. Whisky, riot and ruffianism were rampant by periods, and good government achieved in the interim. In 1850 the population of Atlanta was 3,000, with fifty stores, all of which sold liquor. Then a "moral" party gained the ascendancy, and a happy occasion it was for the metropolis. Other lines of railroad began to come into the city, and the church, the bank, and the newspaper assumed being. Property in the city at that time was not sold by the front foot but by the acre.

The original street was Peachtree, and was laid out by the useful if humble bovines that tramped down hill and back every day, to the present site of the Union depot, where a spring furnished water for the village cows.

Every successive year was filled with increase in business, and a rapidly developing population drew more desirable citizens to the place. It was thus that out of a country village a city developed. Nothing in history of American cities, nay, of all the cities of the world, is so close a parallel to the city of Chicago as Atlanta. As late as 1850, it is said that 100 acres, now the site of the magnificent capitol, were offered for \$1,000, and the misguided party of the second part refused to close the transaction because the price was too high! Land on Peachtree street, half a mile from town, was quoted at \$10 an acre. It now sells for as high as \$500 a front foot.

The city was lighted by gas in 1855, and was one of the first in the south to adopt that method of illumination. George Smith of Chicago, established the first bank in 1850 and capitalized it at \$300,000, and in the same year the first extensive fire occurred in Alabama street.

The panic of 1857, which had so disastrous an effect on the country at large, disturbed Atlanta but little, and the period up to 1861 was a history of commercial development unparalleled in the south.

A table of population of the period from the foundation to 1860 reads as follows:

|         |   |   |   |        |
|---------|---|---|---|--------|
| In 1836 | - | - | - | 3      |
| 1844    | - | - | - | 200    |
| 1855    | - | - | - | 6,025  |
| 1860    | - | - | - | 12,000 |

The doubling of population in five years during heated

political times and in the midst of a panic is little less than miraculous. So much for the first period.

From 1860 to 1864 even with the departure of the leading citizens caused by the claims of the war, Atlanta steadily gained in its population and in 1864 no less than 20,000 people called Atlanta their home.

The events covering the period from 1860 to 1864 are in the books and it is unnecessary to relate them here. Throughout this time Atlanta was a center in this as in other cases. In September of the bloody year of 1864 the cruel necessities of war made Atlanta a heap of ruins. The business portion was almost totally destroyed, and out of three or four thousand houses scarce three hundred remained. Out of the horrors of war the refugees returned however, and with brave hearts again undertook the raising of a city. With the old time energy and pluck, with almost, unsurmountable obstacles, the survivors rebuilt their shattered homes and from chaos brought order and decency. Of this era no commentary need be other than to say that men from New England and Texas, Illinois and Alabama, New York and Mississippi now stand shoulder to shoulder, with but one watchword "Atlanta and the commonweal." One of the most enthusiastic Atlantans that the writer met was a Philadelphian of pronounced quaker ancestry. Atlanta's *genius loci* is overpowering. To stay in the city a day means respect, to tarry a week abundant enthusiasm and a years residence makes one an Atlantan for life.

Like the fabled hero, Atlanta was only the stronger for the fall. The new era began by a revival of trade and business, and if there ever was an old Atlanta there is none now.

Bounding forward the city gathered its forces, and as figures can't lie and our enthusiastic pen might, it is better to refer to statistics. In 1865 there were, say 10,000 souls in the city.

|         |   |   |   |         |
|---------|---|---|---|---------|
| In 1870 | - | - | - | 21,788  |
| 1875    | - | - | - | 30,869  |
| 1880    | - | - | - | 37,409  |
| 1883    | - | - | - | 49,517  |
| 1884    | - | - | - | 53,812  |
| 1888    | - | - | - | 88,936  |
| 1891    | - | - | - | 92,460  |
| 1894    | - | - | - | 110,001 |

AS SHE IS.

Let there be three things that make a city pleasant to live, desirable to trade in, and as needs must be, and we die anywhere, to die in. These three are climate, resources of material wealth and culture—yea, and a fourth, namely, means of intramural transportation. It is our humble opinion that Atlanta is possessed of all these to a high degree.

As for climate, Mr. Weary Walker says "you can't eat it but it's pleasant to have 'round."

The altitude of the city, 1,050 feet above tide with magnificent natural drainage, is very conducive to the non-existence of *bacillus tuberculosis* and *bacillus*

typhoidis. The mean temperature throughout the year is given by the signal service as follows:

| MONTH.          | Temperature.   |          |          |                 | Dew Point—Mean. | Precipitation in inches Total amount. | Prevailing Direction. |
|-----------------|----------------|----------|----------|-----------------|-----------------|---------------------------------------|-----------------------|
|                 | Monthly, Mean. | Maximum. | Minimum. | Absolute Range. |                 |                                       |                       |
| January . . .   | 36.0           | 65       | 8        | 57              | 25              | 3.02                                  | N W                   |
| February . . .  | 46.2           | 70       | 30       | 40              | 37              | 5.45                                  | N W                   |
| March . . . .   | 51.4           | 79       | 18       | 61              | 35              | 2.43                                  | N W                   |

For fourteen Augusts the average temperature in Atlanta was 78.8, while Augusta, Ga., registered 80; Savannah, 79.8; New Orleans, 81.5, and Vicksburg, 80.7. The annual rain fall is 50 inches. Fogs are unknown, and cloudy days few, with the largest number during July and August. The nights are always fairly cool.

The disease peculiar to the south, yellow fever, never becomes epidemic in Atlanta. A few cases escaping the close inspection of the health commission have been known from time to time, but no instance is on record of the disease spreading to another individual.

The total mortality for 1893 was 1,920, of which the colored race furnished 1,107, and 971 cases were over five years of age.

### STREETS.

The ancient cow path, out of which grew Peachtree street, set the fashion of the other older streets of Atlanta for crookedness. By reference to a map of the down town streets, it may be seen how they twist, turn, and from time to time disappear in some other thoroughfare of different name and destination.

Peachtree street runs in a northerly direction, and above Ellis is the great residential street of the south. The Capital City Club, the governor's mansion, the Bell house, an ante-bellum relic, are in this street, which is traversed by the Peachtree and the Ponce de Leon cars to the plant and to Piedmont Park.

Whitehall street has a southwest tendency from the railroad tracks. It is the great retail trade street.

Alabama runs east and west from Whitehall. It is a wholesale and banking center; street cars.

Decatur street starts at Peachtree and parallels the Georgia Railroad tracks. It is a market street; street cars.

Marietta begins in Peachtree and goes west. It is a manufacturing street; street cars. At its junction with

Broad street is the post-office, custom house, old Capitol and Opera House.

Broad street intersects Marietta, north and south. It is a large business street. At or near this corner all Consolidated and Traction cars pass.

Pryor is a wholesale street running north and south from Union depot. Wall street occupies both sides of the railroads. It bounds the Kimball, Union depot and wholesale houses and warerooms.

Washington street and Capitol avenue bound the new Capitol. They are the elegant streets of the South Side and contain handsome residences. From the Capitol a fine view may be had of Stone Mountain, Kenesaw, Lost Mountain, and the city. It will repay the trouble. Street cars.

### L. P. GRANT PARK.

Early in 1883, Col. L. P. Grant began to forecast the possibilities of Atlanta's greatness, and generously gave to the city 100 acres of land on the southeast edge of the city. In the spring of 1888, the donee bought a 45-acre tract north of the first plat, and Grant Park embalmed the memory of the founder in the beautiful spot to which his name is given. A topographical map was drawn up, and work began on the construction of roadways, lakes, gardens and pavilions. There are now seven miles of graded and macadamized driveway and six miles of shady walks. The landscape gardening has been well done, and Atlantans are to be congratulated upon the good use made of appropriations for the purpose—in all \$70,000. The park roads are named after Georgia cities, and fountains, flowers and easy lounging places make it a popular resort of the city's population. There are two large pavilions, a fine collection of native and exotic trees, flowers and shrubs, and a well-selected "zoo" of considerable size. Statues adorn appropriate nooks, and two lakes furnish aquatic amusement.

The confederate fort "Walker," a defensive fortification built in 1864, has been restored and remounted to its original grim interest. The children of the city have given a large and handsomely wrinkled elephant to the collection of animals. The park management has also stationed here the cyclorama known as the Battle of Atlanta, of which the original cost was \$40,000. It occupies a building 50 feet in diameter and 20 feet high, and gives the visitor a truthful commentary on Atlanta's most romantic period. Grant Park may be reached by the Fair street, or the Peachtree, Pryor and Georgia avenue electric cars of the Consolidated. Just north of Grant Park is Little Switzerland, an ideal ground, where cool streams flow for and breezes blow upon the white population only, as it is a private property. Refreshments and games add to the attractions here.

### PIEDMONT PARK.

Just outside of the city limits lies 189 acres of finely diversified land, owned by the Piedmont Exposition Company, but leased to the Cotton States International Exposition, which will open September, '95.

Spacious buildings were erected by the Piedmont Company, all of which, except the main building and Machin-

ery Hall, have been torn down to make way for eight more elegant structures of new design and permanent. One of the new buildings will be devoted to electricity. A fine mile track, a grand stand, club houses and stables are also here, for the use of the Gentlemen's Driving Club.

The Machinery Hall, which is the home of the association, may be seen in our engraving. It is 392 feet east and west, and 74 feet north and south. At the northeast a space has been boarded off 73 feet square, with a rostrum at the north. Here the sessions will be held. A Hamilton-Corliss engine of 250 horse-power stands at the center of the room, but will not be used. Power will be furnished from the plant of the Street Railway Company, which is half a mile distant. The Southern Railroad has a track within gang plank reach of the porch of the building, and packages to the weight of ten tons have been handled over it on rollers with safety and dispatch. The belt road does all the switching.

The Boulevard and the Peachtree lines of the Consolidated go to the park entrances, a distance of two and a half miles from the city's center. Every courtesy will be shown exhibitors, and, as the building has no galleries or dark corners, all space is desirable.

#### PONCE DE LEON.

The fabled spring of eternal youth, for which Ponce De Leon, the Spanish explorer sought so long and hopelessly, is on the nine mile circle, and the Ponce De Leon routes of the consolidated. The street railway company has here a boat house, and a commodious bath house, at either side of a little lake about 500 yards square. It has been a source of considerable profit and is nearly always the scene of festivities during the summer. The waters possess curative properties and are especially efficacious in kidney complaint. Colored people are allowed in the little park surrounding it, only as servants. Opposite the springs is a beautiful grove and picnic ground, controlled by stockholders of the Consolidated Electric Railway Company, which is also the occasion of considerable traffic. It is stated by the superintendent, however, that travel to the resorts, as well as to the business portion of the town has been considerably reduced by the hard times and the general financial stringency. A line to East Lake, an artificial body of water on the line of the Traction Company, is well patronized during the warm season, by bathers. The most desirable suburban spot in Atlanta is Inman park, named after the gentleman whose portrait appears elsewhere. The Inman park (Consolidated) cars run frequently to the addition, and a beautifully paved drive makes it one of the finest carriage roads in the city. The elegant residences of this fashionable neighborhood may be surmised from the engravings presented. It will become at no late date one of the best real estate points in the city.

#### FORT M'PIERSON

is an United States army post, authorized in 1885. The reservation occupies 250 acres, and has barracks, hospital, stables, and other paraphernalia of army life. Several

companies of infantry are stationed here, and on account of the healthfulness of the climate, coast defense troops are brought here during the summer. One company of Indians is stationed at the fort. The reservation is reached by the Traction Company's cars and a beautiful drive.

The Collins Park & Belt Street Railway goes through a section of country which was well tramped over during the late war by the armies of both sides. Along the right of way may be seen the remains of ancient defenses thrown up from the soil, and now covered with the green sod and bright flowers of summer; a contrast to the blood and carnage of former days.

On the Decatur line of the Consolidated is something of interest to the Northerner who visits the cotton belt for the first time, namely, patches of that shrub whose bright yellow flowers will have become bursting pods of commercial importance by the time the street railway men arrive, although late cotton may be seen "in the boll."

The nine mile circle, which passes the Consolidated plant, also skirts the cotton fields, and several grand old homesteads of men who, with the times they graced, have gone into history.

On Peachtree street, just north of the Aragon Hotel, stands one of the features of which Atlanta is justly proud. It is the home of the Capital City Club, whose members are the first citizens of Atlanta, and to which the street railway men will be invited for a reception on the evening of the first day. Our engraving shows the exterior, the cosy ladies' cafe and the exquisite ball room. The floor of the latter is supported on 1,500 spiral springs, and is a gem both artistically and mechanically. The majority of the electrical and street railway men of the city are members of the club. The house was opened in 1884. Major Livingston Mims is president, and J. C. Courtney, secretary and treasurer. The membership is about 300, resident and non-resident. Every department is perfect in its appointments, and, the gentlemen in charge, the most generous hosts. There is no club house in the South that has entertained as many distinguished men.

#### PUBLIC WORKS.

The magnificent new water works system, which has cost \$821,069, has two pumping stations, both on the Chattahoochee river. Four Gaskill horizontal compound condensing engines and fifteen boilers, a reservoir of 170,000,000 gallons, a filter plant capable of 1,000,000 gallons with fifty-six miles of iron pipe, complete the list of appliances in general. The pumping capacity is 20,000,000 gallons per twenty-four hours. The water is of excellent quality.

The city is lighted with 949 arc lamps from the Georgia electric light plant. This magnificent establishment is at the corner of Davis and Thurmond streets, and is the largest in the South with one exception. The building is fire proof, and in the dynamo room may be seen sixteen 50-light arc machines (city), three 50-light

arc machines commercial, two T.-H. M. P. 100-kilowatt 500-volt generators, three 2,000 light alternators, one 1,300 light alternator, one 1,000 light alternator, four T.-H. M. P. railway generators formerly used by the Consolidated. All equipment is General Electric. In the engine room are two double compound Mc-Intosh-Seymour engines of 500-horse-power, one Harris-Corliss of 800, one double compound Green engine of 900, and one 125-horse Armington & Sims. All but the last named,

in this service; this is furnished by this plant. Besides the city lights there are in use 556 75-candle-power series incandescent lights, 120 commercial arcs, 325-horse-power rented to motors, 11,000 incandescents and 70 alternating arcs. H. T. Edgar, the general manager, will extend a formal invitation to the convention to visit his plant.

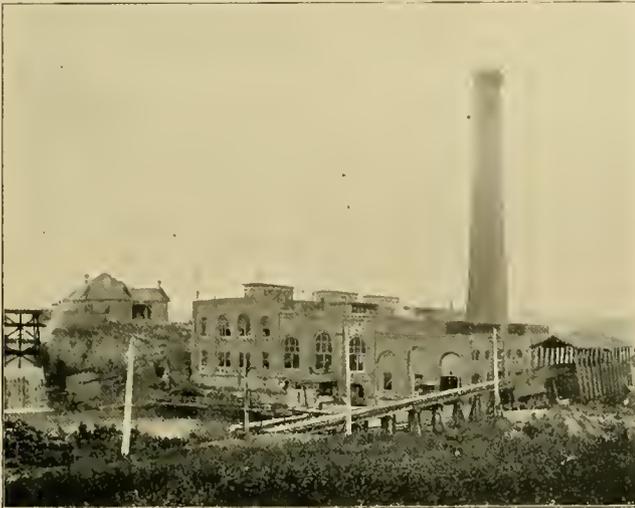

H. T. EDGAR.

**THE STATE CAPITOL** is an imposing building of oolitic limestone, and Georgia granite, and marble. It is 325 feet long; 172 feet wide; to top of dome, 237 feet high; top of figure of liberty, 257 feet; diameter of dome, 75 feet. It cost \$1,000,000.

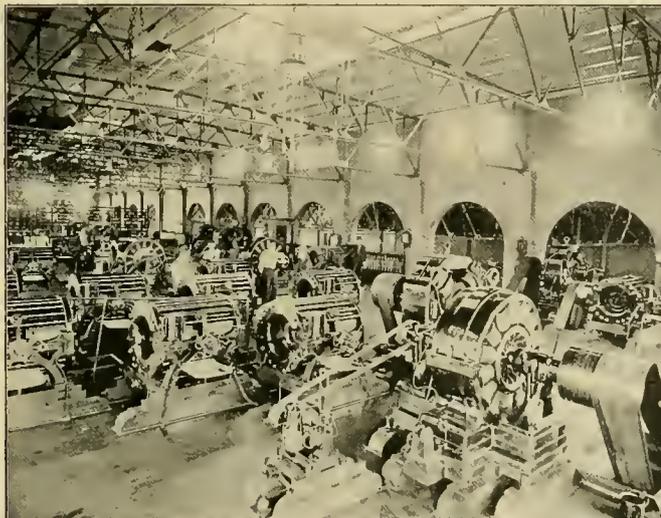

**THE EQUITABLE BUILDING** is the Monadnock of Atlanta, being Atlanta's electrical center. It is a handsome affair of Milwaukee pressed brick, eight stories high, with 285 offices. It cost \$100,000, and was planned by Burnham & Root, Chicago. The East Atlanta Land Company owns the land and structure. The Consolidated offices are on the third floor, and President Hurt's on the second.

**MONUMENTS.**  
The Hill monument stands in the State Capitol, to commemorate the life and work of the late U. S. Senator Benjamin H. Hill.  
The McPherson monument commemorates the gallant federal officer who fell in the battle of Atlanta. It consists of an inscribed base, supporting heavy cannon set on end. The railing about it consists of barrels of muskets.  
The Henry W. Grady monument, standing west of the special track work of the Consolidated, on Marietta

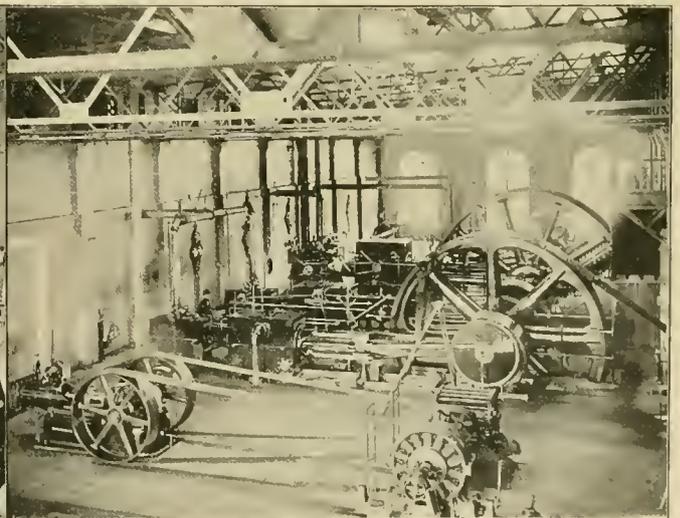

EXTERIOR GEORGIA ELECTRIC LIGHT PLANT.

are run non-condensing. Nine return tubular 250 horse-power Bigelow boilers and one McIntosh furnish the steam. Harris, Blake and Dean pumps are used. The water from the condenser is dropped through a 48-foot tower filled with brush as a cooler. No fans are required. Coal for the plant comes over a half mile of special electric railway track. An ordinary open car carrying two W. P. 30's is used to tow the coal cars. When loaded they are on a slight down grade, but are empty going back. Five hundred kilowatts are required

DYNAMO ROOM.

ENGINE ROOM.

GEORGIA ELECTRIC LIGHT PLANT.

street, west of Broad, is the magnificent heroic statue of the brilliant young pacificator, Henry W. Grady, the most widely known man that Atlanta has placed before the world. His heroic efforts for the city, state and county at large, his wide charity and his earnest life is fittingly honored in this grand piece of work. His other monument is the greatest of southern papers, the world famous Atlanta Constitution, to whose staff Joel Chandler Harris, Frank L. Stanton and other literary celebrities belong. City Editor Adamson has given distinguished consideration to the Street Railway Association.

The fire department is magnificently organized and efficiently managed. Last year 289 alarms were answered, with a total risk of \$1,777,000, and a total damage of only \$96,000. The expenses for the year were \$81,900.

The public schools, the pride of Atlanta, are the best managed and most complete in the south. Every opportunity is given, both for boys and girls, white and negroes, to become intelligent and useful citizens of this distinctively American city. In the high schools there are 17 teachers and 875 students, and in the white grammar schools 130 teachers and 8,000 pupils. The colored grammar schools have 40 teachers and an enrollment of 2,300. The grand total enrollment is 11,240, and the cost of tuition per pupil \$11.62. The total school population is \$15,816. What city can show a better record? Besides this, several institutions of higher learning, the Technological Institute, and medical colleges, add to the culture of the place. The libraries of the Young Men's Library Association and the State Capitol are rich in rare and interesting material, both collated and original documents.

The splendid natural drainage of the city is supplemented by 54½ miles of sewers, and 300 miles of sidewalk make the streets clean and easy of passage. In 1893 more than six miles of streets were paved, giving a total of fifty-seven miles thus provided. The paving is mainly the excellent Belgian block, with some brick, some asphalt and considerable chert.

Atlanta is a religious center as well, containing 100 church edifices, with a seating capacity of 60,000. All are well attended, and 20 missions are supported. A flourishing Y. M. C. A., provided with an elegant building, is doing a splendid work among the young men.

The Kimball House is within a block of the Union depot. It has a large number of comfortable rooms and sets an excellent table. Many street railway men have engaged quarters here, and Manager Porter will show the guests and strangers every attention. It has been for many years the headquarters of political gatherings, and many exciting events have occurred there.

#### COMMERCIAL.

The gateway of the south, with the railroads mentioned above, is a distributing point par excellence, as may be guessed, from the fact that she has 220 wholesale houses, selling \$80,000,000 worth of dry goods,

drugs, boots and shoes, hardware, liquor, tobacco, cotton, etc. There are 15 banks doing business in Atlanta, with a total capital and surplus of \$4,000,000, and deposits of over \$7,000,000.

Atlanta is a port of entry, and the business done through it is surprisingly large. The material imported is chiefly carpets, burlap, cigars, tobacco, watches and jewelry, bronze and ornamental glassware. The home pride which distinguishes the citizens and merchants of Atlanta, makes every year tell in the amount of duty collected.

Of course the city's prominent position in the great cotton belt gives it unusual prominence as a cotton center. In 1872, the total number of bales handled was 16,000, increasing in 1873 to 20,000, and last year to nearly 300,000. The two compresses located in the city have an annual capacity of 600,000 bales, and the storage capacity reaches 60,000 bales. The admirable shipping facilities of the city continue each year to make it more important as a cotton point.

In direct touch with cotton comes the cotton seed oil industry, in which Atlanta ranks as the largest center east of the Mississippi river. The three mills at Atlanta have a crushing capacity of 400 tons a day, or 60,000 tons for a working period of six months, costing \$750,000 and giving employment to 500 men and as many more in buying and shipping seed in the country.

The by-products of cotton are: oil, used for cooking purposes in Europe, for packing sardines and for mixing with olive oil; the inferior oil is utilized for soap, signal oil, paint and in many mechanical processes as a lubricant; cotton seed meal, for cattle food; ammonia and potash, for fertilizers, and the linters or short staple cotton adhering to the shed after passing through the gin; this is obtained in small quantities by the most expensive machinery.

There are catalogued in and about Atlanta nearly 600 manufactories, having a total capital of \$14,000,000, and a product of nearly \$29,000,000. They comprise foundries, machine shops, cotton factories and accessories, ice, stone, brick and terra cotta, lumber, wire and iron works, and all the other necessary producers of a central point upon which so large and increasing a population is dependent. The lumber demands the attention of 26 establishments, which handle little less than 100,000,000 feet per annum. Walnut, hickory and other hard wood, as well as long leaf pine, are abundant and easy of access. The iron, which is mined in great quantities, both in Tennessee and Alabama, employs 2,000 men, and turns out a variety of machines and utensils. Coal and coke are abundant, and water power, adjacent to the city, promises considerable increment of facilities for cheap power for many purposes. Manufactured cotton claims several establishments. The Atlanta Mills, started in 1879, have 13,000 spindles and 330 looms; the Exposition Mills, started in 1883, have 16,000 spindles and 600 looms; the Fulton County Company has 12,000 spindles and 450 looms. Now, there are, all told, 70,000 spindles, employing 2,500 hands.

A FEW GLIMPSES OF ATLANTA.

Other establishments of note comprehend glass factories, buggy and carriage factories, coffin factories, paper and cloth bag mills, trunk shops, and almost every conceivable material of use to the large and varied populace dependent upon Atlanta for its source of supplies.

Agriculture returns wheat, oats, corn, grass, orchard products, and, greatest of all, cotton, while market gardening brings in rich returns, and small fruits flourish. With the splendid railroad facilities, this portion of the state's wealth will become more valuable and attainable as the years pass.

#### BATTLES AROUND ATLANTA.

During the war between the states, five pitched battles may be enumerated as belonging to the region adjacent to Atlanta. They are chronologically arranged thus:

The battle of Peachtree Creek, on July 19, 1864, when a part of the Army of the Cumberland, and Reynold's brigade of Walthell's division of the Confederate troops were "mixed" in lively engagement. The Federal troops crossed Peachtree Creek and attacked the Confederates at Moore's mills, but were driven back. The second battle of Peachtree Creek occurred the following day, when a general attack was made upon the Federal army, which was partly intrenched, by General Hood. It was a bloody and desperate battle. The Battle of Atlanta was fought July 21, 1864, when the Federal troops assumed the offensive, and attacked Cleburne's infantry division and Wheeler's cavalry upon the extreme right of the Confederate lines. The Federal troops advanced in three lines, but were driven back after a desperate struggle. The second battle of Atlanta followed on July 22, with an attack on the Federal troops, which were entrenching on the north and east sides of the town. James B. McPherson, major-general, commanding the Army of the Tennessee, and Major-General William H. S. Walker, of the Confederate army, were killed in this engagement, which was particularly bloody.

The fourth was the Battle of Ezra Church, which began July 28, in a hard struggle between Hood's troops and the Federal army west of Atlanta. After this engagement, until September 4, there was a series of affrays, upon which date Atlanta was evacuated by the Confederates.

#### THE SUPPLY BUSINESS IN ATLANTA.

Naturally as the principal distributing point for the south-east, Atlanta has its quota of sales offices for street railway supplies, which, while not many, are active and efficient, and the numbers will increase as the importance of the southern trade becomes greater year by year. The Atlanta offices of the General Electric Company, are located in rooms 641 to 647 Equitable building, where the business of this great company is transacted for the states of South Carolina, Georgia, Alabama, and Florida. The company has also a warehouse at the corner of Marietta street and Jones avenue, where a goodly stock

of supplies both, for the street railway and light work is carried. The Thomson-Houston Company established its Atlanta headquarters in 1888, in charge of H. E. W. Palmer. In May 1892, when the General Company was formed, these offices were combined with those of the Edison, and Mr. Palmer continued as manager. Mr. Palmer however resigned in February, 1894, and was succeeded by A. F. Giles, who has continued the fine business built up by Mr. Palmer and added materially thereunto. There are fifteen employes attached to the office, the chief of whom are: R. D. Bullen, S. W. Trawick, F. W. Wilcox, Frank Lederee, F. A. Hills, and G. L. Thompson.

The Johnson Company, of Johnstown, Pennsylvania, has an elegant suite on the fourth floor of the Equitable, where W. W. Kingston is chief executive, and Eugene Thomas assistant. No cosier or more finely equipped offices can be found anywhere, and no more genial gentleman than Mr. Kingston is to be found in the land of hospitality. The display of Johnson rails is complete, and on Mr. Kingston's books may be found orders from all of the principal southern street railways.

J. W. Taylor, who is agent for the Stillwell, Bierce &

JOHNSON COMPANY'S OFFICE.

Smith Vaile Company, of Dayton, O., has an office in 21 South Forsyth street. He does a business of from \$75,000 to \$100,000 a year in ice machines, water power, cotton machinery, and heaters and purifiers. He has sold water power plants to several southern street railways.

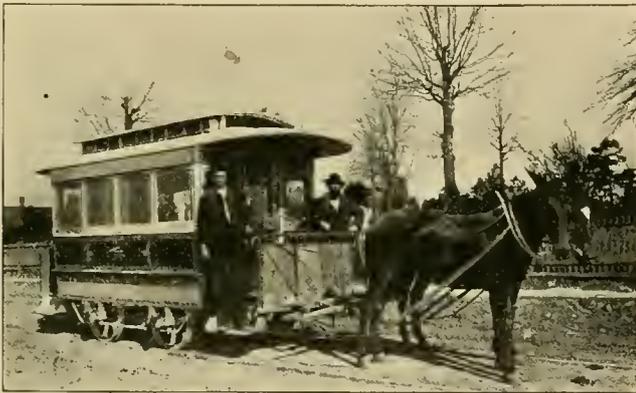

The Carnegie Steel Company has a sales office in the Gould building, in charge of Walter M. Kelley, whose extensive knowledge of street railway men and needs in the south stands him in good stead.

The Southern Belting Company does a fine trade in belting and power transmission, handling several well-known brands.

C. H. Willcox represents the Lane & Bodley Engine Works, of Cincinnati, and his labors have been crowned with success throughout the territory.

## ATLANTA'S STREET RAILWAYS.

The beginning of the street railway idea in Atlanta and consequently the beginning of Atlanta's present magnificent vistas, was in 1871, when the West End road was organized with Col. G. W. Adair, Richard Peters, John James and Maj. B. E. Crane at the head. Fourteen thousand dollars were subscribed and ten thousand more added by Col. Adair and the road was. On the eighth day of September, 1871, the first fare was collected. It was ten cents, and carried the passenger to McPherson's barracks. Horses, of course, were the motors, with flat rail and Stephenson cars. New lines followed rapidly, and soon Marietta, Decatur and Peachtree streets were provided with comfortable if not rapid transit. The first officers of the company were: Richard Peters, president; G. W. Adair, secretary and treasurer, and E. C. Peters, superintendent. Richard Peters, to whose faith in

RAPID TRANSIT.—VINTAGE OF 1871.

Atlanta's future, and Col. Adair, whose generous help at a time of need, made the first line possible, should be and are honored in Atlanta's annals.

The West End line was established in 1871 as noted, but soon the growing city compelled the Marietta street line a year later, and the Decatur street branch. In August, 1872, the Ponce de Leon road was opened, and the next year Taylor's hill was equipped as was McDonough street. Whitehall, the great retail street, fell into line in 1873, and Atlanta had eleven miles of road under competent management. E. C. Peters, superintendent of the first line, and to whom we owe our data for the the above, was chairman of the first committee of the American Street Railway Association which investigated the claims of electric traction. Richard Peters, the first street railway builder, now deceased, made a large fortune in real estate, worth now several million dollars.

The Atlanta City Railroad and its lines was followed by three other companies, which now compose the Consolidated. They were: The Gate City, built in '88, by Nelson, De Grieve and Stevens, and equipped with horse traction, bought in by Mr. Peters a year later; the Metropolitan, running on Pryor and Fair streets, and built by Dr. Rankin et al in '86, but sold to

the Aaron Haas Company in '88 and changed to dummy; the Fulton County Street Railway, built by the Thomson-Houston Company and local capitalists, in the fall of '88; this included the nine mile circle and Peachtree street. This was the first of electric railways in Atlanta.

The Atlanta & West End, now a traction line, was built 1886, by Col. Healy and others, composing a stock company. It was also a horse line until absorbed by the Traction Company.

The Chattahoochee line, now known as the Collins Park & Belt, was built in '91, and was an electric line from the first. It had no immediate excuse for building, but is fast developing a fine residence district.

The Lithia Springs Railway Company has in prospect a 22-mile line to Lithia Springs, a resort and mineral spring west of the Chattahoochee river. The line will develop suburban property, as well as afford easy transit to a lovely spot, where boating and bathing may be indulged in. Henry Camp is president, B. F. Curtis, vice-president, and Thomas Camp, secretary. The financial stringency and the consequent torpidity of real estate transactions have delayed the building of this line, which ought, under competent management, to be a paying concern.

The further erratic career of the present Traction Company is it not written in the chapter upon that line.

## THE ATLANTA CONSOLIDATED STREET RAILWAY COMPANY.

In the year 1871, the primal Atlanta street car made its weary round on the mule plan. It wasn't an extensive affair and the rolling stock not quite up to the elegant standard of work at present considered au fait in Atlanta. The modest and retiring cracker gave up his choicest shave-tailed bay mule to the necessities of advancing progress, and Mr. Stephenson, of New York, provided a comfortable car of the latest pattern. This was not, however, the ultimate.

Many changes were in store for the line as told in our history, but the most important was the consolidation which occurred twenty years after the date of the foundation.

So then after the narrated tribulations the Atlanta Consolidated Street Railway Company was incorporated in 1891 with the following systems represented by the track rolling stock and motive power: The Atlanta and Edgewood Street Railway Company, The Gate City Street Railway Company, the Fulton County Street Railway Company, the Metropolitan Street Railway Company, the Atlanta Street Railroad Company and the Atlanta and West End Street Railway.

The directors of the new company were: Joel Hurt, R. J. Lowry, S. M. Inman, W. C. Sanders, Ernest Woodruff, Henry Jackson, H. A. Inman, J. Carroll Payne, J. T. Dargan, all of Atlanta, and J. H. Watson, of New York city. Five of these gentlemen are in the board of management and owners of the controlling stock. It is essentially an Atlanta company and loyal to that beautiful and enterprising city to the core. Each one is interested in from one to a dozen home enterprises and puts

his money and his talent into the advancement of Atlanta and its fine street car system.

The first thing that the new management resolved upon was the rehabilitating of the road, and H. N. Hurt, now superintendent, and his assistants took immediate steps to lay new track and connect up the various small roads into one coherent system. This took time, money and patience, but it succeeded beyond all hopes to the advantage of every dweller in the Gate City. Mr. Hurt found in the beginning that no corner in Atlanta was at a respectable angle, and this complicated matters to some degree. The success of his engineering methods, however, may be seen by the visitor who may ride over the system.

The reconstructed Atlanta consolidated is now represented by twelve routes, in the city, in streets paved with the solidest and best laid Belgian block and in the outlying districts in the regular county roads, which are first-class specimens of good road building. A large amount

of intense interest to the visitor. It is seven miles in circumference and 1,500 feet high. The exposed rock above the surrounding surface is reckoned to contain seven to eight billion cubic yards. There is a present output of 30,000 paving blocks a day, and the product is controlled by Venable Brothers, of Atlanta. The blocks are shipped to all points both for paving and structural work.

In using the granite blocks for paving to T rail, it has been the custom to lay them flush to the rail and smash the grooves by the ordinary flange pressure. Mr. Hurt considers that method both efficient and practical, although rather "rough" on both passengers and wheel flanges at first. The cost to the street railway for paving is \$1.50 a square yard. On outside lines considerable chert paving is in vogue. This is a silicious material which hardens under exposure like asphalt or cement. It is laid on a Telford foundation. The granite blocks are laid on sand.

Some special track work of interest is the intersection

| NO. | ROUTE.                         | PAVING.            | RAIL.   | LENGTH.    |

There are 63.7 miles of track in the Consolidated system.

of cutting and filling was necessary on several lines, particularly those on the nine-mile circuit and the Decatur route. The accompanying table gives the names of the routes by the streets which they follow and the style of paving obtained thereon, as well as the style of rail and length of the line in feet.

In the table, the Johnson girder is denoted by the letters J G and the section as D or Y, according to the style. Mr. Kingston, the southern agent, has sold the bulk of the rail to the Consolidated. Route number 9 is not yet built upon.

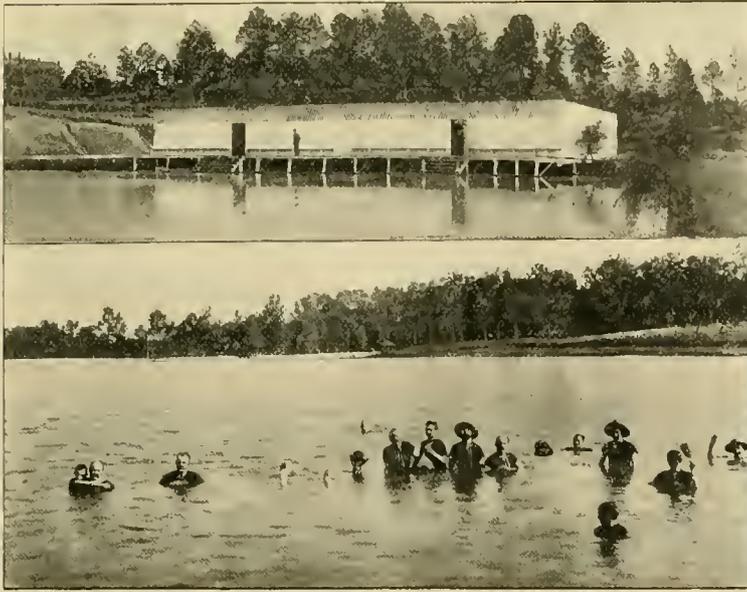

The magnitude of the Belgian block pavement is explained by the fact that close to Atlanta there are magnificent quarries of the best of granite for this purpose. Peachtree street, the magnificent residence thoroughfare of Atlanta, is paved with asphalt. Granite blocks are here used as liners for the rail.

Stone mountain has the largest deposit of granite in the world that is commercially useful. The black dome of the mountain is visible for twenty miles. It lies sixteen miles from Atlanta and will be a feature

of Broad and Marietta streets, where all cars of the Consolidated meet and pass. It is exactly like the Rochester track work recently illustrated in the REVIEW and like it designed by the Johnson Company of Johnstown, and sold by the Atlanta agent, Mr. Kingston.

The Decatur line of the Consolidated which is now equipped with electricity, was formerly a dummy line. It runs to Decatur, a village of 6,000, six miles from Atlanta. Decatur was intended to be the center of the future great city, but Providence and the real estate men ordered it otherwise. On this line are several small stations, at which cars stop to allow passengers to land and mount the cars with convenience. The run to Decatur is a beautiful one and no visitor will omit it.

There are on the lines of this system a number of pleasure resorts, which add greatly to the receipts of the company. They are mentioned more particularly in the chapter on Atlanta. Suffice it to say briefly that the Base Ball park, leased by the company, is reached by routes 2 and 4 (see table); Ponce De Leon Springs by routes 2, 12 and 7; Grant Park by 8 and 10; Piedmont

PONCE DE LEON SPRING.  
EAST LAKE.

SCENE IN LITTLE SWITZERLAND.

Exposition by 2 and 10; Decatur by 6, and Inman Park by the Inman Park cars of the Consolidated.

The rolling stock of the system consists of forty-five cars all told. Lewis & Fowler and Stephenson divide honors with the Brill Company and the Pullman people in their manufacture, and last but not least ten are of the brand of the Atlanta Consolidated. Bemis trucks are used almost exclusively, but a recent order of Graham's well known specialty is en route. The Lewis & Fowler register is exclusively used, and Mr. Hurt considers it the only register for his lines.

The motor equipment consists of eighty-two Thomson-Houston S. R. G., 15-horsepower, two to each car; four Westinghouse 30's; two G. E. 800's. The overhead material is of the Thomson-Houston type. All but five miles of line will be found of side pole pattern, with the five miles mentioned equipped with single side arm construction.

Four car barns are used for storage; one on the Decatur line, one at Exchange place and Edgewood avenue, one at Inman Park, and one at the plant. The latter is the most important and is shown in our engraving.

To furnish power for the sixty-five miles of line, the Consolidated formerly was compelled to utilize the Georgia electric light station, but since the rehabilitation of its own plant, as later described, it has done away with the renting method.

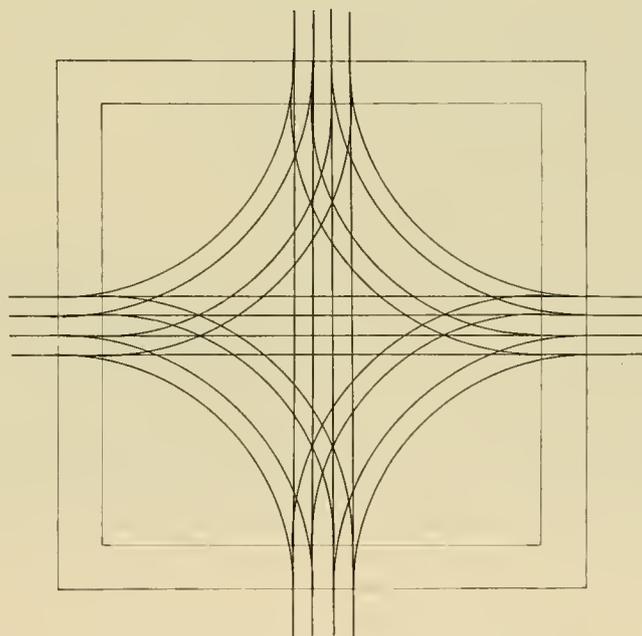

The "plant," as it is called, consists of the station, machine shop, foundry, car barns, and offices, all complete to the last detail of convenience and economy.

THE POWER STATION

of the Consolidated is situated near the track of the Richmond & Danville Railroad Company, which affords excellent coal shipping facilities. It may be reached by the electric cars of the Nine Mile Circle, which pass close to the site of the plant. The plot of ground occupied is three miles from the center of the city, and but a short distance from the Exposition grounds, where the association will hold its meetings and where the exhibits will be placed. Besides the power house proper, there are, adjoining it, two car barns and the repair shop, both of which will be specially mentioned further on. An interesting foundry and two small oil storage houses complete this list of buildings. The three last named are carefully isolated to guard against fire.

The power house proper is a one story brick structure, running 100 feet north and south by 50 east and west. The boiler room, to the south end, measures 40 by 50 feet, leaving a 60 by 50 foot engine room.

The boiler room shelters three Bigelow return tubular boilers, made by the Bigelow Company, of New Haven, Conn. They measure 72 inches by 16 feet, and contain

SPECIAL WORK, BROAD AND MARIETTA STREETS.

96 four-inch tubes each. Each boiler is rated at 150 horse-power. Besides this equipment, there has been recently added a big Manning vertical boiler, which stands 27 feet high. It holds 284 two and a half-inch tubes 15 foot long. The fire box is 84 inches in diameter and 48 inches deep. This boiler is rated at 250 horse-power.

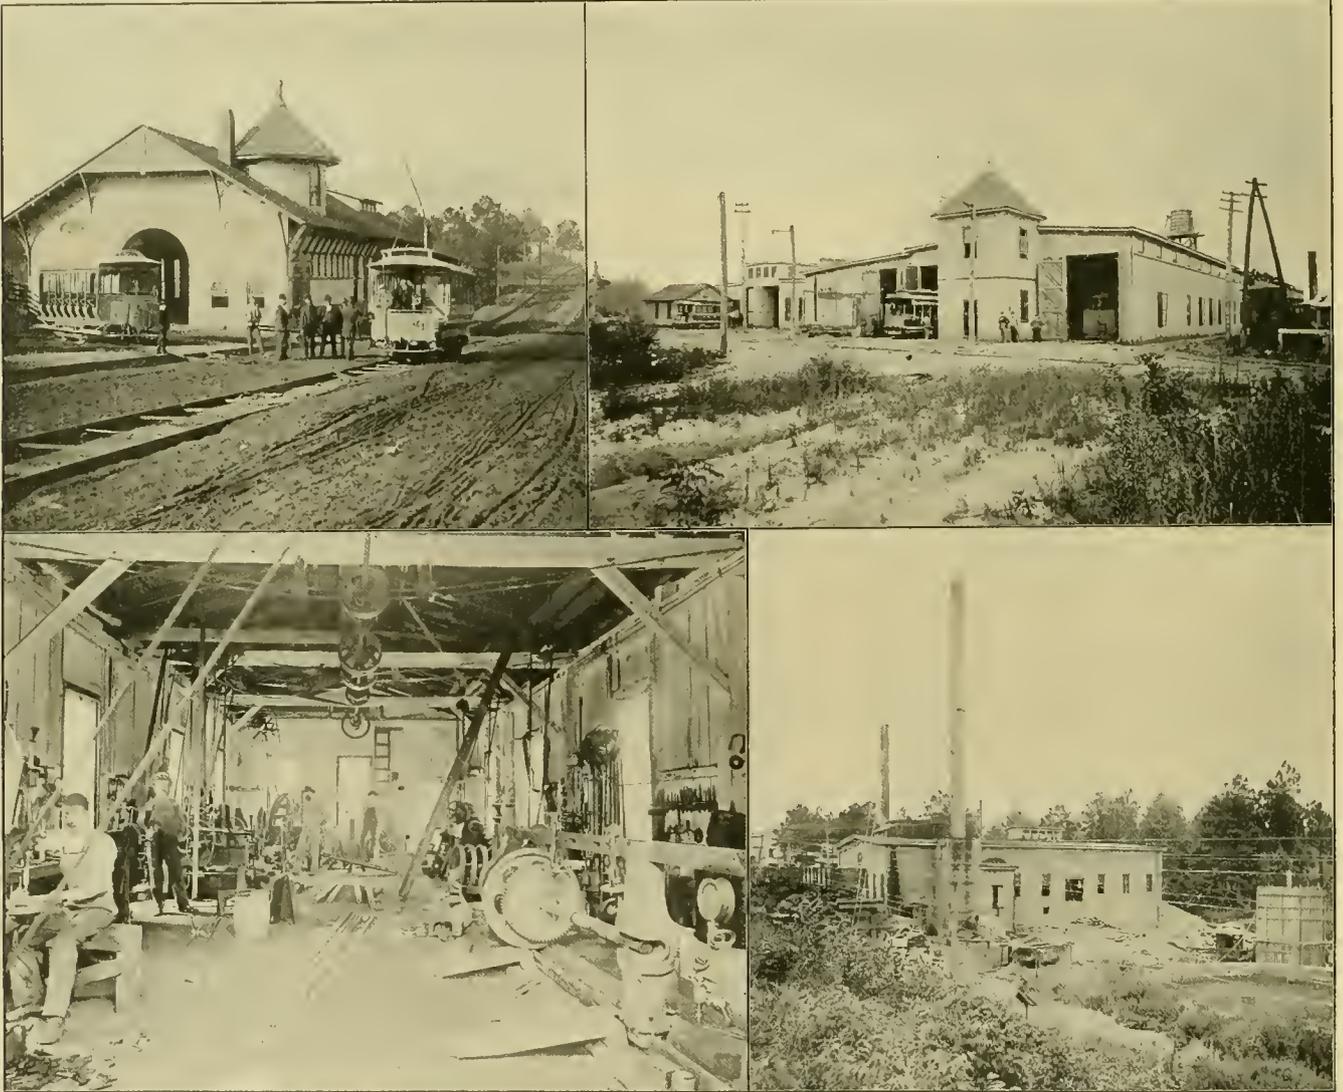

#### THE ENGINE ROOM

In the engine room are two 20 by 40-inch C. & G. Cooper Corliss engines, running at 88 revolutions per

was done away with, and the faithful Coopers coupled direct, as will be related, and a direct coupled unit was resolved upon.

It fell to the engineer and Superintendent Hurt to remodel the plant without shutting down, and the Cooper engines were retained, doing as good work as ever, and another unit installed between them, of a heavier type. To do this the plant had to be kept running regularly at the same time.

Therefore, a new 300-Kilowatt Westinghouse mul-

POWER HOUSE—CONDENSER TANK AND COOLER.

(VIEWS OF CONSOLIDATED COMPANY'S PLANTS.)

minute. From the start they have done splendid service, and still are doing yeoman work. They are now coupled direct to 300-kilowatt Westinghouse machines, but formerly ran seven D 62 Thomson-Houston generators, driving a 40-foot counter shaft by means of Munson belting. The service of the engines was in every particular satisfactory, but increased demands on the station called for further power, and the counter shafting

tropical was installed just in line with the receiving pulley on the shaft. This generator was wired up and finished, and, after shutting-down time at night, the belt was transferred from the shafting to the new generator. The new machine and the three old ones still left on the shaft pulled the load until another 300 kilowatt machine was installed at the other end of the shaft, and, belted direct to the other Cooper engine. Next, all

of the old generators and shafting were removed, and the foundation laid for the direct coupled unit hinted at above.

This foundation was to bear a heavy load, so it was built up solidly of concrete in the following formula:

One part Portland cement.

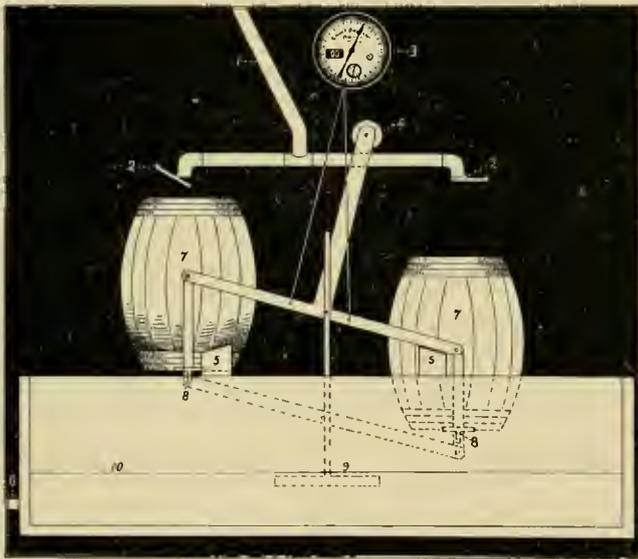

Two parts Louisville.

Four parts granite rock.

This was laid to a depth of 13 feet and covered with blue lime stone above cap stones, weighing 60,000 pounds, making the total foundation weight 750 tons. Previously to this performance, however, an order had been placed with Rankin & Fritsch, engine builders, of St. Louis, for one 800-horse-power tandem compound condensing engine, designed by the Rankin & Fritsch engineers after specifications furnished by Chief Engineer Elliott, of the Consolidated Company. The cylinders of this engine are 22 inches high pressure and 40 low pressure, by 48-inch stroke. Coupled to the shaft of the engine is a Westinghouse 500-kilowatt railway generator, designed for 90 revolutions per minute.

#### A WATER WEAIGHER.

The awful mendacity of water meters and the necess-

ity of weighing water to determine cost of power, has driven the inventive genius of the power plant to the dividing of the "water weigher" illustrated.

The automatic weigher is contained in a rectangular wooden box, 2 by 3 feet in dimension and 8 feet long. Inside are two barrels, one on each side of a pair of levers. When the barrels are in mid-stroke the levers are horizontal and forged to them is an upright on which at the end is the counter-balancing weight. Across the tops of the barrels passes a water pipe which comes from the discharge pipe of the condenser. In the pipe are two valves which are opened by the barrels automatically as they come to the top, and at the bottom of the barrels, two similar valves discharge the water as the barrel sinks. The latter valves are the larger, in order to make it certain that all water is discharged from one barrel before the other one

drops; it is not necessary to change the weight in order to adjust the barrels, but simply to alter the angle to one more acute. The boiler feed pump is connected to the bottom of the tank and a float controls the movement of the barrels. In fact, the barrels must stand until the float sinks and pulls a latch which allows the barrels to discharge. A street car stationary register is attached to the barrel levers and registers as the barrel sinks. It is a neat idea.

#### THE SWITCH BOARD,

At the station is of white marble, brass mounted and small for the capacity of the plant. On it are mounted three Westinghouse new type circuit breakers and one Westinghouse tank lighting arrester. The latter, "says the engineer," has been a very efficient device. All machines are wired to standard underground lead covered cable. Sixteen feeders run out of the station each provided with an ajax switch. All feeders are carried above ground.

#### THE SHOPS.

One no inconsiderable item in connection with the street railway plant is the finely equipped machine shop and foundry, situated at the "plant." The first named is a wooden structure of one story, directly north of the power house. It is 25 feet by 50 feet in dimensions, and contains a full equipment of tools. There is a Fay & Scott lathe, a 34-inch machine, and a Lodge & Davis, of 18 inches. Lodge & Davis is also represented by a planer 24 by 24 inches by 6 feet, and a 24-inch back gear drill press. A Watson & Stillmon wheel press is a useful piece of equipment, and Mr. Elliott says any road of more than six cars should have a wheel press of some description. The shop is operated by a 10-horse-power stationary T.-H. motor, but usually three or four horse-power are amply sufficient for the work. Among the minor features is an adjunct for boring out the axle sleeves, a rod with a right and left thread, which runs out the shavings made by the tool. One important labor saver of the establishment is the "dinkey." It is a flat car mounted on an old truck and equipped with two 15-horse-power motors. It is a queer and clumsy looking affair, but useful, as most clumsy things are. The shops and barns are inter-connected by tracks, so that parts can readily be shifted from place to place. Superintendent Hurt has great regard for the "dinkey."

The Consolidated puts its foundry to use in casting all its own car wheels. The proportions in the wheels is 400 pounds scrap, with enough native Alabama pig iron, 200 pounds, to give durability. A home made chill is used, and the wheels are cast in iron flasks. There are two annealing pits, and cranes for handling the completed product of the foundry. These home made wheels have 3/4-inch flanges, and last, on an average, six months. The motor wheels weigh 300 pounds, and cost one cent a pound to manufacture. The company makes its own brake shoes. These are of hard grade, weigh twenty-one pounds, and as the motormen are strictly forbidden to skid the wheels, they do very well.

Gears, as well, are cast at this foundry. The axle gear wheels are cast solid, of  $\frac{3}{8}$ -inch web and cup shaped. After being bored they are pressed onto the axle. An iron pattern is used in moulding gears. It is made with an excess of  $\frac{1}{4}$  of an inch to allow for shrinking, and a pattern may be lifted from the mould without rapping, so that the gear teeth do not need cutting. This is accomplished by packing sand about the pattern in the usual fashion, and a brass ring toothed similar to the gear wheel is placed on the surface. The pattern is then removed by a tripod screw jack, whose feet rest on the ring and the lifting rod introduced in a threaded aperture in the middle of the pattern. A gear cutter of the company's own make, has two circular cutters working in train. The pinion blanks are bought and the teeth cut by this machine, which finishes the cut at one passage. They cut 4 pinions at once. Armature and axle bearings are also cast at this foundry, as well as trolley wheels. An iron mould is used for this latter process. The mould is in three parts, each provided with a handle. When the brass is poured into the mould the upper part is lifted off, and the split ring which makes the groove is taken out.

#### THE BRASS FOR THE ARMATURE BEARINGS.

The armature brasses are made eccentric. They are  $\frac{1}{4}$  inch thick on top and  $\frac{1}{2}$  inch thick on bottom. This has proved a most valuable feature, as the brasses last about three times longer than the concentric brasses, and it is a very rare thing for an armature to hit the pole pieces.

Frame bearing brasses are cast in a sleeve embracing the axle from the gear wheel to the car wheel opposite. No collar is used next the wheel. The sleeve is turned to fit the axle and has an oil cup on the upper side, and all waste oil is led directly into the gear case, which latter is cast of a composition of scrap. All insulated wire used in winding armatures is waxed, and the armature is not baked. Insullac is the insulation used.

Being a considerable distance from the base of supplies the consolidated is able to make some supplies cheaper than they can be bought, but ordinary practice finds home made in the long run more expensive than regularly manufactured material. In addition to this fact, the proximity to raw material is an advantage to the consolidated which few other systems enjoy. It will not be long, however, before supplies will be regularly manufactured at some central southern point, and why not Atlanta?

#### THE CAR BARN

is of frame 100 feet by 200 feet, and protected against fire by the manufacturers' automatic sprinkler. Here is storage room for 110 cars and a transfer table of Wharton's pattern.

#### THE COOLER.

At the rear of the power house stands a plank cistern built on the surface of the ground. It is rectangular and 16 by 20 feet by 20 feet high. At the base are four 6-foot fans driven by two old S. R. G. 15-horse-power

motors, calculated to speed up to 400 r. p. m. The hot water from the condenser is delivered on top of this cooler by the condenser itself. The supply of water comes from spring and surface water, which runs ten tons an hour. Inside the cooler is a stack of 1 by 2 inch rough pine lumber, laid cob-house fashion and roughed with a pick ax. The water is distributed over these timbers by sixty-four one and a quarter inch pipes, 8 feet long, and perforated on top with  $\frac{1}{4}$  inch holes six inches apart. As the water goes down this torturous course, the fans cool it by means of the induced breeze, and the condensing well is supplied with cool water, and what cool water means for this purpose can be appreciated only by a southern engineer. A Smith-Vaile 12"x16"x24" duplex pump lifts the water to the top of the cooler. It runs by gravity into the condensing tank. This is not an entirely new practice, but is unique, we believe, in street railway work.

The condensing pool is a brick lined well 55 feet in diameter and 10 feet deep. After passing through the condenser the water goes through the above described cooler and back to the pool to be used again.

The new 500 horse-power generator is a 10-pole machine with the brush holders carried on the engine shaft. All three of the machines in the plant are over compounded 10 per cent.

#### THE COLLINS PARK & BELT RAILROAD COMPANY.

The Collins Park & Belt Railroad Company was organized three years ago as the Atlanta & Chattahoochee Railroad Company, and was originally intended to develop the beautiful rolling country lying west of the city, out to the Chattahoochee river, a section redolent with historic interest and still holding the clearly defined outlines of old breastworks, redoubts and camps of the late war. A ride along the line is an historical study of those lively times. This region will at some time be without doubt, a fashionable place of residence, as new and well built streets are being cut through at the present time.

The road was organized in 1891, with J. K. Polk Charleton as president, and D. G. Jones as secretary. The building was an unusually costly piece of construction, as many deep cuts and long fills had to be made and several trestles and bridges built. The first manager, Avery Chastien; the second, J. M. B. Carleton, and the third, R. L. Caldwell. At this time the line passed into the hands of a receiver and the court appointed W. Darr in that capacity, to whose constant watchfulness, great adaptability and general ability the present good condition and flourishing business of the line is mainly due. The line has, under the present management, added so many features that, in spite of the failure of the real estate venture on which it was built, it is doing very well—in fact, much better than would be imagined from the scarcity of houses along the line. The heavy growth of forest on each side of the track for a greater part of the distance furnishes ideal picnic grounds and the historic associations of the adjacent land bring

POWER HOUSE—COLLINS' PARK AND BELT RAILROAD.

many visitors. Besides this, the western terminus of the road is at Bolton, a flourishing suburban village, ten miles from the Atlanta terminus, which is a short distance from the postoffice. The line is single tracked with switch back turnouts.

Fifty-six pound T rail, spiked direct to sawed ties spaced 24 inches from center to center, makes a solid road-bed. In the city the paving is done in Belgian block, placed flush to the rail, as is the custom. The track is cross bonded with galvanized iron supplementary, which is a great convenience in the country section, as any particular section of track may be removed or disabled without affecting the return, and consequently cars may be operated on either side of the break. The run over the line is made in about an hour and a quarter every half trip, and cars run on 30 minute headway. A considerable freight and express business is done. The principal commodities handled being sand, brick, tobacco, and cord wood, from which the road realizes an average of \$50 a month, with but two cars in service. These are flats and trailed, one a small car, for which a charge of 50 cents a load is made and the other larger, with a tariff of \$2.00.

A recently opened cemetery, at a point not far from the western terminus, has developed a paying funeral car business with no additional expense. The ordinary open car is used, from which the reversible back on one seat is taken. The two adjoining seat backs are then reversed and the coffin laid upon them longitudinally, with the pall bearers on either side to keep it from slipping sidewise. The seat backs perform this office for each end. The writer observed one funeral en route. The coffin was covered with flowers and accompanied by four pall bearers. In the other seat, and on the regular car preceding it, were the friends of the deceased. The innovation is kindly received and none but white citizens are accommodated by this service. The company charges ten dollars for each funeral, and from one to four a week pass over the line. A regular funeral car is in prospect, and Mr. Darr says that such a movement will tend to popularize the use of the cars for this service as well as to assist the cemetery company. Some other improvements will also be made in regard to the freight service,

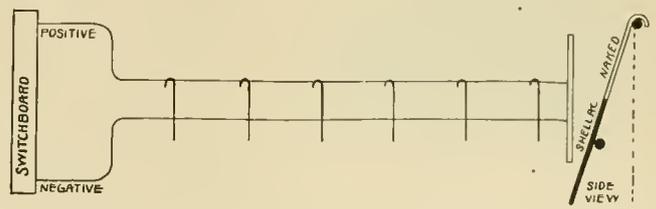

notably a system of weighing the merchandise and creating a regular tariff. Picnic parties are frequent and the road is chiefly known and gets the bulk of its revenue from these three sources of freight, funeral, and fun.

THE POWER STATION

is a solid stone structure, situated  $5\frac{3}{4}$  miles from the Atlanta terminus, and 100 by 60 feet in dimensions, of which the boiler room occupies 40 by 60 feet. The engine room, in charge of D. A. McNabb, is equipped with two Allis-Corliss engines, both of 200 horse-power, 18 inch cylinder, by 44 inch stroke. The fly wheel is 18 feet in diameter and carries a 24-inch belt. It turns at 90 revolutions per minute. Belted direct to the engines are two Short dynamos, one of 300 amperes capacity and the other of 200. The smaller unit is kept always in reserve. They are of the 36-inch armature, multipolar type, using carbon brushes. The average daily output is from 120 to 160 amperes, according to freight, funeral and picnic traffic. In the boiler room are three horizontal tubular boilers, made by E. H. Jones, of Cleveland, O., and rated at 125 horse-power each. One is sufficient for the business of the station. Here are also a 200 horse-power Worthington feed water heater and purifier, and a 8 by 6 inch steam pump of the same make. The water for the boilers comes from a small stream, which approaches in its natural course, within 800 feet of station and the remainder of the way by a 2-inch iron pipe and a V-shaped trough. The water run from this improvised water works into an iron tank, 6 by

2 feet, and from this tank into another of the same kind, 10 by 8 feet. The sand and sediment is precipitated in these boxes, and from the latter it is pumped into the purifier to remove what remains of impurities. The coal used comes from Alabama, on the Western & Atlantic Railroad, to a point  $2\frac{3}{4}$  miles from the station. Where the railway crosses the steam line a switch is laid to connect the tracks, and the heavy coal cars, weighing 30 tons, are hauled successfully on to the electric tracks and to the power house, by any motor car that happens to be idle. In addition to the weight, the two 20-horse-power motors with the coal car are compelled to ascend a 4 per cent grade and go over a 40-foot curve. The coal costs \$2.00 a ton delivered thus at the power house.

HOME MADE LIGHTNING ARRESTER.

In the station, two devices of home design attract one's attention. The first is a lightning arrester, which consists of two horizontal pieces of trolley wire eight feet long. The upper one is connected with the trolley wire and the lower one with the rail. The latter is about 2 inches out of perpendicular, as regards the upper wire, and 12 inches distant. From the top wire, pieces of No. 18 copper wire are hung, touching and resting against the ground wire. These cross-connections are naked on the upper half, but insulated at the ground wire contact point having been dipped in shellac. The shellac insulation, although very thin, is sufficient to withstand the 500-volt current, but allows the static discharge to jump to ground. Much trouble has been experienced with lightning at this point, and in addition to this affair mentioned, two other lightning arresters are also used, one of the Short pattern. At the western terminus a line arrester of a similar pattern to the one described, is placed in a small house to protect the insulation from moisture. This has a capacity of 125 fuses. On this arrester a small wire is used, so that if there is a tendency to ground, it can be blown from the station.

Lightning has worked such havoc, however, that during very heavy storms the plant is shut down. Although no tests have been made of the plant, the fuel used each day amounts to  $3\frac{1}{2}$  tons.

The work bench in the power house is supplemented by a home made lathe designed by the operators. It consists primarily of a frame made of cross ties sunk in the ground. It is provided with babbitted bearings and wooden caps. The tool for turning down commutators is a portable generator slide rest bolted to the frame. A big hand crank fastened to the armature shaft is the power used.

The station requires one mechanic, one fireman, one engineer, and the superintendent. There are nine cars in use and two in reserve. All were made by Brill, mounted on Dorner & Dutton trucks, and equipped with two 20-horse-power Short S. R. motors.

W. DARR,

receiver, superintendent, general manager, and, if need

be, engineer, electrician, motorman or conductor, is but 27. He was born in New York, became a master mechanic in the railroad shops of the Denver & Rio Grande, traveled in Mexico and other places, and finally, in 1890, learned all about Short electric railway goods, in Cleveland. He then became electrical and mechanical engineer of an Ohio

W. DARR.

street railway, but removed to Atlanta in 1891, in his present capacity. His office is at the power house.

#### THE ATLANTA TRACTION COMPANY.

After a romantic experience and lightning changes the old Atlanta Traction Company succeeded, early in 1893, in absorbing, boa-constrictor fashion, a large system known as the Atlanta City Railway Company. The beginning of the Atlanta Traction Company was in the Atlanta & Ft. McPherson line, which sprang forth electrically equipped in 1891. At that time H. L. Woodward was president and J. L. Mountain general manager. In the latter part of 1891, a line was built on Richardson

GLENN STREET POWER HOUSE—ATLANTA TRACTION.

street to Grant Park, and in 1893 the consolidation mentioned above was effected, and the Atlanta City Street Railway, with a line from Atlanta to Decatur (electric), bought. The latter also controlled a branch road to East Lake. By this addition twenty miles of road were united, and all equipped electrically. Before the latter purchase, however, the firm of Hines, Shubrick & Felder, and James W. English, Jr., had purchased a controlling interest in the Traction, and were the moving spirits of the consolidation. Mr. English later retired from the concern, but for a time managed the property prosperously.

The late financial stringency, however, had its effect on the finances of the road and the floating debt, and deferred interest on bonds necessitated a receiver, June 1, 1894. The court appointed Judge E. B. Rosser and vice-president W. C. Hale in that capacity. The officers of the road are Dayton Hale, president; W. C. Hale, vice-president, and W. L. Seddon, secretary. G. W. Evans is superintendent and active manager of the plant.

The twenty miles of track controlled by the Atlantic Traction comprises a line to Fort McPherson, five miles southwest of the city from the down town district. It passes within a block of the corner of Marietta and Broad streets where all the lines of the consolidated company meet.

In the old Atlanta City line there are 10 miles of road and in the Atlanta Traction  $8\frac{1}{2}$ . The routes are four in

number, namely: Union Depot to Decatur, 8 miles; to East Lake, 2 miles; to Fort McPherson,  $6\frac{1}{4}$  miles, and to Grant Park,  $2\frac{1}{4}$  miles, making an exact total of  $18\frac{1}{2}$  miles of single track.

The road is similar to that of the Consolidated as regards paving, and the track consists almost entirely of 40-pound T rail excepting girder down town. It is single throughout with turnouts. The grades are considered the heaviest in the city and range from a few hundred feet to a quarter of a mile in length of from 4 to 8 per cent. The General Electric, Edison and Detroit overhead material may be seen on the line.

There are two power houses used to operate the system, the larger of which is placed at the corner of Glenn and Humphrey streets on the Fort McPherson line. Here also are the general offices of the company and the headquarters of Superintendent G. W. Evans. The plant consist of an engine room, 60 by 80 feet; a boiler room, 20 by 80 feet; a machine shop, 25 by 25 feet, and a car barn, 125 by 100 feet, with capacity for storing 25 cars. Here are two Russell engines, one of 280-horse-

EAST SIDE POWER-HOUSE—ATLANTA TRACTION.

power, 20 by 27 inches, with a double 10-foot fly wheel carrying a 19-inch belt. It is belted direct to two 110-kilowatt Eddy M. P. generators. The other is rated at 125-horse-power, 14 by 20 inches, with a 9-foot fly wheel of 18-inch face. It is belted direct by Munson belting to one 80-kilowatt Edison bi-polar machine. In the boiler room are two vertical McLaughlin boilers of 125-horse-power and one horizontal Russell boiler of the same capacity. A Wainwright feed-water heater, a Buffalo duplex pump,  $5\frac{1}{2}$  by  $3\frac{1}{4}$  by 6 inches, and a Dean pump of the same capacity complete the steam plant. The coal used is the run of the mine, which is landed at the door on the southern railroad tracks. The switch board is on the Edison plan, and contains three-line switches and four feeders. Three lines are run from this plant in separate sections. One Westinghouse lightning arrester, four made by Wason and one home made device protect the station from Jove's arrows. The home device consists of serrated carbon discs connected to

very light fuse wire, about a No. 25, and from thence to the ground. A Westinghouse circuit breaker is also in use satisfactorily. The line arresters consist of two Wasons and three Garton-Daniels.

In the machine shop, which adjoins the engine room, may be found a Barnes, of Rockford, Ill., drill, and a 12-inch lathe, made by Ames, of Chicago. One machinist and a helper are kept busy here making trolley wheels, springs, contacts and other small goods. The wheel castings are bought, and bored and turned in the shop. A  $2\frac{1}{2}$ -horse-power stationary motor keeps the wheels moving. In the car barn, one man is kept busy repairing and repainting cars. There are 20 cars in use in all, with 14 in use steadily. They were made by the American Car Company, of St. Louis, and by Brill. McGuire and Robinson trucks are under the cars. The motor equipment lines up six Spragues, 15-horse-power, two to each car; two Edisons of 30-horse-power, two to each car; four double 20-horse-power equipments; six Detroit of 30-horse-power, and two late editions of the Westinghouse double 25-horse-power equipments.

W. B. Weaver is chief accountant of the office, which occupies a corner of the building.

At the Irwin street power house, which is near the Southern Railroad tracks, two four-valve Russell engines, 14 by 20 inches, of 125-horse-power each, are belted direct by Munson belting to two 80-kilowatt Detroit generators. The fly wheels of the engines are 84 inches in diameter by 20-inch face, and turn at 180 r. p. m. The engine room is 35 by 40. The boiler room, which is 18 by 35 feet in size, contains two Walsh & Weidner boilers, made at Chattanooga, Tennessee. They are of the return tubular type, of 180-horse-power each, measuring 64 inches by 15 feet. Here, also, are one Berryman heater and purifier, one Snow pump and a Wason injector. Coal slack is burned at the rate of  $3\frac{1}{2}$  tons a day. On the fine little switch board may be found a Westinghouse circuit breaker, and Detroit ammeter. The average station load is 120 amperes on the two machines. The lightning arresters here are three in number, of the Wason type, and with three Garton-Daniels on the line. Three feeders run from this station, operating the Decatur and the East Lake and part of the main line.

H. J. Burnap, the station engineer, has the plant in fine condition. He has in the engine room an oil filter of his own design.

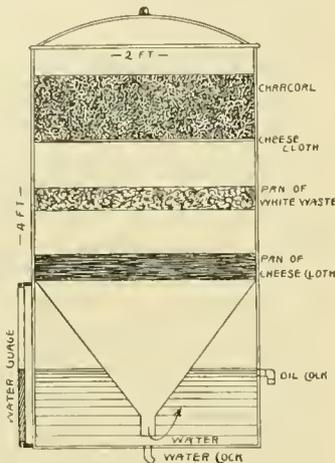

It is a galvanized iron tank, 4 feet high and 2 feet in diameter. On top is a screen which removes coarse refuse as the oil is poured in. Then comes a layer of charcoal, also on a screen. Next below is a pan of white waste, and below that another shallow pan of cheese cloth. The oil then settles to the funnel and through the spout into water ten inches deep. The oil rises level with the oil cock and is drained back for use. A water gauge shows the height of the water, which may be drawn off as often as necessary at the water cock.

The car barn, situated next the engine room, is 50 by 100 feet, with three tracks and a pit. It will hold eight cars. In the engine room is a coil of 50 feet of  $1\frac{1}{2}$  inc 1

hose. This Mr. Burnap has arranged ready to couple to the pump. The city pressure is eighty pounds, and by turning in his steam at eighty pounds, the pressure can of course be doubled. The station is neatly and intelligently kept.

The line does a good business and is materially aided by the resorts mentioned in this chapter and described elsewhere.

This line has the only transfer ticket used in Atlanta.

### THE ECONOMY OF HIGH SPEEDS.

Although the ultimate economy of quick schedules for getting the greatest possible mileage out of cars and men has been spoken of before in these columns, the importance of the subject deserves further mention. It is hardly necessary to reiterate the well known fact that the faster the schedule speed the greater the number of passengers that can be hauled with a given set of cars and men. To take an extreme case, suppose that on a certain round trip of five miles, which had previously been made in an hour, the time is shortened to thirty minutes, by virtue of less laying over time and increased speed. The result will be that it will take only one-half the previous number of cars to maintain the same frequency of service, or, on the other hand, the previous number of cars will give a headway one-half as long as before. Suppose that the headway is kept the same and one-half the cars are taken off. What is the result? The transportation expenses on that line are reduced one-half, the number of motor cars to be bought, inspected, housed and maintained is reduced one-half, and the public is given a much faster and more satisfactory service. But the superintendent may say that the increased speed means more power per car and greater wear and tear on cars and motors. Very true, but will these items overbalance the items before enumerated. In considering the power required, it must be remembered that only one-half the cars are on the road which were previously running. While the cars remaining will theoretically take more than twice as much current, the taking off of one-half the cars will very nearly balance this. In fact, it is a question whether any more power will be required for the faster service, as greater internal, electrical and mechanical losses would occur with the larger number of cars. Even if more power was needed, its cost will be small compared to the saving on trainmen's wages and other items classified as transportation expenses. The cost of power is usually only from 10 to 20 per cent of the entire operating expense, while the transportation

expenses are in the neighborhood of 50 per cent. The further objection to the fast schedule might be raised that it causes excessive wear on the cars and track. As far as the cars are concerned, it is safe to say that it costs less to inspect and maintain five cars making 150 miles a day each, than it does ten cars making 75 miles a day each. The mileage being the same in both cases, it is easier to handle the wear in the smaller number of cars. The wear on the track is so small as to need almost no mention. The only valid objection to the fast schedule is the danger from accidents. While this has some weight, it must be remembered that this is largely a matter of educating the public, and that experience has proved that after the first two or three months the number of accidents falls back to the usual amount. We have taken as a concrete example an extreme case, because it illustrates the principle so clearly. It must be remembered that laying over time at the ends of routes is simply a necessary evil, and does not pay dividends. It is good for nothing except to provide for the making up of lost time, and in some cases to preserve a ten, fifteen, twenty or thirty minute headway that can be easily remembered by the public. Another thing to be remembered is, that it is much easier both on power station and motors to have the motors arranged for a high maximum speed, enabling them to make schedule time without crowding too much in making starts than it is to have the maximum speed so slow that the motormen are obliged to strain them in starting.

See if you cannot quicken your schedule and give the public a more frequent service, thereby inducing traffic at a very little additional expense, or, on the other hand, give your patrons the same service with fewer cars. Raising the voltage to increase the speed may prove to be an advantage in this connection. Perhaps, also, you can put a field shunt on your motors.

Getting the fullest possible use of the apparatus and men you have is the way to pay good dividends. One of the secrets of the success of electricity from a financial standpoint is the increased mileage which can be obtained from a given number of cars and men.

THE transfer tickets which have engraved upon the face certain figures, popularly supposed to be representatives of the human form divine, are dangerous in one particular. At least, a conductor in a neighboring city had this experience: A lady who had seen several different presidents occupy the presidential chair, got into a car as it was leaving Blank street. Her dress was not according to the latest fashion plate, but was neat and well kept. When the conductor took her fare she asked for a transfer. The conductor looked her over and punched the picture of a spinster. She was on her feet in a moment and her tongue started at a rapid rate. The conductor's face presented all the colors of a spectrum while he hastily tore up the first transfer and presented her with another with the face of the modern young lady punched out. Then she subsided.

THE STREET RAILWAY MEN OF ATLANTA AND PROMINENT CITIZENS, MEMBERS OF THE LOCAL COMMITTEE OF ARRANGEMENTS.

The street railway men of Atlanta have been most heartily assisted in their multitudinous preparations for the convention by the enterprising citizens of the enterprising city, and we take pleasure in introducing here those gentlemen who are among the chosen, known as the "Local Committee." We feel sure this presentation will inspire a desire in the hearts of all our readers to meet and become acquainted with our Atlanta hosts.

JOEL HURT,

the president of the Atlanta Consolidated, and the prime mover in all that Atlanta has done for the Association,

JOEL HURT.

is a southern gentleman, and was born in Russell county, Alabama, in 1850. At the early age of 15 he was left without home or support, and worked his way through academy and college, until his graduation from the civil engineering course of the University of Georgia, in 1871. For ten years after the completion of his course he worked at his profession, mainly

in railroad work, on various southern lines. Since the year 1881 Mr. Hurt has been largely interested in real estate, and other large financial operations, in and about Atlanta. Mr. Hurt was the main force in the reorganization of the Consolidated, and to his constant work and unlimited patience and perseverance is due the present success of the system. Mr. Hurt is a handsome man of 44, with snow white hair and mustache, which give him a much older appearance. His operations in all fields of southern enterprise have been large and successful, and none more so than his Consolidated system.

ERNEST WOODRUFF,

the vice-president and general manager of the Atlanta Consolidated Street Railway Company, was born in 1863, at Columbus, Ga., where his early education was obtained. The first business experience of Mr. Woodruff, after leaving school days behind, was as a traveling salesman for a flourishing flouring mill. In this line of duty he was successful to an unusual degree. The cause of this success is patent to every acquaintance into whose experience the ready wit, sympathy and suavity of the gentleman has come. When the reorganization of the Atlanta Consolidated was made in 1891, Mr. Woodruff found himself in the board of management,

E. WOODRUFF.

which, in due course of time recognizes his ability and worth by making him vice president of the corporation and general manager of the property. Mr. Woodruff has been an untiring worker in advancing the interest of both Atlanta and the Consolidated Street Railway system.

He married an Atlanta lady, Miss Winship, and has been a resident of Atlanta since July, 1893. He is an Elk, a Mason, and in the directorate of the East Atlanta Land Company, the Trust Company of Georgia, as well as vice-president of the Consolidated.

SUPERINTENDENT H. N. HURT,

The representative of the Consolidated, upon whose broad shoulders comes the brunt of the daily miseries of street railway life, has neither lost his elegance and candor of manner, nor his faith in human nature, by reason of the trying position of superintendent. H. N. Hurt enjoys not only the confidence of the company and the respect of his employes, but the good will of every citizen of Atlanta, big or little, white or black.

He was born in Hurtsboro, Ala., in 1862, the only child of the family, His father died while the subject of this sketch was but an infant, so that cares and responsibilities fell early upon him. His widowed mother is still living. Young Hurt began active business life at 18, in a surveying party, and followed engineering as a profession until 1891, when he dropped general practice to become engineer for the then new Consolidated. The well-built and reputable track work of the most of the Consolidated's lines is of Mr. Hurt's construction. In 1892, he was made roadmaster, and in 1893, in recognition both of his engineering skill and his finesse in handling men, he was made superintendent of the whole system. Mr. Hurt's unfailing good nature, his charming comradery and his good will, have made for him many staunch friends throughout the south and north.

H. N. HURT.

THOMAS K. GLENN,

with the title of Mr. Joel Hurt's private secretary, assistant treasurer and secretary of the street railway, bears up bravely under 25 years of unmarried bliss. He was born in Vernon, Miss., in 1868, and received a common school education at Marietta, Newnan and Decatur, Ga., where he successively lived. He came to Atlanta in 1885, and entered the banking house of Maddox-Rucker, where he remained five years, and where he gained an

extensive and practical business education, so useful in his present triple capacity. Mr. Glenn is a remarkably bright young man, with plenty of energy and grit, and one of the hardest workers in the local committee.

WILLIAM H. GLENN,

the courteous assistant superintendent and purchasing agent of the Consolidated, is but 23 years of age. He was born in Cave Springs, Ga., and removed to Atlanta in 1883. He is a graduate of the Atlanta public schools and of the Georgia School of Technology, taking the full course in that excellent institution. Mr. Glenn has a brilliant future before him and an intense interest in street railway work, which he entered the next day after his graduation, in 1891. He has worked pretty well "all over the line," and is competent in more than one branch of practice.

WILLIAM W. KINGSTON,

the handsome and debonair representative of the Johnson

formal supervision of all Pennsylvania south to Florida, and it is safe to say that there is no better known or better liked supply man in the South than Mr. Kingston, whose acquaintance is as universal as his good nature. He is a loyal Atlantan, and proud of the beautiful city, which he calls the Chicago of the South. Assisting Mr. Kingston is a young Atlantan of unusual ability. His name is Eugene P. Thomas, and in his twenty years of life he has crowded a fine business experience. He is a graduate of the Atlanta High School and has been in Mr. Kingston's office two years, rising from the position of under clerk. Mr. Thomas has a wide and growing street railway acquaintance, and a brilliant future is his chosen field.

JAMES W. ENGLISH, JR.,

of the local committee, is one of the most prominent society men and business powers in Atlanta. He was born June 11, 1867, in Georgia, and is a graduate of the Atlanta High School. He also took the mechanical

T. K. GLENN.

W. H. GLENN.

W. W. KINGSTON.

E. THOMAS.

Company, of Johnstown, Pa., for the South, has an elegant suite of offices at 437-437½ Equitable building. As an Irish friend of his once said, he is not only a "rile gintleman but a rail gintleman," and to his earnest efforts the visiting brethren will owe much of the hearty welcome that will be accorded to them. Mr. Kingston was born in Philadelphia in 1866, and attended and was graduated from Germantown Academy. In 1879 he entered the Pennsylvania Railroad service in the general freight department, where his ability was soon recognized and his discretion honored by his appointment as special rate clerk, issuing all special rates made by the Pennsylvania Railroad Company. In 1890 he was induced to join the Johnson Company contingent in the Philadelphia office, and in 1892 was made southern agent at Atlanta. He covers a wide territory between North Carolina and Texas, with a

engineering course of the Massachusetts Institute of Technology. For five years he was a railroad contractor, and built many miles of line in his native state. He is at present manager of the Chattahoochee Brick Company, one of the largest concerns in the country. During 1890-91 he was president of the Atlanta Traction Company, but sold out these interests some time before the receivership. Mr. English is a trustee of the magnificent Grady Hospital, and is officially connected with several other important affairs in Atlanta, of which city he is a loyal and enterprising son, a man of large resources and abundant pluck.

JAMES W. ENGLISH, JR.

DR. C. D. HURT,

one of the most prominent of southern physicians, is surgeon for the Atlanta Consolidated, and a brother of President Joel Hurt. He is an Alabama man by birth, and served as a non-commissioned artillery

officer in the Confederate army until 1865, with distinction. He then graduated in medicine, and practiced both at Hurtsboro and Columbus, Ala., with great success. He came to Atlanta in 1892, and stepped into a fine practice which his wide reputation had provided him in advance. He is vice-president of the Atlanta Society of Medicine and of the Atlanta Gynecological Society. Dr. Hurt has a wide repute among the southern practitioners both in medicine and surgery.

CAPTAIN HENRY JACKSON.

This well known lawyer, capitalist and distinguished legal writer was born in Savannah in 1845, of a long line of ancestry famed in revolutionary history and political preferment. He was educated in England while his father was United States Minister to Austria. When war was declared between the states, Captain Jackson entered the confederate army and served with distinction on the staff of Gen. Stonewall Jackson and later became

ceded to be one of the best read lawyers in the south and enjoys a lucrative practice. His engaging personality and his high social position give him great weight in all public affairs. He is a Capital City Club man and a U. of Va. Delta Psi, as well as a director in the Atlanta Consolidated, and attorney for the Nashville, Chattanooga & St. Louis Railroad.

R. J. LOWRY.

One of the most public spirited of Atlanta's wealthy men is R. J. Lowry, who combines the offices of president of the Lowry Banking Company, president of the Atlanta Home Insurance Company, and the Georgia Trust Company; member of the board of directors of half a dozen corporations which are helping to build up Atlanta, and director of the Atlanta Consolidated Street Railway Company. He served in the city council in 1871, and was a prime mover in establishing the present splendid public school system. In 1881, as alderman again, he helped to estab-

J. CARROLL PAYNE.

DR. HURT.

R. J. LOWRY.

CAPT. HENRY JACKSON.

Adjutant General of Colquitt's brigade. After the war he entered the University of Georgia law school and was graduated with honors in 1866. He came to Atlanta in 1868 and has since practiced law, but has found time to write upon legal lore, edited and published Georgia Reports, volumes 45 to 66. He has been counsel for several railroads and is at present counsel of the Southern System. He is president of the great Suwanee Canal Company, a director in several other corporations, including the Atlanta Consolidated Street Railway.

J. CARROLL PAYNE,

a leading jurist of Georgia, is a Virginian by birth. He was graduated from Georgetown College and studied law at the University of Virginia. In 1876 he removed to New Orleans, La., and again graduated in civil law, which is the practice in that state. In 1885 he married Miss Hill, of Georgia, and removed with his bride to Atlanta in 1885. Mr. Payne is con-

lish the fine paid fire department, of which the city is justly proud. In all that tends to build up or advertise Atlanta, Mr. Lowry is willing to help, and the American Street Railway Association meeting is no exception to this rule.

MAJOR LIVINGSTONE MIMS.

Major Livingston Mims, is all that can be expected of a leader of society and business life in the foremost city of the southeast. No public function is complete without his dignified presence, and no enterprise can afford to forego his ready sympathy and efficient help. Major Mims came to Atlanta from North Carolina in 1876. He is district manager of two large insurance companies and president of the Capital City Club. On his recent retirement from the presidency of the South Eastern Tariff Association, the underwriters presented him with a \$3,000 silver service. Major Mims absolutely refuses political preferment and is a modest and thoroughly popular gentleman.

W. L. SEDDON,

of the local committee, was born in Virginia in 1861, where he spent his boyhood. He was graduated civil engineer in 1880, from the University of Mo., and practiced six years in government work. He spent three years in electrical work in St. Louis, and planned the once

W. L. SEDDON.

N. W. L. BROWN.

famous Lindell storage battery scheme. In 1885 he went into the street railway business in Kansas, where he gained much experience. In 1890 he came to Atlanta and helped build the Tracton Company's line, of which he was vice-president and secretary. Mr. Seddon is still hopeful that the line will be reclaimed and put upon a paying basis.

N. W. L. BROWN,

road master of the Consolidated and acquainted with grief as the chairman of the committee on exhibits, has distinguished himself in both capacities. He was born in '68 in Alabama, and entered a surveying party after completing the work of the village academy. He worked in railroad civil engineering in Tennessee, Alabama, Mississippi and Georgia. In 1888 he entered the Rennsalaer Polytechnic Institute and was graduated C. E. two years later. In 1892 he took the students course at Lynn. in the Westinghouse shops and in 1893 came to Atlanta as road master. Mr. Brown is a thorough street railroad man of great enthusiasm and a competent manager in almost any line of work.

R. D. BULLEN,

assistant manager of the Atlanta office of the General Electric Company, was born in Wakefield, Mass., in 1864,

R. D. BULLEN

and was educated at Providence and Pawtucket, R. I., graduating at Brown University. He is a Phi Beta Kappa, and has attained a master's degree. In 1887 he went into electrical work, constructing for the Thomson-Houston Company, and a year later was detailed to the southern office

when he was made head of the supply department. Mr. Bullen is now assistant general manager and the southern office owes much to his efficiency.

S. W. TRAWICK,

is general sales agent for the General Electric Company. He was born in Hawkinsville, Ga., in 1862. He graduated at the town high school and went into the banking business in 1881 at Wellsville, N. Y. In 1888 he went to Chicago with the Excelsior Electric Company, and two years later associated himself with the Westinghouse Company at its St. Louis office. Later he became special agent for the Brush Company at Atlanta, and was transferred to the General Electric Company in 1893, when two Atlanta offices were consolidated.

S. W. TRAWICK.

J. H. ALLEN,

the affable and enterprising manager of Dixie, the great commercial organ of Georgia and the southeast, is a hard working member of the local committee. His office is in the Equitable building, and the gentlemen in charge will be glad to see all the visiting members, street railway men, supply men and newspaper men. Just a glance at Mr. Allen's countenance is assurance

J. H. ALLEN.

that those who may visit his office will find the door open, and that a hospitable welcome awaits within.

THOMAS B. FELDER,

for the year 1893-4 president of the Atlanta Traction Company and a prominent and efficient member of the local committee, was born in 1863, in Burke county, Ga., and was graduated from the Waynesboro High School in 1879 with honors. After attending college at Dahlonga, he graduated from the law department of the University of Georgia in 1883. Mr. Felder has held several important political positions with great honor and credit, and is at present engaged in law practice in Atlanta with great success.

T. B. FELDER, JR.

A glance at Mr. Felder's record shows that he is remarkably bright, having become a full fledged disciple of Blackstone at the age of 20 years. No doubt his progress in his profession has been more rapid than his acquisition of knowledge during his school days, and this accounts for his prominence.

WALTER M. KELLEY,

the wide awake and progressive agent of the Carnegie Steel Company at Atlanta, came from the Pittsburg office three years ago. His office is in the Gould building, and his operations over a wide territory, where he is well known. He has been an active worker for the entertainment of the association. He is a member of the Capital City Club.

S. M. INMAN,

the large cotton dealer, is a director of the street railway. He is fifty years of age, an East Tennessean by birth, and was graduated from Princeton college. He is interested in every good work in Atlanta.

ARTHUR F. GILES.

The brilliant young manager of the southern office of the General Electric Company may ordinarily be found hard at work in room 431 of the Equitable building. He was born in 1871, in Boston, and, after a through Boston

W. M. KELLEY.

S. M. INMAN.

A. F. GILES.

public-school education, went into the Boston office of the Thomson-Houston Company. This was in 1888. With this organization Mr. Giles was sent South in 1891 as auditor of the Thomson-Houston's Atlanta office, and retained the same position under the General Electric Company. In February, 1894, Mr. Giles took general charge of the office, and recent good contracts of the General Electric in the South attest to his sagacity and energy.

DAYTON HALE,

receiver and president of the Atlanta Traction Company, was born in Mississippi in 1849, and received a common-school education. He has been a large manufacturer of saddle blankets, woolen and cotton goods, and was for eight years postmaster at Columbus, Miss. He came to Atlanta in 1893. His colleague is Judge Rosser.

JUDGE E. B. ROSSER,

has been a prominent man in Georgia politics and was a member of the constitutional convention, as well as a judge of the county court for a number of years. He is 56 years of age and a native of Georgia.

He has been largely interested in cotton.

THOMAS ELLIOTT,

the efficient station engineer of the Atlanta Consolidated, and the inventor of the devices credited to him, is an Englishman, having been born in Durham County, in 1863. With few advantages beyond a common school education, young Elliott entered the employ of the great steel firm of Balchow, Vaughan & Company, in the engineering department, where he received an admirable training. In 1882, he came to America and worked successively for Coxe Brothers & Co., of Drifton, Pa., the

THOMAS ELLIOTT.

Lehigh Valley Railroad, the South Brookside Cotton Mills, of Knoxville, Tenn., and with Manager M. R. McAdoo, of the Paterson, N. J., Street Railway. In all cases he was mechanical engineer or master mechanic,

and when, in 1891, he went with the Atlanta Consolidated, he brought to his work a wide experience and thorough training in detail, as well as an active and progressive mind.

## WHAT JUST DESERTS!

The Washington, Pa., Observer, observes as follows: "The city of West Chester wanted the earth to permit the trolley line from Lancaster to Philadelphia to run through its streets, and the trolley company people side tracked West Chester by running around it. Some people think this is a good way to treat West Chester."

There are several other one horse towns in this country that need the example of West Chester.

THE brainy New York Sun has discovered that "The introduction of the cable cars has led to the weeding out of the old and sickly horses of the street car lines, and the superintendents of the big stables have learned that it is better to have frequent relays for their horses and keep their stock in good condition rather than save the wages of a few extra men at the expense of the horses."

## HARRY C. SIMPSON.

The general manager of the St. Louis Register Company, in the New York office of that flourishing concern, is Harry C. Simpson. Perhaps no one of the supply men in the street railway business has entered on life with any more obstacles and surely no one so been more markedly successful in overcoming all difficulties.

Mr. Simpson was born in Philadelphia, in 1847, and gained his knowledge of reading and writing from his mother. He never attended any school, but went to work at eleven years of age as errand boy, on one dollar a week. He filled various positions until his twenty-first year, when he went to New Orleans to engage in business. Yellow fever attacked him here, and on recovery he found his health shattered. A sea voyage was determined on, and, when his funds were spent, he worked his passage. He visited almost every coast country in the world, and returned to America after thirteen months of sea life, in restored health. After a brief experience in the theatrical business and other ventures, during which time he traveled in Europe, he engaged with the well-known firm of Lewis & Fowler, of Brooklyn, handling their fare register. The business prospered and the Lewis & Fowler Manufacturing Company was formed, with Mr. Simpson as secretary, which position he resigned to become contracting agent for Pullman's street cars. Not satisfied with his treatment by this company, he went to South America, engaging in the manufacture of street car springs. This was an unfortunate venture, and he returned to the Lewis & Fowler Company as Pacific coast agent. Finally, a flattering offer from the St. Louis Register Company made him general manager in a short time, which is his present position. Mr. Simpson's career has been one of honor and success, and a large circle of friends and business acquaintances appreciate his sterling worth and ability.

H. C. SIMPSON.

LARGEST ORDER EVER PLACED FOR  
ELECTRIC CAR HEATERS.

That electric car heating has taken a firm hold in New England, where Nor'easters are about as penetrating and cold as any winter wind the land over, is evidenced by the placing on September 12 of the largest order ever given for electric car heaters.

The road whose patrons are thus to enjoy the genial warmth of the unseen force, is the Union Railroad of Providence, R. I., the extensive system of which includes about one hundred miles of tracks. The cities and towns connected by this line are: Providence, Pawtucket, Coventry, Cranston, Cumberland, East Providence, Johnston, Lincoln, North Providence, and Warwick.

The Consolidated Car Heating Company, of Albany, N. Y., was the fortunate one selected to furnish and install this extensive equipment, and will proceed to do so with the utmost dispatch. The facilities for turning out work will enable the company to fill the order promptly.

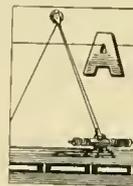

That electric heating is making much more rapid progress than has been fully realized by many, is seen in the statement, that fully 60 roads are now equipped and will use this winter, the electric heaters of the Consolidated Electric Heating Company, and managers who have not already adopted this method, will have ample opportunity to fully investigate the heaters, which will be exhibited at the Atlanta convention.

## ANOTHER AERIAL ROPEWAY.

A company of reliable men has been formed in England to operate an aerial ropeway at Brighton Dyke. The ropeway, which is the middle link of the system of transportation to be built, is to have three spans. The longest or middle span is to be 650 feet. The cables upon which the cars will run are to be suspended from a supporting cable, so that it is possible to keep the car cables almost level. The cars will pass through openings in the towers supporting the spans, so that the whole length of the road (1,250 feet) will be made without interruption. The termini of the aerial road will be approached at each end by cable roads.

## KEEP THE TROLLEY ON THE WIRE.

BY EDGAR THORNE.

MOTOR car stood "lifeless" in the middle of the street,

And all its twenty passengers had risen to their feet  
One said a "fuse" had burned away, with elongated face,

Another that a "plug" was blown out of its proper place,

And all agreed they'd be delayed at least one tedious hour,

Before they could go forward and regain the absent "power."  
At last a modest little maid, whom none could but admire,  
Exclaimed, "I'll tell you what it is—the trolley's off the wire."

In household matters, love affairs, in monetary things,  
If happiness escapes you upon quick departing wings,  
Don't worry, flurry, fuss and fret, but keep your temper down,  
Nor let your placid brow be marred by wrinkle or a frown;  
When friends desert and enemies with hate would pierce you through,  
And everything perplexes, and you don't know what to do,  
Don't be discouraged or dismayed, nor from the world retire,  
But ask yourself this question: Is the trolley on the wire?

In any situation, though you be with sorrow clad,  
Don't be of doleful countenance and to your troubles add,  
Maintain a constant equipoise and peaceful frame of mind,  
And cast anxiety and care out to the fickle wind.  
In all the hurly-burly of this rough-and-tumble world,  
Though at him shafts of malice were unscrupulously hurled,  
I never knew a man to fail who had ambition's fire,  
And kept, with strong and steady hand, the trolley on the wire.  
—Congregationalist.

THE contract for the track of the Columbia Railway cable line, at Washington, D. C., was let to E. Saxton.

## THE PALATIAL ARAGON.

Official Headquarters Hotel, American Street Railway Association.

The most elegant and modern of southern hotels is situated at the corner of Peachtree and Ellis streets in Atlanta, just within the business portion of the city and within five minutes' walk of any given business office or shop. At the same time it fronts on the finest residence thoroughfare in Atlanta, and within a stone's throw of the Capital City Club, the Governor's mansion, and dwelling place of Georgia's elite. The house was opened but recently, yet has already gained a wide clientele. It is conducted on both the American and European plan by Charles F. Dodge, a past master of hotel management of Chicago, New York, and southern experience.

The building is six stories high, with a roof garden of elegant design. The style of the building is Spanish romanesque, and marble; pressed brick and terra cotta enter into its composition. The first story is of Georgia marble, and the other five of pressed brick and terra cotta, with marble trimmings.

The main entrance, on Peachtree street, leads into the marble-floored main office, which is cabinet finished and equipped with the usual desk and manager's office. Here the visitor will be greeted either by Manager Dodge, or clerks D. J. Gracey and Oliver Johnson. Mr. Dodge is a hotel man of many years' experience, both in New York and Chicago, while Messrs. Gracey and Johnson are the most affable and courteous of gentlemen, with a large acquaintance among the traveling public.

At the right of the main entrance is the gentlemen's smoking, reading and writing room looking out on Peachtree street through a French plate-glass front. Here may be found the telephone, telegraph and cab offices. At the left of the main entrance is the ladies' entrance and reception room. The latter is furnished in exquisite taste. Near this room is the elevator shaft, and to the left, the restaurant and cafe. This room is 40 by 70 feet, and has connection with private dining rooms

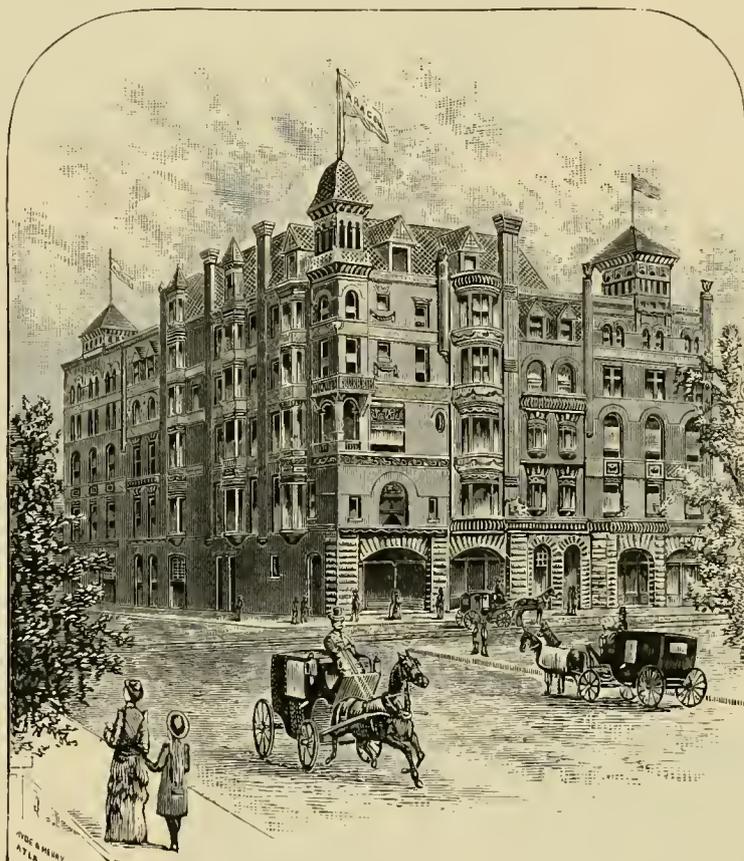

and the breakfast room. The cafe, a view of which we show, is fashioned and appointed as nearly as possible like the Holland House restaurant, New York. It is draped with velour and laces and tropical plants adorn the windows. The silver and china is elegant, as befits the product of Gorham and Haviland. The service is most efficient and the ensemble touches the æsthetic gourmand in several places. While speaking of the dining room, it may be well to mention that the table is provided with every delicacy of the season, and what

the region within a night's ride of Atlanta cannot furnish could be listed in a small space. The sea shore and the semi-tropics of the Gulf, the warm climate of middle Georgia and the moderate temperature of the highlands, give to the epicure all the wealth of water, air and earth in season. Breakfast and an elaborate luncheon, with dinner from 6 to 8, will be found a recurring pleasure. The breakfast room and private dining rooms are of equal elegance and taste.

The buffet, bar, and billiard room, to the rear of the office, have an air of greatest refinement and taste, as well as the best the market affords. On stepping from the elevator on the second floor the guest is attracted by an

open court, in which a fountain plays amid a bower of tropical plants. Here is also the main dining room, 40x60 feet, finished in quartered oak with two elliptic windows, thirty feet each, making one end entirely glass. The ceiling is paneled with oak beams, and on either side of the room are fire places and side boards. The handsome chandeliers and parquetry floors and the vine entwined pillars make it an ideal ball room on occasion.

The numerous parlors are elegantly furnished with costly draperies, bric-a-brac, portieres, inlaid tables and richly upholstered chairs and couches. One suite is in gold and ebony, another semi-colonial, with white and gold, and all have rich paintings and frescoed ceilings. The bridal chamber is a lovely piece of the decorator's

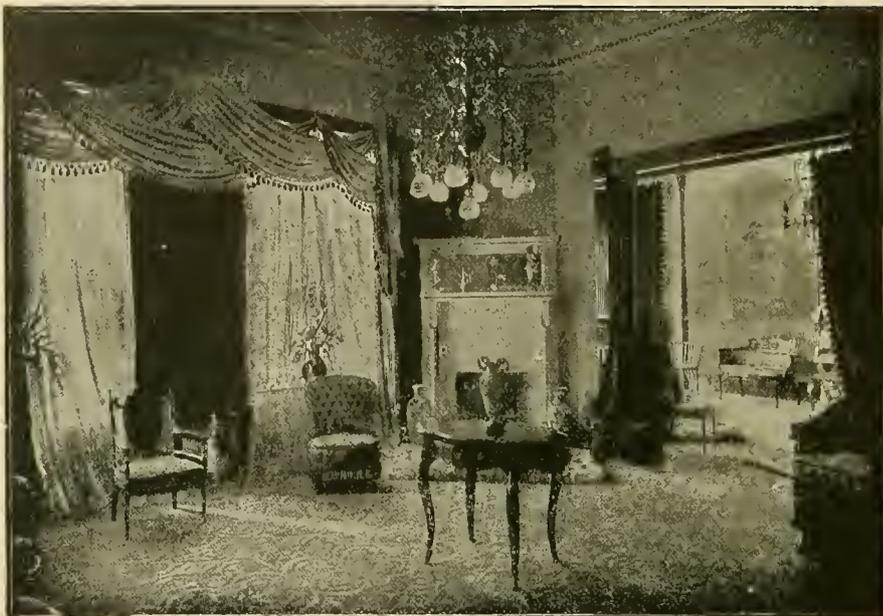

THE ARAGON—HEADQUARTER'S HOTEL.

art, with a grand piano and electric chandelier. Many of the best known supply houses have already secured headquarters in the parlors, and others will follow before the end of the month.

The rooms are uniformly excellent, single and en suite, ranging in size from 10 by 12 to 20 by 26. They are finished in natural wood, and provided with gas and electric light, steam heat and call bells. The decorations are tasteful, and neither too numerous nor too few. A recently added annex, furnished and finished in the same style as that described, will give ample accommodation to all comers.

The kitchen, store room, laundry, and other working departments are in a separate building, as is also the special electric light plant, of the General Electric's installation. The sanitary arrangements are the best and the steam heating system well nigh perfect. The entire building is practically fireproof, but fire escapes are also provided, as an additional guarantee of safety. On the roof is instituted a summer garden that has been most pleasant to visitors and profitable to the management. From its peak may be seen Kenesaw Mountain, Lone Mountain, and the Stone Mountain, mentioned elsewhere in this issue. During the warm season concerts are held here each evening, for guests and such of the towns people as are possessed of season tickets.

Among the minor conveniences is a special free omnibus, that meets guests at the Union depot; the best of

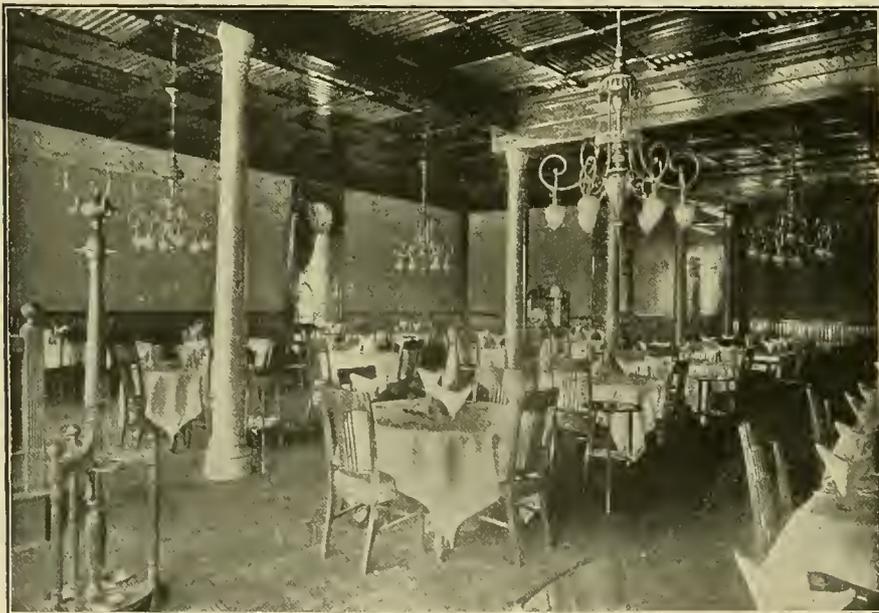

THE ARAGON—PARLOR A.

porter service in moving baggage and exhibits, and prompt attendance to calls.

The committee has made no mistake in selecting the Aragon as headquarters of the Association, from the point of view of its excellence as an inn, as well as from the fact of its convenient location. All the electric cars to Piedmont Park pass the door, and three blocks away stands the Equitable building, the electrical center of the city.

#### THOUGHT HE WAS A DUMMY.

A distressing accident occurred on the San Francisco & San Mateo Electric Railway recently. It seems that mischievous boys have been in the habit of placing straw men on the street railway track and watching the frantic efforts of the motormen to stop the car and avoid running over the dummy. On the occasion alluded to, a motorman ran into and killed a drunken fellow who was lying across the rails, thinking it was a dummy. The motorman was arrested, but released on his own recognizance. It seems to us that the arrest of the boys and their punishment is now in order.

THE ARAGON—CAFE.

JACK T. ADAMS, of Atlanta, is doing a large detective business for southern street railways. He has the confidence of the roads which employ his men, and has acquired a wide circuit that he "works" regularly.

## HOW TO PREVENT ELECTROLYSIS.

And Make a Complete Metallic Circuit for Electric Railways.

BY H. R. KEITHLEY.

The one problem of paramount importance in electric railway engineering, and one which has for the past two years received the careful attention of the foremost electrical engineers and electric railway managers, is the problem of preventing electrolysis, and the destruction of water pipes, gas pipes and underground electric cables of cities and towns, which is caused by the electrolytic action of the heavy underground currents of electric railways. It is now generally accepted by the ablest electrical engineers, who have given the problem the practical, experimental and scientific investigation which its importance demands, that the most practical, feasible and permanent solution of the problem is to provide a "complete metallic circuit for electric railways," and to abandon, as far as possible, the "earth return." Up to a period within the past two years, the universal practice in electric railway construction, has been to rely principally upon the "earth" to complete the circuit from the cars in operation on the road, to the power house, the bonding of the rails being considered of so little importance that only the crudest forms of No. 4 iron or copper bonds were used. In the early stages of the electric railway, the expert electrician made his estimates and calculations with the utmost accuracy and scientific precision for the overhead half of the electric railway circuit, and spared neither money, time, labor, copper, or "midnight oil," to bring the overhead half of the circuit up to the highest standard of construction. But the practical results which he aimed to obtain, viz: a low percentage of loss or drop on the line, and economical consumption of coal at the power house, were seldom, if ever, realized, and all of his elaborate calculation and supposed accurate estimates came to naught, simply because he trusted to Mother Earth and good luck to complete the other half of the railway circuit, and neglected to complete the metallic circuit by utilizing the abundance of metal in the rails, by properly bonding them together at the joints. This neglect has brought about the disastrous results of electrolysis of gas and water pipes and underground cables, and the high percentage of loss of power on the line, and enormous consumption of coal, has set at naught the supposed high standard of engineering perfection aimed at (but missed) in the overhead construction.

To complete the metallic circuit of electric railways by utilizing the abundance of metal in the rails, is simply a question of the application of just as much care and just as much skilled labor, and the same scientific accuracy in construction by bonding the rails properly, that is given to the overhead half of the circuit. For the rails are the other half of one continuous circuit, and unless each half of the circuit receives the same careful work of the engineer and the skilled workman in its construction, the

practical results obtained in the completed, or whole circuit, will exactly correspond to the inefficient work of construction on either half of the circuit, and it does not matter which half receives the inefficient work, the result will be just as disastrous in the end.

To utilize the metal of the rails for completing the metallic circuit is simply a question of properly bonding the rails. And to properly bond the rails is simply for the engineer to select the most perfect rail-bond in the market—both electrical and mechanical perfection should be combined—and to employ skillful workmen to do the bonding, and have accurate and uniformly drilled holes in the rail for applying the bonds; and last but not least, to distribute the rail bonds on the different lines of a railway system by making accurate estimates for the number and size of the rail bonds used at the joints, so that the total cross sectional area of the rail bonds will exceed the cross sectional area of the overhead half of the circuit at any given point on the line of the railway.

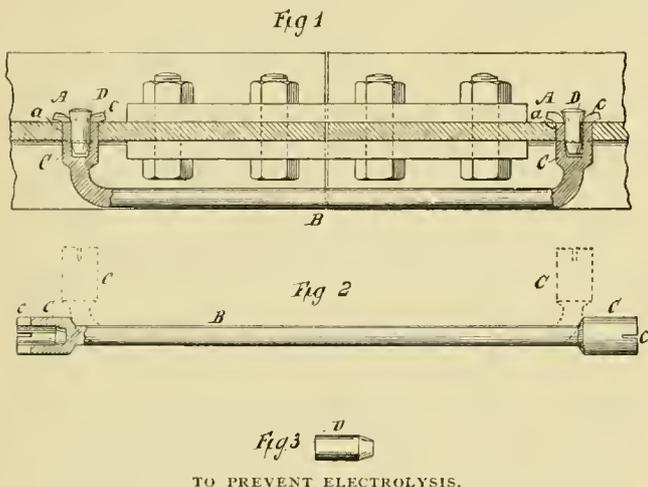

The careful observation of these principles in the construction of a complete metallic circuit for electric railways, will produce the desired results and prevent electrolysis of gas and water pipes and electric cables, reduce the percentage of loss of current on the line, and result in a great saving in the consumption of coal, for this is the inevitable deduction from the well established law, that electric currents follow the path of lowest resistance, and with the thorough system of bonding above described, the rails will be the path of lowest resistance and the amount of current which would leave the rails, thus heavily bonded, to follow gas or water pipes, or lead cables, would be so small that electrolysis would be reduced to a minimum, and all corrosion of pipes at the joints or elsewhere, be prevented.

The problem is now narrowed down to the selection of a rail-bond for making the most complete and perfect metallic circuit of the rails. For there is an abundance of metal in the rails of any road for the construction of a complete metallic circuit, if they can only be perfectly bonded together. For four 70 lb. rails of a double track railway, if bonded so as to utilize all of the metal, will have conductivity equivalent to that of four solid copper conductors, each one inch in diameter; and this amount of copper is rarely ever strung for a great distance over a line of railway. Hence it is obvious that the construction of a "complete metallic circuit for electric railways" is purely a problem of distribution of copper, and the use of the most perfect rail-bond, designed for both electrical and mechanical perfection, and thorough work in construction. The requirements of a rail-bond, designed for both electrical and mechanical perfection, are: first, a one-piece rail-bond; second, absolutely solid and perfect contact of the metallic surfaces in the connection between the bond wire and the rail; third, a rail-bond having its terminals enlarged in diameter at least 1.9 times the diameter of the bond wire itself. This provides for an area of surface contact in the connection equivalent to seven times the cross sectional area of the bond wire itself. This ratio of 7.1 is

required to overcome all electrical resistance in the connection between the two metals, iron and copper, the ratio of the resistance of iron and copper being as 7 is to 1. The mechanical requirements are that the design and structure of the rail-bond shall be such that it cannot be broken or have its connection with the rail broken loose by the vibration of the rail-joint caused by heavy traffic.

The types of rail-bonds now in general use need only be described to determine whether they come up to this standard.

1. The Rivet Bond. It is composed of a piece of wire soldered to a rivet on each of its ends. Its fatal defects are, first, it will corrode and break loose at the point where it is soldered to the rivet. Second, these soldered connections with the rivet, introduce resistance which limits the conductivity of the bond to that of the soldered connection, and since the current is forced through three hundred and fifty-two of these soldered connections in a mile of rail, the resistance must be very

great, thus limiting the conductivity of a No. 0 rivet bond to about that of a No. 4 solid copper wire. Third, a riveted connection with the rail is nearly always imperfect in its contact of the metallic surfaces in the connection. From this it is evident that nearly two-thirds of the copper in rivet bonds is an absolute waste, for no matter how large the wire is, the conductivity of the bond is limited by the soldered connection.

2. The Channel Pin Bond. This is a piece of copper wire having each of its ends secured directly into the rail by iron channel pins. The defects are: The surface contact of the wire in the connection in the rail is always imperfect, and admits moisture, rust and corrosion, causing great resistance to the passage of the electric current, and eventually causing electrolytic action which destroys the connection. The area of the surface contact in the connection is very little more than the cross section of the wire. These defects make the resistance of three hundred and fifty-two such connections per mile of rail very great.

3. The One-Piece Rivet Bond, which consists of a wire having shoulders upset on each end, and is secured to the rails by having its ends riveted into them. This

is an improvement on the old style three-piece rivet bond, but is subject to the same defects, caused by the impossibility of making perfect metallic contact between the surfaces of a riveted connection; also the defect of having its terminals very little, if any larger, than the wire itself, making the area of surface contact in the connection very little greater than the cross section of the wire, whereas, it should be seven times the cross section of the wire. Hence, a large proportion of the copper in this rail-bond is a total waste, for its conductivity is limited by the conductivity of the connection with the rail. And, as there are three hundred and fifty-two of these imperfect connections to a mile of single rail, the resistance is correspondingly great.

The only rail-bond in the market which fulfills all the requirements of a perfect rail-bond, is the rail-bond having large tubular terminals, and which is secured to the rail by the means of drift pins. This is practically a one-piece rail-bond, having large tubular terminals, which are connected into a rail by inserting them into holes drilled to fit them, and permanently expanding such tubular terminals by stretching or swaging of the metal composing them into contact with the holes. This expansion of the terminals is accomplished by driving drift pins into them, said pins being about  $\frac{1}{16}$  of an inch larger than the openings in the tubular terminals. This makes an absolutely perfect and solid contact between the two metallic surfaces, in the connection, and permanently excludes all air and moisture, and renders corrosion or electrolytic action in the connection absolutely impossible, and makes a connection which will remain perfect as long as the bond wire or rail will last. The tubular terminals are 1.9 times as large in diameter as the bond. This gives an area of surface contact, in the connection with the rail, equivalent to seven times the cross section of the bond, and eliminates all electrical resistance from the connection. A single line of rail, carefully bonded with No. 0000 rail-bond, having these tubular terminals, will have its conductivity made equivalent to that of a No. 0000 solid copper wire of the same length. Therefore, this bond utilizes every particle of copper composing it for conductivity, and makes it possible to utilize any amount of metal in the rails required, according to the number and size of the bonds used to a rail joint.

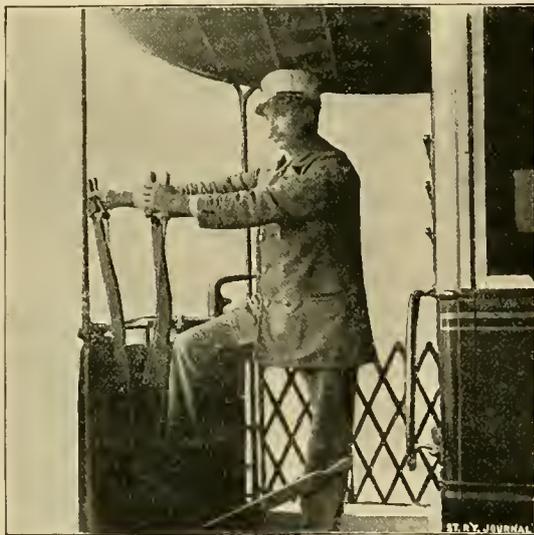

It is a clearly established law of electrical conductors that the carrying capacity of a conductor is limited by the amount of resistance of any one part of that conductor. Then it is clearly evident that the conductivity of the four rails of a double track railway, double-bonded at each joint with No. 0000 bonds having tubular terminals, will be equivalent to the conductivity of 8 No. 0000 solid copper wires, of an equal length, if the rail-bonds are perfect, according to the standard above given, and all the connections are perfectly made. But this is too high a standard of perfection to be obtained in practice, on account of careless work in applying the bonds. But with ordinary care in bonding, and by bonding with cross wires across the track every four or six rail lengths, the four rails can be so bonded, with the tubular

terminal bond, that their conductivity will be equivalent to that of seven solid copper wires, of the same size of the bond, and the same length of the tracks so bonded. This is equivalent to a copper conductor of 1,481,200 circular mils. Only about one-tenth as much copper is required for making a complete metallic circuit by this system of bonding as would be required for a complete metallic circuit, completed by solid copper conductors, or "track feeders," as they are called. Therefore, it is evident that a complete metallic circuit of high conductivity can be constructed at far less expense for first cost of copper and construction by thoroughly bonding the rails with the tubular terminal rail-bond, referring to the principles above laid down.

The above described rail-bond and system of bonding has lately been adopted as the standard for all construction by the three great street railway systems of Chicago, on 450 miles of electric lines now under construction, and is rapidly being adopted by the various leading electric railway systems throughout the United States. It is popularly known as the "Chicago" rail-bond.

GRIPPING CABLES BY COMPRESSED AIR.

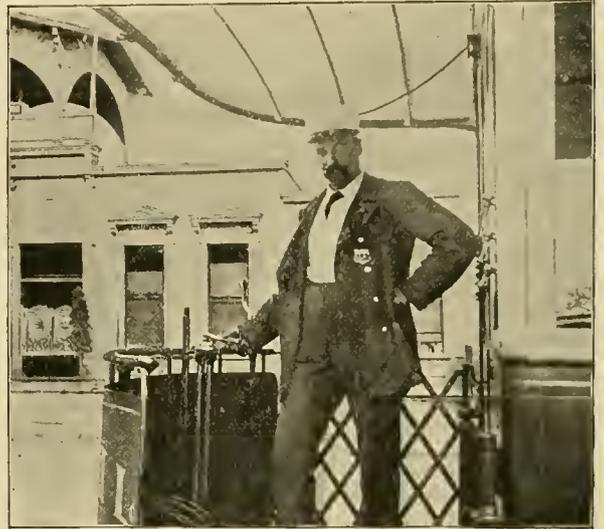

A novel but effective use has been made of the Genett air brake system on the cable cars of the Third avenue road, New York, the cars on which, have for some time been so successfully equipped with the Genett air brake. As the cars are double truck and quite heavy, consider-

THE OLD WAY.

able strength was necessary to close the grip on the cable. With a view to decreasing the labor and increase efficiency, the company have fitted up one car with a mechanical device actuated by compressed air, from the same reservoir that supplies the brakes, and by this means make the position of gripman a very easy one so far as manual labor is concerned. Instead of the grip and brake levers in use on other cable lines, there are instead two small handles, one for use at the termini of

lines and the other with which practically all the work is done. This controlling handle has three positions, one for each of the following conditions: Grip closed with brake off; grip open with brake on, and grip open with brake released, this latter being used in descending grades by gravity. The experiment is working satisfactorily

THE NEW WAY.

and opens up quite a new feature in the equipment of cable cars, as the saving in strength enables the driver better to attend to other duties, and the rapidity and efficiency with which the grip takes the rope effects a marked saving in time and contributes to ease in starting train. Our illustrations show the car "before and after taking" air.

THE TROLLEY CAR MAN.

What a wonderful being 's the trolley car man,  
Of course we all know his worth,  
For do we not see him, each day of our lives,  
As we go up and down on the earth.

CHORUS.

"Yes, ma'am, this car's for down town,"  
"Fare please"—"Let me help you Miss."  
"Get out you young blackguard, I say,"  
"Oh ain't a conductor's job bliss."

Its a part of his calling to be well dressed and neat,  
And polite and attentive to all,  
And if you but give him the least little sign,  
He's sure to respond to your call.

CHORUS.

He has eyes like the lynx, but kindly and true.  
His grasp, it is firm and assuring,  
He always looks after the aged and weak  
With the young and thoughtless enduring.

CHORUS.

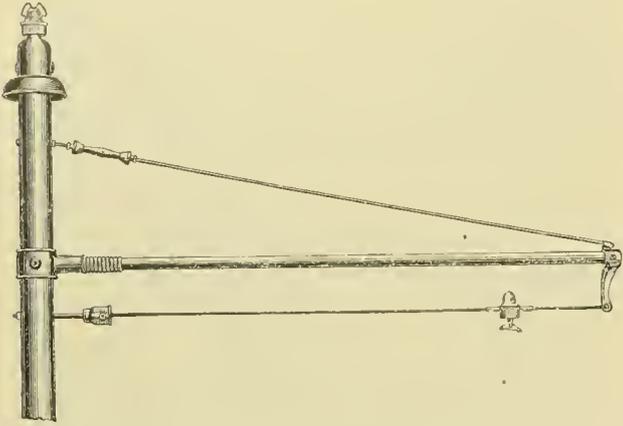

He is out on the streets, in sunshine and storm,  
He'll be found at his post in all seasons,  
He is ready to answer all questions they ask,  
No matter how foolish their reasons.

CHORUS.

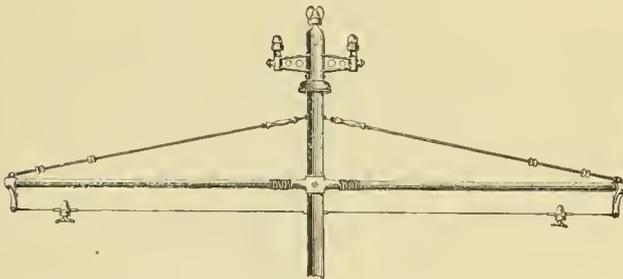

--A Optimist.

### SOME NEW CREAGHEAD FLEXIBLE POLE BRACKETS.

The Creaghead flexible brackets for wooden poles, which we illustrated some time ago, have proved very satisfactory, especially on high speed interurban service, so that other standard types have been brought out by

the company. Those herewith illustrated are the designs for single and double track with iron poles. They are insulated from the pole so that there is double insulation between the wire and the pole. There is an insulated turnbuckle in the top guy rod and a hard wood corrugated plug in the horizontal arm, while the span wire passes through an insulating bushing in the pole. The great need of more flexibility with bracket construction has made this design of pole bracket very popular. The Creaghead Engineering Company has recently equipped throughout, the Cincinnati & South Covington Street Railway's Evergreen line, using a large number of double

brackets for wood poles with a special ornamental curve brace on each side of the pole under the arm. Several hundred have also been ordered for the Rutland, Vt., Street Railway, and many other roads have been supplied with special brackets.

### HOW THEY BROKE HIM IN.

A Southern exchange, The Birmingham, Ala., Age-Herald, thus pictures a new motorman, who took out his first car the other day.

"It required the united efforts of a motorman, the superintendent and a track boss to manage him. It was like breaking a young mule. He was a tall, grawky

youth from the country. He wore his Sunday clothes that had evidently done service at many camp meetings, and had been his companion at many an afternoon sparking. His hat was of the crop of '85 and should have been laid by in the fall of '90. He had outgrown his Prince Albert coat and it struck him about where the modern sack reaches. His pants were cut in the fresh of '84. Coming down Pearson hill the stiff morning breeze caused the tails of his coat to flap like the sails of a wind mill. He looked not unlike Ichabod Crane mounted on Gunpowder and flying from the headless horseman. At a crossing half way down the hill he had to shut off the current, apply the brakes, and ring the gong at the same time. These simultaneous actions were too much for him and he collapsed. He said it was harder to run an electric car than to drive a spike team. Yet in spite of these difficulties he will write back to the girl he left behind him, a glowing description of the rapid progress he is making in Birmingham, and will close his letter with the following poem:

Far, far from home,  
In great Birmingham I roam.  
All sights are strange to me,  
And home again I long to be.  
Yet there is one familiar sound—  
I hear it in my daily round.  
The 'lectric car's the cotton gin,  
And it buzzes and hums with ceaseless din,  
And when the trolley's turned and lights grow dim,  
It's like the screw packin' cotton in.

### THE HUBLEY TROLLEY HARP.

The accompanying engraving is of a harp made by the Hubley Manufacturing Company, of Lancaster, Pa. The harp shows that it has been designed after the most careful study of the conditions which this important part of the car equipment has to meet. It is made of the best malleable iron and also of the highest grade bronze.

The crescent section of the side bars adds strength and lightness, and affords a rounded surface that will not

catch on the trolley wire. The pin is fastened by an improved method, giving a large bearing and avoiding sharp corners. The metal in the wheel is distributed so that the wheel may be entirely worn out. It is of the highest grade of bearing bronze. Some wheels are in service after a run of 10,000 miles. The wheel is a specialty of the Hubley Company, which furnishes complete equipments for electric railway plants, and the works are being doubled to accommodate the increase in demand.

A GANG of thieves was one day recently discovered loading up and hauling off everything movable, on the Forest Park & Clayton Electric line, of St. Louis.

THE AMERICAN ELECTRICAL WORKS.

On the 25th of August, 1894, occurred the sixteenth annual clambake of the American Electrical Works, of Providence, R. I. This is the Fourth of July and Christ-mas and birthday celebration of the electrical fraternity, and the brethren came from Maine to California and York state to New Orleans, to participate. The sixteenth was a particularly happy one, and the Union Club country house was filled with an enthusiastic crowd of friends of the hosts. Artistic menus were carried away by the participants. The motto was

E. F. PHILLIPS.

"For this to night thou shalt have shocks"

President Eugene F. Phillips requested Charles W. Price, of New York, to act as toast master. The latter introduced the "flow of soul," including a characteristic and happy speech from President Phillips. It was a jolly occasion, and every participant may put a white stone for August 25, 1894.

The history of the American Electrical Works runs in this wise. The business was begun in 1870 by Mr. Phillips, and the company incorporated in 1882, when the works were removed to Phillipsdale in 1893. Previous to this, the original plant covered 60,000 square feet of floor space in a five-story building in Stewart street, Providence, and a branch factory in Westfield street with 19,000 square feet of floor room. Increase of business, however, compelled the change to Phillipsdale, a suburb of Providence. Here the company has 28½

acres of ground with the fullest of transportation facilities both by land and water. The buildings occupy three acres, and another is in contemplation. The new factory has fully demonstrated the advisability of the change, and the increased output and greater readiness with which goods are delivered delights

W. A. HATHAWAY.

both the company and its patrons. It is one of the largest concerns in the world, and makes a full line of bare and covered wire for all electrical work, including railway feeders, trolley wire, electric light wire, incandescent and flexible cords, americanite, magnet, office and annunciator

wire, Faraday aerial and underground cable. Included in the facilities of the factory are a rolling mill and a wire mill, giving means of furnishing wires of any size, in unlimited quantities, on short notice. No other company in the United States in electrical lines has more or better friends than has the American Electrical Works. Its branch offices are at 10 Cortlandt street, New York; 241 Madison street, Chicago, and a branch factory in Montreal, known as the Eugene F. Phillips Electrical Works.

The capitalization of the company is \$500,000, with a surplus of \$200,000, and the present officers: Eugene F. Phillips, president; W. A. Hathaway, treasurer, and W. H. Sawyer, secretary. It is needless to state that the moving spirit of the American Electrical Works enterprise is President Phillips, and that Treasurer Hathaway and Secretary Sawyer are able seconds. All have hundreds, nay thousands, of friends in every line of the great electrical industry, and each year adds to the number.

For sixteen years the goodfellowship of the electrical fraternity has centered about the clambake, and as long as Rhode Island clams flourish, may the American Electrical Company and its many friends eat them in high carnival.

HOW GLASGOW RUNS ITS TRAMWAY.

The first full flush of pride has scarcely faded from the pages of the Glasgow dailies, incident to their hour of triumph when the town went into the street car business, when the very thing we have predicted comes to pass. The road and cars belong to the public, and the public propose to dictate how its own cars shall run. In witness whereof the following letter in the Glasgow Herald is self-explanatory:

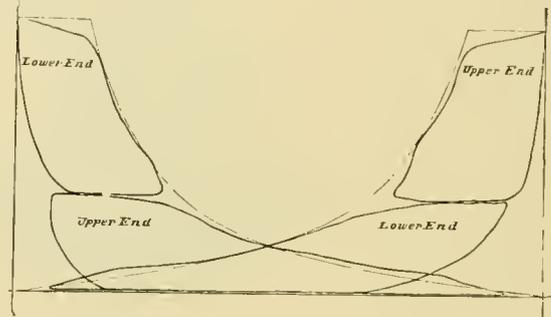

SIR:—We have now had a full month's experience of our new tramway management, and I think it must be patent to every unprejudiced mind that if the corporation is to succeed in securing the monopoly of the street traffic a new departure must be made immediately. I think the fact that the corporation have not reduced the fares in any one instance has tended very much to drive the citizens to the rival omnibuses, in which for long distances they can travel one-third cheaper. Now, surely if it pays a private company to run a 26-passenger conveyance with three horses and two attendants, a mile and a half for a penny, it would pay the corporation to run a 40-passenger car with two horses and two attendants double that distance for the same money. Supposing each car should only earn the sum of 3s 6d per journey, this would represent 7s for each horse doing a double journey equal to twelve miles per day, or a total of 104 guineas per year of 52 weeks, six days per week. Now I am informed that the cost of keep for a horse in a large stable averages £30 per year, and at this estimate there would be a margin of £70 odds from each horse, to pay wages and upkeep of plant. Nor do I think this a very rosy estimate when we remember the dividends paid by the old tramway company. The present system of halfpenny fares for half a mile is one that is perplexing and worrying to both passengers and conductors; and I am certain that were a uniform charge of one penny made, and passengers permitted to board and alight from the car where they pleased, it would not only please the citizens, but would speedily drive the opposition from the field. One other suggestion I would offer, and that is, that season tickets be issued for each route, as is done in Aberdeen, so that daily travelers would not require to trouble themselves booking every journey. I believe there is no desire on the part of the tramway committee to make great profits to the town from the working of the cars, and if this be so I know of no better method by which the citizens could have full advantage of their own property than by the early adoption of above proposals.

JAS. GILLIES.

## THE NEW BALL VERTICAL ENGINE.

The Ball Engine Company, of Erie, Pa., has taken advantage of its long experience in building engines for electric service, to design a vertical engine, and in so doing its engineers have tried to put themselves in the place of station owners and operators. It was their object to build an engine rigid and indestructible, but with easily removable, adjustable and interchangeable parts. An independent valve motion is employed for each cylinder, and each of these is a perfect engine in itself. The strength is shown in the symmetrical form of the upright housings. One side of each housing is planed, and they are bolted together in the center of the middle shaft bearing. The bottoms of the housings are bolted to one continuous bed plate. The introduction of the shaft into this engine is accomplished by arranging the shaft boxes in a large jaw, cutting into one side of the housing deep enough to bring the center of the shaft into a plane with the center of the housing, finish spots being provided to meet correspondingly finished surfaces upon the cast iron boxes. Each housing is also pierced by a large rectangular opening on each side, which is shown, covered by a bolted door. These doors have shutter openings in the middle, for the insertion of the hand to feel the connecting rod strap when the engine is in motion, or wrenches to key up the crank boxes. The adjustment of the journal boxes is accomplished by turning the three set screws in each strut. Above the openings for the shaft the housing becomes a round taper column, having on two sides of its inner surface the cross-

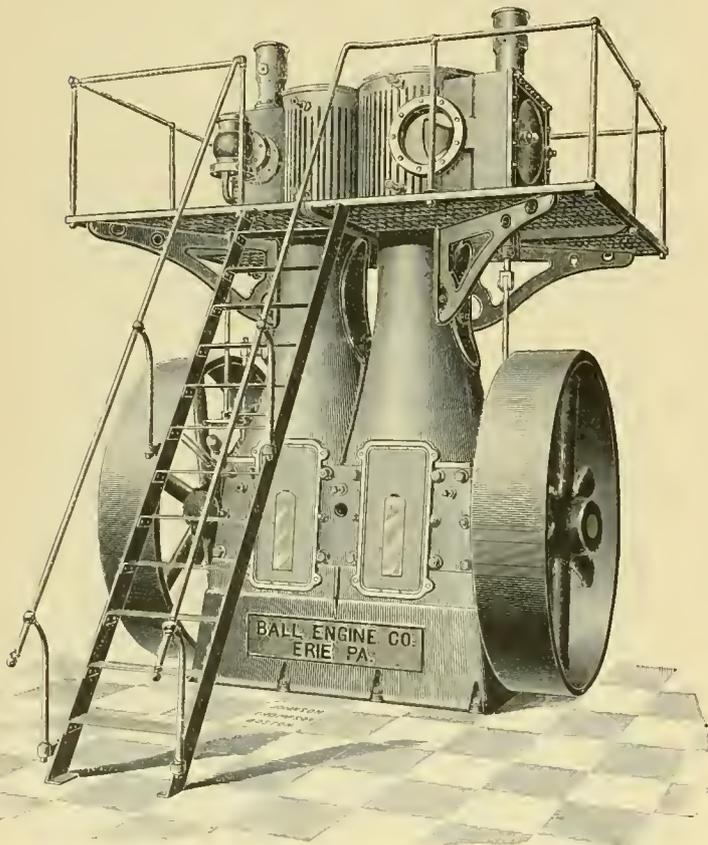

head guides, which are cast in place and bored out. Access to the crossheads is secured by elliptical openings on the other side of each housing. The form of housing adopted is strong, convenient of access, and protects the engine from dirt from without, and the power station from oil thrown by the engine. There is a natural ventilation from the shaft boxes up through the column and out of the elliptical openings. The

shaft is one piece of forged steel from end to end, and the journals and crank pins are cut from the solid down to the round, and ground to a smooth bearing surface. Covering each pair of crank bells is a counterweight, which puts the engine in exact balance. The cranks are  $180^\circ$  apart. The crossheads are of the double plate pocket type, as used in many Corliss engines, having taper shoes, to compensate for any wear that occurs against the guides. They are of cast iron, with sliding surfaces of babbitt metal. The piston packing is made up of two self adjusting parted rings and a broad junk ring, for centering and guiding the piston in the cylinder. The cylinders are made of charcoal iron, mixed in such proportion of hard and soft as to produce a very strong, close grained iron, which enables the surfaces to take a mirror polish. They are provided with single valves, each of which is practically one piece. The high pressure valve is of the double faced telescopic relief type, with the boiler pressure on the inside. The low pressure is the common letter D form, with improved proportions and construction. The idea of the makers is that if a single valve of good design is used, the indicator cards are so near perfect that it is useless to strive after an ideal perfection, which involves the use of complicated and costly valves, which may, in the end, have a small leakage, which will destroy all the theoretically worked out good effect. They have therefore set themselves to make the simplest and best form of steam valve possible, and provided it with a good governor.

The engine is guaranteed not to vary in speed from full to no load more than 1 per cent. The accompanying indicator diagrams are a practical illustration of what these valves can do, and of the high grade of expansion realized in a non-condensing engine.

KONIGSBURG, Germany, is to have an electric railway system. The Union Electricity Company is negotiating with the tramway company to that end.

### THE EMPIRE STATE RADIAL TRUCK.

Indications all point to the use of long cars on suburban lines as well as upon lines connecting smaller villages and towns with the larger centers. In fact, as has from time to time been pointed out by the REVIEW, the day of the suburban steam service is ended, and the abdication is in favor of long and commodious electric cars.

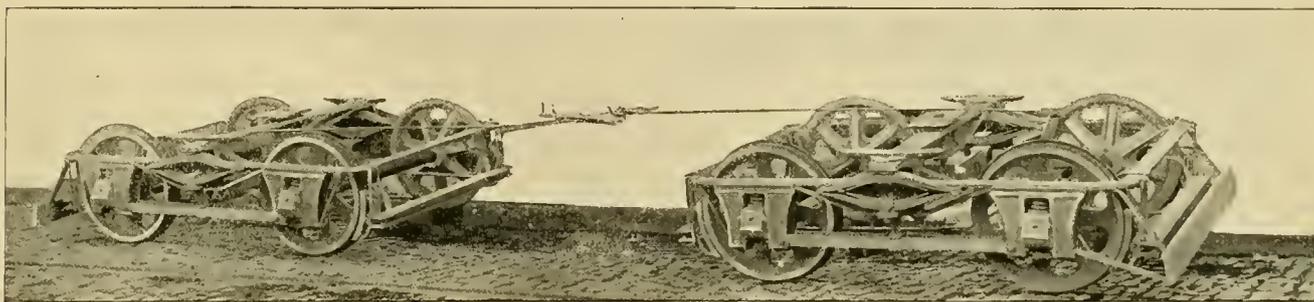

With this end in view, the Taylor Electric Truck Company of Troy, N. Y., has placed upon the market a new truck, designed on the principles which have so long obtained in steam railroad construction, to run at a high rate of speed and to carry the car body with ease. The principal advantage attained by the use of long cars is economy of power, and train service, as a trailer is not necessary, and the company making the new truck feels competent to guarantee both service and construction.

The new truck has been called the Empire State Radial and our engraving clearly shows its construction. A continuous steel frame underneath and on both sides of

use of all threaded parts. The brake is so arranged that in use it is applied to the eight wheels at once. The wear of the brake shoes can be taken up by simply pushing forward the dead lever on the inside end of the truck.

The wheels, axles and all wearing parts of the Empire State Radial are made so that they are readily interchangeable with the well known single truck made by the same company, and the master car builders standard jaw and journal box are used. With the form used for attaching motors the weight is put on the driving wheels, and the car mounted on these trucks is designed to mount a 12 per cent grade. The wheel base is short, calculated to enable the truck to curve around a radius of 35 feet. Any motor can be used, and can be examined and repaired without disturbing a single portion of the truck.

The truck in all its details is thoroughly and mechanically constructed, the elliptic springs are made from the best crucible spring steel and fully tested, so that rigorous and exacting service may be relied upon.

EMPIRE STATE RADIAL TRUCK.

which is a steel arch bar, securely riveted to the frame, forms the base for the construction of the truck. The pedestals or jaws are firmly bolted to the continuous frame, and the axle boxes slide freely between the vertical guides of the pedestal, the axles are thus held parallel to each other, and resist the pressure of the brakes when applied to the wheels. Over the journal boxes are placed coil springs, which receive and reduce the jar caused by obstructions on the tracks, frogs and switches. In the center of the truck on each side of a continuous frame are placed four elliptic springs, securely fastened to the cross tie bar, and upon these springs but not fastened to them, is placed the truck bolster, having curved side bearings. The car is fastened to the truck by a king bolt passing through a male and female center plate, which is secured to the bolster, and the weight and strain of the car is entirely endured by this center plate, while the curved side bearings on the end of the bolster prevent the rocking of the car.

The truck is truly radial, the traction being applied from a point central to the four wheels, and not from plates on the side frame. It is equipped with a solid and substantial lever brake, the connections of which are made by wrought steel clevises and pins, obviating the

### THE LANCASTER RAILWAY CONSTRUCTION COMPANY.

A contract has been awarded to the Lancaster Railway Construction Company, by the Pennsylvania Traction Company, for building forty-three miles of electric railway in Lancaster county, Pa. The lines will run from Lancaster to Manheim, Lancaster to Mechanicsburg, New Holland, Blue Ball and Terre Hill, with an eight-mile branch from Mechanicsburg to Ephrata. The specifications call for Pennsylvania railroad standard construction, including switch and signal system. The overhead construction and all equipment will be of the highest grade, and must be completed, ready for service within ninety days.

The Lancaster Railway Construction Company is a chartered corporation, with ample capital. The officers are: Henry Baumgardner, president; Michael Reilly, vice-president; F. H. Steacy, secretary; J. E. Hubley, treasurer; H. E. Crilly, superintendent of construction.

At Bordeaux, France, a new company proposes to convert the suburban tramway lines into electric lines, similarly to the Bordeaux-Vigeau route.

### DRAWN STEEL TROLLEY POLES.

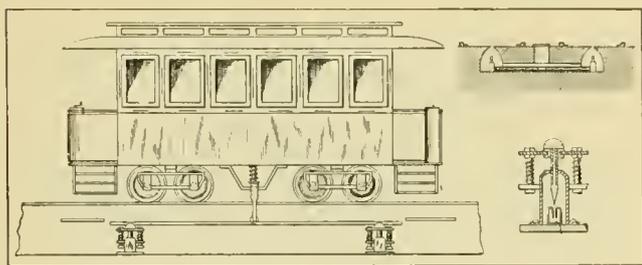

The United States Projectile Company, of Brooklyn, N. Y., which makes the patent hot pressed motor pinion, which has met with such a marked success, has perfected a new design in trolley poles.

The process is unique and original. The poles are made in the same way as bicycle tubing, and of the same material.

The pole is started from a solid block of steel,  $3\frac{3}{4}$  inches in diameter and 7 inches long, and is gradually drawn out until it is the standard length, i. e. 12 to 13 feet. It is then tapered, making a very neat looking pole, smooth and clean. The steel used, is a fine grade of Swedish, very tough and strong, the poles are claimed to be 25 per cent lighter than those now in use, and are much stronger. The Brooklyn Heights Railroad Company, which is one of the hardest roads on trolley poles in this country, on account of the elevated structures, reports, that with the common poles it often has from six to ten a day broken. With these poles, during all the time they have been used, which is now about six months, and they have upwards of 200 in service, only one pole has been broken, so that it could not be used again. The pole when bent is easily straightened and gives promise of great usefulness.

### THE GOODHAND CONDUIT.

James E. Goodhand, of Baltimore, has patented a conduit not unlike some of its predecessors. The trolley rail is normally dead, and is in sections. As the car

comes along the downward pressing trolley bears down the trolley rail section it is on, until connection is made with the main feeder in the bottom of the conduit. The contact mechanism is shown in detail in the engraving.

### A BIG JOLT AT ALBANY, N. Y.

A most unusual accident occurred on one of the grades of the Albany Railway on August 19. The car to which the accident happened was equipped with iron dogs for keeping the car from running backward when on the way up hill. The car was descending a grade when the device which should have held the dog up allowed it to fall while the car was under way. The result can easily be imagined. The lower end of the car reared up, and the motorman was thrown over the dashboard and seri-

ously injured. The passengers were, of course, considerably shaken up. The dog is a very useful appliance on the up grade, but it has great possibilities for working mischief when it gets loose on the return trip.

### THE NEW STANDARD BEVELED RAILS OF THE CHICAGO CITY RAILWAY.

The Chicago City Railway has adopted the accompanying forms of rail for all its future work both for new and relaid lines. Figure 1 is the 83-pound girder now being rolled by the Johnson Company for the new electric lines and Figure 2 is the rail to be used in relaying worn out cable track. The distinctive feature of these rails, and one that will not be at first noticed, is that the head of the rail is slightly beveled so as to correspond to the shape of the wheel tread. This rail is the design

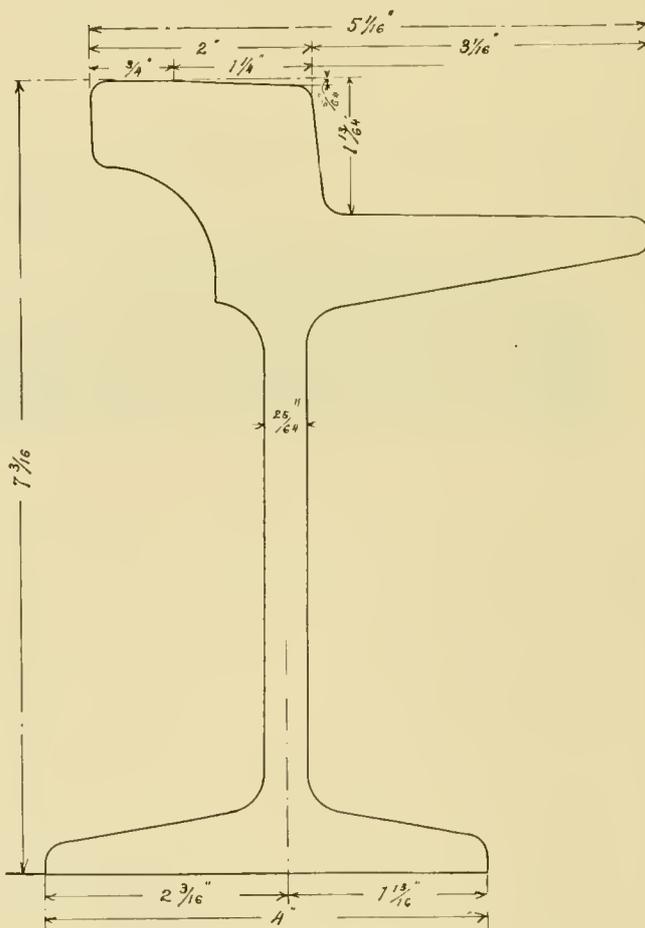

FIG. 1.—SECTION FOR ELECTRIC LINES.

of F. H. Fitch, the civil engineer of the company, and is the result of a very careful study of the wear on rails and wheels. Mr. Fitch's idea is that as long as there is a constant tendency for the wheels to wear the rail head to a bevel and for the wheels to become hollowed out to conform to the shape of the rail head, it is just as well to make them the same shape in the first place. By making them the same shape the wheel bears on a greater surface of the rail, and wheels and rails ought to be longer

lived. At present a great portion of the chilled part of a wheel has to be turned down and is of no account, because the wear on the wheel takes place so much on one groove. The beveled rail is easier to keep clean, and

repair, at all events, and its failure to do so was a violation of its charter and could not be excused on the ground that it held in good faith a different view as to its duties.

A YOUNG FLOOD IN CHICAGO.

September 3 was a damp day in Chicago. The clouds simply went to pieces and it rained an inch an hour from 9 to 12 p. m. The floods invaded both the tunnels under the south branch and the La Salle street bore. The Van Buren street tunnel was fairly swamped by the surface water until fire engines could pump it dry. The cars were unable to use the tunnel for several hours, as the water was five feet deep for a distance of 250 feet. It was an unusual sight. The roar of the big engines reverberating through the tunnel was deafening. In big black clouds the smoke rolled away and passed out at the east end of the tunnel. In the dimmed light of the arc lamps the muddy level of water stretched away like a river, while the cable trains rising above it seemed like wrecks cast away after a storm.

ANOTHER CAR FACTORY.

On August 25, at 2:15 p. m., a new industry was started at Cortland, N. Y., when the contract was signed by President E. E. Ellis, of the Cortland Omnibus & Cab Company, binding the latter to build four new electric street cars for the Cortland & Homer Street Railway. There is no reason why the Omnibus & Cab Company cannot turn out good street cars, since for many years it has placed on the market the highest class of omnibusses, cabs and carriages.

The most of street car builders have started with carriage shops and the present one will be no exception. The four cars to be built will be 18 feet long and finished elegantly, as the workmanship of the company demands.

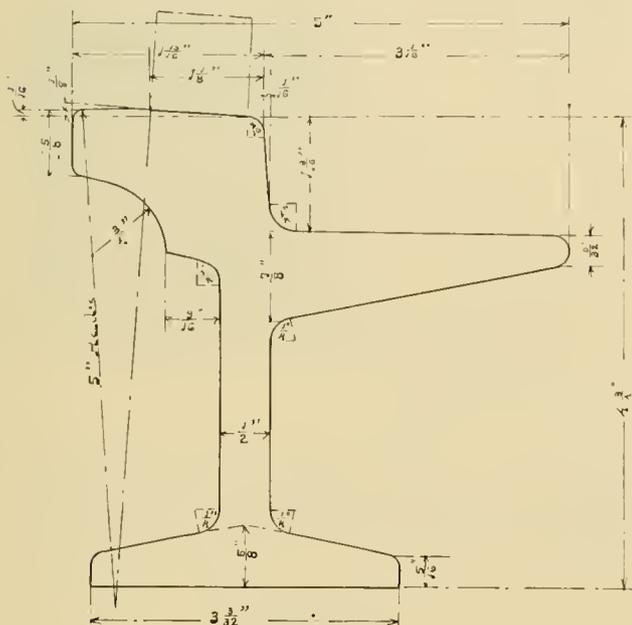

M. M. Jacobs, of the New York Electrical Engineering Company, builder of the Cortland & Homer Street Railway, was the party of the first part in the contract.

GAS MOTORS IN EUROPE.

Frank H. Mason, consul general at Frankfort, Germany, has submitted to the department of state at Washington an additional report on gas motors in that city. By the death of the inventor, Luhrig, the progress of gas motors in Germany has been checked, but electricity goes steadily forward.

A gas motor is working now on the Croydon, England, tramways. It is described by Engineering.

"The car is not noticeably different from a horse car. It runs quietly and easily, emitting neither smoke nor steam, and is quite under control. Inside passengers can hear a slight rumble of machinery and perceive a trifling vibration; but, after a minute or two, these are unheeded, and practically, there is nothing to detract from their comfort. Neither they nor the bystanders in the street can perceive any machinery whatever, for the engine and

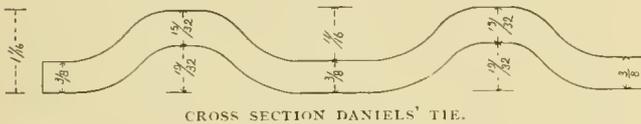

gearing are entirely inclosed, the motor lying under one seat and the wheels and clutches under the floor of the car. \* \* \* It carries twenty-eight passengers in all and makes a very fair speed, the limit allowed by the board of trade being 8 miles per hour. With the slow gear in action, it will readily mount an incline of 1-in-23, with a short piece of 1-in-16, and in coming down, it can be stopped by the brakes in its own length. It also goes round a curve of 35 feet radius on a 1-in-27 grade. Its weight, when filled with passengers, is 5½ tons. For gas, it costs 1d. (2 cents) per mile, against 3½d. (7 cents) per mile for fodder and bedding for horses; so that the gas-motor car starts with an advantage of 2½d. (5 cents) per mile. The performance of the car is quite satisfactory”

As the horse car is the only method of traction compared, the dictum given by the consul that gas motors are improving and likely to supplant horses is hardly credible.

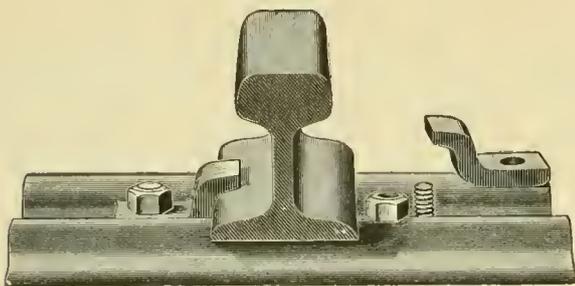

THE DANIELS' STEEL TIE.

The great objection that has so far practically kept the metallic tie from common use in America, has been the first cost of such a tie. Of course there are other minor difficulties which were experienced on steam roads and which would not occur in covered street railway

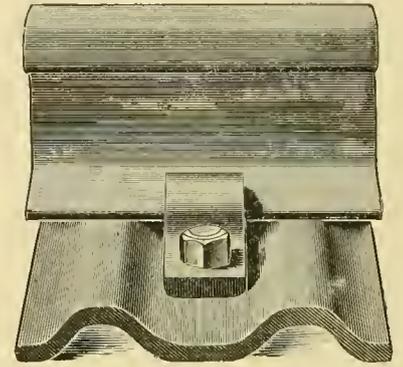

work, where the track has no such tendency to get out of line as on steam roads. The first cost, however, has been the chief obstacle. In America it is not always a question of what lasts the longest, but of what the company is able to buy.

The Daniels' steel tie, owing to the peculiar method in which it is obtained, is nearly as cheap as wood, and when it comes to a question of durability, there is no question as to which is superior. This tie is rolled from old

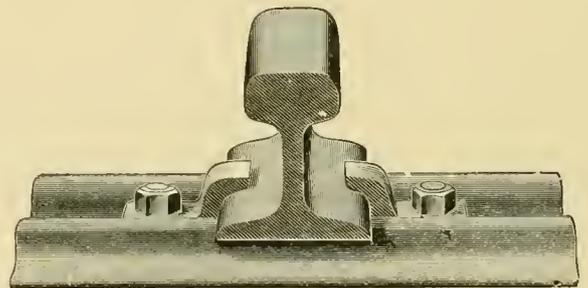

rails, and hence its cheapness. The process of rolling was perfected by R. E. Daniels, who controls the Daniels' Steel Railroad Tie Company, and has had a life-long experience in the rolling mill business. The old rails are cut up into the proper lengths with shears and put into the usual rolling mill furnace. At the right heat they are started through the rolls. The metal is gradu-

ally worked into a section having four corrugations in it, and from this section two ties are made. The rail head forms the basis for one tie and the base for the other, the ties being separated as they pass through the rolls. When the ties come from the rolls, they are automatically carried while still hot into a vat of tar. This gives them a good non-corrosive coat, which permeates the surface of the metal. The Youngstown mills of the Daniels' Steel

Railroad Tie Company have a capacity at present of 2,300 ties a day, and the manufacture of these ties for the west will probably begin soon in Chicago. The rail fastenings are simply clips held down by common fish-plate bolts. These ties are being put under some spe-

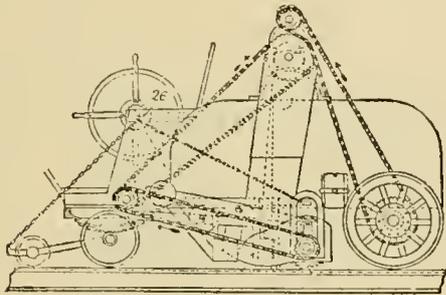

cial work which is being made by the Paige Iron Works of this city for the Terre Haute Street Railway, and some will be shown with the Paige exhibit at the Atlanta convention. The makers of special work like the tie very much, because with it the work must be laid as it was in the shops, and cannot fail to give satisfaction. Some will also be used on straight line construction at Terre Haute.

California in Three and One-Half Days.

If you are going to California and desire to make the journey in the most economical, quick and comfortable manner, purchase your ticket via the Chicago & Northwestern, Union Pacific and Southern Pacific Railways. Pullman drawing-room sleeping cars are run from Chicago to San Francisco without change, in three and one-half days. Completely furnished tourist sleeping cars are also run in which accommodations can be procured by passengers holding either first or second-class tickets at a cost of only \$4 per berth from Chicago to San Francisco and other California points. The hour of departure of trains from Chicago affords prompt connections with all trains from the east and south. Variable route excursion tickets, allowing nine months' stay in the health-giving climate of California, second-class tickets of low rates, sleeping car reservations and full information can be procured of any ticket agent, or by addressing W. A. Thrall, General Passenger and Ticket Agent, Chicago & Northwestern Railway, Chicago

### A GERMAN RAIL CLEANER.

A special tramway rail cleaner in the form of a cart is the invention of C. T. Bischoff, of Hamburg, Germany. It is intended to run on a special truck, and consists of scrapers borne down by weighted levers. Behind the scrapers brushes follow, revolving in the same direction

as the hands of a watch. The brushes drive the dust and dirt into a box, which is emptied by a chain of buckets into a larger receptacle by means of a gear chain. The brushes and levers may be raised so that the machine may be driven along the road. The whole is driven from the cart wheels.

### THE TROLLEY PARTY FAD IN PHILADELPHIA.

With the advent of the trolley in Philadelphia came also the accompanying increase in business and pleasure.

The most extensive craze induced since the anti-trolley yawp of the daily press, has been the trolley party, in regard to which the Public Ledger, under date of August 24, has considerable to say:

"Trolley parties seem to be the most popular amusement yet discovered for those who are not enjoying the seashore or mountains," says the Ledger. "The excitement at the spacious car house of the People's Traction Company, at Eighth and Dauphin streets, last night was intense. General Manager L. H. McIntire, when seen, was surrounded by a group of eager young ladies, and, with his usual coolness, he was endeavoring to bring order out of chaos. In the intervals of quiet he expressed himself highly delighted with the success of the trolleys on this branch. As he expressed it, 'last night was the night of all nights.'

"Forty chartered cars ran over the line, carrying trolley parties, and orders were still pouring in. All the available cars and men were on duty, making double trips, necessitating the use of closed cars on the regular trips.

"Of the forty cars chartered yesterday, seventeen were engaged by Germantown parties, and twenty-three by parties from the city. The people in the neighborhood of Snyder avenue are waking up to the fact that for a small outlay they can make a trip to the beautiful suburb of Germantown, and many are availing themselves of

the opportunity. Recently one party secured a car for three successive nights, and last night a car was chartered for two round trips. A car can be engaged for a whole or half trip. Contrary to reports, the price has not been advanced, but remains the same.

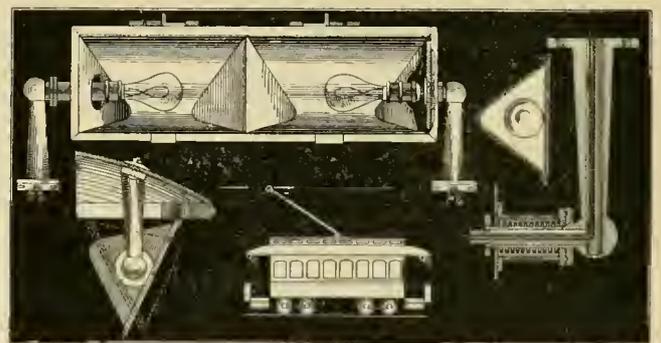

"Several of the parties last night were accompanied by brass bands, and the majority of them were made up of ladies."

Many social clubs, instead of giving balls or banquets, have begun to take their evenings' pleasures on the cars in the open air.

The practice has many advantages over ordinary picnics and gayeties, among them: cheapness, healthfulness and harmlessness. No next day lassitude or headaches follow a night on the car, and the pure air and pleasureable excitement are as good for the nerves and digestion as much doctors' physic and verily less expensive.

### ELECTRIC HEADLIGHTS.

It seems strange that electric headlights are so scarce on electric roads. While other roads not operating by electricity would give a good deal if they could get rid of the oil lamp, electric roads have persisted in perpetrating the oil-headlight nuisance on themselves. The only reason for using oil headlights is that they can be used to repair the machinery when the car breaks down on the road. If such a reason were given to a man unacquainted with electric railway practice, he would certainly take it as a joke and could not be made to believe that it is the solemn reason which governs several hun-

dred street railway men in their choice of headlights. A lantern and some candles can be made a part of the outfit of every car and kept in or near the tool box. They should be made subject to the same rules as the car tools, as regards maintenance and loss. Being used but once in a great while, they cost almost nothing to maintain. Compare this with the oil headlight, which requires a formidable department of its own, with a large storage room and a corps of cleaners and trimmers, and there is no question as to the superiority of the electric light for regular use. The work of getting out the oil headlights and putting them on all the cars every evening is no small task in itself. Superintendent G. W. Baumhoff, of the

Lindell Railway, St. Louis, has designed one of the neatest things in the way of an electric headlight that has been brought out yet. It contains two lamps placed under the edge of the hood. The important feature is that the reflector can be turned so as to light the platform. Both reflectors are turned so as to throw the light forward. The headlight lights the track for about 150 feet, and the one on the rear platform throws light on the platform and into the car. Mr. Baumhoff says that two men were required on his system to take care of the oil lamps, and since using the electric lights he figures that the salary of two men is saved, the current and incandescent lamps used being equivalent to the oil and breakage of lamp chimneys.

### THE ALDERMAN'S DREAM.

The alderman dreamed that he was dead and with great fear and trembling he stood before the pearly gates, and knocked ever so timidly.

"Come into the ante-room," said a voice.

The alderman obeyed with the same alacrity he had always shown when on earth he was called into the ante-room to participate in a star chamber session. Then he saw an immense pair of scales and the clerk of the court dressed in white, with a pen interrogation-pointed behind his ear. He trembled, for he realized that his time had come for weighing in, and, as he carried no weights in his pockets, he might be found wanting.

"Where do you come from?" thundered the voice, now no longer mild.

"From London, Ontario," replied the quaking alderman, as he thanked his lucky star that it was not Hamilton, for in that case he would not have stood any show at all.

"What was your course on the electric railway question?"

The alderman's conscience smote him, yet he managed to reply, "I wanted cheap fares."

"Is that all?"

Was that all! The alderman was going to laugh outright, but he remembered where he was. "No," he replied, "I wanted a percentage."

The clerk's pen was working like lightning. "What else?"

"Mileage," answered the alderman, unabashed and beginning to feel at home.

The man with the pen was looking black and putting down marks equally sombre. "What else did you want, pray?" He was sarcastic now.

"The company to supply the paving material."

"Go on."

"And to supply all labor."

"Yes."

"And pave or repave whenever the city said so."

"Anything else?"

"Well, yes. I wanted the line to run past some promising real estate that I owned. Of course it meant crossing several railroad tracks, but then you know it would have increased the value of my property."

"Nothing else, I suppose!" asked the white-robed scribe as he prepared to cast up accounts.

"Hold on," cried the alderman, as his bosom swelled with conscious pride, "we wanted the company to employ only home labor, and work their men only ten hours a day."

"Did you do that because of your love for the working men, or for votes?"

The alderman was candid. He knew it was no time for levity. "Votes," he replied, as he hung his head.

"Look here, alderman," spoke up the book-keeper, you want neither heaven nor an electric road. What you want is the earth. First elevator to the left going down. Next!"

And the alderman woke to find the council in full session.—London (Can.) Advertiser.

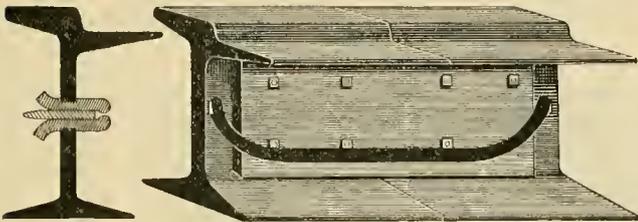

### FIFTY-AMPERE CAR FUSES.

Copper fuses of about 50 amperes capacity have been in use on the cars of the Twenty-second street electric road of this city for several weeks. The company found itself obliged to take care of as many cars as possible with a small temporary power plant which could not be enlarged. To do this, W. F. Brennan, the superintendent, began to educate the motormen so as to save current. At last he hit upon an educator which is more powerful than any number of words. The educator is a number 25 copper wire used as a car fuse. The fuse (unlike an inspector) is always on hand, and the moment a motorman gets careless about crowding on the current he is called to account by the blowing of the fuse. As the motormen are no less lazy than the rest of the human family, they do not relish putting in fuses. As the finding of a double fuse on a man's car means his discharge, there is no alternative but to be careful. A great variety of fuses were experimented with and the number 25 copper wire hit upon as being the most satisfactory for the purpose. This fuse will blow with a current of 50 amperes if it flows for more than two or three seconds. As long as motormen handle their cares carefully they have no trouble, but the moment they get careless and disobey orders, out goes the fuse. Such light fuses are made possible only by the fact that the line is perfectly level. It is probably the lightest fuse used in this service in the world. When hauling trailers, two fuses of this size are put in, although trailers were hauled for two days with the 50-ampere fuse. In blowing, this fuse makes very little disturbance. Even if such fuses are not used regularly, they are a help in training men on level lines, and it is safe to say that the motormen on Twenty-second street will be the better for having served a term under the 50-ampere fuse.

ZACARIAH BOSLEY, night engineer at the Terre Haute, Ind., Street Railway Company's power house, was killed by the current at the power house, August 11. He was troubled with heart disease.

## THE TECHNIC IMPROVED RAIL BOND.

The Technic Electrical Works, of Philadelphia, have placed upon the market an improved rail bond, an illustration of which is self explanatory. It consists essentially of a soft copper rod of the same diameter as the hole in the rail, but bent and slotted at the end. Having been inserted into the rail, a hardened steel wedge is driven into the copper at the bend. The wedge is somewhat larger than the slot, and is driven in to such a depth that

the soft copper may be closed over it to prevent its slipping out. This spreads the bond over the edge of the hole in the rail, and forces apart the split ends at the same time, practically riveting the bond and making a permanent and positive contact that is not affected by any vibration of the rail. The bond can be placed very rapidly, using only a hammer and cold chisel to open the slot at the bend, and at the same time the contact is claimed to be as effective and more reliable in its results than bonding with channel pins, yet carrying the same amount of current. Our engraving displays a section of the rail at the bond, as well as a lateral view of this excellent device.

## RATTLE IN STREET CARS.

"Why on earth," asked a street car patron the other day, "can't box cars be made so that passengers will not be continually thinking that they are being treated to a performance on the tin pan dinner gong of some country railroad eating room? Every closed street car I get into could give pandemonium pointers on noise."

In spite of the exaggeration, the man expressed a great truth. Although the disappearance of double reduction motors has reduced the noise to a minimum to those along the street, there is still a great surplus of noise inside the car. This materially takes away from the pleasure of riding in closed cars, for many passengers, at least. The greatest source of noise seems to be the glass, which is not tightly enough secured in the window sashes. Some think that the principal noise is from the rattle of the sashes, but a little investigation will show that the trouble is between the glass and sash, and not between the sash and window casing. It is, of course, not to be expected that a light street car, running on a dirty track, can be made as quiet as heavy steam cars, running on perfectly clean rails. There is, however, undoubtedly room for improvement in this particular. Every little item of this kind counts in the long run, and every inducement should be held out to create travel during the time of closed cars, when the traffic is lightest.

## A PREACHER WITH SENSE.

Dr. Robert S. MacArthur, pastor of the Calvary Baptist Church, New York, and one of the foremost clergymen of his denomination in the world, was at the late Baptist Young Peoples' Convention in Toronto, where he was of course interviewed on the subject of Sunday cars. In the course of this interview Dr. MacArthur said: "Well, I make it a rule never to cross a bridge before I come to it. In American cities we are not much in danger of a too puritanical interpretation of the law. I do not know enough of your local conditions to express an opinion either for or against them. I am disposed to make my creed more strict for myself than for my neighbor. Were I in Toronto it is possible that I might side with the brethren against them, but I know that in New York if we did not have a Sunday car service it would mean the entire recasting of the personnel of the membership of the city's churches. I once knew an old clergyman so prejudiced against Sunday cars that when ever he went abroad of a Sunday he had to hire a carriage and pair, thus making Sunday labor for one whole man and two whole horses, when otherwise he might have utilized one-twenty-fifth of a man or one-twenty-fifth of a team of horses. Its hard to be consistent, isn't it? I believe in minimizing one's Sunday travel so far as possible, but when it is a matter of necessity to keep an appointment on a Sunday, I do not hesitate to use both the street cars and the elevated railroad to reach my destination."

## TORONTOS' BLUE LAW.

The pious people of Toronto, as is well known to REVIEW readers, do not allow the street railway companies to run cars on Sunday. An enterprising citizen, however, has started a bus system, and allows the people to contribute what they will. On July 15, heroic measures were taken to keep the wicked horse cars from desecrating the sabbath, and a large force of extra men was kept ready to pounce on them should they emerge. The bus man was also stopped. Police were every where, on corners, and even in the cars. Such a ridiculous sight has not been known since the enforcement of the blue laws of Connecticut, and as the Toronto World observes: "Toronto is about to get into a nice old pickle, lots of law, lots of action for damages, also a reputation that will make her the laughing stock of America. Torontos' business reputation will be ruined by the crank Sabbatarians and crank laws."

The Globe says that the mayor was the first man to run counter to the law, as he hired a coupe and drove about inspecting the police.

Perhaps the dear public will get tired of this business some day.

THE Communal administration of Jekaterinsdar, Russia, will receive offers for the establishment of electric or horse tramways in that town until July 25.

### SPECIAL WORK WITH T RAIL AT PAIGE IRON WORKS.

The accompanying engraving is of the initial part of a Y curve, as it lay on the floor of the assembling room of the Paige Iron Works, of this city, before it was shipped to the Terre Haute Electric Railway. It is laid on the Daniels steel tie, and is one of several pieces of special work which the Paige Iron Works have made for that road. The 72-pound shanghai T rail is used on this as on the other Terre Haute work. The engraving shows the Paige method of attaching a guard to the T rail. The policy

### ENGINEERING DIFFICULTIES IN NEW ORLEANS.

The great trial of the constructing engineer in New Orleans is water. In our April issue, some of the peculiar methods of pole setting in the quicksands of that city were illustrated. A good story is told of the attempt of some pits in the Traction Company's new car barn to float away. The pits were made of wood with caulked joints so as to be water tight. One night some of the pits seemed to have a tendency to float and some 300 car wheels were put on them to hold them down. The

PAIGE IRON WORKS—SINGLE TRACK T RAIL Y CURVE BUILT OF ILLINOIS STEEL COMPANY'S SHANGHAI T RAIL. SET ON DANIELS STEEL TIES.

of the company on work of this kind is to make it as much like steam road practice as possible. The curves on this, and all the other work mentioned, are transition, so as to give an easy motion to the cars. The engraving also shows the extensive facilities the Paige Iron Works have for handling work of this kind. They began on steam road work, and the increasingly severe requirements of street railways have brought it about that there is a demand for the kind of work here turned out, viz., heavy steam road practice adapted to paved streets.

The Paige Works have also in hand for the Chicago City Railway one of the largest orders ever placed for special street railway work. The special is for curves and switches on cable tracks and much of it is very complicated.

Don't fail to visit the REVIEW at the Atlanta Convention.

next morning the pits were found to have risen bodily and taken their load of car wheels with them. Hydraulic jacks are all right in their place, but their place is in the pit, and not under it. Those who work in New Orleans need to anchor their structures somewhere in the neighborhood of China if they are expected to stay.

THE New York L roads are waking up to the necessities of inducing traffic. A novel accommodation for wheelmen has been arranged by the Kings County "L" road. For the convenience of cyclers who desire to use the macadamized roads in Queens county, a special car for transporting bicycles will be run from the Franklin and Nostrand avenue stations to the city line on Saturdays, Sundays, and holidays. Wheels will be checked, and a charge of ten cents will be made for each trip in one direction. Time tables have been placed in all the stations of the road.

VOGAN BROTHERS, of New Castle, Pa., report business on the increase, and good reports from their sand boxes, folding gates and draw bars.

THE Peckham Motor Truck & Wheel Company has closed an order for 75 trucks with the Metropolitan Traction Company of New York.

THE Fuel Economizer Company, of Matteawan, N. Y., reports a medal of honor awarded to the Green fuel economizer by the Antwerp Exposition.

THE Edward P. Allis Company, of Milwaukee, has given a mortgage on its plant for \$340,000 to the Northwestern Mutual Life Insurance Company.

THE Mather Electric Company has just recently sold two 130-kilowatt generators to the Danbury & Bethel Electric Railway Company, of Danbury, Conn.

C. S. WILSON, retiring superintendent of the Mobile, Ala., Light & Railway Company, was presented with a handsome gold medal from his employes on the severance of his relation.

FRANK J. LEWIS, late of the Steel Motor Company and the Eastern Electrical Equipment Company, has sold out his latter interest, to establish a supply concern of his own in Cleveland.

H. J. WIGHTMAN & Co., Scranton, Pa., reports an excellent summer trade, and a large order just completed for the Scranton Traction Company, with another for the Lackawanna Valley Rapid Transit Company.

THOMAS PARKER, Ltd., London, is the title of a new company, of which the well-known electrician, Thomas Parker is the head. The capital is named at \$375,000, of which \$15,000 in shares of \$50 each are open for public subscription.

THE Siemens-Halske Electric Company of America reports six contracts for various classes of machinery since the fire. The two most important are a large lighting plant for Hotel Savoy, New York, and a power transmission plant for Franklin MacVeagh & Co., of Chicago.

THE Okonite Company, Ltd., 13 Park Row, New York, is doing a good business in its well known insulated wires and cables, and reports that the sales for August exceed those for any other month during the current year. The company anticipates an excellent fall and winter business.

THE International Register Company, Chicago, has recently equipped the Cedar Rapids & Marion Street Railway, the Toledo & Maumee, O., and the Dennison, Tex., Street Railway, with its well known portable register, while the Akron & Cuyahoga Falls has been equipped with the International stationary.

THE A. Mertes Manufacturing Company, Pittsburg, is putting in a new gear cutting machine and will soon have one of the largest gear cutting plants in the country. The success of the company is large and deserved, and with the new equipment will be able to handle more orders with neatness and dispatch.

THE Simplex Electric Company has been awarded the contracts for braided caoutchouc wire in the New Castle Square Theater, Boston, and the Congressional Library building at Washington, D. C. The latter is a government building, and the selection of Simplex wire for it is a deserved testimonial of its merits.

THE Alameda, Oakland & Piedmont Electric Railway, Alameda, Cal., has ordered a 400-horse-power tandem compound condensing engine from the Ball Engine Company, Erie, Pa. The splendid running of two former engines furnished, the good results obtained, together with the immunity from repairs, has induced this second order.

ALLAN, WHITE & Co., of Rutherglen, Glasgow, Scotland, compose a new cable making firm. Mr. Allen was formerly connected with George Cradock & Co. and Mr. Whyte with William Smith, of New-Castle-on-Tyne. The new company has thus gathered ample experience and promises to the cable railways of the world a first-class rope.

THE numerous friends of Albert A. Carey (member A. S. M. E.), of the Abendroth & Root Manufacturing Company, New York City, will be sorry to learn that he has been seriously ill for the past few weeks with appendicitis, and was recently obliged to undergo an operation. He is at present doing nicely, and it is expected will be out again within a few days.

ANOTHER cable made by Geo. Cradock & Co., of Wakefield, England, has been taken out of the North Side tunnel loop in Chicago, after a record of 122 days—the best record yet—and it will be remembered that the Cradock ropes have all been record breakers on that loop. There was not a broken wire in its length when it was recently taken out.

THE Ellis Manufacturing Company, of 218 South Fourth street, Philadelphia, has just closed contracts with the Delaware County & Philadelphia Electric Railway Company for an outfit of Hansell equalizing motor trucks. The Ellis Company is now well represented, both east and west, by J. T. Dudley, 136 Liberty street, New York City, and L. S. Boomer, "The Rookery," Chicago.

THE R. A. Crawford Manufacturing Company, Pittsburg, has a house full of fender orders, among them calls from Indianapolis and Terre Haute, Indiana, New Orleans, La., Williamsport and Philadelphia, Pa., Rochester, N. Y., and other points. Nearly all cars in Pittsburg and Allegheny are equipped with the Crawford fender, and the brilliant success of the device promises well for future business.

FRANK X. CICOTT, manager of the railway department of Pettingill-Andrews, of Boston, and of the Billings & Spencer Company drop forged commutator bars, was a Chicago visitor during the first September days. Mr. Cicott has had a very successful western trip and finds old friends and new ones among the street railway men. Few supply men have a wider or more desirable list of acquaintances than Mr. Cicott.

CARTER H. FITZ-HUGH, 1636 Monadnock Block, Chicago, has taken the agency for the western territory of the Central Electric Heating Company, of New York. This company controls the patents of the Dewey, Carpenter, Burton, Ahearn and other heaters, besides having many valuable devices of their own. The coming winter promises well for an extensive use of the Central Electric Heating Company's methods.

THE Fuel Economizer Company of Matteawan, N. Y., has recently installed the Green fuel economizers for 3,000-horse-power in the station of the Toronto Street Railway; 1,500-horse-power for the St. Johns, N. B., Railroad; 500-horse-power for the Springfield, Mass., Street Railway Company; 400-horse-power for the Jamestown, N. Y., Street Railway Company. The works have been running full time during the dull season.

WARREN WEBSTER & Co., Camden, N. J., report remarkable activity in their business. The Webster vacuum feed water heater and purifier retains its place in the front rank. Nearly 20,000 horse-power of this specialty has been lately contracted for by prominent steam users. The Cincinnati Street Railway Company called for 1,000 horse-power, the Westinghouse Manufacturing Company for 2,500, the B. & O. tunnel plant for 3,000.

THE McGuire Manufacturing Company, this city, is in receipt of the following unique postal card from Tokio, Japan, from one of the REVIEW readers. It is as follows: "We are now intending to expand our works, so we must purchase more trucks, and yours are most famous recently in Japan. Therefore, we shall be very much obliged if you will forward to our address your general catalogues, which, containing full information in regard to advantages, particulars and prices of your celebrated machinery.—Satouchi & Co."

THE Chicago City Railway Company has let contracts for the following supplies: 120 trucks, to the McGuire Manufacturing Company, Chicago: 240 motors (equip-

ment for 120 cars), to the Westinghouse Electric & Manufacturing Company; 6 generators to the Westinghouse Company; 240 controllers, to the General Electric Company; 6 Wheelock engines, of 500-horse-power each, to the California Engineering Company (this includes rope transmission); 7 Murphy furnaces and 7 J. Mohr boilers of 700-horse-power each. The new equipment will be placed in the Fifty-first street plant.

THE Fulton Truck & Foundry Company, of Cleveland, O., reports a first class business in all lines. The plant is running at its fullest capacity, and President Haycox is greatly delighted thereat. The factory is ready to handle any quantity of street railway supplies, such as motor trucks, trailer trucks, wrecking trucks, wheels and axles, steam car wheels, turn tables, transfer tables, track castings, railroad crossings, special work, draw bars, door fasteners, track cleaners, sand boxes, snow plows, wheel presses, motor lifts, brush holders, and brake shoes.

CHARLES J. MAYER, of Philadelphia, has found his quarters at 600 Betz Building too small and has taken rooms on the twelfth floor of the same building, where he has much more room to handle the goods of the R. D. Nuttall Company, the W. T. C. Macallen Company, the Solar Carbon Company and Streiby & Foot, besides the Nelson insulated overhead crossings made by Arthur Partridge, of St. Louis, of which Mr. Mayer has sold 600 in Philadelphia alone. He has found business much better than he expected since starting last April, and is prepared to quote prices on all line material.

THE Ball Engine Company, Erie, Pa., sends the following list of engines recently sold by that enterprising concern within the last few weeks: Peninsula Electric Light & Power Company, of Houghton, Mich., 350-horse-power tandem compound; Berwick Electric Light Company, Berwick, Pa., 160-horse-power; E. P. Dodge, of Newburyport, Mass., 50-horse-power; City of Adrian, Mich., 70-horse-power, direct coupled to Siemens-Halske dynamo, and nine other engines, ranging in horse-power from 80 to 160, for other than electric purposes. The total horse-power sold in all amounts, to nearly 2,000.

THE Sterling Supply & Manufacturing Company, 97 Bank street, New York, reports the perfecting of a new fender, or life guard, which has been tried on the Broadway, New York City line, for which line a full equipment has been ordered. The capacity of the company's shops has been recently doubled, and to Manager Carson is due the present flourishing condition of this excellent company and its present wide facilities. The general business of the company is in fine condition, and the different departments are full of work. Manager Carson is to be congratulated upon his executive ability and push.

THE Modemann Car Fender, manufactured by the United States Street Car Fender Company, 300 Bennett

Building, New York City, has had a trial in Brooklyn. This device is a wire basket with side wings, weighing about fifty pounds, which sets three inches above the rail. It is said any object, weighing forty pounds or over, coming in contact with it, quickly collapses the fender, which picks up the object and lifts it about 13 inches from the ground. An oscillatory movement prevents injury to the fender by the oscillation of the car. When not in use the fender can be folded on the dash board, thus taking little room when in the barn.

B. J. JONES has resigned his position as superintendent of the Riverside Park Railway and the Sioux City & Leeds Electric Railway, of Sioux City, Iowa. Mr. Jones has had a full experience in street railway construction, having changed the Sioux City Street Railway from horse to electric traction, and the Riverside Park line from locomotive to electricity. He also reconstructed the Sioux City Elevated line when it was changed to electricity, and just recently superintended the rehabilitation of the Sioux City Cable Railway, with its electric equipment. His present address is 221 McKee street, Columbus, O.

THE well known cedar-pole firm, W. C. Sterling & Son, of Monroe, Mich., has just received at their yards at Monroe, a large raft of cedar poles from the north, and expect two more during the summer. One crib in the next raft will be over 400 feet long, the longest that has ever come down the lakes, and contain about 6,000 poles. The Monroe yard is one of the largest in the world, and is well known all over the country. From this yard shipments are made to all points in the United States, and all material in the line of cedar that is used in the construction of electric light, railway, telegraph or telephone lines is manufactured and furnished.

THE Ajax Forge Company, of Chicago, is rapidly making its way to the front rank of special crossing builders for street railway crossings of steam roads. Its latest contract is for the construction of 216 steam railroad crossings for the Chicago City Railway electric lines. The company is naturally elated over securing this order, as the competition was strong and the merits of the case strictly recognized in the matter. The matter of crossings of this character develop a number of questions, both as to mechanical construction and excellence of material, neither of which can afford to be less than the very best.

THE superior workmanship and quality of the metal which the Ohio Brass Company, of Mansfield, Ohio, is employing in the manufacture of railway motor bearings, has resulted in a large increase in its sales of those articles, and they number among their patrons many of the largest roads in the country. These bearings are made of a guaranteed bell metal, and are turned and trued up and milled by special machines lately installed for this purpose. The great care taken with the finish of these insures a perfect fit, and an even and smooth

bearing for the shaft. The Ohio Brass Company has prepared a revised price list of bearings, and at figures which will no doubt largely increase their output.

THE Ohio Brass Company reports orders of considerable size during the month of July, from twenty-five roads, for its Type W material. Among the larger roads are the Middletown & Goshen Traction Company, Middletown, N. Y.; the Consolidated Street Railway Company, Toledo, O.; the Cincinnati Street Railway Company, Cincinnati, O.; Des Moines Street Railroad Company, Des Moines, Ia.; Beaver Valley Traction Company, Beaver Falls, Pa.; Ft. Wayne Electric Railway Company, Ft. Wayne, Ind.; Union Street Railway Company, Saginaw, Mich.; Nashville Traction Company, Nashville, Tenn., and the Columbus Street Railway Company.

B. W. PAYNE & SONS, Elmira, N. Y., the well known engine builders, have closed a contract through their New York office, at 41 Dey street, with Hilton, Hughes & Co., for the installation in the latter's store at Broadway and Ninth street, of four 150-horse-power direct connected engines. The plant will be one of the largest private lighting plants in the world and modern in every particular. The dynamos to be attached to the Payne engines are four 100-kilowatt General Electric multipolar dynamos. Payne & Sons will also furnish six 125-horse-power horizontal tubular boilers. The name of Payne & Sons assures the owners of the plant that economy, neatness and strength will all be conserved in this important plant.

THE Eureka Tempered Copper Company, of North East, Pa., reports a large and ever increasing trade in tempered copper commutator castings. This company is the pioneer in this line of work, and in addition to casting pure tempered copper commutator segments, it refills commutators of every description, including street railway motor and generator commutators. In order to supply the wants of its numerous Eastern customers with greater dispatch, the company now carries in New York a large stock of standard segments for street railway motor and general commutators, as well as finished commutators, for the various systems of street railway motors. The eastern office is located at 126 Liberty street, New York, and J. C. Dolph is their sales agent.

REPORTS of the efficiency of the motors made by the Mather Electric Company, tend to rejoice the hearts of the entire Mather contingent. J. Holt Gates, Monadnock building, Chicago, general western agent, sends in statement of a recent test of a 3-horse-power Manchester motor, in which an efficiency of 92 + per cent was obtained. The general design of the well known Manchester type was followed, and mica insulation is used exclusively. The fields are of cast steel, while the base, sub base, etc., are of cast iron, with the result that the motor is very light for the output. The armature shaft is very large in diameter, doing entirely away with that

prevalent trouble—"springing of shaft." This motor has been thoroughly tried, and has given great satisfaction.

THE Hoppes Manufacturing Company, of Springfield, Ohio, is now busily engaged installing four of its live steam feed-water purifiers of 3,000 horse-power total capacity in the new electric station of the Lindell Railway at St. Louis. The Hoppes Company justly feels somewhat elated in securing this contract, as it was secured in the face of very strong competition. Among other recent sales are the following: Live steam feed-water purifiers of 500 horse-power to the Procter & Gamble Company, Ivorydale, Ohio; 1,500 horse-power to the Indianapolis Light & Power Company; 150 horse-power to Wm. Coombs, of Coldwater, Mich.; 400 horse-power to the National Milling Company of Toledo, Ohio; 150 horse-power to the Cincinnati Street Railway Company; 150 horse-power to Chas. H. Suppes, of Johnstown, Pa.

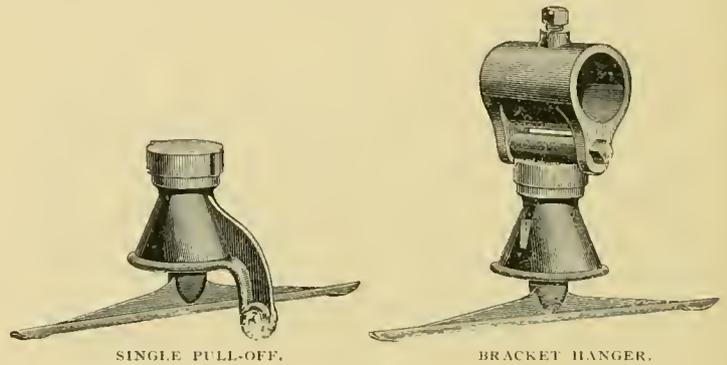

THE Standard Railway Supply Company during the last four weeks has filled large orders for standard stoves for the J. G. Brill Company and the American Car Company. In each instance the standard stoves were specified by the companies in whose cars these stoves will be placed, and go to parties who last year and year before, purchased Standard stoves direct from the Standard Railway Supply Company. Additional orders have already been placed with the company by several large and by a number of smaller electric roads, also previous users of these stoves. The company is prepared to fill orders on receipt, a full stock being furnished for the fall business. Numerous orders for a full supply of overhead material for new roads and extensions have been filled within the last thirty days, and business in this line is brisk. This concern was recently made the Chicago and northwest sales department for R. D. Nuttall Company, well known manufacturers of gears, pinions, trolleys and supplies for all electric systems. The improved Nuttall trolley base and stand has won the recognition and preference of the electric roads in Chicago, through recent thorough tests, in which the reliability and advantages of their improvements have been demonstrated.

THE NEW SCIENCE REVIEW is a quarterly publication just launched by J. M. Stoddard, of Philadelphia. It is intended to cover a popular field between the purely technical publications and the popular magazines.

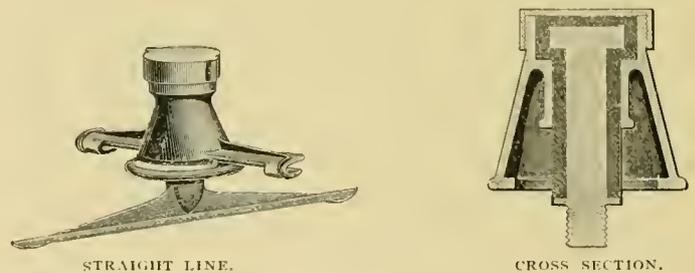

WHY go to the sea shore for a vacation trip, when within a night's ride of business the vacationist may find flesh, fish, fowl, boating, and all sorts of healthful recreation among the lovely little resorts reached by the Wisconsin Central Railroad? Even within three hours' ride of Chicago the busy man may find health giving breezes, lakes full of fish and woods full of game. Near Chicago are: Gray's Lake station, with nine ponds accessible; Lake Villa, with an attractive resort; Fox Lake, so well known for beauty, and half a hundred other lovely spots; or if wild scenery is wished a few hours longer takes the tourist into the most savage of mountains and forests in upper Wisconsin and eastern Minnesota. The Wisconsin Central Railroad offices, 204 Clark street, Chicago, will send on application a beautifully illustrated book upon the subject.

## THE WESTERN ELECTRIC TROLLEY HANGERS.

The new trolley hangers brought out by the Western Electric Company on its entrance to the railway field are a modification of the "West End" hanger, and retain all the good points of that hanger. The changes have been toward symmetry, simplicity and lightness. The

length of the insulation on the bolt of the new hanger is increased over that on the "West End." The first road to use these hangers is the Hestonville, Mantua & Fairmont Passenger Railway, of Philadelphia, where twenty miles are being put up. Several other roads are contemplating its use, and doubtless it will soon become one

of the standards. In addition to the trolley hangers, there is also a new section insulator and an insulated cross-over. The cross-overs are furnished either rigid or adjustable. It can be put up without cutting a single wire when the line is already up, which is a convenience in construction work. A full line of this company's devices will be shown at the Atlanta convention.

## THE DETROIT SALE.

The purchasers of the Detroit Citizens road entered into a controlling interest by the purchase of 6,025 shares, giving them a majority, the purchase being made by R. T. Wilson & Company, of 33 Wall street. The reorganization gives the following officers and directors: President, Major J. M. Edwards, 33 Wall street, New York; vice-president, M. W. O'Brien, Detroit; treasurer, R. T. Wilson; assistant treasurer, J. V. Johnston, 33 Wall street, New York; secretary, J. R. Stirling; general manager, J. D. Hawks; and general superintendent, J. H. Fry, of Detroit,

## THE RANKEN-FRITSCH CORLISS ENGINE AT ATLANTA.

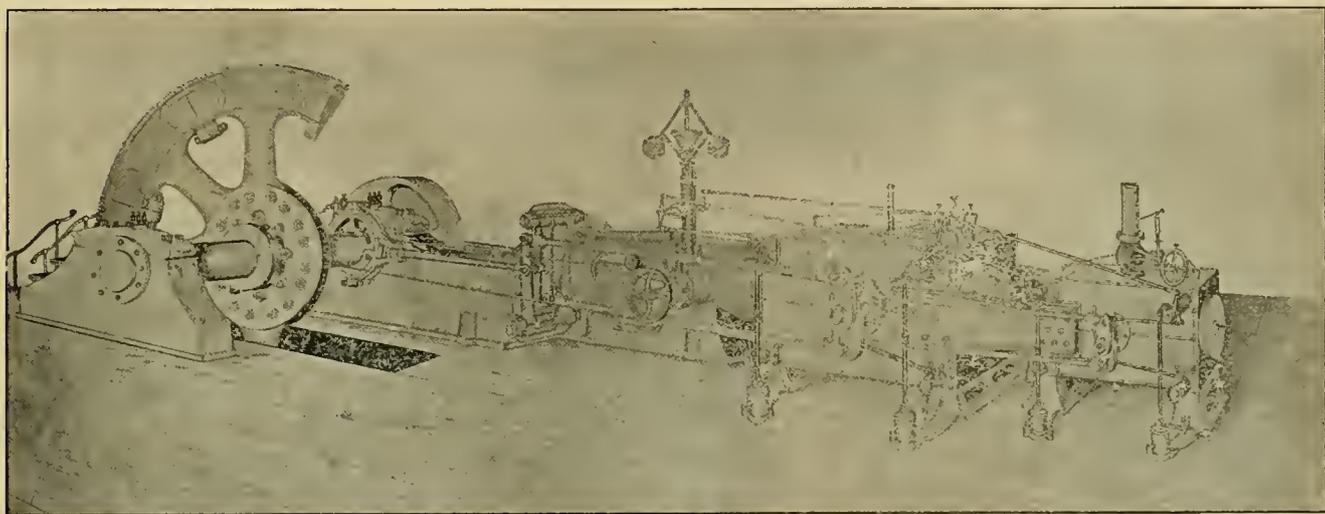

The visitors to the power house of the Atlanta Consolidated Street Railway Company during the convention, will have the pleasure of seeing the new Corliss engine made by the Ranken & Fritsch Foundry & Machine Company, of St. Louis.

The engine was designed by Manager J. P. Sneddon, of the Ranken-Fritsch Company, and is an 800-horse-power tandem compound condenser. The cylinders are 22 inches high pressure and 40 low pressure, by 48-inch stroke. On the shaft is mounted a 500-kilowatt Westinghouse railway generator, designed for 90 revolutions per minute.

The case is stated mildly when it is said the engine is massive. It is probably the heaviest ever built for the same horse-power. The fly wheel is 18 feet in diameter,

ally heavy proportions. It has bearings on the foundations from cylinder to about seven feet beyond the main shaft. The guide section is cast separate, and bolted to the half bed plate. The cross head is of cast steel, and the cross head shoes, which are babbitted, are 18 by 28 inches. They are adjustable by taper wedges, which have a bearing for the full length of the cross head.

The half bed plate weighs 34,000 pounds, and the guide section tips the balance at 16,000. The on board bearing is a duplicate of the main bearing of the engine, if the latter were separated from the bed plate. It is provided with a vertical adjusting wedge the same as the main bearing. The engine has separate eccentrics for steam and exhaust valves, the former valve being connected with the rocker arm in the usual manner, but the exhaust valve eccentric is connected by an inverted rocker to the wrist plates, which are also inverted, and rock on the hub of the steam wrist plate. Both these valves are double

RANKEN & FRITSCH 800-HORSE POWER CORLISS ENGINE BUILT FOR THE ATLANTA CONSOLIDATED.

with a rim section of 19 by 20 inches, built up in eight segments, one hollow oval arm being cast with each segment. The wheel centers are 84 inches in diameter and the ends of the arms secured by 24 three-inch bolts. The rim is held together at the joints by one 2½-inch bolt passing through inwardly, projecting flanges and two wrought iron links 3 by 3 by 24 inches in size. These are shrunk into recesses cast in the face of each segment. This latter is regular rolling mill practice for binding fly wheels and has proved satisfactory in the heaviest work. The main shaft is 21 inches in diameter at the center and 19 inches at the bearings and is forged from hammered selected scrap. It is 20 feet 4 inches long. The main bearings are 19 inches in diameter, 30 inches long, and are adjustable vertically by cast steel taper wedges that are the full length of the bearing, as are also the quarter boxes. By this means the distance between the armature and pole pieces may be regulated. The crank is 72 inches in length and weighs 11,000 pounds. The crank pin is 9 by 10½ inches in size.

The bed plate is of the box girder type and of unusu-

ported and the clearance is very small for both cylinders. The cylinders are connected by cast steel side bearing pieces, which are rigidly secured to both cylinders. The main rod is in rectangular section, both ends being solid. It is of hammered scrap, and weighs 5,000 pounds. The piston rod from the low pressure cylinder is 5⅞ inches in diameter, and keyed in the cross head. On the governor an automatic stop is provided, to guard against the forgetfulness of the engineer. This stop is controlled by an idler pulley, riding on the governor belt. As long as the belt remains intact the stop will remain in place and prevent the engine from shutting down under heavy load. In case of the breaking of the governor belt, however, the idler pulley will swing downward and remove the stop, thus saving the catastrophe often accompanying such an accident.

Both cylinders are provided with water relief valves, but in case of serious trouble from water the steam valves will be raised from their seat. The total weight of the engine is 310,000 pounds and its rated capacity 800 horse-power.

The Ranken-Fritsch engine should be seen by every visitor and will be the center of attraction at the power house. The tendency toward heavy engines is commendable, and we look forward to other good work for street railway plants by the makers of this thoroughly good and reliable engine. We hope to be able to publish extensive tests later, and no doubt they will be consonant with the care, finish and thought put into the machinery. The Ranken-Fritsch Foundry & Machine Company was organized in September, 1888, at St. Louis, Mo. The officers are W. H. Thomson, president; Otto W. Von Schrader, secretary and treasurer; and James P. Sneddon, manager. The company manufactures Corliss and high grade positive moving valve engines, of the highest grade. It is now building two 600-horse-power vertical cross compound direct coupled engines for the city of Chicago. Since the organization in 1888 an addition to the works has been necessitated each year, until now they cover a full city block. The accompanying engraving will give some idea as to their extent. The shops are equipped with traveling cranes, and all the most modern machinery for heavy work. Among the numerous and modern tools are noted a 20-foot boring mill, an 84-inch by 26-foot screw-cutting lathe, a 60-inch by 32-foot lathe, an 8-foot by 8-foot by 30-foot planer, a special Corliss cylinder boring and facing machine, and last, but not least, that important adjunct to a modern engine builder, a 400-ton hydraulic press. The steam railway switches run into the works, so that everything is loaded or unloaded inside of the shops, just where it is needed. We take pleasure in showing a portrait of the general manager, and designer of the engine at Atlanta, J. P. Sneddon, who is a member of the American Society of Mechanical Engineers, born in Scotland, in 1863, but came to the United States at the age of 13; he has been laborer, fireman, steam engineer, apprentice, machinist, chief engineer, master mechanic, etc., successively, now occupying the position of manager with the company.

J. P. SNEDDON.

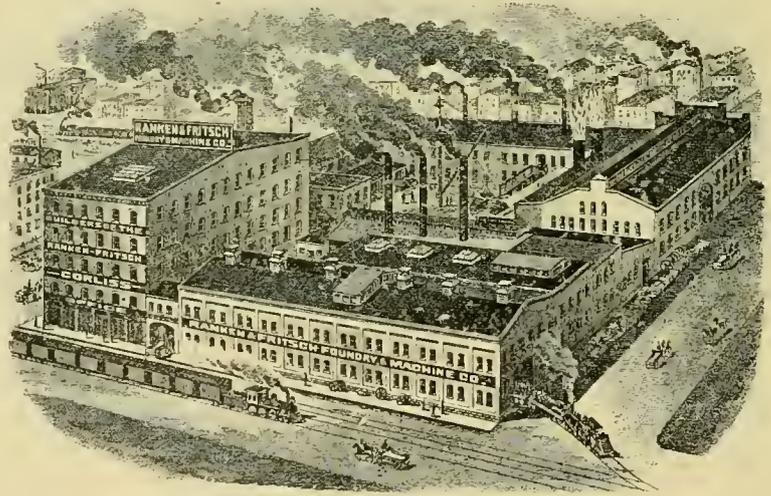

A MAN burdened with the name of J. Micromegas Carayan is about to launch a flying machine at Oakland, Cal. He has already invented a car starter and a conduit electric railway.

It has not been decided which line of the Metropolitan Traction Company of New York will be equipped with the conduit system recently contracted for with the General Electric Company. It is not probable the matter will be settled soon.

## STREET RAILWAY PATENTS.

ISSUED SEPTEMBER 4, 1894.

ICE AND SLEET CUTTING TROLLEY WHEELS.

On this page is an illustration of the ice and sleet cutting trolley wheel, manufactured by the Storm Manufacturing Company, Newark, N. J. In our last issue was a note that the Storm Manufacturing Company had obtained the control of both the United States and Canadian patents on this wheel, which was formerly manufactured by Haight & Clark, Albany, N. Y.

Last year this wheel was introduced on a few of the prominent trolley lines of this country, and, we are informed, that without a single exception, every line which tried and used it was enthusiastic in its praises. The company thinks it has a trolley wheel that will automatically remove the incrustations of ice from the wires, so as to leave the latter clean and in perfect condition for the transmission of the current. When a coating of ice forms on a trolley wire it usually gathers on the lower side. The water flows down and is frozen before it falls from the bottom of the wire. The ice remains on the lower side of the wire until melted by the heat of the atmosphere, or removed by mechanical means. The makers say the ice is instantly removed when their trolley wheel comes in contact with it, and there is absolutely no delay in the movement of cars.

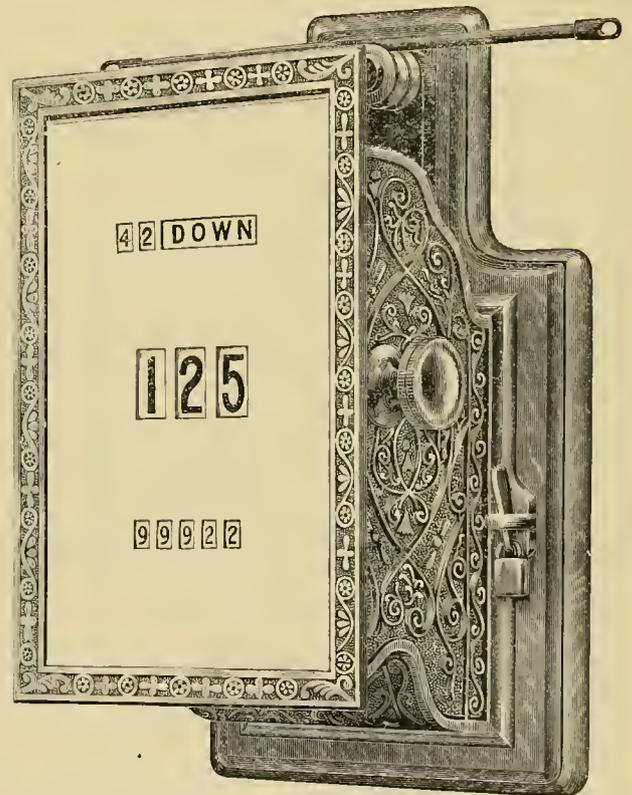

The Storm Manufacturing Company has recently issued a circular describing fully the merits of this wheel, and also containing a number of indorsements from well known roads that have used it. This circular will be gladly sent to anyone who may write for it to Newark, N. J. The company will make a display of these wheels at the convention at Atlanta, in October. C. A. Hoagland, of John H. Graham & Co., of New York, will represent the company, and will show and explain the merits of the invention to all who may be interested in it.

A PROMINENT daily in the west, commenting on the rate war in Savannah, where two parallel lines have been hauling passengers at one cent per head, where the former fare was five cents, undertakes to show the cut rate has proved profitable to both contending companies, and drawing an inference from the reduced price of daily papers, tries to establish a prediction that low car fares would prove equally successful. That the decreased price of daily papers from five to two or even one cent has proved a wise business moye to the publishers of daily papers can be readily understood. But the case is in but few respects a parallel one. In these days publishers expect to make little or no profit on subscriptions, depending almost entirely on their revenue from advertising. Hence the struggle to secure circulation, for circulation means advertising and largely regulates the

price therefor. The publisher then gauges the amount and cost of his reading columns in proportion to the advertising. But in the case of the street railway, what is the situation? The manager is expected to constantly improve the service by larger and better cars and more of them. He must give an even longer haul, but seldom with any increase in rates. No, the case in question is no parallel and the day when street cars will haul people at a penny a one is far in the future.

THE NEW HAVEN REGISTER.

The New Haven Car Register Company is continuing its successful career, and during the past year has introduced its machines on a large number of new roads, until now its list includes 125 lines. Prominent among these are the Philadelphia Traction Company, the North Hudson County Railway Company, Hoboken, N. J., the

NEW HAVEN REGISTER.

Rochester Railway System, the Montreal & Toronto System and the Oakland Cal., systems.

These registers are made in solid cast bronze cases, at once attractive and durable, and faced with plate glass. Three sets of numerals are exposed; one being the trip record, another the total registrations of all trips for the day or conductor, and the third the total which records to 100,000 and then returns to zero.

The company is energetic in securing business and careful in its inspection of all work leaving the factory, and the result has been an increase in business most gratifying to its friends.

THE Chicago and northwestern members of the American Street Railway Association, and their friends, who will attend the Atlanta convention, have offered to them a choice route by the Monon, via Cincinnati. The city ticket office of the Monon route, 232 Clark street, Chicago, will cheerfully furnish any information in regard to route, trains, tickets, and sleeping car accommodations. The Monon has long been famous for its splendidly equipped car service, and passing as it does through a picturesque country, the trip to Cincinnati is a delightful one.

A NEW section of the Montreal Park & Island Railway has been opened and the road now penetrates five miles into the suburbs. The mayor of Toronto, at the opening ceremonies, paid a graceful compliment to Senator Thiebeaudeau and A. J. Corriveau, whose energy brought about the opening of the road. Joseph E. Roy is chief engineer of the work, and L. E. Marple electrical engineer.

Custer's Last Battlefield.

A visit to this spot, which is now a National Cemetery, is extremely interesting. Here, seventeen years ago, General Custer and five companies of the Seventh U. S. Cavalry, numbering over 200 officers and men, were cut to pieces by the Sioux Indians and allied tribes under Sitting Bull. The battlefield, the valley of the Little Big Horn, located some forty odd miles south of Custer, Montana, a station on the Northern Pacific Railroad, can be easily reached by stage. If you will write Chas. F. Fee, St. Paul, Minnesota, inclosing four cents in postage, he will send you a handsomely illustrated 100 page book, free of charge, in which you will find a graphic account of the sad catastrophe which overtook the brave Custer and his followers in the valley of the Little Big Horn, in June, '76.

Largest and Best—More Exhibits Than Ever—All Parts of the Country Represented—Big Southern Representation—Atlanta a Model Host—A Grand Success.

Cotton jest a-rollin' in—  
Haystacks risin' high;  
Corn a-pilin' up the bin,  
Cider when you're dry!  
Hills' and valleys full o' song—  
Whisperin' of fall;  
Fiddle going all night long—  
Balance—balance all!  
—Atlanta Constitution.

Some members had predicted that the unusual distance from most parts of the country to the convention meeting point, would this year have a marked effect upon both attendance and number of exhibits. The importance to which the association has grown was never more strongly evidenced than in the large number present when the first session opened. The very fact that so many delegates had never visited a portion of our country of which they had heard so much, led many to start a day or two earlier than usual, and the night before the opening day found the hotels completely filled. Late evening trains of Tuesday and early morning trains of Wednesday still further swelled the crowd. The weather was simply perfect and the delightful ride out Peachtree street on the swiftly moving cars of the Traction Company's line presented a panorama of beautiful grounds and spacious

residences, while the soft clear balmy air put everyone at their best.

The arrangement which provided quarters for exhibits and business sessions under one roof was greatly appreciated by all, and it was with evident reluctance the delegates were called from the imposing appearance of Machinery Hall to gather in the annex for the first session.

At the usual hour of 10:30 President Payne called the meeting to order and declared the convention open. Never before has so large a body been present, nor so large a proportion of prominent officials.

THE ADDRESS OF WELCOME

was given by Governor Northen, who extended the hospitality of Atlanta in graceful, well chosen words expressed in heartiest terms. He said in part:

I apprehend that many of you have never before visited this state and possibly not the south. We are glad to have you here, that you may know for yourselves, the attractive advantages of the south.

This ideal, balmy day is fully representative of our light and health-giving climate.

Many of you, I dare say, expected to find us living in the tropics.

It may surprise you to know that the hottest day I have experienced in five years, I found last June in Toronto, Canada, and the next highest temperature, last August, in Nebraska.

We are glad to have you personally, know about the variety, abundance and richness of our agricultural products, our mineral, timber and industrial resources.

We give you especial welcome upon these special grounds, so that, impressed, as you will necessarily be, by the preparations in progress for the coming Cotton States and International Exposition, you will not only advertise abroad its possibilities and its attractions, but you will return next year and bring with you your friends to look upon its splendid magnificence and share the benefits to come from its exhibits.

We receive you gladly into our state because we want you to know our people better. Warm-hearted, hospitable, genial, cultured, progressive and true, the equals of any among the civilized nations of the earth.

Again, we are glad to have you visit us, that you may know the financial and business conditions of the south.

Did you know that during the recent financial distress that came upon our common country, we had fewer bank and business failures at the south than in any other section of the Union? Did you know that the south owes less money than any other division of states?

The average land mortgage indebtedness for fourteen states at the south is only \$33,000,000, while the same indebtedness for fourteen states at the north amounts to \$334,000,000.

The average annual interest for these states at the south on this mortgage indebtedness is \$2,600,000; for the corresponding states at the north it is \$21,900,000. The average per capita of this indebtedness for the south is \$25, while for the north it is \$129.

Knowing these conditions, we are glad to have you visit our section with a view to the further development of your interests at the south. Electric street railways have made wonderful progress in this section. We now have at the south 1,611 miles completed and projected, calling for an investment of \$71,080,000 to equip them. This has all been done, too, within the last six years.

We welcome you, because you are an organization of thorough business men, come to consider the business conditions about you for the advancement of the common good.

More than all, we give you greeting, because we believe you to be the strong factor for the advancement of the business interest and the civilization of the times that has given spirit to our progress for the last quarter of a century.

Standing then in this distinguished presence, in view of the conditions you find here and the intelligence and purposes you bring with you, speaking for Georgia and the entire south, I give you most cordial greeting and glad welcome to our state and among our people.

#### PRESIDENT PAYNE'S RESPONSE.

At the conclusion of the governor's remarks President Payne made the following response:  
Your Excellency:

For myself, and on behalf of the American Street Railway Association, permit me to return our most sincere thanks to your excellency for your very cordial welcome to your beautiful city of Atlanta.

I am sure that we shall carry away with us on our return to our several homes, such remembrances of the generous hospitality of your citizens that we shall become missionaries in our various localities in the interest of the great exposition for which you are making such magnificent preparations.

The street railway business is so closely identified with all the material welfare of our large cities that I am sure your citizens will be interested in the splendid exhibit of all that enters into the equipment of a first-class street railroad, now to be seen in this building, and all your good people are cordially invited to visit and inspect the same.

Secretary Richardson read letters from C. B. Holmes,

H. M. Watson and Wm. H. Sinclair, regretting their inability to be present.

President Payne then delivered the following address:

#### PRESIDENT'S ADDRESS.

#### GENTLEMEN OF THE ASSOCIATION:

For your partiality in electing me to the office of president of the association, I desire to return my most heartfelt thanks.

It is hardly necessary for me to say that since our last meeting the street railway business has suffered, in common with all other enterprises, owing to the financial stringency and business depression which has prevailed in all parts of the country. These conditions, however, have not been without lasting benefit to the interests which we represent; I think we have all studied more thoroughly to bring about economies in operation, to limit construction of new lines into unproductive territory, and in every way to bring our business to a more healthy basis; so that from that point of view there is compensation for the depression through which we have passed.

I presume it is the common experience of all that we are on the up grade and I confidently anticipate a slow but gradual return to normal business conditions. The resources and characteristics of the American people are such that they cannot long continue in a state of either mental or financial depression.

During the transition period from animal to electric power on the tramways of our country, it was but natural that the proceedings of the annual meetings of the association should be largely taken up with the consideration of the application of electricity to transportation purposes. Now that we may fairly consider such application as an accomplished fact, I think our attention should to a greater degree, be turned to a comparison of views regarding the practical operation of our several roads.

The substitution of electricity for animal power has elevated the business to a higher plane. Street railways have become as essential to the prosperity of our metropolitan cities as the steam railways to the country at large.

Having had practical experience in the management of both these methods of transportation, I can fairly say that the duties of a manager of a street railway equipped for rapid transit are more vexatious than, and require quite as much ability, intelligence and application as those of one in charge of a steam railway. The steam railway manager makes his time tables, publishes them, and the people are expected to, and do suit their convenience to the same. Not so with us. We are expected to make our time tables conform to the convenience of each individual separate passenger who desires to be transported, and a car is expected to be at each and every corner at the identical moment when the passenger is ready to be carried.

Again, the steam railway manager has to encounter legislatures and legislation but once in two years, or at the most once in each year, and that during a short period in the winter only; while the life of the street rail-

way manager is made unhappy, to say the least, by the legislative bodies in cities, which are practically in continuous session.

The American capitalist is quick to discover promising fields for the investment of capital, and I think it is safe to say that never in the history of our country has there been a more rapid development than has come from the application of electricity to transportation purposes. In the anxiety to secure franchises and to reconstruct street railways, very excessive valuations have been placed upon and paid for the right to operate by electricity in our large cities. This has led the representatives of the people to believe that there is a present value attached to franchises far beyond that which the facts will sustain.

Consequently these conditions have led to a fruitful field for the legislator as well as for the assessor, from whose tender solicitude for the welfare of the people the street railways, whose prosperity contributes so much to the general good, have suffered.

The interest, as well as the inclination of most managers tends toward giving as liberal and good a service to the public as the patronage will justify.

Transfers, and to what extent they should be granted, commutation and its effects upon earnings, and the relative earnings of cars operated on long and short time headway, furnish fruitful topics for discussion and comparison of views. These and many other practical subjects which will occur to you, I think should receive your attention, and I believe their consideration will be not only of great interest, but of material advantage to us all.

Your executive committee have set apart one morning for executive session, at which time I trust we shall have full and free exchange of views bearing upon matters to which I have referred and many others affecting the practical operation of our roads.

The question of insurance has become a perplexing one. In many instances the larger systems find it very difficult to obtain insurance in sufficient amounts to cover their risks, and I think the common experience is that rates have increased to such an extent as to be so burdensome as to justify us in considering the propriety of organizing a mutual insurance association.

I cannot close without referring to the great loss which we have suffered from the removal by death since our last meeting of two of our most prominent and active members.

Mr. William Richardson, of Brooklyn, N. Y., had been identified with the association since its organization. All will recall the great interest which he took in our deliberations, and I am sure that we all feel a sense of personal sorrow that we shall no more have his wise counsel. His life's work, so far as business activities were concerned, was completed, and he was looking forward to that quiet and peaceful ending of his days to which a long and active life had entitled him.

Mr. William J. Stephenson, of Washington, D. C., first vice-president of the association, was, to my mind, an almost perfect type of an aggressive, forcible, intelligent

business man. He had been for a considerable time engaged in maturing plans for the introduction of the underground trolley system upon his road. To this end he had succeeded in obtaining the necessary legislation from congress, and his plans were very far matured toward the actual commencement of the work of reconstruction. We cannot but regret that he has not lived to consummate the plans which he had so ably matured. Mr. Stephenson was looking forward with the greatest interest to this meeting, and I am sure that I but reflect the sentiment of every member in expressing my sorrow and regret at his untimely taking off.

The report of the executive committee was a carefully prepared document, as follows:

REPORT OF THE EXECUTIVE COMMITTEE.

ATLANTA, GA., October, 17, 1894

TO THE AMERICAN STREET RAILWAY ASSOCIATION.

GENTLEMEN:—Your Executive Committee respectfully submits the following report:

MEMBERSHIP.

The hard times affect the street railway business as surely as they do any other. The fare is so small—only a nickel—that one of the unthinking public is surprised when he learns for the first time that business depression affects the receipts of a street railway company. The fact is there is no more accurate test or measure of the state of the business of the country than the varying income of a street railway company, showing, with absolute accuracy, the state of business activity or depression in the community. Business in general, during the last year, has been bad, and the street railway business, in particular, has suffered, several of the member companies having gone into receivers' hands, while consolidation still continues to be the trend of the times. While the year has been a hard one, the business outlook is encouraging, and we look forward with confidence to a successful year's business.

At the opening of the meeting in the city of Milwaukee there were 197 member companies. At that meeting, and during the year, the following companies have joined:

- Camden, N. J.—Camden, Gloucester & Woodbury Railway Company.
- Charleston, S. C.—Enterprise Railroad Company.
- Columbia, S. C.—Columbia Electric Street Railway, Light & Power Company.
- Helena, Mont.—Helena Rapid Transit Railroad.
- Macon, Ga.—Macon & Indian Spring Electric Street Railway Company.
- Mobile, Ala.—Mobile Electric Light and Railway Company.
- Nashville, Tenn.—Nashville Traction Company.
- New Britain, Conn.—Central Railway and Electric Company.
- Newburgh, N. Y.—Newburgh Electric Railway Company.
- New Orleans, La.—New Orleans Traction Company, Limited.
- Paterson, N. J.—Paterson, Passaic & Rutherford Electric Railway Company.
- Poughkeepsie, N. Y.—Poughkeepsie City & Wappinger's Falls Electric Railway Company.
- Rockland, Me.—Rockland, Thomaston & Camden Street Railroad Company.
- Tampa, Fla.—Tampa Electric Light & Street Railroad Company.

The following changes in the names of members have taken place:

- Brooklyn, N. Y.—Brooklyn, Queens County & Suburban Railroad Company, in place of Broadway Railroad Company.
- Carbondale, Pa.—Lackawanna Valley Rapid Transit Company, in place of Carbondale Traction Company.
- Kansas City, Mo.—Kansas City Cable Railway Company, Consolidated, in place of Kansas City Cable Railway Company.
- Nashville, Tenn.—Nashville Street Railway, in place of United Electric Railway.
- New York, N. Y.—Metropolitan Street Railway Company, in place of Houston, West Street & Pavonia Ferry Railroad Company.
- Norwalk, Conn.—Norwalk Street Railway Company, in place of Norwalk Horse Railroad Company.

Washington, D. C.—Belt Railway Company, in place of Capitol, North O Street & South Washington Railway Company.

The following changes of names of companies by substitution and consolidation, the new companies succeeding the old, have taken place:

Jersey City, N. J.—Consolidated Traction Company, in place of the Jersey City & Bergen Railroad Company and the New Jersey Traction Company, of Newark, N. J.

Lawrence, Mass.—Lowell, Lawrence & Haverhill Street Railway Company, in place of Haverhill & Groveland Street Railway Company and Merrimack Valley Street Railway Company, of Lawrence, Mass.

San Francisco, Cal.—Market Street Railway Company, in place of City Railroad Company, and Ferries and Cliff House Railway Company.

St. Louis Mo.—Union Depot Railway Company, in place of the Benton-Bellefontain Railway Company.

The following companies have withdrawn; several of them having gone into the hands of receivers, or leased to other companies, and nearly all of them being very weak financially

Alexandria, Va.—Washington, Alexandria & Mt. Vernon Railway Company.

Amsterdam, N. Y.—Amsterdam Street Railroad Company.

Birmingham, Conn.—Derby Street Railway Company.

Cincinnati, O.—Mt. Auburn Cable Railway Company.

Dover, N. H.—Consolidated Light and Power Company.

Erie, N. Y.—Erie Electric Motor Company.

Findlay, O.—Findlay Street Railway Company.

Lancaster, Pa.—Lancaster Street Railway Company.

Lyons, Ia.—Clinton and Lyons Horse Railroad Company.

Nashua, N. H.—Nashua Street Railway Company.

New York, N. Y.—North and East River Railroad Company.

Peoria, Ill.—Fort Clark Horse Railway Company.

Raleigh, N. C.—Raleigh Street Railway Company.

Yonkers, N. Y.—Yonkers Railroad Company.

As a result of the foregoing changes, the membership now numbers 187 companies.

#### THE TECHNICAL PRESS.

It is with unfeigned pride that we regard the journals devoted to the Street Railway business. We desire as a committee to acknowledge the services offered this association in the earnest endeavors to increase the membership, and honestly express an appreciation of the efforts to make their publication the peer of any other trade papers in the land. The souvenir editions show fine character of typography, high grade of illustration and thoughtful care in composition. We heartily wish them all possible success in their earnest endeavors to excel. While we do not desire to make any particular distinction in our reference to the technical papers, we feel called upon to express our thanks to Mr. C. B. Fairchild, editor of the Street Railway Journal, for his personal efforts in the interest of the association in his contact with the street railway men of the country, and for the benefit conferred upon the fraternity in the production of the book, entitled "Street Railway Trams."

#### SPECIAL REPORTS AND PAPERS.

The special reports and papers that have been prepared cover a wide range of subjects, and express the latest thought and practice in the business.

#### EXPOSITION.

The Exposition of Street Railway Supplies will be found of unusual interest, the product there displayed being the latest expression as to the needs of a street railway, especially if the motive power be electricity.

#### STREET RAILWAY LAW.

Judicial decisions and opinions have been issued during the year, and constitute parts of volumes X. and XI. of "Street Railway Law," as follows:

1893.

November.—George Rouser vs. North Park Street Railway Company.

December.—W. L. Allen vs. Birmingham Railway & Electric Company.

1894.

January.—John C. Bleil vs. Detroit Street Railway Company.

February.—George A. Jennings vs. Tacoma Railway & Motor Company.

March.—Otto J. Lang vs. Houston, West Street & Pavonia Ferry Railroad Company.

April.—Catherine King vs. Second Avenue Railroad Company.

May.—James E. Johnson, et al., vs. Reading City Passenger Railroad Company.

June.—James E. Morgan vs. Jersey City & Bergen Railroad Company.

July.—Mary Flanagan vs. People's Passenger Railway Company.

August.—Lena T. Cleveland vs. Bangor Street Railway Company.

September.—State of Minnesota vs. Frank S. Hoskins and Dow S. Smith.

October.—Youngstown Street Railway Company vs. Elmer Hovestick and 115 others.

#### AMERICAN STREET RAILWAY DECISIONS.

The second volume of the work started some years since, entitled American Street Railway Decisions, has been printed, and is now in the binder's hands, and will be issued to subscribers during November.

The editors have copy in hand to push the work to a speedy conclusion, and they promise to bring the matter down to date as rapidly as possible, consistent with accuracy. Companies that have not already subscribed for the work are reminded to send in their subscriptions. The price is \$5 a volume, net, delivered.

#### PROPOSED AMENDMENTS.

Two proposed amendments, one to the Constitution, the other to the By-Laws, are herewith submitted, and, though it would not be binding in any sense, we should be pleased if a vote were taken at this meeting, without debate, that we might ascertain whether the judgment of the association is in accord with that of your committee on both subjects.

The proposed amendment to the Constitution is to provide for the admission of individuals and companies, not street railways, as associate members, under certain conditions; such character of membership having been found conducive to the general welfare of kindred associations.

The proposed amendment to the by-laws has in view morning sessions only; providing for less exhaustive meetings; for more opportunity for social enjoyment, as well as for opportunity to examine the display at the exposition, which has become so important a feature of our annual meetings.

#### CONSTITUTION.

##### MEMBERS.

Article III of the constitution shall be amended so as to read as follows:

Section I. There shall be two classes of members—active and associate.

Section II. Active members shall be American street railway companies, or lessees, or individual owners of street railways, and each member shall be entitled to one vote by a delegation presenting proper credentials.

Section III. Associate members shall be individuals, or firms, or companies not embraced in section II, who shall have been recommended by an active member. Associate members shall not be entitled to vote.

##### BY-LAWS.

Article VII shall be amended by the substitution of the word "Tuesday" for "Wednesday," and by the addition of the following words to the first sentence, namely: "And shall continue four days."

##### OBITUARY.

William Richardson departed this life December 31st, 1893, in the seventy-first year of his age. He was for many years the president of the Atlantic Avenue Railroad Company, of Brooklyn, from which position he retired the early part of last year. He began his street railway experience with the Dry Dock, East Broadway & Battery Railroad Company, of New York, and was acting president of that company at the time of his death. He was a regular attendant at the annual meetings of this association, and always took a lively interest in its welfare. He was an ideal companion in his home; of the strictest integrity in business, of untiring energy and high ambition to excel in all he undertook to do, and withal a sincere friend. We shall miss his inspiring presence.

John H. Dalzell died May 29th, 1894. He was the President of the Pittsburgh, Allegheny & Manchester Traction Company, and a man of large influence in the community in which he lived. He was blessed with exceptional foresight, and determining early to make a success in

life, he succeeded by his indomitable pluck, energy and earnest purpose in attaining a position of large prominence. His loss is mourned by a large circle of friends.

Allen Tindolph died July 27th, 1894, aged 52 years. He was president of the Vincennes Street Railway Company, and was prominent in other business enterprises in the place in which he lived. He was a man who stood very high in the esteem of his fellow citizens by reason of his sterling qualities of character. He was a Christian gentleman, a public-spirited citizen, and a model in his home.

For the first time in the history of the association, an officer has died during his incumbency. William J. Stephenson left the sphere of his earthly activities on August 31, 1894. He was the president of the Metropolitan Railroad Company, of Washington, having been previously connected with the Columbia Railway Company of the same city in a like capacity.

He was energetic, enterprising, in short a typical progressive American. Always enjoying the best of health, with ruddy clear complexion, of commanding appearance, having convictions and the courage of them, a ready speaker, always with something to say, reinforced with deep interest in this association, his was a familiar figure and voice at the annual meetings.

We shall sadly miss our friends and companions.

Respectfully submitted,

H. C. PAYNE,  
LEWIS PERRINE, JR.,  
E. S. GOODRICH,  
THOS. H. McLEAN,  
Committee.

W. J. RICHARDSON,  
Secretary.

#### THE TREASURER'S REPORT

showed receipts from all sources for the year to be \$8,290; expenditures \$8,196, leaving a balance of \$94 on hand.

The first report presented was on the Best Method of Treating Accidents and Complaints.

#### THE BEST METHOD OF TREATING ACCIDENTS AND COMPLAINTS.

By P. M. Dyer, of Claim Department of North and West Chicago Street Railroads.

Among the subjects coming to the attention of the general manager, none is more replete with perplexity and difficulties than the disposition of personal injury claims. Expense of operation can be approximated; cost of construction estimated by the engineer or architect; but when and where accidents will happen and what they will cost the company, can never be predicted. By the aid of modern inventions the cost of operation has been lessened; but this gain is threatened by the additional expense incident to the increased number of accidents on street railroads operated in the crowded thoroughfares of our large cities. It is my purpose to explain to you in what manner the North and West Chicago street railroads attend to personal injury cases, commencing with the accident and following the theme to the final disposition of the claim.

These two corporations carried 167,000,000 of passengers during the year ending December 31, 1893 and upon the claim department devolves the duty of investigating all accidents and the making of settlements, or the preparation of the defense, in all claims that spring from this great traffic. One claim department does this work for both roads.

The working force consists of a medical staff, and a sufficient number of investigators, all under the direction of the chief adjuster, who reports to the general counsel of the two companies.

For the purpose of this article the work of the claim department may be divided into three periods, each separate and distinct from the others, as follows:

- First, investigation.
- Second, negotiation.
- Third, litigation.

First, as to investigation. The work of this period begins immediately after the accident and continues until there has been secured a full and accurate account of the accident, with reliable information as to the nature and extent of the injuries to person. Employees have been

instructed to notify the claim department of the occurrence of an accident on car or train, giving circumstances of same, nature of injuries to, and residence of the injured, and, as far as possible, to secure the names of the witnesses. When this has been accomplished, and the injured one has been placed in the charge of a physician, or the police, the car or train may continue its journey. In the meantime, a representative of the claim department will proceed with all possible dispatch to the scene of the accident.

If the injured party has not yet been removed, he must see that conveyance is provided to the hospital or to the home. These companies usually bear the expense of temporary medical care and transportation, without regard to liability, believing such attention is appreciated by the injured and the community at large. In all cases of personal injury it is the duty of the medical staff to secure the privilege of an examination, the physician making same to avoid any assumption of responsibility for the treatment, but to fully ascertain the nature and extent of the injuries, and obtain, if possible, a concurrence in his report by the attending physician. All employees witnessing accidents are required to make written statements of the circumstances of the same on printed forms provided for that purpose, attaching their names, and place of residence of all witnesses. This report must be completed and given to the foreman before the employe finishes his day's duties. These reports are forwarded to the claim department without delay, and when received, circular letters containing printed interrogatories are sent to each witness. If the seriousness of the accident demands it, interviews are had with the witnesses. That the claim department may be kept fully advised, from time to time, as to the conditions of persons injured on these roads, they are occasionally visited during the period of recovery by the investigators assigned to those cases. In Chicago all hearings before the coroner are had immediately after the accident, and the verdict of the coroner's jury is usually rendered on the day following the deaths. It is the policy of these companies to secure the presence of their witnesses at the hearing before the coroner, and obtain stenographic minutes of the proceedings. Thus in a comparatively short time, the claim department will have collected much information as to the condition of the injured, and the circumstances of the accident.

We may now consider the work of the first period completed. The reports relating to an accident could now be filed away, perhaps forever, if it were not for the industry of some claim lawyer, or other hustler, who persuades the injured to make a demand on the company for compensation.

The making of a claim leads us to a consideration of the second period, that of negotiation. Demand being made for compensation, it becomes the duty of the chief adjuster to place before the general manager, or general counsel, all facts within his knowledge bearing on the claim, for a decision as to liability, and the naming of the maximum sum to be paid, if a settlement is deemed advisable, the claimant being promptly informed of the decision.

As to the negotiations preceding a settlement, I will say but little. They are usually conducted by the chief adjuster on the part of the company. If not successful, the period of negotiation will end usually to be followed by that of litigation, the third and last.

After the commencement of a suit, all witnesses are again located by the claim department, and thereafter located at stated intervals until the time of trial, and if possible, additional witnesses are found to strengthen the defense.

Success in defending suits arising from personal injuries largely depends on the character of the work done during the period of investigation. The officers of these companies believe in the thorough investigation of all accidents; if possible, the full settlement on a reasonable basis of all valid claims; in vigorously contesting fraudulent demands; and that prompt settlements are for the best interests of their companies.

In conclusion, I will say that the time is at hand when all railway corporations must be prepared to resist claims in a large percentage of their accidents. To promptly prepare to do this it is the part of wisdom, when considered from a financial stand point, usually the determining consideration in corporate management.

#### DISCUSSION.

Mr. Payne, of Milwaukee, stated his method was practically the same as the one described, but their experience was that a company stood very little chance before a jury in any event, hence their effort is to definitely ascertain the extent of injury and settle out of court as early as possible.

To the question as to what extent a company should go in furnishing relief, Mr. Dyer replied: "First ascertain the liability, and if it appears that the company is not legally liable it then becomes a question of

charity, at the same time exacting a release. A great deal of money is paid out where there is no legal liability whatever." A peculiar—and as all will bear witness, a very rare case—recently was handled by Mr. Dyer. A man, who had lost a leg on the company's car, came in and stated the accident was entirely his own fault and the company in no way to blame. He even offered to make affidavit to that effect and would sign release. He, however, asked as a matter of charity for sufficient money to purchase an artificial limb, which request was granted. The West Chicago Street Railroad used an insurance company for one year in 1890 and '91, but have not since.

Mr. Payne quoted a case of misplaced charity, where the company was in no way liable, and sent the patient to a hospital and paid the expenses, amounting to about \$1,000. When the party recovered he entered suit and secured damages in the sum of \$7,800, the plea being largely that the company had practically admitted its liability, having paid the hospital bills.

Lunch was served in the building immediately after the morning session and members devoted two hours to an inspection of the exhibits described in detail elsewhere. The display was a highly creditable one, and again emphasized the fact that the day of fake and impractical

cut flowers were scattered in profusion. Early in the evening an eloquent address of welcome was given by the president of the club, Major Livingstone Mims, and was frequently interrupted by applause. Dancing followed, in which the superb qualities of the ball room floor were fully appreciated. Elaborate refreshments were served throughout the evening, in the banquet hall, and reflected great credit on the club's chef. There were present many of the leading members of Atlanta society, and the beauty of the ladies, and the elegance of their dress, more than met the visitors' expectations of Southern loveliness. The function was one of the most noteworthy in the history of street railway conventions, and will pass into history, as a never to be forgotten event.

#### THURSDAY MORNING.

An executive session was held on Thursday morning.

LADIES' CAFE.

BALL ROOM.

inventions is passing. Every exhibit possessed merit, and the entire floor space of Machinery Hall was filled. Exhibitors, too, were early in place and ready to show and describe appliances, thus saving much valuable time which has in years past been worse than wasted. That their efforts were appreciated is evidenced in the careful inspection accorded by the delegates. At four o'clock, special cars were taken, starting from Machinery Hall, and an inspection given of the lines and power house of the Consolidated Company, where the mammoth new engine of the Rankin-Fritsch Company was greatly admired.

#### WEDNESDAY EVENING.

Wednesday evening was very appropriately set apart to the acceptance of the reception tendered the association by the Capital City Club, the fame and position of which, as one of the leading social factors in the South is national. The club house is spacious and most thoroughly well appointed, and the guests arrived early and remained until a late hour. Over one thousand were present, but there was no crowding or confusion. Tropical plants and

The subject of transfers and commutations was considered, the general impression being that the privileges should not be extended further than was absolutely necessary. The subject of the formation of a street railway mutual fire insurance company, was also taken up, and on motion of Russell B. Harrison, the incoming officers and executive committee were appointed a committee to report on the subject.

On motion of H. M. Littell, of New Orleans, Messrs Littell, Perrine and Connette were appointed a committee to wait upon the officers of the Underwriters' Association of the South, with a view to securing better conditions and rates for insurance of street railway properties; the office of the association being in Atlanta. Thereupon the executive session adjourned. The convention next took up the report "can the T rail be satisfactorily used in paved streets." The paper prepared by S. Hendrie, of Detroit, was in his absence, read by the chairman of the committee, Joel Hurt, of Atlanta. This paper appears in full on page 601 of this issue.

On motion of T. H. McLean, the nominating committee

was appointed, consisting of Messrs. McLean, Connette, McNamara, Baumhoff, Breed, Semmes and Rugg. Invitations were tendered for the next place of meeting from Cincinnati, Philadelphia and Montreal. This closed the morning session.

The afternoon of Thursday was spent very pleasantly in a street car ride around the city, and Thursday evening came the banquet, an account of which will be found elsewhere.

FRIDAY MORNING.

Only a few members attended the opening session this morning, but they strolled in during the morning until the time of the election of officers, when there was comparatively a full representation. The first paper was on City and Suburban Electric Railways, by E. C. Foster, which appears on page 603. Then came the interesting report of Russell B. Harrison, on the T Rail Construction at Terre Haute, Ind.

"SMOOTH, DURABLE AND SUCCESSFUL T RAIL STREET RAILWAY TRACK CONSTRUCTION IN PAVED STREETS."

A Report to the American Street Railway Association on the T Rail Track Construction of the Terre Haute Electric Railway, of Terre Haute, Indiana, by Russell B. Harrison, M. E., M. S., President of the Road.

MR. PRESIDENT AND GENTLEMEN OF THE CONVENTION:

It gives me pleasure to respond to the request and invitation of the American Street Railway Association, extended last year at the Milwaukee convention, to make a report at the Atlanta convention, on "The T Rail Track Construction of the Terre Haute Electric Railway." Not alone from the fact that it is very gratifying to have so influential a body as the American Street Railway Association thus recognize the pioneer and successful work of the Terre Haute road in the important field of track construction, but more specially from the standpoint that, having given several years study to street railway track construction—not following as others lead—but working on the problem with new and original ideas, I believe the presentation of the results that have been secured, and at the same time calling attention to the defects and imperfections demonstrated by our experience, will not only prove of great value and interest to the members of the association, in showing how T rail track construction may be successfully laid in paved streets, with the hearty approval of the public, but will give the members a standard to follow that will enable them to save thousands of dollars in expensive experience and in costly experiments. If but a small part of my expectations in this respect shall be immediately realized, the seed will be sown and will produce a great harvest, bringing ample reward for our efforts and work on the problem, and attention to this paper.

The present standard of "all steel" T rail track construction of the Terre Haute Electric railway, not only has no equal in this country, but is so far in advance of anything yet attempted in the way of street railway track construction, that I feel a brief outline of our work on the problem prior to reaching the present standard, will not only not be out of place, but will prove of real interest.

I am aware, gentlemen, that these are strong words to be used in connection with our present track construction, and that my opinion may not be immediately shared by every member of the association, but I am confident that all members making an actual inspection of the track will share my opinion as to its smoothness, solidity, durability, permanency and general merits, and the great advantages and public popularity of the smoothly finished asphalt and brick paving laid in connection with it.

I realize that, with the track in Terre Haute, it will be difficult, by a paper, to explain intelligently how the track was laid and show its many advantages, but I shall make the attempt with the aid of some photographs, and supplement the effort by inviting the members of the association to visit Terre Haute and make a personal inspection and examina-

tion of the several types of our T rail track construction, knowing that the eye is better than the ear in passing judgment on as perfect a street railway track construction as has been laid up to the close of the year 1894.

Terre Haute is an anomaly among the cities of this country, on the subject of street railway track construction. It is the only city that would not permit girder or grooved rail in its streets, and would make as great a fuss now on the subject as the average city would do, if an attempt were made to lay T rail track. This will seem to the members of the association a strange condition, but to the company it is a very pleasant one, making the company's relations with the city on the subject harmonious, and permitting the road to secure, with popular approval, the best and most durable form of rail, at the least cost.

This feeling, the approval by the public of a T rail did not exist at the start, but was brought about gradually by tact and good judgment, assisted by the greatest of all teachers, experience.

It would not be in existence to-day if the management of the road had not all times realized that public opinion and the approval of the public were valuable assets to a street railway company, and worth every earnest effort to hold and maintain. Our motto has been, not, how cheap, but how good we could construct our tracks in the streets. The public have appreciated our efforts and sustained us loyally.

I shall not have time in this paper, nor do I feel that it would prove interesting, to go into the details of my studies and investigations concerning rails, foundations, joints, paving, ties, etc., or into the details of the conclusions that have caused me to adopt the present "all steel track" as our present standard.

The time at your disposal is limited, and what you want is results, and I shall endeavor to lay investigations, theories and speculations aside in this paper, and as briefly as possible make a report that will give you also results in smoothness of track, durability of construction and economy of operation, if you will follow our example and advice.

There has been in the past too much attention paid to motors, generators, cars, power houses, etc., and too little to the foundation for successful and economical operation—a perfect track.

The development of electricity as a motive power for street railway service, was very rapid, and it is only natural that the inexperienced should be misled in their hurry to change power and have an electric road that would make them very rich in a year or two.

The agents of many electric concerns were chiefly interested in selling apparatus, and with the apparatus sold the future of the roads and their ability to earn a profit, did not enter into their calculations.

Is it any wonder, then, that many roads should find after a year or two of experience, that the track was too light for the cars and motors, and the cars and motors were too heavy for the track, and that both were worn out and required rebuilding at a time when the great panic had reduced traffic to the lowest point. Light and abused track and worn out cars and motors, coupled with reduced traffic, have brought to too many roads the unwelcome guest—the receiver.

Many of these roads, through receivers, or in their reorganized condition, are profiting by experience, and giving proper and careful attention to the track.

It seems strange to me that street railway track construction should drift so far away, in theory and practice, from steam railway track construction. One had but to study the wonderful display showing the development of track construction in the Transportation building, at the World's Fair, to acquire a liberal education on the subject.

The Terre Haute road has, indeed, had a fortunate experience. Its management early realized that successful track construction should approach, as far as possible, and not deviate from, further than necessary, the best steam railway track construction. So, to-day, the Terre Haute road is an all T rail road, and every block of track in paved streets of so durable a character that it will last for years, with a minimum of repairs.

Terre Haute, although a small town at the close of the great civil war was very enterprising, and determined to have a street railway. A company was incorporated for this purpose, in 1866, with ample capital, and commenced to lay track early the following year, when one and a half miles were completed. The operations of the company and its trackage increased as the years rolled by, like other horse or mule railways. Its earlier operations are not interesting in connection with this paper, as they were after the manner of other roads, and of a type familiar to all street railway men.

It is an interesting fact, however, in connection with the present low price of steel, that the side bearing flat iron rails purchased by the company in 1867, cost \$108 per ton. Those rails were used about twenty years, and then 38-pound girder rails were substituted.

The franchise of the company does not contain any requirements as to the style, character or weight of the rails. While there has been no expression from the public on the subject, the management feared that the general and popular prejudice against the use of T rails in the streets would appear in Terre Haute. They therefore hesitated about so radical a change, but appreciating the good results that would come from the use of such a rail, they concluded to place a trial order.

No publication was made of the fact that they intended to use T rail. The first T rail laid by the company was on South Third street, and in the fall of 1890. This rail was laid preparatory to changing the motive power from horse to electricity. The management proceeded to make plans to lay this track with caution, and fear as to the way the public would receive it.

The old girder rail on Third street was taken up, new ties distributed, and when everything was ready the T rail was distributed in a matter-of-fact way, as if it was the only rail that could be used, and a force of men put to work in laying them. The mayor of the city came around shortly, reports having reached him as to the company laying a steam railway track, and when he saw the reports were true, said, with some excitement, "What are you doing here, putting a steam road in our streets?" The superintendent, who was on the spot, was equal to the emergency, and replied pleasantly, but earnestly, that the track was being built for an electric railway. The mayor replied that that could not be the case, as the rails were steam road rails. The superintendent then informed him that these T rails were the only rails adapted for the successful operation of electric railways, and while it appeared to be the steam road rail, it was in reality very much lighter (the section being 40-pound T) than a steam road rail. Further explanations satisfied the mayor, and convinced him as to the merits of the T rail. In a short time he not only became interested, but enthusiastic, and brought councilmen to see the rail, and explained to them its advantages for electric street railway service. They in turn brought prominent citizens and others to look at it, and explained these advantages.

Thus, by tact and management, and perhaps some good fortune at the start, the mayor, council and the public welcomed the T rail, as an improvement, and a necessity in securing the electric street railway service, which they greatly desired, and the road was happily started in the right way with T rail, without opposition, adding a great value to the plant. The only fear and worry was by members of the company. They were timid as to the T rail, and feared that it would not be successful in paved streets. From this good start it has been a steady march of improvement.

A description of the laying of this first T rail track will prove of interest. It was a 40 pound T rail, laid on oak ties 3 inches by 7 inches, by 7 feet, with 3 feet space from center to center. The rails were laid without proper regard to having the end of the rail rest on a tie.

Planks 2 inches by 6 inches by 13 feet were laid on both sides of the rail. On the inside the planks were nailed to the ties, and on the outside blocks were nailed to the ties to raise the plank to a level with the rail to provide vehicles an easy crossing. Ordinary flat splice bars were used with the rails. The rails were bonded with  $\frac{3}{8}$  galvanized bond wire, with a single bond to the joint. They in turn were wired and soldered to a supplementary wire of  $\frac{1}{4}$  inch galvanized stranded iron wire; each alternate joint being soldered and wired from both rails of the track. In the single track the supplementary wire was in the center of the track, and in double track between tracks. The track was covered in with good gravel.

One year's experience demonstrated that planking was unnecessary; that gravel which is found in great abundance under and about Terre Haute made—with a little clay which is found above it—a superior substitute for the plank, and protected the rails better in permitting vehicles to pass along, and to cross the track easily and without injury. This substitute only required occasional attention in filling up low spots to maintain a level roadway. In two years the planks were badly decayed and warped up at the end, and as the track was thoroughly overhauled at that time the planking was taken up and gravel substituted.

At the end of two year's service of the track, it was found in making repairs that the galvanized iron supplementary ground wire was rusted out, and gone for various distances, making a return circuit an impossibility, and we only had the rails to depend upon, which in themselves, for this purpose, are not sufficient. This trouble not only reduced the efficiency of the light circuits in the cars, but caused frequent burn outs of the armatures and fields. It grew to such an extent that it was found necessary to re-bond this track, and it was decided at the same time to dig up and repair the entire track and increase the number of ties by  $\frac{1}{3}$ , and at the same time give careful attention to hav-

ing the ties under and properly supporting the rail joints. Tinned No. 00 copper wire was substituted for iron as the bond and supplementary wire. Good gravel with a little clay was substituted for the plank along the rail, and the substitute has given very much better service than the planks have ever done.

This section of the road, as re-built, is in daily use now and giving good service.

Our experience with this first piece of T rail track was very valuable in many ways, and enables the management to use the experience thus gained to make many improvements in laying additional T rail track.

It was indeed fortunate that we gained so much experience before laying T rails in paved streets.

The era of street paving did not set in Terre Haute until 1892. This was not because Terre Haute lacked in enterprise and progressiveness, but was because the town was situated on a high bluff fronting the Wabash river, and had, with the gravel sub-soil, good drainage and good streets. When it was decided to pave Wabash avenue or Main street with brick for fifteen blocks, it became necessary for the company to take up its girder rail. Our experience thus far with T rail had been so satisfactory and successful that it was decided to continue its use on a larger and greatly improved scale.

Much study and consideration was given to the problem, the result of which the track was laid as follows:

Rail.—About this time the Illinois Steel Company brought out their 60 pound shanghai T rail, and as it was  $5\frac{1}{4}$  inches high, permitting pay-

All Steel Track, Terre Haute. First Process, Rolling the Roadbed after Excavation.

ing without chairs and direct spiking of the rails to the ties, it was very promptly adopted.

Ties.—Carefully selected oak ties 5 inches by 7 inches by 7 feet, were used.

Foundation.—After excavating for the track, the ground was rolled by a heavy 14-ton steam road roller. Then 6 inches of broken stone was placed in position as a bed and rolled by the 14-ton steam road roller.

Track.—Then the ties and rails were placed in position and raised to grade by tamping broken stone underneath. Spaces between ties were filled with broken stone and raised to position.

Bonding.—Single bonds were used of 7-16 galvanized iron wire, and a supplementary wire of No. 00 tinned copper wire

Paving.—On top of the broken stone, screened sharp sand was placed, and with one inch hose this sand was washed into the interstices of the stone. After drying, the sand was brought up to an even surface by a fresh deposit, and it was then smoothed to even surface and the desired thickness by mould board. Then vitrified bricks were placed in position leaving them somewhat higher than the rail. They were driven in to the cushion of sand by means of hand rammers, with a square piece of boiler plate placed on top of them to force all to the proper level. The sand cushion permitted the bricks to crown evenly from center toward each rail to afford proper drainage. A special brick with one corner cut off, with sloping angle to give space for flange of wheel to run in, was laid next to the rail; those bricks were not the shape of the special nose brick now used, and only set against the lower edge of inside of head of rail. The space between the brick and web of rail was filled with

grouting. Bricks of regular size were laid between. After the bricks had been rammed and rolled to proper position, a grout of boat-screened sharp sand and Portland cement with water, made to such flowing consistency as to permeate all the crevices, was poured over them and by brooms pushed into the openings. When this set, the bricks were solidly united and they cannot be separated, except with great difficulty. A finishing coat of sand was thrown over the entire surface, and traffic kept off it for one week. After thoroughly setting, the sand was swept off and the street opened for traffic. The street, between the tracks and curb stone, as well as between the tracks, is one solid mass of concrete and brick from center of street to curb, and will sustain great pressure. Since this track was laid, our experience with it has demonstrated that it could have been improved in one particular, viz.: the sand and broken stone should have been united with cement into regular concrete, for, we have found since the paving was completed, that the use of the water on the sand did not wash it thoroughly into interstices of the broken stone. In time the sand dried and settled down into the spaces, and while the ties and the paving immediately over them have remained firm and solid, the paving between the ties has settled slightly, without breaking or disturbing, the concrete holding them together. This track, laid in Wabash avenue, the principal business street of the city, has had two years' severe service, and has been thoroughly tested in every particular, and thus practically demonstrated its great success and merit. Vehicles, carriages and wagons can pass along the rail, and turn in or out at will, without jar or wrenching. It can be crossed at right angles, or at any angle, with equal ease and comfort. A continuous traffic over it has caused no perceptible wear, and the cars glide over it without oscillation, as smoothly as when first laid.

Our next experience with T rail construction was in a street paved with asphalt, where a half a mile was laid in the fall of 1892, and a mile more in the spring of 1893.

While asphalt presented some new problems, the T rail, ties, joint plates, bonding and supplementary wire was the same on Wabash avenue. The foundation was improved by making it of concrete, six inches below the ties. This broken stone concrete was also placed between the ties and up to a point to allow space for four inches of asphalt packed into position.

The asphalt was brought up to and in contact with the rail on the outside. On the inside of the rail for the first half mile, the vitrified brick used on Wabash avenue, with corner cut off on a sloping angle, were used to give flange space, and between the ends of the brick, asphalt was used in the regular way. On the last mile the merits of the Haydenville blocks having been brought to our attention it was decided to use them

All Steel Track, Terre Haute. Second Process,—Preparing to Receive the Broken Stone. Setting the Stakes.

both inside and outside of the rail, and while it made a smoother finish to the rail than the brick or asphalt, our experience proves that these blocks do not have the wearing qualities of the brick. This track and asphalt paving are beautiful in finish, and of unusual strength and smoothness. It is a genuine pleasure for passengers to ride over this track, for there is no motion perceptible, except the forward motion.

Our next experience with T rail construction was during the year 1893, in several streets paved with brick. The rail was 60-pound shang-

hai, and rail plates, bond wire and supplementary wire were the same as in the street laid in asphalt. The foundation was six inches broken stone concrete below these ties, and about five and a half inches additional concrete between the ties. It also covered slightly the top of the ties. The foundation for this brick track was further improved by pouring a thin wash of sand and cement over the top of the foundation before placing the sand cushion thereon. This gave the foundation, track, ties and concrete a solid union. The brick paving was laid in a manner similar to that on Main street. Instead of angle cut brick for flange space

All Steel Track, Terre Haute. Third Process, Laying the First Eight Inches of Broken Stone.

Haydenville blocks were placed on the inside of the rails, one and a half inches distant therefrom. The lower part of the space between the Haydenville block and rail was filled with sand concrete, pressed down tight. On top of this an inch of tar was placed. The hollow spaces in the Haydenville block were filled with sand concrete before placing in position, and the space in center of track between blocks was laid with vitrified brick in the regular way. This track is perfect in strength, smoothness and durability. A year's experience with the Haydenville blocks on these business streets shows that the glazed upper surface wears too rapidly and their use has been entirely discontinued.

While this track, just described, was in every way a superior, durable and popular track, I gave further study to where additional improvements could be made in durability, strength and wearing qualities. My investigations and experiments caused me to decide on the following changes: 1st. To use a heavier rail with wider head. 2d. To substitute metal ties for wood. 3d. To secure greater rigidity and evenness in rail ends. 4th. A firm and permanent hold on the rails without the use of nuts and bolts. 5th. In paving, a better brick and of such shape as would provide a better flange room and contact with the web of the rail.

These changes brought us to an all steel T rail track.

#### RAIL.

When the Illinois Steel Company brought out the 72-pound shanghai T rail, which was an improvement both in weight, strength and in the width of the head of the rail over 60 shanghai T of same make, it was immediately adopted as the company's standard and was used in our latest and best T rail track construction. The shanghai rails of this company's make are so well known that a description is hardly necessary, but as this paper will be read by some who have not seen sections of them, I will give the dimensions of the 72-pound rail. The rail is 6 inches high; the base is 5 inches wide; the top, or head, is  $2\frac{3}{4}$  inches in width; the web from where the turns begin is  $3\frac{1}{2}$  inches. The long web permits the rail to rest on the ties and brings the top of rail to proper level for paving with brick, asphalt or granite blocks. In this track the rails are laid broken jointed. The 72-pound rail has a wider head, which gives better contact and wider bearing surface for the wheels of the car and even wear for the tread of the wheels. The edges of the wheels do not nick or chip out, as with the lighter rails with narrower heads.

Experience with the narrow head rails demonstrates that by wear an outer flange is formed on the wheel, and that this outer flange is very

destructive to the life of special work and the wheels. The wider rail head is also better for gravel or macadamized streets, as it gives no opportunity for the stones lying adjacent to the rail to nick the outer edge of the tread of the wheel.

#### FOUNDATION.

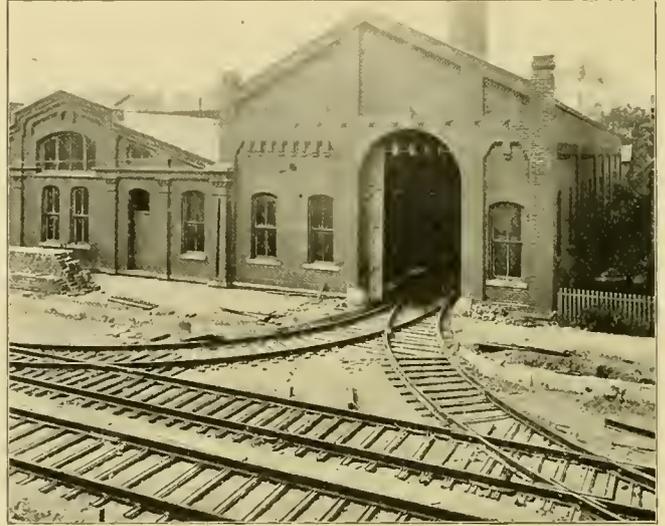

The foundation of a track is to a larger degree than any other part responsible for its wearing qualities, and this fact has not been lost sight of in our work. Good rails, ties, and joints cannot alone make a track, or properly sustain it so as to keep it level and give good wearing qualities, therefore, under all steel track it was determined to place a heavy foundation of the best material. After the necessary excavations, the ground was rolled with a heavy fourteen ton steam road roller. Then eight inches of broken stone concrete was placed in position and allowed to set. Then the rails, ties and joints were distributed, and connected together, and when the track is completed it is brought to the required grade or level by putting blocks under the rails at intervals, to bring track to proper grade. Then four inches of broken stone concrete is tamped under the ties and under the rails. After the tamping process is completed, the inequalities of the surface are filled with concrete, and the whole leveled up with concrete over the top of the ties, and pounded to a level surface with a wooden pounder, and allowed to set.

#### TIES.

The ties are steel, double corrugated, and heavily coated with tar while hot and being made, and are 2 inches high, 7 inches wide and 7 feet long, for straight line work, and were laid 15 inches between centers. For special work the ties vary in length as the necessities require, up to 20 feet or more. The metal of the tie is  $\frac{1}{2}$ -inch thick. These ties were manufactured by the Daniels Steel Tie Company, of Youngstown, O. The rails rest on and are fastened to the ties by clamps, with off sets to fit the base of rail. These clamps are secured and adjusted on the top of the tie by a special made bolt with oval shoulder, which is inserted from bottom of tie, with the head below and the nut on top, which permits a powerful box wrench being used to draw the nuts on bolts to a permanent position.

In using these steel ties in connection with the Wheeler rail joint, a mechanical difficulty arose, but which I overcame in the following way, after some study. The Wheeler joint has a thickness of three inches below the rail base, and in laying track with broken rail joints a straight tie would not answer. At first I thought it would be necessary to use a wooden tie under rail joints, but by devising a special tie was able to have them all of metal. The special steel tie for use under

and nuts and embodied the best of all mechanical principles—that of the wedge. These joints, at that time, had not been made for shanghai rails or for steel ties, but I overcame those difficulties by designing a new joint to be used with these rails and ties, and secured in this new pattern more bearing surface on the tie, by having the bottom of the joint made to fit the corrugations of the tie. The joint consists of two parts, one of which is keyed onto the other. The larger or heavier part, used on outside of rail, has two lugs that fit in the angle joint holes nearest the ends of rails. After it is placed in position the lighter part is keyed on with a large maul and holds the rails rigid. Then the tie is placed under joint and is fastened to it in the regular way, with the exception that the

Y CURVES TO POWER HOUSE.

clamps have longer off sets; the holes in the ties for the bolts are also wider apart, on account of the width of the base of the joint. The joint has corrugations on each side at right angles to the rail, which gives it great strength. The joint is made of the best malleable iron, and weighs thirty-two pounds complete.

#### BOND AND SUPPLEMENTARY WIRE.

Iron wire having proved unserviceable and unsatisfactory, the heaviest copper wire was used in connection with this steel track. Double bonds of No. 0000 copper wire were used at each rail joint, one in the upper and one in the lower part of the web of rail; these bonds were soldered and connected to the No. 00 tinned copper supplementary wire that has been accepted as standard.

#### PAVING.

When the foundation is completed and the track set in it as just described, nothing remains but the paving to complete the track and street for use. The all steel track was laid on Ninth street, a business street leading from Wabash avenue, or Main street, to the Union depot and brick was therefore selected for the paving material. This brick pavement was laid as previously described, and needs no further description.

As the use of the Haydenville block had been abandoned and the angle nose cut brick did not touch the web of the rail, I designed a special shape brick that has many advantages, combined with the same wearing qualities as the brick on each side of the tracks. A sample pattern of brick which I have with me will give a clear understanding as to the shape.

#### DRAINAGE.

In the earlier laid track in paved streets, rapid and proper drainage of the tracks was not provided for. The paving was crowned to the center of the track and followed the slope of the streets, but when the lowest point in the street was reached, no provision was made to carry the water quickly to the sewer. In this new track, proper provision is made to get rid of the water from rain, snow and street sprinkling, quickly and effectively. In the center of each track, at the lowest point in the grade of each street, an 8-inch sewer pipe was laid to the sewer. Over the top or opening of this pipe, in the center of street, is placed a small catch basin, surmounted by a special made iron grating. The water flowing down the track and along the side of the rails is thus rapidly removed and a simple and effective drainage secured.

All Steel Track, Terre Haute. Fourth Process.—Track Ready for Tamping with Last Broken Stone.

joints was adjusted to the necessary levels by bending it down in the center three inches, by an easy off set.

In laying the track, these special ties were easily placed in position, and gave perfect satisfaction. The clamps and bolts were the same as on straight line work.

#### JOINTS.

I gave a great deal of attention to the subject of securing a good joint for this all steel track, and after examining many devices selected the Wheeler rail joint, made at Marion, Ind., as it did away with the bolts

## INJURY TO TRACK BY VEHICLES AND HEAVY TEAMING.

On our track, which is standard gage, 4 feet 8½ inches wide, heavily loaded vehicles cannot drive along it and get the benefit of the smooth metallic surface, as in the case with girder rails. This condition is a great improvement and makes a saving in many ways.

First. It saves an immense amount of money in repairing the injury and wrenching to track and rapid wear and tear thereto, caused by vehicles and particularly heavily loaded wagons turning in and out and driving along the track.

Second. It permits a quicker and more frequent car service, which all street railway men know means time and money, by giving the cars a clear track.

These are great advantages and will be best appreciated by the managers of the lines in the larger cities. They can also bear testimony to the large savings effected in the wear and tear.

To further prevent heavy teaming along the flange spaces of our track and at the same time make the wear and tear on the street paving, which we are required to maintain a minimum, the following ordinance was passed by our city council, October 4, 1892:

"An ordinance regulating heavy hauling over and through the improved streets of the city of Terre Haute.

Be it ordained by the common council of the city of Terre Haute, that it shall be unlawful for any person to drive, or cause to be driven, or permit his or her servant to drive upon any street or alley paved with wood, stone, brick or asphalt, any wagon or other vehicle having upon it a weight, which, together with the weight of the wagon or vehicle, shall exceed four thousand pounds (4,000) and less than seven thousand pounds (7,000), unless the tires upon such wagon or vehicle shall be at least three inches in width; nor shall any such wagon or vehicle having upon it a weight, which, together with the weight of the wagon or vehicle, shall exceed seven thousand pounds (7,000), be so driven in or upon any such paved street or alley, unless the tires on such wagon or vehicle shall be at least three and one-half inches (3½) in width.

Section 2. Any person who shall violate any of the provisions of this ordinance, shall, upon conviction therefor, be fined, and forfeit and pay not less than five dollars (\$5.00), nor more than fifty dollars (\$50.00), for each and every offense.

Section 3. This ordinance shall take effect and be in full force and effect on and after December 1, 1892.

Adopted October 4, 1892.

I, Chas. H. Goodwin, clerk of the city of Terre Haute, Indiana, hereby certify the above and foregoing to be a true and correct copy of "An ordinance regulating heavy hauling over and through the improved streets of the city of Terre Haute," as the same appears of record and on file in my office. Witness my hand and seal this 15th day of October, 1894.

CHAS. H. GOODWIN,  
City Clerk.

In closing this report, gentlemen, I wish to thank you for your attention, and at the same time express the hope that it will prove, as it was intended, a good guide to you in securing that very necessary condition for successful and economical operation—a perfect track.

Before closing I wish to call your attention to the fact that through the kindness of the Paige Iron Works, of Chicago, I am enabled to show you in the Exhibition Hall a sample of our special track work made of 72-pound shanghai steel rail and laid on the Daniels steel ties as we lay it.

Also samples of Wheeler rail joints attached and unattached to rails. Also a crude sample of our brick paving. This sample is not as correctly or as smoothly laid as we lay it in Terre Haute, but as I did not reach Atlanta in time to supervise the laying, it would be unreasonable to expect unskilled hands without guidance to lay it as our experienced employes do.

To the samples and photographs I have with me, and to the special track work and samples in Exhibition Hall, I invite the attention of all who are interested in the subject of perfect Electric Street Railway T Rail Track Construction.

Mr. Seeley desired to know difference in cost of construction between T rail and the same weight of girder rail, but Mr. Harrison could not answer the question, as he had had no experience in laying girder rail. He also said brick paving was more lasting than granite. There is no jolt or jar when cars go over the joints, which are made as close and tight as possible, with the usual space

for expansion and contraction. There is very little metal exposed, so there is not so much expansion or contraction as with a girder rail. The ties and rails are both tamped with concrete resting on a solid bed and there is a minimum wear and tear.

Telegrams were read from Thomas Lowry and the Commercial Clubs of Minneapolis and St. Paul, inviting the next convention to be held in Minneapolis.

O. T. Crosby sent a letter of apology for his inability to serve as chairman of the committee on standards and nomenclature. The committee was continued, consisting of Charles W. Wason, electrical engineer, Cleveland Electric Railway Company, Cleveland; L. H. McIntire, Philadelphia Traction Company; Thomas H. McLean, general manager Citizens' Street Railway Company, Indianapolis; C. G. Goodrich, vice-president and secretary of Twin City Rapid Transit Company, Minneapolis, Minn.

A letter was read from M. O'Connell, president of the Surface Railway Employes' Association of the United States and Canada, in which he expressed his desire to have more cordial relations between the official bodies of both employes and employers. The secretary was instructed to answer the communication.

The following was received from M. K. Bowen, superintendent of the Chicago City Railway Company and referred to a committee to be appointed by the president.

GENTLEMEN: I desire to call your attention to a matter, and not being able to be present with you at Atlanta this year, I have asked Mr. Penington to take up the same with you.

In the lines following you will find an outline of the subject referred to:

The list of patented articles in use on street railways is growing very fast, and has increased wonderfully since the adoption of electricity as a motive power. All street railways are paying either directly to the patentee, or indirectly to the manufacturer, a royalty on one or more devices in use in the operation of their lines. In many cases the patent is worthless, yet no test or investigation has been made to determine whether a royalty is rightfully due the holder of the patent or not, and consequently many thousands of dollars are spent annually in royalties that could be otherwise saved, or the price of such articles reduced by concerted action in fighting and exposing all such so called "patents."

The street railway companies are also liable to be made defendants in suits from using articles that are an infringement on some patent, while the manufacturer is the party that should stand the burden of such litigation and not the purchaser or consumer.

In this matter we are far behind the steam railroads of this country. In this city there is an organization known as the Western Railroad Association, that has been in successful operation for twenty-four years, and has a membership of ninety. There is also an eastern association, with headquarters at Washington, similar to the one here, and the two organizations have as members all the important railways in the United States, and most of the smaller ones. The several railways pay annual dues, based either on their mileage or gross or net receipts. This association furnishes reports and opinions on all patent matters on request from its members, and defends all patent suits in which the railroads are made defendants. The railroad, as a rule, gets an opinion from the association before buying, making or using any patented device. An association of this character would be highly beneficial to our street railway companies. If this could be carried into active operation by an association of street railways, all patented articles in use on our lines could be investigated and reported on.

In conclusion I will say that if it meets your approval, I would recommend that a committee be appointed to take up this matter and submit a plan of organization, to report to the executive committee at their meeting in January.

The president appointed F. R. Greene, Chicago; John

W. McNamara, Albany; Charles W. Wason, Cleveland.

A letter from J. J. Sullivan, of the Electric Traction Company, Philadelphia, was read, in which he expressed his regrets for not being able to attend the convention.

The committee on insurance appointed at the private session Thursday, was asked for a report, but on account of being unable to see a gentleman who was out of the city, nothing had been done.

W. B. Brophy, representing the Cotton and Woolen M. & M. Insurance Company, Rubber Manufacturers Mutual Insurance Company, and the Industrial Mutual Insurance Company, addressed the meeting at the request of members. His companies insure power house and car barn risks with premiums of 1 per cent on brick power houses,  $1\frac{1}{4}$  per cent on frame,  $1\frac{1}{4}$  per cent car barns brick,  $1\frac{1}{2}$  per cent frame, including contents. The limit is \$60,000. A dividend of 40 per cent was returned to policy holders. No restrictions are made in regard to cement or iron floors for power houses, but there must be no storage rooms without sprinkler equipment.

The amendments to the constitution and by-laws as recommended in the Executive Committee report were adopted.

Lewis Perrine offered the following, which was adopted:

RESOLVED, That the Executive Committee is hereby requested to take under consideration the question of the enlargement of the field and scope of the association and submit a plan suggesting ways and means therefor at the next meeting of the association.

#### ELECTION OF OFFICERS.

The nominating committee reported Montreal as the place of meeting, and for officers: Joel Hurt, Atlanta, president; W. Worth Bean, St. Joseph, Mich., first vice-president; John M. Cunningham, Boston, second vice-president; R. B. Harrison, Terre Haute, Ind., third vice-president; W. J. Richardson, Brooklyn, secretary and treasurer; executive committee, H. C. Payne, Milwaukee; General W. H. Jackson, Nashville; G. C. Cunningham, Canada; D. G. Hamilton, St. Louis and Chicago; John M. Partridge, New York.

The report of the committee was adopted as far as election of officers was concerned, but objections were made to Montreal as a place of meeting. Philadelphia, Cincinnati and St. Louis put forth their claims. The ballot resulted in the choice of Montreal, which received 38 votes to 17 for Philadelphia.

Granville C. Cunningham, manager of the Montreal Street Railway Company, said he was very much pleased that Montreal had been chosen by the association for the next place of meeting. He could assure the members that everything possible would be done to remove the difficulties in the way of bringing in supplies, and could, confidently promise that there would be no more difficulty in bringing supplies to Montreal than to any part of the United States.

The president appointed as a committee to investigate

mutual insurance, Messrs. Harrison, Terre Haute; Dyer, Augusta; Perrine, Trenton; Lusher, Montreal, and Baumhoff, St. Louis.

The paper on Transfers and Street Railways, by J. N. Beckley, was read by title and ordered printed. It will be found elsewhere.

The paper by Richard McCulloch, St. Louis, on Mail, Express and Freight Service for Electric Roads, which appears on page 626, was read by title and ordered printed.

James Vail read a paper on the Booster System, which will be found on page 607.

President Joel Hurt was escorted to the platform by Messrs. Dunlop and McNamara. He said:

"GENTLEMEN: I sincerely thank you for the honor you have conferred upon me. It was not sought, but I appreciate it none the less. I will not tax your time, but will simply say that I am fully in accord with those who have the best interests of the association at heart and have done so much to make it a success. I will do my best for the advancement of the association and ask your co-operation and help in every direction. I feel that the association is entering on a much more useful period than has marked its past career. Its scope should be enlarged to embrace features that are daily devolving on managers of street railways and should receive special attention from the association during the next twelve months."

On motion of Mr. Perrine, a vote of thanks was given the citizens of Atlanta in general, the Atlanta Consolidated Railway Company, the Capital City Club and other organizations, the local committee, local press and others for the many pleasant entertainments.

The following papers were read by title, as printed copies had been furnished to the members: Destructive Arcing of 500-Volt Fuses, W. E. Harrington; Brake Shoes, D. F. Henry and Powell Evans; Power vs. Hand Brakes, by E. J. Wessels, with a discussion by Elmer Sperry, which was delivered only to a committee, and will appear in the official proceedings, and Taxation, by Allen R. Foote.

The convention adjourned.

#### THE BARBECUE.

Partridges a-callin',  
Hick'ry nuts a-fallin',  
Country jest a-smilin' all around;  
Cattle bells a-tinklin',  
Silver frost a-sprinklin'  
Spicy-like, and sweetenin' all the ground!

By day, the sunshine streamin',  
By night, the sweetest dreamin'—  
Country jest as happy as can be!  
Not a bit o' trouble—  
Single-file an' double,  
The juicy joy jest rains on you an' me!

—Atlanta Constitution.

It was just such a day, on Friday, the 19th, when, at two o'clock, the barbecue was served at Ponce de Leon, a resort in the city of Atlanta, where there are woods and boats and bathing places, and bowling alleys, which in the North would be called picnic grounds. It was a

delightful walk of about 500 feet from the street car line to the long barbecue tables, of Georgia pine, on which were placed the wooden dishes with Brunswick stew.

But the beer came first. Many kegs, with long wooden spigots, were sweating from the cool amber fluid, brewed in Atlanta, which is superior to the northern beer. Each keg supported a huge piece of ice, and as they stood at the entrance to the grounds, were very inviting to the thirsty visitors, who enjoyed the cool refreshment of the long drinks.

The barbecue consisted of twenty-five carcasses, of pig, lamb, and kid. On Thursday, a trench 20 feet long, 3½ feet wide, and 18 inches deep was dug, hickory boughs were put in and set on fire at midnight. Other fires were started near by. When the wood had burned to ashes, which took about three hours, live coals from the other fires were put in the trench. Each carcass was laid on two hickory poles, or two iron rods, and was placed over the trench, being cooked by the heat from the wood coals, which were being constantly replenished. The cooking meat is basted for four hours by a long stick with a swab on the end, from a mixture of hot water, salt, pure apple vinegar, red pod and cayenne pepper, mustard, lemons, onions, a little garlic, and lastly is covered with the best dairy butter. The choice bits are first the kidney and next the ribs.

No barbecue is complete without Brunswick stew. Now, very few people can make Brunswick stew, as it requires a peculiar skill. The stew served at the barbecue required sixty chickens, which were chopped to pieces and boiled until all the meat dropped from the bones. Cow's liver was added, which had been boiled until it crumbled. Maine corn, which was sweet and tender, lemons, onions, Worcestershire sauce, and the same ingredients as were used in the basting of the meats, were boiled down with the liquor from the meats, until it made a most delightful, though very rich and palatable food. This stew had been boiling since 5:30 in the morning.

The barbecue will never be forgotten by those who partook of the real Georgia barbecue, for it was entirely new to them.

#### FRIDAY EVENING

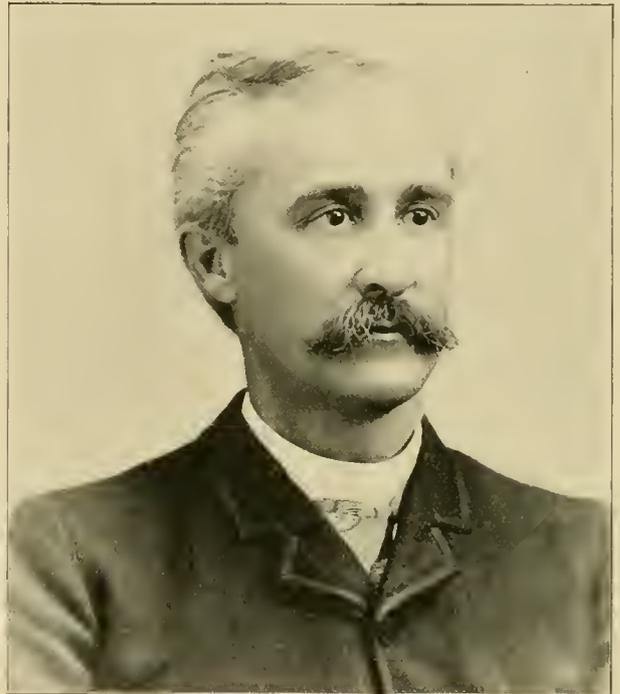

the visitors packed their trunks, and left the fair city of Atlanta, at eleven o'clock, with many regrets that their visit could not be continued. Many pleasant acquaintances were formed, both among the visitors themselves and the citizens of Atlanta. The local entertainment committee was tireless in its efforts to impress upon all the fact that southern hospitality was not simply a name.

At 11 o'clock the visitors left for Chattanooga to be the guests of the Chattanooga Electric Railway Company, which had invited them to spend Saturday at Look-out Mountain and Missionary Ridge. Before the train left everybody assembled on the depot platform, singing the familiar songs that are customary, and as "all aboard" was shouted, gave three cheers for Atlanta.

#### PRESIDENT JOEL HURT.

Joel Hurt is an example of what can be done by a person who develops the opportunities that are around him. He was born in Russell County, Alabama, at the age of fifteen, being thrust upon the world without home, or support. Many a boy would have been discouraged at the outlook, which must have caused him to realize how helpless he was. That he had grit is shown by his career. He worked his way through academy and college, graduating in 1871 as a civil engineer.

For ten years he practiced his profession, being chiefly engaged in railroad work in the South. The lessons he

PRESIDENT JOEL HURT.

had been forced to learn in his youth were a good preparation, and the foundation for his prosperity was laid. Since 1881, Mr. Hurt has been interested in real estate and financial institutions in Atlanta, and is one of the foremost public spirited citizens of that beautiful Southern city.

He is president of the Atlanta Consolidated system, and stands in the first rank of street railway presidents. In 1892 Mr. Hurt was elected second vice president of the American Street Railway Association. His counsel and advice has always been sought by the officers.

Socially Mr. Hurt makes himself liked by all with whom he comes in contact. He was very active at Atlanta in his efforts to compel the visitors to enjoy themselves, the compulsion being caused by the many entertainments that were offered. Mr. Hurt is a pleasant speaker and his address, when he thanked the convention for the honor conferred upon him, reveals his modest character.

## EXHIBITS AT CONVENTION

THE Pullman Company was represented by W. S. Louttit, an old timer at railway conventions.

A. L. REGISTER, of Pepper & Register, Philadelphia, electrical and mechanical engineers, was present.

FREDERICK R. CASE, of Philadelphia, represented the Hoopes & Townsend Company, manufacturers of bolts, nuts and rivets.

T. H. MARTIN, managing editor of "Dixie," that leader of Southern industrial interests, was a most welcome caller at the REVIEW booth.

F. G. Fuller, special agent of Day's Kerite, took pleasure in giving information to the few who had never heard of that well known high grade insulation.

THE H. Falk Manufacturing Company, Milwaukee, through A. Hoffman, showed its patent trolley and method of casting rails together making no joints.

J. W. ENO, of the Wilkesbarre Traction Company, a sprightly young man of 75 years was the oldest delegate in attendance, but expressed his willingness to learn.

FRANK X. CICOTT, the genial story-teller and manager of the railway department of Pettingell Andrews Company, Boston and New York, was on hand, meeting old friends from all parts of the country.

THE Charles Munson Belting Company, Chicago, showed samples of various styles of belting for street railway work. H. E. Skinner had charge of the exhibit, which was an attractive one.

THE Wallace Electric Company, Chicago, was at Atlanta, in the person of Max A. Berg, secretary. He showed samples of Robinson's patent trolley wheel, Fletcher's rapid transit switch, Paulsen's rail bond cap, and printed matter.

THE Guarantors Liability Indemnity Company, of Pennsylvania, was represented by R. E. Watson, of Aaron Haas & R. E. Watson, general southern agents. Mr. Watson had a tastefully arranged booth, and gave away pocket books.

THE National Lock Washer Company, Newark, N. J., showed track joints with its washer locking nuts on bolts, of which 90,000,000 are in use by various truck and motor manufacturers and car builders. R. L. Thomas was the representative.

THE American Railway Supply Company, New York, showed buttons, checks, caps and other specialties, which are in wide use by street railway companies. Walter Chur, the general manager, distributed an aluminum pocket medal, representing Pikes Peak.

THE Niles Tool Works, Hamilton, O., showed a hydraulic press of 100 tons capacity, built especially for street railway work; a 36-inch car wheel borer. A 24-inch lathe was exhibited, which is sold to a great many street railways. W. A. Stadelman was in charge.

THE Flood & Conklin Company, Newark, N. J., manufacturers of varnishes, was represented by H. C. Dick, who demonstrated the value of the company's varnishes. He distributed stamp boxes, which were greatly sought, and an atlas. The Flood & Conklin Company is having a large trade.

THE Maxwood Brake Shoe Company, of La Crosse, Wis., had something new in the shape of specially prepared and hydraulically pressed wood for brake shoes. A pressure of 3,000 pounds per square inch does the business. A sample shown had been in service 10,000 miles making 1,836 stops.

THE Bushnell Manufacturing Company, Easton, Pa., had an exhibit of longitudinal and reversible seatings in plush, rattan, carpet and leather, with a new reversible cross seat for open or closed cars, reversing within itself. E. M. Bushnell, secretary and treasurer, was in charge of the company's interests.

THE National Malleable Castings Company, Chicago, Cleveland, Indianapolis and Toledo, was represented by F. R. Angell, sales agent. Overhead trolley material, rail braces, rail chairs and other supplies were on exhibition. The company does a large business in furnishing castings for street railway construction.

CHARLES L. CORNELL, Hamilton, O., showed two novelties, an electric soldering iron and an arc headlight. The soldering iron has been used in laboratory and shop work two years. The lamp works in series with the incandescent lights on the car. Twenty are in use on the Hamilton & Lindenwald Railway Company, Hamilton, O.

THE Adams & Westlake Company, Chicago, showed the Acme automatic car window shade, headlights, platform safety gates and curtain material and other specialties, under the direction of L. A. Gray and G. A.

Crisson. The special feature was a new automatic double locking safety platform gate, very simple and compact.

THE Stanwood Manufacturing Company, was represented by President Stanwood, always a welcome addition to any gathering of railway men. His steel steps were in service on exhibition cars, and while failing to remove any snow or ice from the feet of passengers, afforded a sure and firm footing which alone is a sufficient recommendation.

THE Fitzgerald-Van Dorn Company, Lincoln, Neb., represented by W. T. Van Dorn, exhibited its automatic draw bar for street railroads and the type of automatic drawbar, to be used by the Metropolitan Elevated Road, Chicago. There was also a ball and socket joint attachment for the drawbar to take up lost motion, and a bar for going up and down mountain roads.

THE Stilwell-Bierce & Smith-Vaile Company, Dayton, O., Chicago, New York and Atlanta, exhibited steam pumps, Victor water wheels, Worrall friction clutch, railway truck jacks, steam feed, water heaters, purifiers and a self-oiling device for loose pulleys in connection with a friction clutch. J. W. Taylor, Southern agent, Atlanta, and E. J. Whitehead, city agent, prepared the exhibit.

THE Bass Foundry Company, Fort Wayne, occupied a conspicuous space in the center of Machinery Hall, where the artistic taste of P. F. Leach was evidenced in the arrangement of the exhibit, which included both cast, steel tired and cushion street car wheels. Samples were also shown having been in long and specially severe service, and altogether the display was fully up to the high standard of the Bass Company in former years.

E. F. DEWITT & Co., Lansingburg, N. Y., showed a new pattern of the common sense sand box. E. F. De Witt, who was at Atlanta himself, said that the new box can be put on old cars, and be worked where there is three inches of room. The knives are further up in car and the sand is in the car. Three regulators are fitted to the box so that it is adapted to any kind of sand. These sand boxes were used on the Jackson-Sharp exhibit cars.

THE Central Electric Heating Company, represented by Edward B. Wyman, general manager, R. J. Jerome and Sydney Hoch showed three styles of car heaters, A, B and C, in operation, using a special wire of its own, which has high resistance. The company has closed a contract to supply all the electric cars of the North Chicago Street Railroad Company with its heaters, which are used by 200 roads, either under the riser, against the riser, or under cross seats.

THE Davis Car Shade Company, Portland, Me., showed various styles of shades. The Inside, an oval tube, are two rods, which press a brake against a rubber wheel, preventing the shade from moving. The wheels

revolve in a groove, when the brake is released, and it is said there is no staggering. A waterproof curtain for open cars was exhibited, having the same attachment. C. M. Fuller, the general agent, says the curtain can be rolled up wet and left six months without mildew forming.

THE Rochester Car Wheel Works, Rochester, N. Y., showed fourteen wheels from 700-pound locomotive wheels to 200-pound street car wheels. A 33-inch motor wheel, originally 300 pounds, in use for two years on the Rochester Railway, having traveled 70,000 miles, was an interesting specimen. It weighed 240 pounds, having lost 60 pounds of metal and  $1\frac{1}{8}$  inches of its diameter. F. D. Russell, general manager, and George C. Morse, general sales agent, represented the company.

THE Michigan Electric Company attended its first convention with a large assortment of overhead material, attractively displayed. A new feature in signal lights was shown for the first time, consisting of an incandescent lamp in a lantern, behind a semaphore lens, the whole attached to the side of the revolving portion of trolley stand. Thus an approaching car distinctly indicates its route by color. The signal has been tested satisfactorily for eighteen months. Exhibits in charge of Joseph E. Lockwood.

THE Scarritt Car Seat Company, St. Louis, showed four styles of patent reversible seats, covered with cane, plush, imitation leather. These seats have a superelastic cushion. One plush and one cane longitudinal seat were shown. There were samples of the Columbian hand strap, with advertising features. S. G. Scarritt, manager, St. Louis, and H. O. Nourse, Chicago, were the representatives, and distributed a puzzle called "Coons in a hole," consisting of a small box covered with glass, four shot, one of which was to be put in each of four holes, a difficult yet attractive task.

THE Taylor Electrical Truck Company, Troy, N. Y., was represented by John Taylor. Mr. Taylor, showed the Taylor improved single truck, and the empire state radial truck, with Eureka anti-heating metal lined bearings. The empire truck is said to be safe to run 40 miles an hour, and curve around a 34 foot radius. The weight of motors is carried on the driving wheels. The form of truss in frame, has been changed. A new compound lever brake is furnished with the trucks which can be used with absolute safety, Mr. Taylor says, on a  $13\frac{1}{2}$  or 14 per cent grade.

THE Composite Brake Shoe Company, Boston, Mass., had an exhibit in charge of Geo. C. Ewing, superintendent. One shoe, and two that were worn out, were shown. A McGuire's truck was expected, but final arrangements were not made. The company has a record of 20,000 miles in 8 months, of one of its shoes on the line of the Trenton Passenger Railway Company, Tren-

ton N. J. The favor with which the composite brake shoe has met, is shown by the rapid growth of its trade. A year ago, only one foundry was necessary, but now four are in steady operation in Boston, Philadelphia, Pittsburg and San Francisco.

THE Meaker Manufacturing Company, Chicago, with extensive works at South Waukegan, Ill., was at Atlanta, in the person of J. W. Meaker, the president. Four stationary fare registers and several portable registers were shown. The stationary registers have a new mechanical pull, which is an improvement over the old method. A new mechanical trolley wire clip was shown, which has only two parts, wedging very tightly. Mr. Meaker showed a new hanger with a taper bolt of new insulating material. It can also be used with the Aetna bolt. Both the clip and hanger attracted a great deal of attention, and were probably the most important of the new devices shown.

THE E. T. Burrows Company, Portland, Me., represented by John W. Baker, showed models of five different kinds of shades. The oakette, for open and closed cars, is the exclusive property of this company. It is absolutely impervious to water, is durable, and can be cleaned. Mr. Baker says it rolls smoother and smaller than any other shade, not taking as large a space as cloth, and will last two or three times as long. It is different from any other shade material, not being affected by cold or heat. One hundred and fifty samples of goods entirely new and exclusive, were shown. The fixtures are more attractive and are proof against rust, preventing metal from rotting out the material.

THE Fulton Truck and Foundry Company, Mansfield, O., had a well arranged exhibit which was crowded all the time. W. E. Haycox, president and general manager, and Frank A. Rogers, special sales agent, were in charge. The imperial single steel truck, with improved life guard, brake rigging, with springs over journal box under the truss, was set up on the floor. In operation was an imperial double truck run by a Card motor. The equipment of the double truck is the same as the single, except it has a special swing brake. There was also shown the improved track cleaner, which will pass over any large obstruction such as stone, and immediately return in position. A six-inch hydraulic motor was exhibited.

THE Mather Electric Company, Manchester, Conn., had no exhibit except a desk, printed matter, showing its multipolar generator, direct connected generator, Ring type dynamos, Manchester stationary motor, photographs of the multipolar generator. Thomas C. Perkins, vice-president and J. Holt Gates, western contractor, Chicago, entertained. It was the intention to show a 100 kilowatt new type multipolar machine and some Manchester type motors. One multipolar machine was built for the convention, but was sold before it could be shipped, to the Street Railway Company at Danbury, Conn.

Another was built to take its place, but was sold to go to Scranton, Pa. The shops are worked until 10 p. m. every night.

THE Baltimore Car Wheel Company, Baltimore, Md., showed the Lord Baltimore truck, equipped with No. 12 Westinghouse motors, also a Lord Baltimore truck equipped with Baltimore central suspension and General Electric 800 motors. The Baltimore central suspension supports the motor under the center of armature taking most of the weight of the bearings, adding to the life of the bearings. Two bearings were shown that had been in use two months, the only signs of wear being two marks. J. B. Scott, mechanical engineer of the City & Suburban Railway Company, Baltimore, writes: "After two months' use there was almost no wear at all. It facilitates the removal of armatures and lessens the cost of track repairs." J. Paul Baker, secretary of the company, was in charge of the exhibit.

THE Consolidated Car Heating Company, Albany, N. Y., and Chicago, was represented by James F. McElroy, consulting engineer, Edwin A. Smith, general agent, Chicago, and H. R. Ransom, special eastern agent. Five different styles of electric heaters were shown in operation on car seats, three of which have only the opening of the heater in the riser, exposed in the car, and represent different styles of finishing. The casing is made of iron, lined with asbestos. Two styles were shown for use where objection is made to cutting the panel, the heater being screwed against the riser on the outside. The wire is wound around flat porcelain in some styles, and around tubular porcelain in others. An ornament shield protects the resistance material, and at the same time permits at all times a free flow of air. Where the seats are placed crosswise, a short heater with iron casing is attached under the seat. An improved regulating switch regulating the amount of current used in the heater, is so arranged, as to prevent sparking taking place. These are furnished with either wood or metal frames. Fuse boxes of new design, with snap lock switches, were also exhibited by which the switch is locked closed until the handle is clear back.

WHILE the Westinghouse Company did not have the usual elaborate exhibit in the exposition hall, for which that company has always been noted, there was, nevertheless, a good deal of Westinghouse apparatus displayed about the city. In the power house of the Consolidated Street Car Company, the three generators, two 400 horse-power and one 750 horse-power direct connected generator attracted a great deal of attention and a constant stream of visitors was noticed watching the operation of these machines. They were generally admired and praised for the substantial manner of their construction and the smoothness of operation. The Westinghouse Company had also a number of their new No. 12 motors and new style controller equipments on the cars running to and fro between the city and the exposition grounds.

(Continued on page 663.)

## POWER BRAKES VS. HAND BRAKES.

Paper Read at Atlanta Convention by E. J. Wessels, General Manager of the Gennett Air Brake Company, New York City.

Gentlemen: Hand brakes and friction brakes have not materially changed since the day they were first put in service. It is obvious that a brake only powerful enough to stop a small, slow moving light weight car, has outlived its usefulness when applied to cars weighing seven tons or more, propelled by an unseen force which has driven live stock from the field. The modern brake, when placed alongside of the old-time brake, bears the same relation to it that an arc light does to a kerosene lamp. Brakes of all kinds are useful, but the brake installed to day should answer all the severe requirements of modern practice.

E. J. WESSELS.

By common consent, the two things regarded as most important in steam railroading are the wheel flange and brake. None of us would like to travel on the Empire State Express if we had to depend upon hand brakes instead of the well known air brake. It is not strange that car builders have not kept pace with present requirements, in their braking apparatus. They have done well for the street railway fraternity, but heads and hands have been occupied in developing trucks, wheels and car bodies, and builders have not been able to do justice to the brake. The radical changes in car building brought about by cable and motor cars, have kept builders busy. They could not devote their entire attention to improved brakes. We have no controversy with car builders on this question and wish to suggest rather than criticise. If buyers demanded improved brakes, builders would conform. As such demand has not been made, the brake of to-day remains in appearance substantially what it was twenty years ago.

The evolution of the electric motor has been rapid and astonishing. Motor builders have had great odds to contend with, but have overcome them, and the leading types of machines combine efficiency with low cost and economy of operation. Motors have been standardized.

It will not be denied that hand brakes are inadequate. If power brakes could be furnished at the same first cost as hand brakes, they would be universally adopted. The day is approaching when air brakes will be considered as separate equipments and will not be quoted in the lump sum named per car. There is no more reason for including brakes in the estimates than for including motors. On roads free from grades, there is obviously not such imperative necessity for reliable brakes as there is on roads which have grades of from five to fourteen per cent, or where travel is congested, and especially on suburban roads operated at high speeds.

Railway men are seeking the most improved appliances of all kinds. They have found it profitable to include many things in their rolling stock which formerly were not used. Thus, elegant cars have come into use equipped with vestibules, plate glass, stained glass, Pintsch gas, upholstered seats, electric heaters, fine head lights, and even call bells. These are radical departures from the old time cheerless cars, which were generally not heated and had smoking oil lamps, and floors littered with straw. Improvements pay. If they did not, they would not be made. Formerly it was difficult to work one's way to the door of a car, and when one got there, it was at times hard to get out. To-day, with improved facilities for ingress and egress, crowds are comfortably carried. This change in car construction involves additional expense. It is paid without complaint, because the outlay is found to more than pay for itself in increased business. Then, too, the public demands improvements, and there is more disposition on managers' part to give the public what it demands, if practicable.

It will not be maintained that the improvements are absolute necessities, nor can it be shown that they are in any sense "life-saving." Ocean flyers in service have \$20,000 oil paintings ministering to the aesthetic taste of tourists, in their saloons. In the hour of collision it

is far more important that passengers have a properly constructed life-boat at their disposal, than any creation of the painter's art. Each has its sphere, but the more important thing is the life-boat. It is so in street railway practice. Cars should be artistic, but they should be equipped with brakes that will do their work quickly when danger impends.

On steam roads hand brakes proved utterly inadequate. They were tested and found wanting. When the first air brake made its appearance it encountered great opposition. Where would steam railway practice be to-day if air brakes were eliminated? The battle of power brakes vs. hand brakes on steam roads was fought years ago, and air brakes remained in possession of the field. It is questionable if the need for power brakes is as great on steam roads as it is on surface roads, especially when trailers are run. Steam road stations are miles apart. It was comparatively easy for an engineer to whistle "down brakes," to cut off steam and bring his train up standing. The inertia to be overcome was greater, but he had not the grades to contend with that exist on surface roads.

Electric cars, in even out of the way places, ascend grades that no mogul engine has to confront. Of course there is a corresponding down grade, and it is here that the difficulty arises, for surface cars ought to stop for passengers, no matter how steep the grade or high the speed may be. Otherwise earnings decrease. The braking power on an electric or cable car should be so positive as to permit of stopping in less than the car's length, if necessary. One has only to watch the men braking cars going down such grades as exist in Albany and Jamestown, N. Y., Easton and Allentown, Pa., and scores of places, to have a full appreciation of this point.

Recognizing the inadequacy of a single hand brake on grades, many roads have provided a duplicate inside equipment. This extra equipment is additionally expensive, not only in first cost, but especially in maintenance. A motorman realizes how difficult it is to keep his car under control, hence he sets one brake before car starts down grade. He then depends upon his other brake. Manifestly, when one brake is set from start to finish, it means wear and tear of apparatus and short life for the shoes. Moreover, the speed of car is needlessly retarded and fewer car miles per day can be run than would be made if he had a positive braking outfit at command.

In a good air brake the brake cylinder is constructed of iron and contains a piston and piston rod, which is attached to brake levers under the car. The rear end of the brake cylinder is made air tight, and connected with the train pipe, so that when air is applied from the reservoir it forces out the piston in the cylinder and sets the brakes. The power of the brake cylinder can be easily calculated, and is equal to the square inch area of the piston multiplied by the air pressure carried in the reservoir, hence:

Brake cylinder 6 in. diameter and 30 lbs. pressure gives 848 lbs. power at the brake cylinder.

Brake cylinder 7 in. diameter and 30 lbs. pressure gives 1,154 lbs. power at the brake cylinder.

Brake cylinder 7 in. diameter and 32 lbs. pressure gives 1,231 lbs. power at the brake cylinder.

Brake cylinder 8 in. diameter and 35 lbs. pressure gives 1,759 lbs. power at the brake cylinder.

This may be increased by using larger diameters, or higher pressure, and by arrangement of brake levers any additional power may be obtained; at the same time it can be graded suitably to the weight and speed of car.

Friction (or continuous) brakes operated from the axle have been used for years, and the jar from them has caused constant complaint. The braking force requisite to bring a car or train to a stop, should never exceed the weight of load resting upon the wheels to which brakes are applied. Any power applied in excess of this is wasteful and dangerous. The full power of a friction brake depends upon the load carried on axle to which friction discs are attached. With a grip car and passengers weighing 8,000 pounds, the weight being equally divided between two axles, leaves 4,000 pounds carried by the axle with friction discs. With a car wheel of two and one-half times the diameter of friction drum, we gain that much leverage, which multiplied by 4,000 pounds, gives the direct pull power of friction brake of 10,000 pounds.

Nor is this all. The brake levers of street cars are, as a rule, adjusted to about four and one-half times leverage. If, then, we multiply the 10,000 pounds pull of friction brake by this leverage we have a strain of 45,000 pounds upon brake beam and shoes. This is vastly more power than is ever required. When two or more cars are

coupled together it is impossible to regulate brake chains and brake gear so that every shoe will press with equal force against the wheel.

When, therefore, a gripman applies his friction brake, the entire 45,000 pounds is carried by the beam and shoe that are adjusted nearest the wheels and the remaining wheels revolve without noticeable check.

In a train of three four wheeled cars with passengers, weighing 36,000 pounds, resting on twelve wheels, a brake power of say 2,000 pounds applied to each wheel would make the most perfect stop. If the entire 45,000 pounds power of friction brake is applied to only two wheels of such train, there will be 38,000 pounds more power exerted than necessary to stop wheels from revolving, and at same time only one-sixth effectual braking power is obtained as compared with a braking pressure distributed against every wheel under the train. Such harsh, rigid excessive power of the friction brake, applied quickly by the momentum of the whole train, will wear out any kind of brake gear, no matter how good or how strongly made, and the constant jar adversely affects the life of cars. In cold, wet and stormy weather (with slippery tracks), when grip car is abandoned except by the gripman, the pull power of friction drum is greatly reduced just at the time it is most needed to set brakes on trailers which are always overcrowded at such time.

A twenty-eight foot closed electric car weighing without passengers 20,000 pounds and running at ten miles per hour, has over six times the energy to overcome when brakes are applied, that a horse car has, weighing one-fourth as much and traveling at less than one-half the speed. Moreover, when horses were employed there were ten feet extra length in which to stop car. This extra length is no longer available since the advent of electric cars. Unless cars have proper brakes, high speeds are most dangerous.

Without entering the humane feature of braking, it cannot be denied that at best hand braking is a great task for even strong men. They report fresh in the morning and for a time muscles stand the strain; but after a few hours handling of a grip lever or controller handle, they find their strength decreasing. Realizing this, for the rest of the day they slow up earlier than strictly necessary or (as often happens) they do not stop at all and let cars run past crossings, missing passengers, who do not always wait for the next car, but walk instead.

If, however, the men have ready for instant use an ally in the shape of power requiring but the touch of a handle to become available, they are placed in the best possible position to make as many stops in as short a distance as is necessary. Not being fagged out, they are better able to do their company more justice and are more on the alert to prevent accidents.

In the distressing accident which occurred seven weeks ago in New Jersey, this point was particularly emphasized. We quote from New York *Herald*, August 27, after having ascertained from the officials that the report is accurate. "When the crowded car began to go down the incline, the brakes would not respond promptly to the demand of Motorman Gornley. Tight as he could wind up the chain, he felt it slip repeatedly. He knew what this meant, and with full strength he set the brake as hard as he could. But his efforts were in vain, and the car gained greater headway every instant. It was beyond his control, and he realized that in a few seconds the car would strike the sharp 'Crab tree' curve. As it dashed down the steep mountain side tracks, he turned and shouted to Conductor Badgely to put on the rear brake chain.

"Badgely was inside the car, and at Gornley's call every one suddenly realized the danger. The conductor was wedged between the passengers but he fought his way to the rear platform and wound up the remaining chain of the single brake system from there. In an instant he saw that it, too, was of no use in the emergency, and turning, he shouted, 'Jump, for your lives? The car is running away and will strike a curve.' The car was rushing on to that fateful curve. Like a shot propelled by some awful power it went. Then it struck that curve. A section of one of the wheel flanges snapped off, and an instant later the car left the rails. It ploughed its way across the track with scarcely any perceptible diminution of speed, was jerked sharply to the right, when the wheels struck the opposite rail and then capsized, landing squarely on its side with a crash which was heard a quarter of a mile away."

We need not pursue the account further, except to say that eighteen people were hurt, many of them badly, and one boy's arm had to be amputated. A \$35,000 damage suit is pending against the Accident

Insurance Company which wrote the risk on that road, and the same company has settled a number of cases out of court.

It is only fair to state that had that entire system been equipped with power brakes equal to such emergency, the car could have been stopped long before danger point was reached, without injury to limb or property.

It is not the purpose of this paper to make capital from such sad occurrence; we are opposed to sensationalism, but it is proper to call attention to such calamity, as a warning. What happened on that road has happened on others, and will again occur, so long as implicit reliance is placed upon hand brakes, which cannot possibly do the work required of them at such crisis. The first cost of equipping the entire line with power brakes would have been but a fraction of what the damages will cost.

It is unnecessary to multiply instances where hand brakes have shown radical defects. That practical men have been apt to think too lightly of the question of improved brakes, is explainable by their having so many other important things to oversee. Then, too, the aim of a railway man is to incur as few obligations as possible, and to operate with utmost economy and earn dividends. But often seemingly cheap apparatus proves dearest in the end.

Probably 75 per cent of recorded accidents are chargeable to inefficient brakes. Statistics of this sort are hard to tabulate, and some records show even a higher percentage. While hand brakes often stop cars quickly, they do so by consuming excessive energy. This means waste and increases maintenance account. Then, too, it is impossible for a motorman to maintain his maximum strength for a long time. In active service he has to apply brakes between 250 and 400 times daily. He can only exert his maximum strength spasmodically and temporarily, even when aided by the weight of his body. "A chain is no stronger than its weakest link."

The day is past when railway employes are considered merely automatons. Not all men make good motormen or gripmen. These positions, like that of conductor, are ones of trust. The men, as a rule, are intelligent, and during the recent financial depression many recruits have been made who formerly filled much higher spheres. The strain of a day's work on these men is very severe. When we consider how many chances people take in crossing tracks in front of moving cars, or in jumping on or off despite printed warnings, this strain becomes more apparent. No matter how fast or slow cars go, people are always dodging them with reckless disregard of danger. A motorman is not allowed to shout. He is required to keep silent. In the presence of danger he can only rely upon his gong or whistle and his arms. These alone are not adequate when drunken or deaf men are on the tracks.

The most painful thing which comes under a street railway man's notice, is the killing or maiming, especially of children. When a little child, ignorant of danger, toddles to the track and sees the car coming, it generally stops, hesitates, starts off and usually rushes in front of the car. The motorman, who has to depend upon a hand brake at such time, seldom succeeds in stopping his car. It is not an unusual sight to see a little child taken from under the wheels.

Touching the legal aspect of the brake question, while it often happens that plaintiffs are non-suited on the ground of contributive negligence, to the railway man this frequently means outlay for legal talent. Even though his company or the underwriters are not called upon to pay damages in such cases, it is surely better to prevent accidents than to defend law suits, especially as prevention is cheaper.

It is a menace to life and property to have a high speed motor at work without having suitable power to control it. Thus far "reversing" has not proved a success, and, while theoretically one motor acts as a generator to drive the other (if there be two, which is not always the case), in practice this has proved a failure. The danger of relying upon the same current which propels a car to stop it too, is only too apparent. If the current fails to work in one case, how can it be expected to work in another? The trolley may run off, or there may be a break in the line when current is needed for braking a car plunging down grade. "It's the unexpected that happens."

Hand brakes have no emergency stops. Air brakes have, and, if necessary, stops can be made so quickly as to apply brake shoes instantly to every wheel on one car or a train of cars, in the most effectual manner. No hand brake can do this.

When hand brakes are used it is necessary to have a separate brakeman for each trailer. When an air brake is used, these extra men are entirely dispensed with. On a train of a motor car and two

trailers, if air brakes are used, only one motorman and one conductor are necessary. If hand brakes are used to control the same train, four men instead of two, are necessary. This means a saving in wages of at least \$25 a week, and will soon pay for an air brake equipment.

Moreover, when air brakes are used, there is no shuttle movement jerking or jumping, and the shoes are applied evenly to all the wheels; whereas, in hand braking it is impossible for different men on different cars to brake in harmony. One car will be braked hard and another not so hard. Of course no good results from such ununiform braking.

Air brakes are provided with reserve power stored in reservoirs, and, by having large enough capacity, the air pressure required for braking becomes practically inexhaustible. The air pump of a thoroughly good air brake is most economical in operation. It requires no power when car is starting or when it climbs grades. As it takes ten times the power to start a car that it takes to keep it going, the advantage of this is obvious. A good air brake is so compact that very little room is required for it under car body. It has no cumbersome or complicated machinery to get out of order. It works automatically. It needs much less attention than an electric motor gets. It is only necessary to keep the mechanism clean and in order, and to lubricate pump regularly. No binges or springs annoy inspectors or employes. A good air brake pump, the moment it has compressed sufficient air, cuts out and runs in free air with the axle. A good air brake entirely replaces a hand brake. The hand brake may be left on the car, and the air brake can be so attached as to leave the hand brake available should it be required. A good air brake requires no expert to operate it. It is so simple that a child can work it. This being so, a railway manager is not restricted to hiring men of a certain height or weight, for when work is done by compressed air instead of muscular strength, no Samson is required to work the handle.

In steam practice, trunk lines maintain schools of instruction in which men are taught to handle air brakes, and only qualified engineers are trusted to operate them. A good air brake for surface roads is so constructed that, when used by men not schooled in its use, it does not get out of order. It is capable of being misused without proving defective. The physical labor involved in working the ordinary hand brake causes the other good qualities of a gripman or motorman to suffer. This has a direct bearing on accident account, wear and tear and repair accounts. The application is obvious. "A stitch in time saves nine."

A good air brake enables a man to make the best possible stops without noise, jar or injury to apparatus. In hand braking much excess force is used. This means that rods and bars are strained when stopping car, and often brake gear is in such shape that, when a quick stop is required, some part is sure to collapse.

One type of air brake equipment in service enables a gripman with but a small handle to work grip and brake either simultaneously or independently. When this type brake is used on car, grip and brake levers are entirely removed, giving more space for passengers on platforms. Through its use, what formerly involved painfully hard work, is now accomplished with ease. This device is in successful operation on car 421 of the Third Avenue Railroad, New York.

We believe it is better to keep the motor controller and the brake handle separate, but if railway men demand a single handle to operate both it can be supplied just as was done in the air brake on Third Avenue, New York, car 421, which works grip and brake. We doubt, however, if real necessity for a single handle exists.

Recently a new form of power brake has been announced, in which electricity is relied upon. The electric brake, while undoubtedly possessing some valuable features, has some which are a decided disadvantage. It is, of course, in its infancy, and the future of the electric brake will be watched with interest. We saw the paper read by Mr. Sperry on the 19th of last September before the American Institute of Electrical Engineers, entitled, "The Electric Brake in Practice." Mr. Sperry, unknown to himself quotes our language verbatim, which was used as an editorial by one of the dailies and subsequently was copied in the journals. It is to be regretted that, when using a part of our matter, the able electrician did not use other parts also.

He says that a locomotive engineer has his pressure gauges, which allow him to adjust the brake application to a nicety. A good air brake for surface roads is also supplied with a pressure gauge, but in practice no Westinghouse air brake engineer looks at a gauge, and they are more ornamental than necessary. He states that with an electric brake the brake shoes are entirely dispensed with. Do the street railway men intend to abolish brake shoes? Suppose, as may happen, the electric brake fails to work, what will become of the car or train? There is an

apparent contradiction in the article on this point. In one place it states that the electric brake does away with brake shoes, and in another place it admits that it will be necessary to resort to hand brakes. How can hand brakes be used without shoes, and how can a car be held by an electric brake after the residual magnetism (or Foucault current) is dissipated? He says that the one grave fault of an air brake in railway service is that the maximum brake application does not exist as it should at the higher speeds. This is an error. The immense advantage of an air brake over an electric brake is the fact that power can be applied in varying degrees; great power when needed and almost imperceptible power if only very slight retardation is wanted.

An air brake holds the wheels and keeps doing so. An electric brake, after first stop, depends wholly upon residual magnetism. This, at its best, is an uncertain factor. As we understand the paper, the residual magnetism in the electric brake is only available for something less than one-half minute after car has stopped. When this magnetism is consumed the electric brake possesses no more braking power whatever, until the car is again in motion. It is right here that the air brake shows its immense superiority, for it has the air reservoirs to draw upon when a car is stopped, and therefore ample power is available for immediate and constant use. This failure in source of supply is a tremendously weak point in an electric brake. The paper states that "the current flowing after motion ceases, though small (mark this admission) is found exceedingly useful in holding the car from starting itself, even on quite a heavy grade, as only a small quantity of energy, added to the already great friction of quiescence, will prevent the car from starting." We fear that at such times the advocate of electric brakes would need something more reliable and constant to lean upon. The paper says, "when an electric brake is used it seems as though the car was running into an air cushion." This pays a well merited compliment to air brakes, for by them an air cushion stop is made possible. The paper adds "operating the brake in this manner it will at once be seen that the system is one of the utmost certainty of operation, surer even than the hand brake, air, or other power brakes." If the speaker had not been for some years in the electric motor business, he might not take such decided exception to this claim as he does; but since working with air pressures he has found them much more reliable and safer than electricity. The inventor referred to makes fourteen claims of the advantages of his brake over other brake systems. As this paper is not written for advertising effects we purposely refrain from naming any special make of air brake in contrast with the electric.

1st. He speaks of the certainty of an electric brake in operating.

So is a good air brake certain in operation.

2d. The enormous power and under perfect control.

A good air brake has much more power, more constant power, and is under better control. It will be noticed that the inventor omits all reference to electric brake power being constant. This lack of constant braking power is the objectionable and fatal defect of the electric brake. It will not be noticeable on a level, but it will be only too apparent on a grade. At the Institute meeting, before which the paper on electric brakes was read, one of the members stated he had been on a train in Connecticut where two motor cars and three trailers were ascending a nine per cent grade. While doing so a fuse on the second motor car blew out, throwing all the work on the first motor car. This it was unable to do and hand brake had to be immediately applied to prevent train from running away. The author of the paper was asked "what would you do at such a time with your electric brake?" Mr. Sperry, in reply to the question, said that a case of this kind was rather unusual, but that he would have applied the electric brakes, which would have brought the train to a stand-still, and by that time the hand brakes could be applied to prevent the car from running backward down the grade. How then can he claim that the brake dispenses with brake shoes, and if the electric brake had been used on the train in question to the exclusion of hand brakes and brake shoes; what would have become of the train and passengers?

3d. "The absence of all power absorption at moneyed cost from the central station."

This may be true if brake shoes are not used, but remains to be proved in daily service. Shoes probably will continue to be used. A good air brake consumes very little power. You can test how little by watching the readings on a car operated at this time with an air brake on the Atlantic Consolidated Road.

4th. "Its high efficiency, being far superior to compressed air; amply proven in numberless instances where electricity has replaced air. (The air requires a direct application of energy, amounting to an immense aggregate power absorption during the day from the central station; the working parts of the air machinery are attached to the car axles and re-

quire a large quantity of energy not only while compressing, but at other times as well."

We are unaware of a single case where electricity has replaced air. We are informed on high authority that air compressors for driving rock drills and coal cutters so greatly outnumbered electrical machinery for such purposes that hundreds of air compressors are sold for every drill or cutter sold. The statement that an air brake requires a large quantity of energy not only while compressing, but at other times as well, is wholly inaccurate and entirely incapable of proof. A good air pump requires no perceptible power after it cuts out."

5th. "Its extreme simplicity."

So is a good air brake very simple.

6th. "Observe saving in wheels, two or three fold."

A good air brake properly applied saves the wheels.

7th. "Saving of brake shoes."

We believe brake shoes will be retained and would not care to ride on a car without them. Under certain conditions the paper admits hand brakes will be needed. How can hand brakes be applied without shoes?

8th. "Very little wear of either wheel or magnet."

There is little wear to a good air brake, and lightning plays no pranks with an air brake, but is likely to do so with an electric brake.

9th. "No hissing to frighten horses on streets."

We have yet to hear of a case where a horse was frightened by an air brake.

10th. "The low E. M. F. at which it operates."

That is true of a good air brake. It is easy to test power consumption with a watt meter, by running car with air pump, and then running car (under exactly similar conditions) with air pump detached; the slight power consumed will then appear.

11th. "The ease of its application and control."

Nothing surpasses a good air brake in these respects.

12th. "Conserving strength, prolonging the usefulness and life of the motormen."

This is open to question when one sees the despair of motormen when fuses melt and switches burn out. Gripman Williams, on air brake car 421 of the Third avenue road, New York (where 120 equipments are in daily operation), told the speaker, "This job is so soft, I expect some of you Wall street fellows will come here to run cars since times are hard."

13th. "The smoothness of its operation."

Nothing can surpass the air cushioning effect of a good air brake.

14th. "Cannot cause flat wheels."

A good air brake properly applied also prevents flattening of wheels.

We had no intention to refer at length to electric brakes, but have felt constrained to do so because the statements we have replied to appear in the printed Transactions of the American Institute of Electrical Engineers, and should not remain uncontradicted.

Lastly it must be remembered that the magnetic clutch of this electric brake has to bear on the surface of a flat disc cast upon the car wheel. This can hardly be called "ease of application," for the brake cannot be applied to the ordinary type of street car wheel. It requires a special casting to be made on one wheel on each axle. This on a large system means an additional outlay for wheels, as "extras are charged for."

We have purposely avoided tabulating the fatal accidents in the last twelve months, directly due to inadequate braking facilities. It, however, is timely to call attention to the charge of Judge Lippincott to the Grand Jury of Hudson County, New Jersey, last month. He devotes special attention to the subject of "killing by the trolley," which he characterized as being sometimes manslaughter. He said, "Deaths by accident have become very frequent. Personal injury, not resulting in death by accident, has become frequent. Now, from mere unavoidable accident, resulting in death or personal injury, no liability whatever arises, but the general rule of law is that where death or other personal injury results by reason of the omission on the part of another to discharge a legal duty, there a criminal liability arises for manslaughter in the case of death, or for an assault and battery where death does not ensue. If the neglect of a legal duty is the cause of death, the person guilty of such neglect is chargeable with manslaughter. If death does not result, but only other personal injury, then he is chargeable with assault and battery. The law imposes upon every one reasonable care in his acts toward another. There is a legal duty owing from one to the other, and a negligent omission of the performance of that duty, resulting in death or other bodily injury, is indictable." He proceeds: "There are many familiar illustrations of these principles of law: a motorman running his electric car along the streets carelessly, negligently, runs over another and kills him, it is manslaughter, although it was not his intention to injure him. A motorman running his car at a dangerous rate of

speed along the streets, running over another by reason of his dangerous rate of speed, the death arising from this omission of duty to run at a reasonable rate of speed, he becomes guilty of manslaughter. If persons in charge of the running of steamboats, railroad trains, electric trolley cars, horse cars or other public conveyances, neglect the duty of using reasonable care and death results therefrom, they are answerable for manslaughter, whether it be in the erection of buildings, the running of machinery, or any other employment."

It will be seen that the judge's charge covers the operating of motors. A jury will certainly class an air brake as being more than a reasonably safe appliance. It is certain that a plaintiff's attorney in prosecuting a suit for damages will call attention to the fact that it was possible for a company to have availed itself of an air brake which would have been reliable.

Recently two verdicts were given against one traction company in New Jersey, one for \$3,000, the other for \$5,000, and there are other suits pending for over \$500,000 damages in that place alone on account of trolley car accidents. Thirty-eight deaths to date are charged against that one road since it adopted electricity.

On September 21st, Motorman Michael Lewis was convicted of manslaughter in the Court of Special Sessions at Newark. Lewis ran the motor car which killed four-year-old Martha Henry on August 4th.

On September 25th, Judge Kirkpatrick sentenced Lewis for one year in the County Penitentiary. The Judge lectured him severely for carelessness and said he felt it his duty to make an example of him. Lewis was crushed by the unexpected sentence. He expected only to be fined and that his company would help him. On the same day motorman Desmond was arrested in Brooklyn for nearly killing a six-year-old girl. His car cut off her right foot. He claimed he did not see her until she was directly in front of the car and that it was impossible to stop it in time.

In Alliance, Ohio, it is recorded that "The motorman, when he found his car going down hill at too great speed, immediately lost his nerve and deserted his post." That car was equipped with a presumably good hand brake. This would not have occurred, had a good air brake been available.

More than one motorman has lost his reason as the result of a fatal accident. Recently a motorman committed suicide owing to his remorse for having run over a child. It may be said this was not his company's affair, but had this unfortunate man had a power brake at hand, he would not have killed the child and taken his own life. In a sense we are our brother's keepers. Would it not be well to place in every motorman's hand apparatus which would render indictment by a grand jury out of the question?

There are some railway men who complacently tell us they have no accidents on their road. It may be that such fortunate individuals exist, but we have not found them. It is somewhat curious that after men made this statement there were bad accidents on their roads.

The newspapers have been hounding the fraternity so much in Brooklyn and elsewhere that trolley accidents have become household words or a subject for jest.

There is no part of electric or cable railroading so important as the ability to stop cars quickly and to keep them stopped! This is specially true where electric or cable cars cross steam roads at grade. At such times hand brakes show their inherent inadequacy.

We do not advocate the adoption of a scientific toy, but submit for your consideration the fact that you can procure at comparatively low cost air brakes which are positive, simple, economical and highly efficient, and which have been tested in the crucible of daily operation.

In advocating the adoption of air brakes we are often told by railway men, "We haven't time for experiments. Let somebody else do the experimenting and then we will look into the thing." Had this position been taken by progressive men would there be a single commercial electric motor in existence?

The experimental stage was passed long ago, and with 350,000 air brakes on locomotives, passenger and freight cars, it is untimely to talk about experimenting, for steam roads and surface roads have much in common. If a freight car loaded with pig iron needs an air brake, how much more is one needed to brake a car carrying living beings?

There are air brakes and air brakes. Of the merits of the different ones, buyers will do well to satisfy themselves before contracting.

The all important question is whether the first cost of a good air brake is too high, or not, in proportion to the advantages gained. No accountant can figure accurately how many dollars of damage claims will be avoided; nor how much revenue will be increased by the quicker schedules made possible with air brakes (for even seconds count); nor what the gain in labor account will be by not being restricted to hiring

any particular height or weight of man; or how much the life of car body, truck and motor will be prolonged. There is a decided gain from whatever point we view the air brake, and with an air brake an employe is armed at all points.

Will it not be worth your while to give this braking matter earnest attention? If but a few of this audience will determine to investigate the advantages of the air brake over all other forms of brakes, this paper will not have been prepared in vain.

It was written to suggest the value of good power brakes over hand brakes, in minutes snatched from busy days.

## CAN THE T RAIL BE SATISFACTORILY USED IN PAVED STREETS.

A Report to the American Street Railway Association by S. Hendrie, Manager Wyandotte and Detroit River Railway.

Strathearn Hendrie, was born in Detroit, Mich., 28 years ago, was nursed on street railways in infancy, and has continued in that line ever since. His father was treasurer and general manager of the old Detroit City Railway. This progressive young man began his active street railway career in 1887, with the Detroit City Railway, two years later being made treasurer and assistant to the president and general manager, holding that busy position until 1891, when he went out with the other old stockholders, and the lines were sold to the Detroit Citizens Railway Company. He has always been interested in the suburban railway idea, and in 1892 consolidated the Detroit Electric Railway, East Detroit & Grosse Pointe Electric Railway, the Jefferson Avenue Railway and the Gratiot Avenue Railway, in all of which he had been previously interested, into the Detroit Suburban Railway Company, which he sold to the Detroit Citizens' Street Railway Company. Mr. Hendrie represented the Wyandotte & Detroit River Railway in the convention, and is interested in the extension of the Detroit, Rouge River & Dearborn Railway, and other suburban plans. His paper is prepared, so that it will be of use by railway companies in their arguments with city officials.

STRATHEARN HENDRIE.

GENTLEMEN: For reasons unnecessary to mention your committee's report has been prepared with more haste than the subject deserves, and you will undoubtedly find it incomplete in many details. A vivid recollection, however, of the disappointment of your members at previous meetings when papers have failed to materialize, has emboldened us to present this report in its incomplete state, as better than no report at all and as continuing the discussion of a subject in which so much interest was expressed at the last convention.

We would preface our report by the explanation that we have considered the word "satisfactorily" as applying to the point of view of the city and the driving public, as well as that of the company, and we will endeavor to show that the T rail is not only satisfactorily used in paved streets, but that it is the best rail for the purpose.

The tendency of the larger cities in this country—in fact we might say in all the cities of this country—during the past ten or twelve years has been towards smoother and better paved streets, and the general public, watching the progress of its city officials, has become in many places impatient of the action of the street railway people in maintaining the old forms of rail which make a ridge on the smooth surface of a first-class modern street in an American city. Our travelers have come home from England and the continent extolling the grooved rail, and our city officials have in many cases forced either the English grooved rail or its American modification upon the railway companies. No street railway man hankers after the grooved head before he gets it, or enjoys it after he has put it in, and he therefore fights its introduction, demanding to be left alone, as he was, with his center-bearing or five inch tram head. What we would show him—and through and beyond him his public—is that he can progress in the direction of their desires for a smooth street, and can give them something even more satisfactory to them than their favorite grooved rail.

For the street railway men, questions of price, joints, quick delivery, competition, coal pile, and construction, combine to recommend the T rail. The old argument for the tram head—that the steel paving for the three inches is the cheapest in the end—no longer holds good in these days of good street pavements and rapid transit. Wagon traffic goes where it belongs—on the side of the street. To those who can still use

the clean headed old center bearing rail, we can only say, "You lucky dogs"; to most of us it is lost forever. As a substitute for this, where old grants are being renewed or new ones made, the grooved headed rail has been in many places hastily, and, we believe, unadvisedly required. While the suggestion of a T rail, for use in paved streets in cities, is startling to the average citizen, alderman, or city engineer, and is in most cases impatiently rejected by them, yet we must recollect that the mention of a rail such as steam roads use, calls up in their minds the idea of four or five inches of steel standing up above the street and of dilapidated plank crossings with half-drawn spikes, and we should go patiently to work to teach them that as there is more than one way to supply motive power to a car, so there is more than one way of putting a rail in the street.

To aid you in this, we have prepared a list of twenty-six cities in which the T rail is used, with remarks thereon (to be found at the end of this paper), kindly furnished this committee by the railway companies in answer to a list of questions sent out; and we might also say that there are over fifty other members of this association whose roads are reported in the railway publications as being partly or wholly constructed of T rail, who declined or neglected to answer the inquiries of your committee. The general consensus of opinion of the twenty-six roads referred to, and of the officials of the cities in which they run, is that if you can once get down a hundred yards of T rail and make a decent job of the paving, neither the officials nor the citizens will permit you to use anything else in the future. The main thing is to make your paving job a neat and good one. In three of the other cities, where there is at present no T rail, but which are blessed with enlightened city officials, the T rail is about to be made a requirement on the companies.

Modern street railway construction and street paving imply a broken stone, concrete or other solid foundation, a high girder or T rail, and a brick, asphalt or granite surface to the street, in the larger cities, or cedar block, cobble or macadam in the smaller ones.

Asphalt or macadam can be paved as easily to a T rail as to any other. They should be laid flush, and room should be made for the flange by running a railroad freight car, or other car having a larger flange than the street car, over the track before it is opened for traffic. Bricks are now molded by many paving brick manufacturers to fit girder and T rails, those for the latter allowing a small space for the flange of the car wheel. Whether it is more expensive to chip the corners of granite or Medina blocks, or to leave them intact a short distance from the head of the rail and fill the space thus made with asphalt, creosoted wood or concrete, is open to question, but, in either case, a first-class job can be made. The writer is familiar with two excellent pieces of 56 pound T rail construction on chairs, in one of which the pavement consists of six-inch cedar blocks, and in the other of small three or four-inch cobble stones, both paved close to the rail with no filling.

It may be useful, in your arguments with city officials in favor of a T rail as against a grooved girder, to insist that a T rail is a girder rail with a head differing less from that of the grooved girder than this does from the tram or center bearing head. Also the substitution, in this country, of the steel base and upright member of the girder for the wooden stringer, took place before the introduction of the grooved rail, and was due to entirely different causes and certainly has not been brought about by any demand for smooth streets originating with the cities or citizens. Such substitution is equivalent to that of steel for wood in buildings. The girder is an established fact; its grooved head, we hope, is merely a passing fancy. The grooved rail might easily be a big headed T out of which a piece corresponding to the groove had been planed. This can easily be shown by reference to cross sections. And we should bear in mind that if we hope to peacefully and with good feeling avoid the use of a grooved rail, we must do so, not by demanding obstinately what we know in our inmost minds to be reasonably objectionable, to be bad practice, to be obsolete, but by presenting to the public, and educating it up to, a rail which shall, from its point of view, be as far ahead of the grooved rail as that is ahead of the tram or center bearing rail. And we should also bear in mind that the public will demand and in the long run will secure streets satisfactory to itself.

Your committee has not gone more fully into the details of construction from a street railway man's point of view, because these must necessarily vary in different localities; but it suggests that the progress which has been made in girder rail construction in the past two or three years should not be lost sight of when we secure the T. Have it big enough and heavy enough.

As it may be of use to members of the association, your committee has attached to this report, in the form of an appendix, a list of the street railways which have answered its queries, together with a synopsis

## Street Railway Review

## T RAILS IN PAVED STREETS

| New Haven, Conn.        | Winchester Av. R. Co.                  | 11                     |            | 52 to 72 lb.  | 1¼ & 4¾ in.  | On chairs and on ties.   | Half blk half cobble.                                | Same                      |                                       | The common council will have nothing else.            |
| Norwalk, Conn.          | The Norwalk Street R'y Co.             | 3                      |            | 60 lb.        | 6 in.        | Three brace chairs to each rail                                      | Blocks & cobbles.                                    | Blocks & macadam          |                                       | Gives satisfaction.                                   |
| Norwich, Conn.          | Norwich St. R'y Co.                    | 1.2                    |            | 48 lb.        | 4 in.        | Chairs and stringers.  |  |                           | Gravel                                | Is not favored much.                                  |
| Port Huron, Mich.       | The City Elec. R'y Co.                 | 5                      |            | 45 lb.        |              | Cedar ties, and pine stringers.                                      | Cedar block.   | Same.                     | Oak strip inside, pine strip outside. | Gives satisfaction.                                   |
| Racine, Wis.            | Belle City St. R'y Co.                 | 2.27                   | 2.773      |               | 4¾ in.       |  | Brick.   |                           |                                       | Public & officials like it.                           |
| Salt Lake City, U. Ter. | Salt Lake City R. Co.                  | 3.                     |            | 72 lb.        | 6 in.        |  | Sand-stone block.                                    | Same.                     | Sand                                  | Public & city officials well satisfied.               |
| Savannah, Ga.           | City and Suburban R'y.                 | 1                      | 8          |               |              | Chairs or stringers.   |  |                           |                                       | Not favored.  |
| Springfield, Ill.       | Springfield Consolidated R'y Co.       | 2.2                    |            | 40 and 60 lb. |              |  | Beveled brick or block                               |                           |                                       | Gives satisfaction. Authorized by city council.       |
| Springfield, Mass.      | Springfield St. R'y Co.                | 1.5                    |            | 56 lb.        | 4 and 4¼ in. | On stringers and on ties and chairs.                                 | Granite and cobble.                                  | Granite, macadam          | Asphalt and brick                     | No complaint; evidently satisfactory.                 |
| Waterbury, Conn.        | Waterbury Traction Co.                 | 8                      |            |               | 6 and 7 in.  | Spiked; ties 2 ft.   | Belgian block for 7 in. rail; cobble-stone for 6 in. | Belgian block.            | None                                  | None better, when properly laid and paved to          |
| Windsor, Ont.           | Sandwich, Windsor and Amherstburg R'y. | 3                      | 1          | 56 lb.        | 4¼ in.       | Steel chairs; ties bedded in gravel, then inch board & block paving. | Cedar block.   | Same.                     | None                                  | Preferred to girder rail.                             |
| Wyandotte, Mich.        | Wyandotte and Detroit River R'y.       | 2                      |            | 56 lb.        | 4¾ in.       | On broken stones.  | Macadam  | Same                      | None                                  | No objections   |

of the answers, regretting that, out of one hundred and seventy-eight letters sent out with stamped envelopes for reply, it received but eighty responses, and, as above stated, of the ninety-eight who failed to come to time, more than fifty are using the T rail, but whether in paved streets or not is unknown.

## "CITY AND SUBURBAN ELECTRIC RAILWAYS."

A Report to the American Street Railway Association, by E. C. Foster, Lynn & Boston Street Railway.

### THE AMERICAN STREET RAILWAY ASSOCIATION.

GENTLEMEN:—The subject that has been assigned to me for discussion, that of "City and Suburban Electric Railways," is decidedly a comprehensive one. Inasmuch as the interurban electric railways are comparatively few, it covers nearly the whole electric railway field. The latter class of roads is a growing one, however, and, as my work is in connection with lines of this kind, connecting Boston with the smaller cities surrounding it on the north, I shall assume that it is excusable in me to devote a considerable part of this paper to the consideration of the interurban roads.

E. C. FOSTER.

It is difficult to make the distinction between city roads and suburban roads. The function of nearly all city roads is largely to convey the people from the residential districts, mainly in the suburbs, to the business sections, and likewise, from the latter

to the former. In the improvements it has made in this class of transportation, lie the greatest benefits of the application of electricity to street car propulsion. The growth of our great cities has resulted in the appreciation of value of all real estate near the business sections, to a point where the only residence a workingman can afford in these districts is a tenement house. These tenements are invariably crowded to a degree that is unhealthy. That the electric railway has done much for humanity in enabling the working population to leave these homes in the congested districts, and procure more comfortable and respectable ones in the suburbs, goes without saying.

Next to this most important use of the electric railways comes their use in furnishing recreation for the masses of the people. Nothing accomplishes so much in the elevation of our population as frequent opportunity to cultivate acquaintance with nature. Optimism is the natural and healthy condition of the mind, and nothing encourages one to look on the bright side of life as does a ride or ramble through the country. The combination of fresh air and pretty scenery makes the only tonic that tones. The two necessary considerations in the accomplishment of the scheme of country air for the masses are, first, the public parks, and second, the means of transportation to them. It is only within the past year that, in the state of Massachusetts, a State Public Park Commission has been created, for the purpose of purchasing large tracts of land and opening them to the public, that they may enjoy the beauties of nature without trespassing upon private property. On a portion of the Blue Hills, only ten miles distant from the heart of the city of Boston, over 1,200 acres have been secured to be preserved forever for the benefit of the people. Also, in Arlington, a like distance in another direction, a large reservation is made; Middlesex Fells in another, and the Commission is now turning its attention to the shores of Revere Beach, immediately north of the city, one of the grandest beaches of this continent. It is needless to add that the street railway companies are doing their share in the matter of providing the necessary transportation. While their motives are not purely philanthropic, the results accomplished are of almost as substantial benefit as though the people only were considered. While this fact is very greatly appreciated, there seems to exist a growing feeling, on the part of some, that the street railway companies get everything and give nothing. Certainly the very evident benefits the people have secured, coupled with the fact that few companies have earned more than moderate dividends, and many none, should be enough to convince the most skeptical that the stockholder's experience is not always a profitable one.

However, I presume that it was not expected of me to devote this paper to a demonstration of the advantages accruing from the existence of electric railways, but rather to consider the question of the operation of roads and the projection and construction of new lines. It seems almost useless for me to tell you, who know, certainly as well as, if not better than I, how to operate existing roads, and how to determine what lines will pay, and under what conditions of fares and traffic. When I say, hereinafter, that such a thing should be so, even though it be without modification, you must understand that I offer such only as my opinion, formed from my own experience, and not necessarily as an established fact.

"I CAN'T take this transfer, sir," said the conductor, "It is punched for a man with a smooth face, while you wear full whiskers." "That's all right," replied the passenger, "they grew while I was waiting for the car."

As a road is projected, and studied from a financial point of view first, then constructed, and then operated, it may be well to consider these topics in this same order. The first point, covering the work preliminary to the construction, admits of nothing but rather general discussion. As it is not the purpose of this paper to consider roads built to yield their dividends in benefits to allied interests, as in developing real estate, it may be taken for granted that the question of primal importance, in the consideration of a proposed line, is its probable earning capacity. The stimulation to the growth of the country crossed may be considered only in the reflex effect that such growth may have upon the business of the road. A line to pay should be one that makes itself a necessity to the people, in offering them the best facilities for transportation in the particular direction. Competing lines should be avoided, excepting where the volume of business is large enough to support both. Besides the assurance that the line is necessary to the people accommodated, it must be ascertained that the number of the latter is large enough to support the road on a paying basis, not only the first year, when the repairs are slight, but later, when reconstruction becomes necessary. I consider that there are very few cases where a company is warranted in investing its money in a line, on the strength alone of the future that may be expected from it. A road should be, at least, capable of earning its operating expenses from the start, and the evidence of a more prosperous time, later on, should be very strong, before it is constructed without immediate promise of good dividends. It is sometimes necessary for an established company to build on a location, merely to keep out competition. The only thing that warrants this is the knowledge that the opportunity exists for the proposed competing company to be self-supporting from the start, and ultimately a serious rival. Otherwise it is economy to allow them to build the road and buy them out at the foreclosure sale.

Track construction is a subject that has been so thoroughly discussed in all its details that I shall not attempt to do more than express my opinion, in a general way, as to what forms are best suited for the various demands of the suburban roads. The kind of construction most desirable for a certain location depends, of course, entirely upon the particular conditions. For roads connecting towns, I think that it is often possible to secure an independent right of way for a very slight cost per mile, and very often for nothing; this might require special legislation. Progressive land owners realize that the one way to enhance the value of their real estate is to put it within means of easy communication with the surrounding neighborhood, and especially the principal town. For this reason they are often willing to give the necessary land for an electric railway—without any undesirable conditions or restrictions—and oftentimes to contribute something toward the grading. If, in this way, the right of way can be obtained that is desirable as to route and grade, it offers many advantages that cannot be had on public highways. For such a right of way the regular steam road form of construction would be employed. About a 60 lb. T rail 6x7 in. oak or chestnut ties, laid 2 ft. centers, needle switches with lever throw, etc., would give a track that would allow a speed of forty miles an hour, making it necessary to slacken speed only for curves, and as much for switches as the overhead construction demanded, the track switches requiring no reduction of speed. Curves, in such a road, should be few, and of the longest possible radii.

Where it is decided to build on country roads, a location at the side of the road is, of course, preferable. Here T rail may be laid, and the track filled with gravel, covering the ties and leaving the heads of the rails entirely exposed.

In the streets of smaller towns, where permission can be obtained, it is also desirable to lay T rail, although there is always more or less trouble maintaining the paved brow that is usually required, and consequent difficulty in plowing snow from the track, due to the shears and diggers of the plow striking the partially displaced blocks.

In city streets, and others that are paved, the girder rail seems to be the only one suitable. In order to obtain the necessary depth for paving, this rail should be nine inches deep, and should weigh about ninety pounds per yard. This makes very expensive construction, but the expense is justifiable when the conditions are considered. While such construction is necessary, where laid in streets paved from curb to curb, it is an open question in my mind as to what is best in macadam streets. There are many lines that are operated on 15 or 30 minutes, or even on hourly intervals, where the business is hardly such as to warrant the use of track construction costing from \$20,000 to \$30,000 per mile. The frequency of the service is an important factor in determining the most economical construction for use under particular conditions, and I think that the nine inch girder rail ceases to become a necessity, and becomes a luxury, when the number of cars run over it daily is reduced below a

certain figure. Further, there are positive objections to the use of such rigid construction as this in dirty streets, as in macadam streets where the top dressing contains a great deal besides stone. My experience has been that the rail becomes covered with dirt, and that the cars rattle and "chatter" badly in running over it, more than in running over a dirty rail of less rigidity. It may seem revolutionary to suggest it, but I think that, for certain places, it is at least worth while to consider relaying good tram rail, using some approved form of joint plate. I am not quite convinced in my own mind that there are conditions existing where this is warrantable, but the subject is certainly worthy of discussion and consideration.

Overhead line construction has kept pace in its improvements with those of the other branches of electric railway work, and the success that has been had with the lines built during the early periods of development encourages one in the belief that modern lines may be depended upon to give little trouble.

Regarding equipment, my idea is that the longest car that can be operated successfully on four wheels is the most desirable for the ordinary conditions. For long distance lines having heavy traffic, I would recommend thirty foot bodies, on double trucks, for box cars, and fifteen bench open bodies, on similar trucks. Where there is a sufficient demand, I would run a combination smoking and baggage car as the trail car of a train of two.

In building a new road for short distance travel, I would give all curves the necessary radii for the use of seven foot wheel bases through them, and have trucks this standard. On these trucks I would use twenty foot box cars and ten bench open cars, either class measuring about twenty-nine feet six inches over the buffers. As a supplement to the regular equipment of motor cars, I recommend trailers, and that they may be run economically, a power brake is necessary. To meet this demand, the air brake is being developed, and promises to fill the requirements. For convenience in attaching trailers to motor cars, automatic couplers are necessary. There are several forms of latch couplings that can be made to do the work satisfactorily. An important thing in connection with the use of trailers is the adoption of, and adherence to, a standard, that all buffers and draw bars may be of one height, and other parts right for the proper operation of cars in trains.

For electrical equipment, it goes without saying that the modern multipolar, single reduction motors, with series parallel controllers, are the only ones that a road can afford to use. The performance of the various equipments, now manufactured by the different companies, has been so universally satisfactory that I feel that a great deal has been accomplished in the past two years in the development of the car equipment.

I am a firm believer in the desirability of heating all cars in the North thinking that it has a very important effect upon receipts. As much as I like the results obtained from electric heating, I hardly feel that we can depend upon this method. Our experience is that it takes from eight to twelve amperes to keep a twenty foot car comfortable, that is, forty degrees above the outside temperature. This means that it requires about as much current per hour as to propel a car four miles. This would make seventy-two car miles of power per day of eighteen hours, chargeable against the heaters. When it is considered that this extra power is often demanded when power is needed for other purposes, as in snow storms, it may be seen that, aside from the question of cost of coal, the consideration of the necessary increased capacity of the power station and feeder system is an important one. Having put myself on record as opposed to electrically heated cars, it is probably expected of me that I present a method that is satisfactory. Unfortunately, though this I am unable to do. For short trips, run from a car house, the hot water storage system may do. We still depend upon the stove, and "with all its faults we love it still," until we can find something that we consider an improvement upon it.

It is not improbable that before long, a telephone will be considered a necessary part of the equipment of each car operated on suburban lines. It often happens that means of communication with the nearest car house, or with the starter, would save much delay, and even danger, in cases of cars disabled or, thrown off their schedule time by other causes. Either a telephone in each car, with means of plugging in on convenient poles, or 'phones, arranged at the turn-outs, in boxes, may be used. As a substitute for this arrangement, or in connection with it, a system of signals between turn-outs may be desirable, under certain conditions. By the use of lantern boxes, containing incandescent lamps, and the necessary hand or automatic switches, a simple system of signals may be devised, by means of which cars running between turn-outs on single track lines will be protected from meeting other cars.

While these devices may be necessary in some cases, they will always be more or less burdens, in the complications they add. The signal system, especially, has one important objection. Regardless of the most carefully enforced rules to the contrary, men will learn to consider it as freeing them from the necessity of maintaining the same careful lookout for approaching cars and in cases of failure of the signals, accidents will be more likely to occur than they would without the signal system.

The adoption of a proper schedule of fares and transfers is a most important matter. Where lines are short enough to allow the use of the one standard fare throughout, this question is a simple one, but where routes are longer, and it becomes necessary to collect higher fares, complication commences. When this latter condition is aggravated by systems of transfers, the complexity increases. My experience has been that, in general, it is best to divide such a line into sections, collecting a single fare each, and registering all as the standard fares. These sections are arbitrary, of course, but in our case are determined by town boundary lines. For instance, where we have a line running through several towns, we collect a single five cent fare in each town. In connection with this, I would say that there are instances where further restrictions need to be made. Cases have arisen where towns of large area have comparatively small centers of population a long distance apart. Single fares have been established as being good anywhere within the limits of either town. A line is then built connecting the two towns, and instead of ten cents, it is considered necessary to get fifteen cent fares. The question then arises as to how the required three sections can be arranged. According to established precedent, the five cent fare sections include each whole town, although the line in question did not exist when this understanding was originated. In this case, however, it becomes necessary to establish the third section as including that part of the line between the boundaries of the more thickly populated portions of the towns, and including the intervening open country in both towns. As an exception to this method of paying fares "on the installment plan," I would mention the case where there exists a very heavy through traffic on a line, compared with which the local traffic is slight. In this case I consider it best to collect the whole fare at once, issuing to the through passengers conductors' private checks. These latter are held by the passenger, as evidence that he has paid through fare, and surrendered to the conductor before the end of the trip.

The selection of the best rates of fares is a matter requiring the consideration of numerous conditions governing the particular case in question. It is safe to assume that the result to be worked for is the earning of the largest possible net revenue, considering, at the same time, the development of the business. Exactly the best way to accomplish this is the problem to solve. The expense of operating may be approximated reasonably close. It is more difficult, however, to determine the amount of traffic that different rates of fare may bring. It is well to study the classes of travel that may be expected, and fix such a basis of rates as will probably yield the largest margin of profit. After having done this, the basis thus determined may be increased by a considerable percentage, and this new basis adopted as one to use in opening the road. As every one knows, it is a simple matter to decrease fares, and, while I do not believe in starting out with high rates merely for the opportunity of obtaining the credit of cutting them at some future time I do consider that it is necessary to have a margin of safety, to avoid the possibility of being burdened with rates that are too low, and cannot possibly be raised. In this state, with the existence of a law making it illegal for railroad companies to withdraw transfer checks issued without permission from the Railroad Commissioners, it becomes more than ever necessary to very carefully consider all proposed changes, studying them especially as to their probable effect in the future, when the road has developed and taken in new territory. It is aggravating to see the opportunity for a new line, into a district that might naturally be expected to pay, by means of a rate of fare higher than the standard, and have the fact of a previously established rate, that can be construed to cover the line in question, standing in the way of the consummation of the scheme. I consider  $1\frac{1}{4}$  cents per mile a minimum rate for the basis of a system of fares, no fare to be less than five cents, and would advise the establishing of higher rates, up to two cents, as the particular condition would seem to recommend.

In certain cases I think it advisable to sell round trip tickets. Our fare from Lynn to Boston is 15 cents, but we sell two tickets for 25 cents. We think that the possession of this return ticket leads people to use our cars when they would otherwise patronize the steam roads. We have no other commutation, excepting workmen's ticket over certain routes, good only during the hours of 6 and 7, morning and evening.

Transfers may be used within reasonable distances. The system must, of course, be carefully worked out, to avoid the possibility of abuse. In

all of our efforts to be just to the public we cannot lose sight of the fact that the public is not just to us when it can avoid being, and that it behooves us to take the necessary precautions to protect ourselves, inasmuch as the popular moral code includes no provision for our protection. The existence of this unfortunate condition of affairs demands that we use care to prevent the abuse of the privilege we grant the public, the most common form of which abuse is the failure to observe the "not transferable" restriction.

Suburban roads work at a disadvantage compared with city roads, when the question of operating expense is considered. There are many reasons why a given number of cars can be operated for less money, within a small territory than when spread over a large area. These reasons are obvious. In the former case a large number of cars may be cared for in one car house, thus allowing a minimum expense of maintenance. A small car house cannot afford the motor tables, traveling cranes, etc., that do so much to lessen the cost of motor and truck repair, nor can the work of the small house be divided among different men, giving each his specialty, as in a large house. In one of the largest car houses in the world, the Lenox street house of the West End Street Railway Company of Boston, two men fill all grease cups, examine and replace brushes, and inspect other parts of the motors of from one hundred and twenty to one hundred and fifty cars daily. The other work in this house is divided up among some twenty men, including carpenters and blacksmiths, so that the average is about six cars per man. This number of cars per man is often assigned, but probably the work is seldom so well done as in this house. Another important disadvantage under which the suburban road labors is that of the high cost of power. It usually is dependent upon a number of small stations, due to the fact that it is impossible to cover the necessary territory from one station, and both the labor and coal consumption of small stations are necessarily greater per car mile than are those of large ones. The opportunities of making the expense in the first instance, that of car house work, compare favorably in the small house with the large are rather few. They lie in the dependence upon one capable man, circulating among the houses, directing the efforts of lower priced labor. Another idea that suggests itself is the equipping of one house with a complete outfit of labor saving appliances and bringing all unusual repairs to this house. This is objectionable, however, in that it requires the moving of cars over long distances, at a time when they are least in condition; and, further, that it makes two gangs of men responsible for the care of the cars. Regarding the elimination of the difference in power costs, now existing in favor of the city road, the indications are that the time is coming when it will be no longer necessary for the country road to maintain its numerous steam plants. I refer to the probable introduction of the alternating system of long distance electrical transmission into railway work. Suppose the case where it becomes necessary to distribute power for railway purposes over large areas, as on many suburban roads where several power stations are now used. With this system there need be but one main power station, which can be located at the point possessing the greatest advantage for cheap production of power. At various selected places rotary transformers may be placed, one for each section of road. These receive alternating current, over long distance lines, from the main station, and deliver it as direct current to the trolley wires, or possibly to such local feeders as may be necessary for the distribution throughout the particular section. These rotary transformers require only the same care as generators. Beside them, the only apparatus in the sub-station, needing attention, would be the circuit breakers. The latter would be arranged between the rotary transformers and the lines, in the same way that those in the present stations are. It will be seen, therefore, that one ordinary dynamo tender would be all the labor required in a sub-station. Further than this, the sub-station might often be in car houses, where one of the regular employes could care for the machinery, thus reducing the labor charge to a minimum. By this arrangement, power could be distributed to cars operating over areas of from twenty-five to fifty miles radius from one station, at cost slightly above that for distribution within the ordinary distances of present practice. I am told, that with such a system, using 6,000 volts, three phase currents, from a station located at the central point, we could supply power, by the use of three No. O B & S. wires, to a road fifty miles in length, when fifty cars were being operated. The total efficiency of this transmission, neglecting the loss in the trolley wires, would be about 65 per cent. These fifty cars, on the fifty mile road, would give fifteen minute headway, with a speed of eight miles per hour. With the higher speed, that would more probably fit the conditions of such a road, the number of cars would be reduced, allowing a proportionate decrease in the size of the wires, so long as the current allowance, 20 amperes per car, was sufficient. To accomplish these same results with the present

system of 500 volts, would require 600 No. 0 B. & S. wires, the cost of which would, of course, be impracticable.

While this system has many advantages which are sure to result in its extensive application, it has its attendant disadvantages, which must be overcome. Most important of these is the difficulty of insulating the lines. Practice has been to use bare wire, simply because the covering is of no use with such voltages. The principal use of the insulation on the majority of overhead wires is a sentimental one. The public prefers the appearance of the covering to the bare wire. It is probable that it will be wise to recognize the existence of this preference, and cover the wires, merely to save comment. The most serious difficulty, however, lies in the fact that it seems to be absolutely necessary to keep the wires out of the trees. Mr. George D. Johnson, superintendent of the Hartford Electric Light Company, writes that a twig short circuits their 5,700-volt mains, almost as readily as a wire.

It will be evident that the adoption of a long distance transmission system will admit of the use of any suitable water power that may be located too far away to be available under the direct method of transmission.

Although I have discussed no branch of my subject sufficiently in detail to treat it thoroughly, I feel that I have already taken more than my share of your time. In conclusion, I would say that I have very great faith in the future of the electric railway. It has demonstrated its ability to live through periods of adversity. The lesson in economy that the country in general has had, has taught us a great deal with the rest. Roads that have paid expenses, during the past two years, will have nice margins of profits left from the receipts of the years to come, and those that have paid their dividends will pay larger ones, and add to their sinking funds. While a considerable part of the curtailment, made necessary by reduced receipts, has been in the line of the sacrifice of repairs that should be made in prosperous times, there have been many unnecessary expenses brought to light and cut off. Things which we thought necessities proved to have been luxuries, when we learned how well we could do without them. I am a firm believer in the policy of putting everything into the best of condition and keeping it so, as being the one that yields the largest net revenue, present and future, but I realize now better than I did two years ago, that in our zeal to have the best of everything, kept in the best of condition, we allow extravagances to creep in, with the necessary expenditures. The education in economy that we have gained will help us wonderfully in the future, and the combination of increased earnings and reduced expenditures will give an increase in the net revenue that will be substantial.

### DESTRUCTIVE ARCING OF 500 VOLT FUSES.

Special Paper at the American Street Railway Association by  
W. E. Harrington.

The destructive effects of the arc accompanying the opening of 500-volt circuits with switches, lightning arresters and fuses, has led the writer to inquire into these phenomena, particularly in reference to fuse practice. A series of carefully conducted tests were made, to find the relation between the fusing currents of different size copper wires, ranging from No. 30 to No. 21, B & S. gauge, the time required to open the circuit, and to what extent they are contributed to the time required.

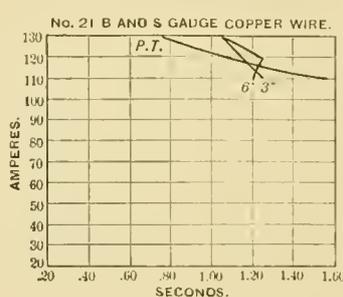

An inclined trackway was constructed, having two copper tracks upon which a traveler, consisting of a block of hard wood, having copper plates in contact with the tracks, could run, the circuit from rail to rail of track, being completed through an electro magnet on top of the traveler. Parallel with and alongside of the track was a raised board on which a paper was attached.

An impress was made on paper by a lever on the traveler, when released by electro magnet, owing to stoppage of current. Before tests were made, the trackway was carefully calibrated as regards time for traveler to go from top to bottom and the intermediate points, resulting in knowing the time to  $\frac{1}{10}$  of a second.

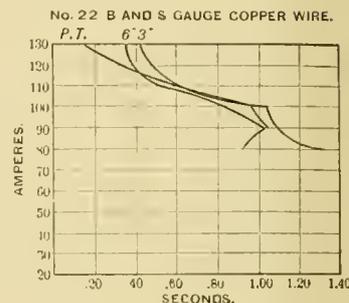

The tests were conducted across the bus bars of switchboard of the Camden Horse Railroad Company, Camden, N. J.; average voltage, 515 volts. Before blowing a fuse in circuit, a water rheostat was set, using a Weston ammeter for this purpose, so that the current desired would flow through the fuse, when the circuit was completed by the traveler on the trackway. The different size fuse wires were subject to the following limitations: The time of the traveler running full length on the trackway, 1.5 seconds; the current ranging from 20 to 130 amperes in 10 ampere steps. The smaller fuse wires would fuse with the minimum

current of 20 amperes, and in all instances inside of the 1.5 arc limit. Consequently, the curves show a wide range, but in the larger size wires a greater current was required to fuse the wires in the 1.5 second limitation, consequently the curves given for the larger fuse wires show less and less range as the fuse wires increase in size.

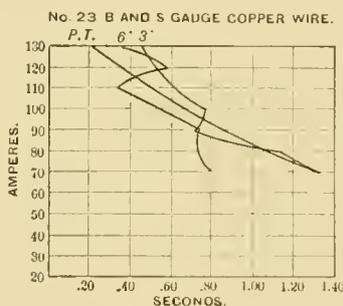

In order to strike an average, the tests were repeated under similar conditions as regards current and gauge wire, with a 3-inch horizontal fuse, a 6-inch vertical fuse, both of which were connected to a standard form of fuse block, also  $4\frac{1}{2}$ -inch fuse, the average in length of the

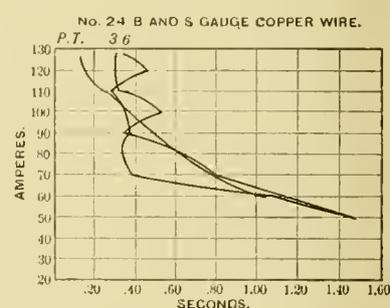

No. 1

No. 2

No. 3

No. 4

3-inch and 6-inch was employed connected in a specially constructed fuse block, which absolutely prevented any arcing of the terminals. In other words, the fusing of the fuse wire could not burn the terminals to which it was attached. The results recorded graphically in the following charts give, therefore, the time required in fractions of a second for the circuit to be opened under identically similar conditions as regards current and gauge of wire for a 3-inch, a 6-inch unprotected and a  $4\frac{1}{2}$ -inch protected terminal fuse.

The curves, as given in chart No. 8 for No. 28 B. & S. copper wire, illustrate excellently the erratic character of the fusing of wires under conditions as observed in the practice of to-day.

The time required to open a protected terminal fuse wire becomes less and less as current increases and grows less regularly, showing that a regular law is followed. The curve is an hyperbola having its asymptotes for its axes, and the equation for it is  $xy=13$  for No. 28 copper. Whereas, the two unprotected terminal fuses are uncertain and show in a very pronounced manner wherein the terminals contribute to this end. The conclusion one is forced to draw is that a fuse wire in practice, when it fuses, does not do as it was intended to, open the circuit, but establishes a condition, though the time may be limited, wherein the terminals act as a magazine to furnish the gas through which the circuit is continued. The curves throughout do not show any superiority of the 6-inch fuse over the 3-inch. Looking at the results in comparison, as given by the Board of Fire Underwriters, which is attached to this paper, the very point they should have observed is overlooked, to-wit, the continuance of the arc through but a short period of time, at the expense of the terminals, and the possibility of the vicious gas thus generated coming in contact with other circuits and establishing other and more serious conditions, such as short circuits and possible fires.

Not to be misunderstood, while the tests as are herein recorded show no superiority of the 6-inch unprotected terminal fuse wire over the 3-inch unprotected terminal fuse wire, the 6-inch fuse wire is unquestionably safer when conditions are more extreme, such as, for instance, when a short circuit occurs.

The determining factor in this matter of fuses is; What are the conditions required to protect against absolute short circuits across the bus

bars of a large power station 500-volt switchboard? Tests conducted showing how fuses act under conditions that are predetermined, certain currents which are made to flow, etc., but you never see anything published or advice given in this matter of fuses for the condition which really occurs the most frequently, that is, absolute short circuits. The Board of Fire Underwriters' report, herewith attached, gives the different length fuse blocks required for 10 amperes, 20, 30, 40, and so on. Now, the requirements and limitations, as prescribed in the Board of

The conclusions one is forced to draw from the above tests and the general literature upon the subject of fuses, are as follows:

First.—The proper and only fuse block to be used is one having protected terminals.

Second.—The fuse blocks should be furnished so that the terminals would not be burned under conditions approaching an absolute short circuit across the bus bars of a 500-volt power station.

Third.—That magnetic cut-outs are immeasurably preferable under all circumstances.

## APPENDIX.

### REPORT OF UNDERWRITERS' INTERNATIONAL ELECTRIC ASSOCIATION.

#### DATA.

The following data gives the maximum length between terminals at which arcing occurs, the minimum lengths at which no arcing was observed, and the safe lengths on 500-volt circuits for fuses, whose melting points are identical with the various current strengths designated.

| Amperes. | Maximum length at which arcing occurred. | Maximum length at which no arc was observed | Safe lengths. |
|----------|--|---|---------------|
| 10       | 1/4 inch                                 | 1/2 inch                                    | 1 inch        |
| 20       | 1/2 "                                    | 3/4 "                                       | 2 "           |
| 30       | 2 "                                      | 2 "   | 2 3/4 "       |

| 100      | 3 3/4 "                                  | 4 "   | 4 1/2 "       |

### "THE USE OF THE BOOSTER ON ELECTRIC RAILWAY CIRCUITS."

A Special Paper Read Before the American Street Railway Association by J. H. Vail and S. H. Wynkoop.

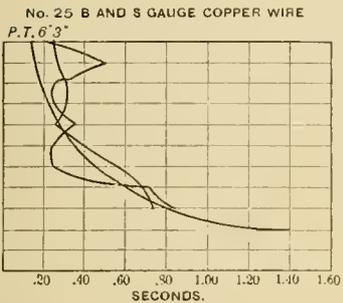

#### THE AMERICAN STREET RAILWAY ASSOCIATION,

Gentlemen:—The question of investment in copper is one which has always been a bug-bear to the street railway manager, and is to-day the most serious problem confronting the operating company, inasmuch as it tends to restrict the extension of long distance lines for serving suburban traffic. Since the cost of copper for a given service increases directly as the square of the distance, the necessary investment becomes prohibitory when the line extends more than three or four miles from the station.

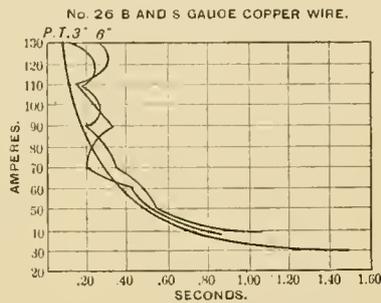

Railway generators and motors are becoming more satisfactory; we are still allowed, in the absence of a conduit system inspiring confidence, to suspend our trolley wires overhead; and in some cities the authorities will look the other way while we string cables as large as hawsers from pole to pole, in pairs, in dozens, and—if poles could be found to stand the strain—probably in scores.

Even then we are not happy. The power house site is usually chosen, so far as circumstances will permit, with reference to convenient coal delivery and the distribution of traffic. In the heart of the city crowded streets render slow speed imperative; in the suburbs, where a clear track invites to rapid transit, the pressure is low—usually abominably so. In fact, the writers have in mind a city not far from the metropolis, where two motor cars are run upon a single car's time; and they have witnessed the fading out of the electric headlights as the two cars started together. The reduced voltage was in this case self-evident; and the net horse power secured to move the cars was probably less than half the proportionate amount originally generated in the station. The loss in transmission does not require further demonstration.

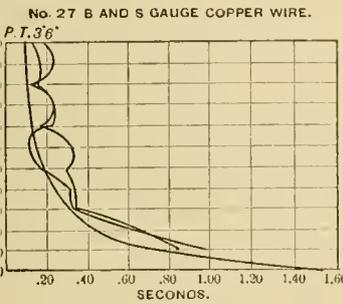

Accurate tests show that the commercial efficiency of the street-railway motor at normal voltage is 78 per cent, while at two thirds the normal it is only 52 per cent. We all undoubtedly recognize the fact that the resultant effects of too little copper show up to the non-expert traveling public in slow speed and dimming of lamps; but to the railway company the results are actual losses—decreased traffic and increased coal bill; which is the direct opposite of what we desire. In other words, instead of aiming at the greatest receipts for the least expenditure, we are actually getting least receipts for greatest expenditure.

No. 8

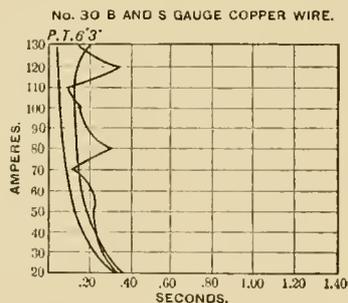

Fire Underwriters' report, are true and perfectly safe when the fuse "blows" under the conditions as outlined in the tests, as made by the committee appointed to make such tests.

But on an absolute short circuit across bus bars, as above stated, a 10 ampere fuse block constructed as specified, will, instead of protecting one when most in need of such protection, burn up in the most vicious way, and will open magnetic cut-outs in a power station requiring currents up to a 1,000 ampere to open. Understand, the fuse does not itself do this, but the arc established at the expense of the terminals, is the immediate and sole cause, and the circuit must be opened elsewhere. As stated, the magnetic cut-outs, above referred to, open the circuit.

This matter of arbitrarily adopting a series of fixed dimensions and

No. 9

No. 10

conditions, under which fuses are to be used, is absurd and is very similar to a case which came up on the railway with which I am connected.

A man came to the president with a car fender, which he was anxious to have adopted. After expatiating for some time upon its merits, it finally came out that under certain conditions the fender was really good, and if a person should fall in one particular way the fender would surely save him; and he promised to send printed instructions with each fender, so that the people could be instructed to fall properly.

The general remedy suggested is: use more copper. Very good. But if the owners of the road are already groaning under the weight of the copper mine that has been saddled upon them, together with the cash invested therein; if they live in constant fear that they will be forced to place all feed wires in large cities underground, what then?

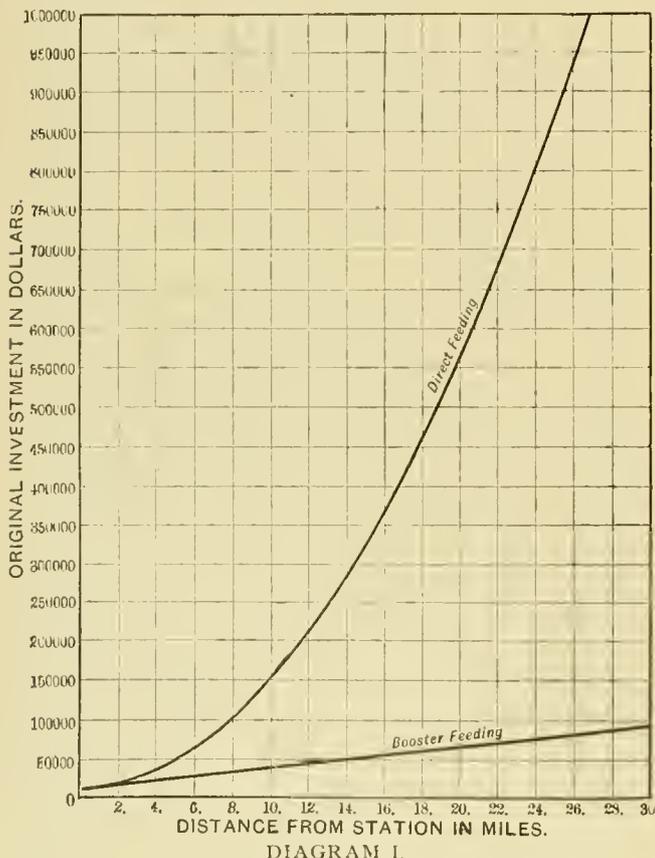

Leaving out of this discussion improvement in generating station, car equipment and track, we must look for higher economy to the alteration of our methods of electrical distribution, adopting such as will prove, after careful comparison, to be of least first cost, of reasonably high commercial efficiency, of interchangeability on different divisions of the system, and of practically automatic action.

We are in need of a marked advance over present practice in this direction, and must devise some method of distribution that shall give better and more economical service over a large area, and which shall at the same time enable us to reach out from the power station to distances at present inaccessible.

The alternating current system, which has done so much to develop the distribution of electricity for lighting by incandescence, has not yet reached that stage of eminent perfection in motive power service which will warrant us in admitting its value for railway work at the present time.

Another method which might be suggested is one which contemplates the use of motor generators located at intervals along the line and actuated by high tension currents. Such a system must be automatic under all conditions of load and short circuits, working with cool bearings and not requiring careful attendance. This scheme also requires practical development.

The well-known booster system, invented by W. S. Barstow, and applied by him with great success to the feeders of constant potential electric lighting plants covering large areas, is worthy of our careful investigation, as it promises to offer a practical aid to the economic solution of what may be called the medium long distance electric railway problem.

Initial Cost of Steam and Generating Plant, Copper and Special Apparatus for Delivering 200 Amperes at 500 Volts.

With direct feeding we can overcome the loss in transmitting energy only by incurring the heavy cost of copper as a first investment. With the booster system, we overcome the loss in transmission by incurring the cost of operation of a machine which shall automatically raise the initial voltage above that of the bus bars by an amount which may exactly equal the drop in potential on the feeder at that instant.

When using this machine, we calculate our feeder for ampere capacity only, and constantly maintain the pressure at the service end of the feeder equal to the pressure at the bus bars, irrespective of the length of the feeder or the load.

In any given instance, the cost of a direct feeder increases as the square of the distance, while the cost of the booster feeder is directly proportional to the number of miles. These characteristics of the latter system result in a reduction of first cost of from 25 to 75 per cent as compared with the first cost of the ordinary direct feeding methods of our present practice; and it thereby becomes possible for numerous electric street railway companies to extend their lines into suburban localities from ten to twenty miles distant from the power station, at the same time retaining the investment within reasonable limits.

In order to present these matters in a manner easily comprehensible, we can readily establish equations for the two systems to be compared; and then, by assuming certain accepted values, plot the results. Let

- C<sub>1</sub>—Current delivered to trolley wire.
- V — Voltage at generator.
- V<sub>1</sub>—Voltage at trolley wire.
- V<sub>2</sub>—Voltage of booster.
- E<sub>g</sub>—Efficiency of generating apparatus.
- E<sub>b</sub>—Efficiency of booster.
- E<sub>1</sub>—Operating expenses for direct feeding—coal, oil, water, waste, engineers, firemen, and interest on so much of the steam generating and transmission plant as is due to the feeder under consideration.
- E<sub>2</sub>—Operating expenses for booster feeding—details as before.
- M —Length of feeder in miles.
- m —Circular milage of feeder.
- \$ —Initial cost of as much of the steam generating and transmission plant as is due to the feeder under consideration.
- I —Per cent interest on investment.
- D —Per cent depreciation on investment.
- s —Cost of steam plant per H. P.
- g —Cost of generating plant per K. W.
- b —Cost of booster per K. W. output.
- k —Cost of insulated wire per lb.
- p —Cost of placing 544 ft. No. 0000 wire, including insulators, pins, cross arms, sundry hardware and labor—5 per cent allowance for sag.
- z —Cost of supplying one H. P. per year, in quantities of over 100 H. P.

Then for direct feeding

$$\$ = \frac{C_1 V_1}{746} + \frac{C_1 (V - V_1)}{746} S + \left\{ \frac{C_1 V_1}{1000} + \frac{C_1 (V - V_1)}{1000} \right\} g + \frac{2315.488 M^2 C}{V - V_1} K + \frac{.5664 M^2 C}{V - V_1} p \quad (I.)$$

And for booster feeding

$$\$ = \frac{C_1 V_1}{746} + \frac{C_1 (V - V_1)}{746} + \frac{C_1 V_2}{746 E_b} S + \left\{ \frac{C_1 V_1}{1000} + \frac{C_1 (V - V_1)}{1000} + \frac{C_1 V_2}{1000 E_b} \right\} g + \frac{C_1 V_2}{1000} b + 0.19318 m M k + \frac{m M}{211600} p \quad (II.)$$

Substitute the following values in Eq. I.:

- C — 200
- V — 500
- V<sub>1</sub> — 550
- S — 45
- E<sub>g</sub> — .95
- g — 25
- k — .13
- p — 75

We have

$$\$ = 9735 + 1374M^2 \quad (III.)$$

Substitute the same values in Eq. II assuming 211,600 as the value of m, taking E<sub>b</sub>— .90, and finding an expression for V<sub>2</sub> in terms of M, we get

$$\$ = 8732 + 2857 M \quad (IV.)$$

In order to graphically represent the relation between initial investments in the two methods of feeding under discussion, Eq. I. and II. have been solved for varying values of M from 1 to 30, and the results

plotted on Diagram I. An inspection of this diagram shows at once the immense superiority of the booster system over direct feeding in cases where first cost is the essential feature. It will be noted that the curves have been carried out for the entire thirty miles, without regard to the practical voltage limit in direct current machines, or the point at which the cost of operating an independent station becomes less than operating from the main station.

Diagram I shows that for distances greater than one and one-half miles it will cost less to install a booster system than to place copper and machinery in the usual manner for feeding direct. In cases where motive power is water, costing little or nothing per H. P., these curves give at once the relative economy of the two methods; but ordinarily on account of the consumption of coal, the loss in the line (represented in the new method by the power required to operate the booster) becomes an important factor in the discussion; and it is necessary to establish equations for the operating expenses, taking into account the fixed charges of interest and depreciation on the investment, as well as the cost of furnishing the required power.

The following equations will enable us to determine these values for different distances:

Direct feeding:

$$E = \frac{C_1 V_1}{746} + \frac{C_1 (V - V_1)}{746} z + \$(I + D) \quad (V.)$$

$$E = \frac{C_1 V_1}{746} + \frac{C_1 (V - V_1)}{746} + \frac{C_1 V_2}{Eb} z + \$(I + D) \quad (VI.)$$

Making the same substitutions in Eq. V. and VI. as were made in I. and II, placing  $(I+D) = .10$ , and remembering that  $\$$  varies according to the method and distance under discussion, we get

$$E' = 155z + \frac{\$}{10} \quad (VII)$$

$$E'' = (139 + 36M)z + \frac{\$}{10} \quad (VIII)$$

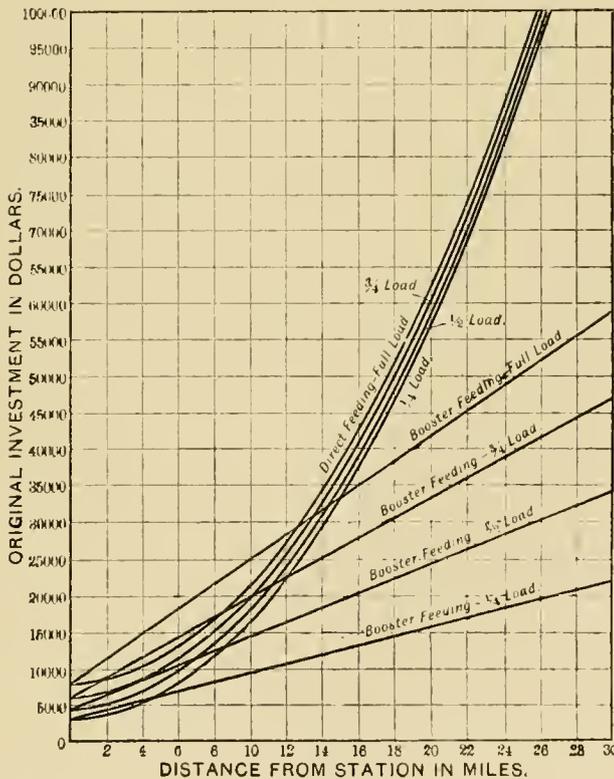

DIAGRAM II.

Operating Expenses of Plant Delivering 200 Amperes at 500 Volts, Including Coal, Oil, Waste, Water, Labor; and Interest and Depreciation on the Investment.

Diagram II. represents these equations plotted for varying values of M, being taken at 40.

The intersection of the upper curve with the upper straight line is the point at which the booster system costs as much to operate as does the direct system. This distance we find to be twelve and one-half miles. For shorter distances, direct feeding is more economical, while for longer distances the booster system has an absolute advantage. Now, the assumption upon which Eq. V and VI were solved, is a feeder constantly loaded to its maximum capacity. The absurdity of this assumption is apparent when one considers the actual conditions which obtain in railway work; the average load on the feeder during the entire year will be more nearly one-third or one quarter of the maximum. We have therefore established and plotted equations similar to V and VI, for  $\frac{3}{4}$ ,  $\frac{1}{2}$  and  $\frac{1}{4}$  load, and the resultant curves are shown on Diagram II, in order to afford ready means of comparison.

A careful study of these diagrams demonstrates in what the economy of the booster system consists. While the method we have outlined may seem like robbing Peter to pay Paul, it must be remembered that in direct feeding there is a large amount of capital invested in the pole line, accruing interest day and night, in storm and sunshine, irrespective of the traffic on the line; while with booster feeding, the interest on copper investment is nominal, the power required to drive the booster itself being proportional to the load on the line. Thus we can readily understand why, under the conditions given, with an average load of one-quarter the maximum, the booster system is absolutely more economical than the direct feeding system for distances over four and one half miles.

The equations here laid down will serve to answer any questions that may arise as to relative first cost or operating expense. It has been impossible to represent results derived under varying conditions without multiplying the diagrams indefinitely. All calculations have been based upon the most recent methods of rail bonding and track feeding; and the assumption that the resistance of the return circuit is equal to that of the outgoing circuit is therefore perfectly safe.

It may occur to some that the installation of a special high voltage generator to supply the feeder in question would be a simpler method of reducing the copper; but a cognizance of the enormous variations in drop under extreme changes in load, on a long feeder calculated for ampere capacity only, leads at once to the discarding of such a scheme until such time as manufacturers can furnish efficient generators over-compounded from 50 to 150 per cent.

The adaptability of the booster to railway work of all kinds is wonderful. A few specific instances are noted, in the confident belief that the suggestions thus thrown out will impel each and every electric railway manager to personally investigate this system, with a view to ascertaining exactly how far it would prove of advantage when applied to his particular road.

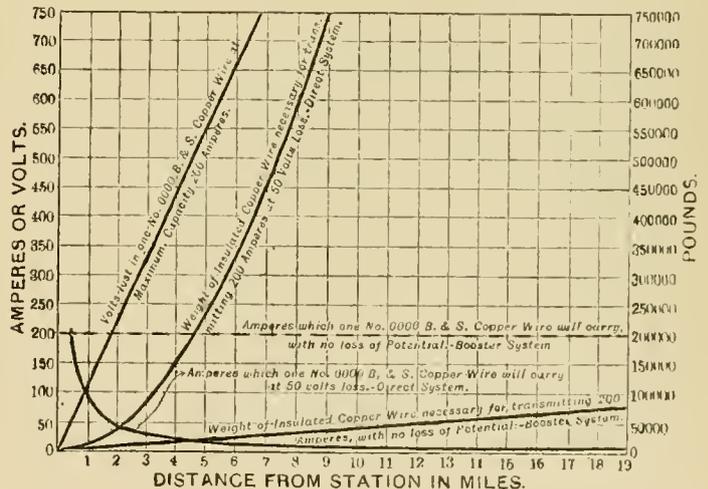

DIAGRAM III.

Comparison between Direct and Booster Feeding for Railways. Resistance of Return Circuit (Rails)=Resistance of Feeder. Allowance for weight of Insulation=15%. Allowance for Sag=5%. Show the Investment Saved in Weight of Copper by Means of the Booster System.

Ordinarily in calculating copper for distribution we are obliged to allow for special features influencing traffic, such as ball grounds, race tracks, picnic groves, etc. As there is seldom any necessity for bunching cars at all these points simultaneously, and as the various features are usually

scattered, it follows that at all times one or more of the feeders is lying comparatively idle. Under the plan suggested, the copper is figured for average conditions and a booster, placed in the station, is arranged to be thrown immediately upon any feeder which may become burdened with an excessive load.

Another feature of this system which makes for economy becomes prominent on long suburban lines forced to run an infrequent schedule late at night. On such a road the booster may be shut down and cut out of circuit entirely when the load on the long distance feeder drops to say one quarter of the maximum, depending upon the amount of copper in the line.

If this suburban line extends to a park or pavilion which is open only during the summer months, the advantage of the booster over direct feeding is enormous, since the investment on a booster lying idle is a small fractional part of the interest on the idle copper of a direct feeder.

On many roads already in operation the copper in the line has proven entirely insufficient, and the erection of additional feeders is contemplated. Would it not be worth while to consider the installation of a booster at one-tenth the cost of the extra copper, provided calculations showed the economy of operating the two systems to be equal?

In the progress of electric railways, as in the growth of cities, development frequently fails to follow the lines predicted for it. It therefore happens that many a road to-day is worrying along, the victim of misplaced judgment—and copper. In many instances the adoption of a booster, and a re-distribution of the present copper, will remedy the evil in the most economical manner.

In large cities such as Boston, Brooklyn and Philadelphia the tons of copper could in this way be largely reduced, with a gain at the same time in uniformity of pressure.

## TAXATION.

Special Paper Read by Allen Ripley Foote, of Washington, D. C.,  
before the American Street Railway Association.

The following paper on the subject of Taxation is respectfully submitted for your earnest and thoughtful consideration.

It is subdivided as follows:

1. Taxes: Why are they paid?
2. Taxes: Why and how is payment evaded?
3. Taxes: By whom should they be paid?
4. Taxes:—How can a just system be established?

### TAXES—WHY ARE THEY PAID?

1. One of the fundamental objects of government is to establish justice. This function of government is the only one considered in this discussion. Justice is established by securing obedience to just laws. Injustice is done only when the rights of one are invaded by another. Law and enforced obedience to it, when such course is necessary, is the protection given to each to secure him against an invasion of his rights by others. The cost of this protection measures the amount required for the support of the government in its effort to establish justice. To secure this protection taxes are paid.

2. Protection is most needed by the weakest member of society. A government that fails to make protection certain for the life and property of its weakest member invariably becomes a tyranny and forfeits its right to exist. Failure to punish a crime gives protection to wrong doing. The punishment of crime gives protection to right doing. The whole expense of enforcing obedience to law is caused by those who disobey law. This is the direct burden paid by taxation.

3. The indirect burden caused by disobedience to law is far greater than the direct burden. If it could be made certain that no law would be disobeyed the tremendous burdens laid on industry for the enforcement of obedience to law, and the still greater cost, borne in a thousand ways, by individuals, families, firms, companies, corporations, and associations, to secure themselves against the injustice of others, would cease to be a tax on the energies and thrift of honest people. If absolute justice could be done the entire amount of the direct tax and the indirect burden levied upon society by law-breakers would be exacted from the criminals. This is an impossibility. Taxes can be paid only by assessments upon property. The combined property of law-breakers would not be sufficient to pay more than an extremely small fraction of the total cost to society of their conduct.

4. The natural law of justice is the only true standard of conduct. This law existed before governments were created. Had it never been disobeyed, enacted law to enforce obedience would never have

been necessary. The fundamental necessity for organizing governments was to enforce obedience to law. Every principle of enacted laws and of regulations for giving them practical effect must be aligned with the principles of natural justice if justice is to be established among men. When this is done the principles of enacted laws ring true through the ages and stand unchanged in the laws of all nations having sufficient intelligence to desire to promote the individual and public welfare of all men. So stand the laws:

"Thou shalt not kill."

"Thou shalt not steal."

5. Justice is established through obeying just laws. The laws of themselves can do nothing. They are simply rules for the guidance of conduct. Through right conduct only is justice done. In seeking to establish justice the first duty is to see that enacted laws are just and then to see that they are obeyed. Voluntary obedience of laws is the act of a free man responding to the dictates of his own conscience. Such obedience to its full extent relieves society from all expense for the enforcement of law and thus lightens the burdens of taxation.

6. Involuntary obedience to laws may be secured to a large extent through the coercion of many persons by public opinion. Such obedience also reduces the expense for enforcing laws. This saving may be designated as an increment of value developed by the presence of a large number of law-obeying persons in a community.

7. Enforced obedience of laws is secured through the certainty of detection and punishment for disobedience. This entails on society all of the direct and indirect expense of securing protection against evil-doers. This tax must be paid or there will be no security for life or property. This fact is quickly apparent when it occurs, through a combination of circumstances, that public authorities are temporarily deprived of the power to enforce obedience to laws. Instantly all the evil in men is liberated for a high carnival of crime. The desire to commit acts of violence draws all of like disposition to a central point of disturbance and the rights of life and property are invaded with fiery enthusiasm. An object lesson illustrating the value of the protection secured for life and property through the enforcement of laws has recently been given by the riots in the West. The cost of these riots shows how infinitely cheaper it is to pay the cost of an efficient government than to suffer the damages caused by a suspension of the enforcement of laws.

8. The lesson taught by all experience is plain. Considered only as a matter practical of business, it is less expensive and much more satisfactory so to educate each person, as far as it possibly can be done, as to cause him to voluntarily obey just laws, than to spend money for punishing transgressions of laws. The benefit of securing obedience in this way is cumulative through its effect on those who are influenced to right doing, with as much certainty as they are influenced to wrong doing, by the character of their environments. Riots destroy more value in a few days than would be sufficient to pay for many years of educational work. It is very much cheaper to spend money for the purpose of training political action to secure the enactment of just laws than it is to fight the effects of unjust laws. The cost of business panics and industrial disturbances emphasize the sound business policy of such use of funds, and yet, so-called practical men will do little or nothing in this direction, being apparently unable to grasp the fact that they are but incidents controlled by overruling forces and pay they must, either for the proper economic education of the masses, or for the destruction, disturbances, and uncertainties caused through lack of such education.

9. That present conditions present a most favorable opportunity for seeking a reduction of direct taxation and indirect burdens through well considered and well sustained economic educational work is shown by the following news items:

BUFFALO, N. Y., Sept. 9, 1894.—J. W. Sovereign, General Master Workman, Knights of Labor, said: "Generally speaking, nothing more than a temporary victory can possibly be achieved by strikes at best. They widen the breach between capital and labor, and no matter which side is worsted, it is sore over its defeat and will retaliate with vengeance at its first opportunity. All strikes are illegal and all strikers are criminals. We cannot hope to accomplish much by strikes. It is in study and education and the wise use of the power that is placed in their hands through the ballot that workmen must hope for relief from the conditions of which they justly complain." —*New York Herald*, Sept. 10, 1894.

(Continued on page 645.)

# IN THE POWER HOUSE

*This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances, are expected to give their views and experiences on subjects within the range of the department.*

EVERY month come reports of the serious crippling or entire shutting down of stations where the beautiful and efficient (?) line shaft is still in use. One time it is a broken shaft, at another it is a cracked pulley, and again it is a wrecked clutch or a hot box.

\*\*\*

ONE of the most frequent causes of shutdowns of large stations is a failure of the water supply. In arranging a plant it is often forgotten that the city water supply of no city is infallible. A reserve tank large enough to be of any value is not always easily found room for in crowded city plants, but where there is no provision made the company must expect to suffer the consequences.

\*\*\*

EVERY engineer of a small plant knows how trying a job it is to stand and pour a fine stream of oil from a wide necked cylinder oil can into the small orifice usually provided for that purpose in the ordinary cylinder lubricator. Don't do it any more, but put up a cup large enough to fill the lubricator, so that by simply opening a valve its contents can be emptied into the lubricator. It saves bad words.

\*\*\*

THERE is a promising, though as yet unoccupied field, for the use of electric motors, to take the place of the small steam engines around a railway power plant. Electric motors are now running the mechanical stokers in an electric station at Liverpool, England, and it will probably be only a question of time until they are extensively used for other station work. There are many plants in this country that are using small steam engines for several purposes. The first use that suggests itself for the electric motor in this connection is for the boiler feed pump. An objection appears at once to the average engineer, that the pump can only be run while the generators are running. That is very true, but two pumps are installed in every good station to provide against breakdowns, and one of them could be electric and one steam. The electric pump could be run the greater part of the time and the steam pump kept for emergencies and times when no

generators are running. The steam feed pump of the ordinary direct acting type is a notoriously inefficient apparatus, both on account of condensation and because it makes no use of the expansion of the steam. The electric pump ought to at least make as good a record as the steam, as to efficiency, while running with much less attention and repairs. If properly wound, the speed of the electric pump can be varied without interfering seriously with its efficiency. Any engineer of experience knows that the average steam feed pump needs a good deal of attention in proportion to the work it performs, and when it is run slow, as is often the case, there is a great deal of condensation of steam and leakage of both steam and water. If mechanical stokers are used, another field is open for the motor, as is also the case with mechanical draft created by fans in the stack, and ash and coal conveyors. In all of these places the reserve can be the usual small steam engine, so there is no increased danger of a shutdown.

\*\*\*

THE number of power house engineers who get a "rake off" for recommending to their confiding employers the apparatus and supplies to be used, is said to be very large, but it is probably smaller in the street railway business than in any other, because the engineers are of a better class and the business is so largely a mechanical one that the owners and superior officers understand the details of power house work too well to have the wool pulled over their eyes. It usually happens that those who are caught this way are those who most deserve it. If those who control the financial interests of a road have no more common sense than to hire cheap labor, which is the most open to bribery, and then place all their dependence on it, they ought to suffer for it, and they generally do, if not in the way mentioned, in some other. The competent engineer is usually honest, and there are plenty such to be had, so that there is no excuse for employing men with aldermanic tendencies.

\*\*\*

It would be of value to know whether there is as much loss in practice as is commonly thought when the smoke is not consumed. Smoke sometimes indicates poor combustion and consequent loss of fuel, but it has not been conclusively shown that smoke consuming devices, taken as a class, increase the efficiency of a boiler plant to any extent. The majority of such devices

necessitate a slower combustion, and hence a reduced steaming capacity of the boiler in question or else increase its heating surface without increasing its steaming capacity, which amounts to the same thing. It seems to be impossible to burn all the smoke when a boiler is being forced. One of the simplest devices for securing perfect combustion is one that has been put in by Edward Saxe, chief engineer of the C. B. & Q. building in this city. The boilers are common return tubular, and the bridge wall is brought clear up to the shell of the boiler and perforated with holes several inches square for the flames to pass through. The fire doors swing up from the bottom and are kept slightly open so that a sheet of air passes over the fire. With the ordinary bridge wall this would be fatal to economy, but with the divided wall the air passing over the fire is made to thoroughly mix with the unconsumed gases coming off of the fire and to make a perfect combustion. The harder the boilers are being worked, the more air is admitted over the fire. Only a light smoke is given off from the chimney and the boiler efficiency is good. R. R. Tatlock, in the Chemical News, cites some experiments of his which show that not over 15 per cent of the heat in a fuel is lost in smoke, and as a rule much less. He thinks that there is little or no gain in burning smoke.

\* \* \*

It has been a well known fact that lowering the voltage on a railway system will sometimes cause a great increase in current; which fact is made manifest by a continual opening of circuit breakers and blowing of car fuses. Nearly every power house man of long experience has either had or heard of cases of this kind. Two excellent examples of this recently came under the writer's notice. In one case the traffic on a road was unusually heavy on account of a special celebration, and one and two heavily loaded trailers were being hauled by the majority of the motors. Fuses on the cars were being blown frequently. Word was telephoned to the power station and the engineer raised the voltage, with the result that the trouble ceased. The other case was in a small power station running three 90-kilowatt generators. The chief engineer being absent, an attendant had charge, who was afraid of overdoing things and kept the voltage low. Forthwith trouble began from belts coming off, and this continued until the chief came back. He immediately saw the cause of the trouble, which disappeared when the voltage was raised. The average electrician, when asked the reason for an increase in current when the voltage is let down, will thoughtlessly answer that it is because a certain amount of energy is required to do the work, and if the volts are decreased the amperes must increase as energy is measured in volts times amperes. It is manifest that this does not explain the matter, for if it did, more current would flow through a given resistance with the pressure at 300 volts than at 500 volts, and we know very well that the reverse is true. The real explanation must be that when the pressure is low an immense amount of energy is wasted before a car begins

to move with a heavy load. It happens in this way. Suppose a car to have its resistance so arranged as to give an easy start to the car running alone under ordinary conditions with the voltage at 450 to 500. This is the usual adjustment. The motorman puts the controller on the first notch and the car moves off. The motorman becomes taught by his experience that the car will start on the first point. He is also taught by his instructors that he must pause after each point. Suppose now the voltage be lowered from one of many possible causes. Suppose also for example that 60 amperes is required to start the car. When the voltage was high the resistance on the first point was such that 60 amperes immediately flowed and the car moved off so that the current was soon brought down to 25 or 30 amperes. But if the voltage is lowered the current that flows on the first point may be only 40 or 50 amperes, and the necessary 60 amperes may not flow until the third or fourth point has been reached. Meanwhile the motorman is moving the controller from one point to another, and pausing after each point, so that quite an interval occurs before the car starts. During all this interval a heavy current is flowing, which, although falling short of that necessary to move the car, causes a much heavier drain on the station than if the current jumped up immediately to the required point and then was soon reduced by the counter electro-motive force of the moving motors. When trailers are hauled this waste of current before the car starts is likely to be even greater. Motormen should be taught to lose no time with the controller until the car begins to move. On some roads this is taught. On others it is not, but ought to be. Another reason which causes an increase of current on some roads when the voltage is lowered, is that it cuts down the car speed. In order to make schedule time the motormen are obliged to have the current on the motors a greater per cent of the time, and thus several cars on a system are drawing current when under ordinary conditions they would be coasting or lying over at the ends of routes. Still another reason is the lower efficiency of the motors when the voltage is below normal.

#### NORTH SHORE ELECTRIC LEASE.

The Chicago North Shore Street Railway Company has demonstrated itself a financial success, having earned the interest on the bonds, besides a fair dividend, which is remarkable, considering that the \$650,000 of capital stock is entirely water, the proceeds of the bonds having built the road. So promising is the future of the new road that the shrewd managers of the North Chicago Street Railroad Company are trying to secure a permanent lease of it. As a consideration for such a lease, the latter company offers to guarantee a dividend of 6 per cent and the interest on the bonds. As the new road is virtually an extension of the other, the proposed lease would be a mutual benefit. The road has to all practical intents been operated as a part of the north side system for some time.

## LESSONS FROM TERRE HAUTE.

The track construction of the Terre Haute Electric Railway has long had a national reputation, and within the past few months other features of this road recently inaugurated by its new president, Russell B. Harrison, have attracted so much attention that the system was deemed worthy of a personal inspection by one of the REVIEW staff. He was not disappointed in his search for ideas of value and interest to other street railway men.

He found the service excellent as to frequency and speed. Employes, both conductors and motormen are well trained to their respective duties. The rolling stock is being rapidly brought up to a high standard and the motor equipments are the greater part of them of the latest Westinghouse type. For a road electrically equipped several years ago this is a splendid showing.

The first thing to attract attention was, of course, the magnificent system of paving used in connection with the T rail, which rail is used exclusively. The T rail is used with success in dozens of other small cities of this country, but a surprise is in store for those who think they have exhausted the subject of paving to T rail before they have visited Terre Haute. As far as track work and paving are concerned, it is safe to say that Terre Haute has the most beautiful street railway streets in the world. Wabash avenue, the main street, is paved with brick from curb to curb. The street railway track is double on this street, and is of 60-pound Shanghai T rail. The ties and paving rests on seven inches of concrete. The paving and track have been down three years. The paving is as smooth as a floor, and the rail joints are scarcely perceptible. On this street, which was one of the first laid, a brick is used which fits up against the web of the rail and leaves a groove for the wheel flanges. On other streets, large hollow corrugated blocks are used along the rail and the filling around the rail web, both inside and out, is cement and pitch. This, too, seems to give very good service, but the management says that the corrugated surfaces wear too fast. There is also one route on which the street is paved with asphalt and the hollow corrugated blocks are laid on each side of each rail. The street presents a beautiful appearance. On none of the streets is the interference with team traffic as great as with a girder rail. It has also

been conclusively shown that where T rail is used, the street traffic does not get in the way of cars as much as with girder. Managers who are struggling with a city council for permission to lay T rail would do well to arrange for an inspection of the work at Terre Haute. Some track is about to be laid with 72-pound rail on the Daniels steel ties (15 inch centers), with new and original brick paving, designed by Mr. Harrison. Mr. Harrison justly prides himself on the fact that this will probably be the finest piece of street railway track in the world. It will be unsurpassed for strength and smoothness. The Illinois Steel Company's Shanghai 72-pound T rail, 6 inches high, is now used on all work, and gives universal satisfaction.

RUSSELL B. HARRISON.

This road has the distinction of being the first to try the new No. 12 Westinghouse motor. The first pair was received last January, and put under a snow plow. Since then the cars in regular service have been equipped with them. It was found to be quite a problem to adapt the spring suspension to the trucks on hand. In fact the company had to work out its own salvation in this regard, as at that time neither the truck makers nor the Westinghouse Company had given the problem of adapting the motor to a particular make of truck much attention. The experience gained on this road has been very valuable to the manufacturers for future work. The Westinghouse new motor is so constructed that it will permit of nothing but the new method of suspension, and that suspension is a peculiar one. It is in effect almost as if the motor was hung from the car floor by a spring attached to the middle of the top of the motor frame. The method adopted for use with the Peckham trucks, with which all are now equipped, is very satisfactory. There have been some fears that spring suspension would cause galloping and surging of the motors, and the writer confesses to have shared in these fears, but after riding many miles over the spring suspended motors as used on this road, and having an opportunity to observe closely what action took place, those fears were proved groundless as far as the Westinghouse

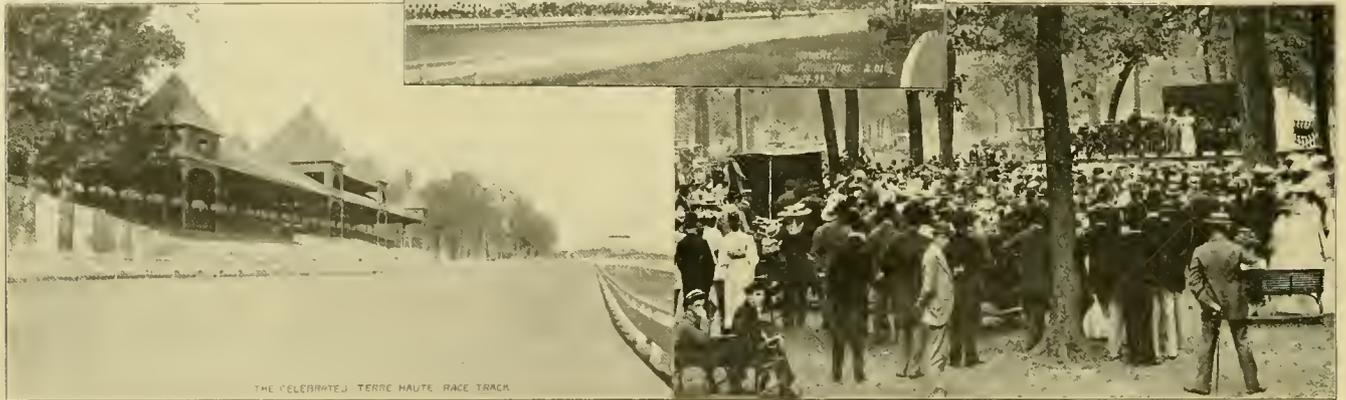

MAIN STREET—TERRE HAUTE, IND.

## Street Railway Review

No. 12 motor is concerned. There can be no doubt but that this suspension is easier on the track and car.

One of the first things to attract the visitor's attention on arriving at Terre Haute, is the peculiar position of the signal bell rope on the cars. The conductor's end, instead of being hitched to the hood, as usual, hangs down and is passed under the hand rail, terminating in a pear shaped handle, about three feet above

The power plant is the work of Westinghouse, Church, Kerr & Company, and is one of the smallest street railway plants in the country using mechanical stokers. There are three horizontal return flue boilers 54 inches by sixteen feet. The saving over hand firing, is unquestionable, as only one man is kept on duty in the boiler room. The ashes are thrown into a dump car of special design and hauled off to ballast the remote

the platform. The reason for this is soon learned, when it is seen that conductors are required to step off the car to help women and children off and on, and the position of the bell cord, where they can reach it from the ground, saves much time. The plan of building platforms now adopted by the management is to extend the dash so as to have steps only on the right side of the rear platform, and the left side of the front platform. Another change being inaugurated, is to take the slats off the car floor and put down rubber mats. These mats keep all moisture from dripping through on to the motors, besides being more easily cleaned than the slats. They are also much pleasanter to walk on, and give the car a more attractive appearance.

The road is, for its size, remarkably well equipped for doing its own work. In addition to the repair shop, it has a department for building and rebuilding cars, which employs three car carpenters and one car painter. Many cars have been entirely rebuilt, and new trailers are constantly making their appearance. The company will soon commence building closed cars. In the blacksmith shop, which employs two men, the greater part of the special track work, frogs and switches, required by the company is turned out, as well as the ordinary run of rolling stock repairs. The company has a fine and well equipped machine shop, and we were pleased at the extent and character of the work turned out.

parts of the system. A year ago public sentiment was hostile to the street railway, but owing to the progressive policy which has marked "Harrison's Administration," there is now the best of feeling. The employes also uphold the management with enthusiasm, and the laboring people of Terre Haute not only appreciate the change, but are staunch and true friends. On the very evening when the Debs strike was inaugurated, resolutions were passed by the local American Railway Union endorsing the street railway president of Terre Haute, Debs' home.

Some very original ideas in the way of public entertainment and inducing traffic have been launched in the past few months. On the fourth of July horse and bicycle races and games were held on the fair grounds, the contestants being followed by a powerful electric search light run from the railway circuit. The same evening there was also a balloon ascension and parachute drop by search light. On another occasion an electric fountain was fitted up for use in an evening parade. The effect was beautiful and caused much wonder. The fountain was built on a flat car. The tank was lined with tarpaulin and the water kept in motion with an electric pump. All the unsightly part of the car was covered with lights and decorations. The fountains consisted of a perforated circle of lead pipe laid on top of the glass plate, under which the fountain lights were

placed. It was lit from the trolley wire and hauled by horses, as were the other floats in the parade.

The enterprise and hustle of the management is well illustrated by the dispatch with which the electrical dis-

play for the Elk's picnic was prepared last fourth of July. A car load of electrical designs was shipped by a special car from the Edison Lamp Works at Newark, N. J. Everything in connection with the display had to be set up specially for the occasion. The fourth was on Wednesday. The alternator for running the lights came at 7 p. m. the previous Sunday. The wire and cross arms for connecting the station with the fair grounds two miles away did not come until Monday noon. In spite of the haste with which things were put up everything was a success and there was no hitch in the display. The set pieces of the electrical fireworks are enumerated as follows: one waving flag 10x12; two large and two small shields; an old Dutch windmill; an eagle's nest; two stars; a cone; two prisms and a peacock. The display cost about \$1,000 and was so well received that it was repeated several nights. The set pieces were rented from the Edison Lamp Works. This fall a number of balloon ascensions have been made by search light.

A great deal of enterprise is being shown in the development of traffic to Collett Park, a beautiful park owned by the city and situated about two and a half miles from the business center. This was until very recently closed by the city at 8 p. m., and it took a good deal of work to get it open in the evenings, as the people had never enjoyed the pleasures of an electric illuminated park. Finally a contract was given to the street railway to light the park at a very low figure, and attractions are now provided by the company every night. A stage has been built and surrounded with seats. The park and stage are brilliantly lighted with arc and incandescent lights. The railway operates a search light, which, as it turns around, illuminates every corner and makes an attractive scene. The entertainment provided is high class, and the park is nightly patronized by the best class of people. Admission to the park and entertainments is free. Two very fine solo cornetists have been employed for several weeks past at a good round figure and have proved a drawing card. In addition to these there is

usually a good variety programme. For example, on one evening recently a colored quartette, two tumblers, a contortionist and a shulle dancer, contributed one or two numbers each.

The company has a very fine band known as the Electric Railway Band, and an orchestra of eighteen pieces known as the Electric Railway Orchestra.

From five to ten thousand people visit the park daily. Everything is done to make the trip attractive. All cars, including trailers, have double the usual number of lights, and it is surprising how much it improves their appearance at night. It is safe to say that the additional lights are about as good an investment as can be made. It is hard to resist the temptation to take a run to the park when the brilliant trains are seen going by. The cars are run on a fast schedule, which makes riding most agreeable and gets the most service out of cars and men. The motor cars each make 120 miles a day.

On leaving Collett Park one evening recently, the REVIEW man was confronted by a train of five trailers and one motor car. The trailers were attached to the motor car and the train was ready to take a part of the rush at the close of the entertainment, a plan here frequently adopted. The train was headed by motor car No. 53, which had a double equipment of Westinghouse

No. 12, 30-horse-power motors. This train, loaded to the sills, moved off on a level track with the controller on the first point. On the way in, a 45 foot radius curve was rounded. In the center of town the train had to stop on a 55 foot radius curve, but was started with the controller on the third point. About 400 people were on the train.

The management is making every effort to make the road a model one, and the effort is being crowned with success. It is well situated in a good business town of 40,000 people. It need hardly be mentioned that the fair grounds, which are reached by the street railway, contain a racing track, the fastest in the world, famous

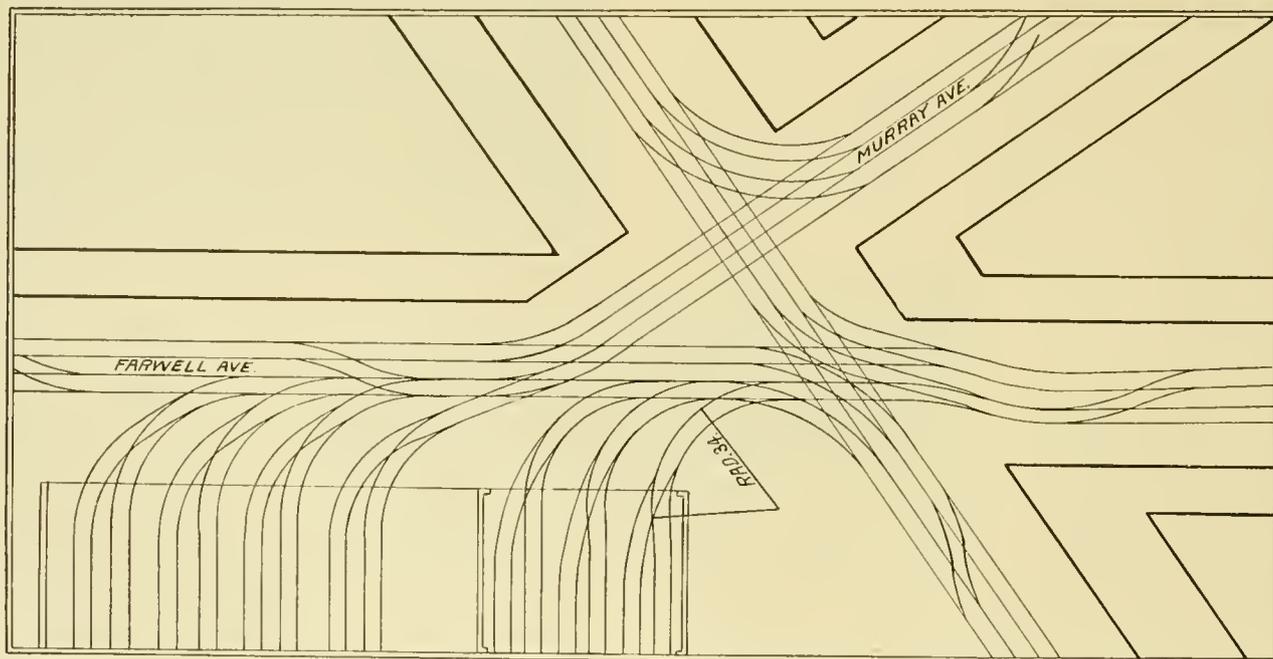

COMPLICATED SPECIAL WORK—MILWAUKEE.

for its world's records, and what is of more interest to our readers, the great crowds which assemble there, are handled so well that the efficiency of the service is frequently commented on by the press and by all the strangers who visit Terre Haute. The Terre Haute Electric Railway is a model from the standpoint of the public and worthy of the attention of all street railway men. President Harrison and Superintendent Burke are a great team of progressive wide awake hustlers, and under their management the road is being made a most successful one.

#### COMPLICATED SPECIAL WORK AT MILWAUKEE.

The accompanying engraving represents a view looking up Farwell avenue, in Milwaukee, at the intersection of Murray and North avenues. The Farwell avenue car barn is seen at the left. An idea of the amount of work done in designing the curves and crossings can be

obtained from a glance at the plan which shows that there are 24 curves, 30 pairs of tongue switches and mates and two double-track crossings. The narrowness of the street and the small clearance of posts in the car barns complicated matters even more. Superintendent of Construction A. W. Lynn, has long seen the importance of putting in this special work, so as to make the Farwell avenue barn the distributing center for the east side, and he is to be congratulated for at last having his idea carried out and the soundness of his judgment proved. The plans were made by Clement C. Smith, formerly engineer of the Milwaukee Street Railway, and now assistant engineer of track construction on the Chicago City Railway. The special work was all made by the Milwaukee Street Railway. Guards are put on the inside rail only. The guard rail is an old tram rail bolted to a girder rail from which a part of the tram has been cut off. The thick edge of the tram rail forms the guard. Cast iron blocks form the fillers between the tram rail and the web of the girder.

#### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW

269 Dearborn Street, Chicago

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4.

OCTOBER 15, 1894.

NO. 10.

It is with great pleasure the REVIEW announces the fact of having added the services of Mr. James Boyd, in a prominent position of its editorial department. Mr. Boyd has held responsible positions for several years as department editor on one of Chicago's leading dailies, and later as managing editor of a prominent trade journal. This latter position he leaves to accept a more lucrative one with the REVIEW. Mr. Boyd is a young man of unusual experience and promise, whose reputation is already made, and we bespeak for him the welcome and exchange of courtesies which has always been so fully tendered the REVIEW staff.

STREET railway shares are now a prominent trading feature on Wall street, and are bound to become more important each year.

THE little interurban, described in this issue, between Tama and Toledo, Iowa, is but a forerunner of hundreds of similar roads that will be built within a few years. We call this a forerunner because it is probably the smallest paying road of its class in the world.

THE absence of strikes on street railway lines during the present year is a commendable and hopeful sign that both employer and employe are coming to understand each other better, and are more strongly united than ever before in the one purpose to promote the good of a common cause.

BETWEEN the interior fittings of the horse car of six years ago and the average electric car of to-day there is almost as much difference as between the two methods of traction. One of the apparently small, though by no means unimportant, differences is in the height of the seat. There are very few fine cars built at present with seats as low as was common on old horse cars. It seems to be the universal decision that the higher seat is preferable. While tastes differ in this regard it is generally true that tall people are more uncomfortable on low seats than short people on high seats, and modern car builders recognize the fact. This is a point that it is well to remember in refitting and improving old cars. The public does not usually stop to reason why street car riding is comfortable or uncomfortable, but it renders its verdict just the same to the profit or detriment of the company. The decision is based on such little details as the one mentioned whether recognized or unrecognized.

IF all the good money that has been wasted on electrical patent litigation in the past five years could be spent in manufacturing and in making new inventions, it would put the companies that have spent it in positions where they would not need to care whether the contested patents were valid or not. It seems strange that some electrical companies cannot perceive what everyone else must, that there are some inventions of such doubtful origin that they can never be permanently located as the property of any one company. After a device or principle has been in use for some time by a large number, it is like flying in the face of fate to try to establish claims to the exclusive control of it by one company, especially if the company in question appears to intend to "put on the screws" when it gets control. Very little of the money spent in electrical patent litigation is anything better than absolutely wasted. The business of electrical companies is in manufacturing, not litigation, but some of them seem to forget it to the detriment of all concerned.

ONE has only to glance at the map of any good agricultural state and note the number of small township centers and villages that are without railroad communication, to be convinced that something will be done to give these communities a better outlet to the rest of the world than a wagon road that is never good and is almost impassable six months of the year. The country is becoming thickly enough settled so that it will not pay to leave its richest agricultural districts so much isolated from the main highways of commerce. America is distinctly a country of railroads, and the factor of distance, which has caused the remarkable growth of steam roads, will make the interurban flourish. The meshes of the steam road network are about as fine as it will pay to make them in many parts of the country, and the rest of the territory must be covered by the electric road. There is hardly enough business as yet in any part of the country to support a road built for "purely agricultural" traffic, but when combined with the interurban there is an abundant field for good investment.

THE convention report, by Richard McCulloch, on mail, express and freight service for electric railways is by far the most thorough treatment the subject has yet received. One point never brought up before, as we believe, is that of carrying express and freight to suburban districts for the sake of increasing the desirability of those districts as places of residence. While the express and freight business may not appear very attractive to managers on account of the extra trouble involved and the smallness of the revenue in proportion to that received from passenger traffic on a city and suburban line, this argument of inducing suburban residence ought to have a good deal of weight. The want of facilities of this kind is no doubt quite an important factor in hindering suburban growth, as many can testify from actual experience, but if express and freight packages can be handled cheaply and quickly another obstacle in the way of suburban life disappears. However, we think that in most cases where the carrying of this traffic is practicable it will appeal to the manager from the standpoint of cash revenue, as well as induced passenger traffic.

SOME of the convention papers remind us that street railway practice is, in some particulars, becoming settled enough so that the adoption of standards is not only practicable, but would be a great advantage. Things have been in a very chaotic state since the adoption of electricity, and it is only recently that it would have been practicable to adopt any standards. The conditions on street railways are so variable, as compared with those on steam roads, that the adoption of standards that will suit a large number is more difficult than on steam roads. The argument that the adoption of standards prevents all improvement and progress, has a little weight, but very little, because those who do not care to conform to the standard used by the majority can still obtain their supplies as cheap as before, while those who have adopted the standard ought to get them cheaper than before. The interchange of cars does not necessitate standards in our business at present, so that the main argument is that of cheapness and convenience. If a number of companies will unite on some standards they will immediately begin to realize the benefits of the new arrangement, while those who do not will be no worse off than before.

ONE who travels much among street railways and has an opportunity to observe the way in which different lines are managed, is impressed with the varying emphasis which is put upon the several branches of street railway service by the superintendents of different systems. On one line the greatest attention is given to the appearance of cars and trainmen, and everything is done to put on a good appearance at the points where the company meets the public. At the same time the service may be very inferior as regards frequency and public accommodation, or, on the other hand, the road may be going to ruin mechanically and electrically. A manager who is by taste an electrical, mechanical or civil engineer is liable to fall into the opposite mistake of paying attention to the

mechanical and electrical details, to the detriment of the other departments mentioned. The successful manager must be a man of wide vision, and he must know enough to hire competent men to do what he cannot do with advantage himself. It is one thing to operate a road economically. It is another thing to get passengers to ride on it. These two elements of management seem sometimes to be almost opposed to one another, and it is only the successful manager that knows how to combine them.

MOTORMEN are not usually the careless and blood-thirsty individuals they are sometimes made out to be by the daily press, but there are a few careless ones always, and it may have the effect of making them more careful if they are reminded that within the past sixty days two motormen have been indicted for manslaughter. In one case (that of a motorman on the Newark & South Orange Street Railway) the man was found guilty and sentenced to one year at the penitentiary. It was proved to the satisfaction of the court that the motorman was not properly attending to business, and that at the time of his running over the child, he was not looking ahead, and did not have hold of the brake or ring the gong. The other case was at Quincy, Ill., and the man was acquitted. He was one of the company's most reliable men, and it was proved that the accident was beyond his control. Two ladies in a carriage drove onto a trestle in a dark hollow at night. The trestle was not a part of the carriage driveway. It was impossible to see many feet ahead, and the car ran into the carriage, killing one of the ladies. The motorman, as was shown in court, did his best to stop, and so was acquitted. It is all right for the company to stand by the boys in troubles of this kind, but prevention is better than cure, and it will have a good effect on the careless ones to have them understand that while the company pays the damage suits, it cannot prevent them from being convicted of manslaughter if they do not attend strictly to business.

THE time for car heating is again here, and the managers who have not adopted electric heating are casting questioning glances in that direction. Electric heating received a black eye at the start, from two causes: burnouts, and not enough heat with the current claimed by the makers as sufficient to heat a car. There have since been as great improvements in heaters as in street railway motors, and the amount of current necessary to heat a car is now known from actual practice, so that the use of electric heaters is not as much of a question of guess work as formerly. This being the case, electric heating is now ready to advance on a well-known and established basis. There is probably not much doubt but that electric heating on the majority of roads is more expensive than coal stoves. It even goes so far sometimes as to require an expensive addition to the power station machinery, because its load comes heaviest at a time when the load would be heaviest were no electric heaters used, and hence the maximum station capacity has to

be increased. In spite of all this, electric heating is steadily coming into favor. Electric heating is more expensive than coal. So is gas and electric light more expensive than kerosene. So is a well lighted, well fitted up car more expensive than a cheerless, dimly-lighted one. When it comes to a question of public comfort, expense has to take a back seat. At least that has been the history of both steam and street railway practice. Electric heaters heat a car evenly and near the floor, two things that a coal heater does not, and for that reason are immeasurably more comfortable for passengers, especially those that make long trips. This is the secret of the electric heater's success. The electric heater is not coming in with a rush, and it will be a long time before the car stove will disappear. On small roads where passengers take short rides, and the heat of the car does not make so much difference, the cheapness of the stove will keep the electric heater out for a long time but there are plenty of roads where the electric heater will be forced in as has been the electric light, not because of its cheapness, but for its convenience and comfort.

STORAGE batteries, as usual, are not profitable. The report of the Birmingham, England, Tramways Company, for the year ending with June, states the cost of the working of different systems in that town. Electric storage cars cost 14.70d. per car mile; steam trams, 10.02d. per car mile; horse trams, 9.43d. per car mile; and cable trams, 5.67d. per car mile.

THE tramway cars at Chemnitz, in Saxony, have no conductors. There is a fare box at either end of the cars, as in this country. By doing away with conductors a saving of 44,000 marks a year has been effected. If 450,000 persons evaded paying the fare (10 pfennig everywhere) in the year, the loss would just counterbalance the saving. But the number of evasions is probably very small in a population who are in the habit of having their restaurant and beer shop scores left to their honor. If culprits are detected, their names are "posted" in the newspapers.

THE city of Baltimore has been giving the matter of car fenders an unusual amount of attention for the past year, and on September 28 a culmination was reached by the passage of an ordinance requiring all cars to be provided with an improved fender within three months, with a penalty of \$5 per day per car for non compliance. Each car must be provided with both front and wheel guards in accordance with the ideas embodied in the report of Mendes Cohen, engineer of the fender commission. The fenders must be approved by the mayor, register, and city commissioner, who must certify in writing that the fenders comply with the requirements laid down in Engineer Cohen's report to the commission. It seems not unlikely that the company can not now be held liable for damages in accidents having any connection with the fenders.

## STATE ASSOCIATION CONVENTIONS.

Three state associations held their meetings just prior to the annual convention. One was the pioneer, the Ohio, another was the lusty youth, the New York, and the third was the baby, Michigan.

### NEW YORK.

The twelfth annual meeting of the Street Railway Association of the state of New York was held at the Yates, Syracuse, September 18, with President D. B. Hasbrouck at the motor. Twelve companies were represented, besides a goodly company of thirty-two supply men and others. The report of the treasurer showed receipts, \$5,860.09; expenses, \$5,381.20; balance, \$478.89. The executive committee reported a membership of thirty companies, the highest yet reached. The Forty-second Street Manhattanville & St. Nicholas Avenue Railway Company withdrew, and the Syracuse Street Railway Company, the host, and the Hornellsville Electric Railway Company have been received. Papers were read by J. B. Craven on "Economy in Electric Power Stations;" George W. McNulty, "Recent Improvements in Cable Traction;" Allen R. Foote, Washington, D. C., "Taxation." Following are the new officers: President, G. Tracy Rogers, Binghamton; vice-presidents, John H. Moffitt, Syracuse; William W. Cole, Elmira; secretary and treasurer, William J. Richardson, Brooklyn; executive committee, D. B. Hasbrouck, New York City; John N. Beckley, Rochester; Daniel F. Lewis, Brooklyn. Albany will be the next meeting place.

### MICHIGAN.

The Michigan Street Railway Association held its first annual meeting September 19 at Grand Rapids. Eight companies were represented, St. Joseph & Benton Harbor Street Railway Company, Benton Harbor; City Electric Railway Company, Port Huron; Muskegon Railway Company, Muskegon; Manistee, Filer City & East Lake Railway Company, Manistee; Consolidated Street Railway Company, Bay City; City of Saginaw Street Railroad Company, Saginaw; Lansing City Railway Company, Lansing; Consolidated Street Railway Company, Grand Rapids.

Papers were read by W. Worth Bean on "Construction, Maintenance and Operation of Small Street Railways;" C. M. Swift, "Suburban Electric Railways and their Possibilities;" David D. Erwin, "Street Railway Accidents and Fire Insurance."

The new officers are: President, W. L. Jenks, Port Huron; vice-president, W. Worth Bean, St. Joseph; secretary and treasurer, B. S. Hanchett, Jr., Grand Rapids; executive committee, the officers and David H. Jerome, Saginaw, and Strathern Hendrie, Detroit. The next meeting will be held in Grand Rapids, December, 1895. The association is a strong one for its age, and will be of great value to the street railway interests of the state.

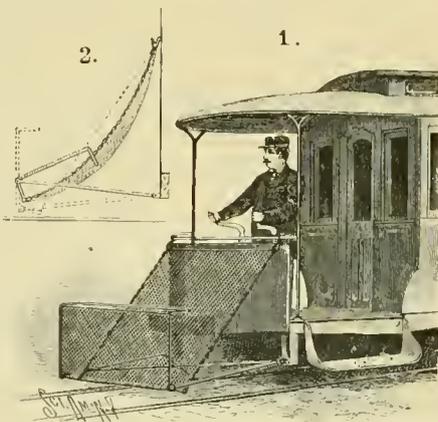

## OHIO.

The annual meeting of the Ohio State Tramway Association took place at the Boody House, Toledo, Ohio, September 26th, at 9 o'clock a. m. President Albion E. Lang, of the Consolidated Street Railroad, Toledo, welcomed the members in a short address. The papers under discussion were: 1st—The best method of collecting fares; 2d—A desirable and satisfactory fender; 3d—What are the best qualifications for car and motor men; 4th—The treatment of low joints in rails, and how to prevent them.

Among those present were Albion E. Lang, Consolidated Street Railroad, Toledo; James Robinson, Toledo Street Railroad, Toledo; J. K. Newcomer, Delaware Electric Railroad, Delaware, O.; R. Carpenter, of the Mansfield Street Railroad, Mansfield, O.; B. P. Foster, Toledo & Maumee Valley Railroad; W. F. Kelly, Columbus Street Railroad, Columbus, O.; W. S. Jewell, Consolidated Street Railroad, Toledo; J. B. Hanna, Cleveland City Railroad; W. G. Owens, Des Moines Street Railroad, Des Moines, Iowa, and others. The supply trade was represented by C. M. Fuller, of the Davis Car Shade Company; H. H. Foster, the Dreher Manufacturing Company, New York; John Dale, of the Dale Manufacturing Company; E. A. Smith, Consolidated Car Heating Company. The members and guests were entertained by visits to various industries in Toledo, and a banquet in the evening at the Toledo Club. This association is the pioneer of street railroad associations, having been thirteen years in existence. The place for the next meeting was referred to a committee who are to report at a later date.

## EATON CAR FENDER.

HENRY W. EATON, 45 Williams Street, New York, has patented a car fender, shown here, the illustration being

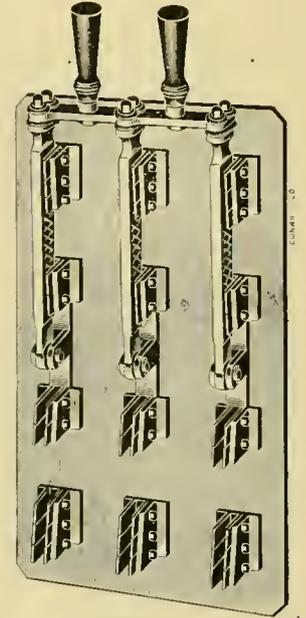

from the scientific American. A forwardly extending lower frame work is connected by a hinge joint to the car, and chains extend from the forward end of the frame to hooks at either side of the dashboard. The chains are connected by a netting and are only indirectly connected with the lower frame, being attached at their outer ends to the arms of a swinging frame pivoted to the lower

frame, and which extends normally upwards, as shown in Figure 1, this frame when turned over as shown in Figure 2, striking the chains and network to depress them near the center, and swinging them and the frame up slightly at the front end of the fender.

## HEAVY CURRENT SWITCHES.

The illustration shows the new switch manufactured by the W. S. Hill Electric Company for railway and central stations. For the past year these switches have been in use in very large numbers, one power station alone having over 300 in use of from 500 to 400 amperes capacity. The improvements (which are covered by patents) consist in broadening the ends of the blades and yoke so as to admit of using two bolts. This unites the two so firmly that it prevents all twisting or straining of the parts while the switch is being operated.

The method of backing up the flexible brush contacts by plates of pure copper, practically converts the blade and contact into one continuous piece of metal, and as the size of all the carrying parts are computed at 1000 circular mils per ampere, it will be seen that perfection has been attained. The company reports business good in all its lines, but more especially brisk in switchboards, some of the largest and finest ones in the country having been lately turned out.

## A LONG INDIANA INTERURBAN.

The lines of both Goshen and Elkhart, Indiana, have been purchased by the Indiana Electric Railway Company. The old line of Elkhart is now being reconstructed and will probably be running in 60 days. Construction has been begun in Goshen and between Goshen and Elkhart. When the system is finished, this company will operate  $6\frac{1}{2}$  miles in Elkhart, 4 in Goshen and 60 miles of interurban to other towns and pleasure resorts. The distance from Goshen to Elkhart is about ten miles. Goshen is the county seat of Elkhart county. The towns are now connected by two steam roads. The new roads will handle baggage, freight and express matter. The officers are J. J. Burns, president and general manager; W. L. Stonex, secretary, and J. Clyde Brown, chief engineer and general superintendent.

THE electric line of the South Covington & Cincinnati Street Railway Company, between Cincinnati and Ludlow was opened for traffic September 24.

## BRAKE SHOES.

Abstract of a Paper read before the American Street Railway Association by D. F. Henry, President Federal Street and Pleasant Valley Passenger Railway Company, Pittsburg, and Powell Evans, Foundry Sales Agent of William Wharton, Jr., & Co.

The street railway is quite as old as the steam railway proper. Owing to the immensely greater size of the latter, however, early in its existence the importance of even insignificant items of cost in construction and maintenance was made clear. Economy required on every hand the adoption of standards wherever possible for each system. This principle then extended to the adoption of standards, applying not only internally to each system, but externally to all systems.

The necessity for standards was the prime cause of existence of the Master Car Builder's Association, which includes representatives from about every steam railway company in the United States. This association has collected most facts relating to the operation of all lines, and gradually reduced the greater number of details to standards. Among other net results at the present time are— the standard track gauge, coupler, wheel, and all such parts as must necessarily be similar to permit cars from any one line to be operated on any other.

If standards have proven simpler and more economical in every way for steam roads, the fact should apply with equal force to street railway operation. Much as been done in this direction, but there is more still before you.

It is not, and probably never will be, possible for all managers to agree on all points; but why should there be a difference of height of car floor above track, or diameter of wheel, on any two new or remodelled street railway lines? For our city and suburban service practically similar conditions exists all over the country, and like the steam railways we should have universal standards.

With the increase of standards comes a parity in the experience of those using them, and by the continued comparison of such experiences it becomes possible to approach perfection. When standards are adopted, we need not carry a large stock of the various parts; and our men, becoming familiar with these parts, can save time and money in replacing them when broken or worn out.

I believe in standards throughout; but now wish to call your special attention to the subject of the "shape" and "material" for brake shoes.

An extract from a letter by W. W. Whitcomb, President of the Composite Brake Shoe Company, of Boston, in the "Street Railway Journal" of September, 1893, aptly emphasizes the need of reformation in this matter. He says:

"Giving attention more particularly to rolling stock, I have been struck by the fact that there is a great lack of uniformity or standard in the numerous repair parts, a state of affairs which the manager knows only too well. Take, for instance, brake shoes and their connection with the brake mechanism. Having occasion some time ago to visit a large and widely known truck manufacturing concern, I was shown nearly one hundred different styles of brake shoes, many of them differing only in some small detail, yet enough to unfit them for any truck except the one for which they were designed; and the end is not yet with them. At another truck company's works the managers failed to recognize a drawing of one of their own shoes, made some years before. This condition of things, annoying in the extreme to the buyer, ought not to exist, and a remedy for it should be adopted. That such a remedy can be found only in the adoption of some standard, suitable alike to all makes of trucks and their brake mechanism, will be readily admitted."

His logic seems perfectly sound.

The steam railways have reduced the parts of their brake-gear to a standard of shape—the beam, link, release spring, hanger, clevis and shoe. They have found designs good enough for all to use, and so good that no one road seems able to improve upon them.

Having decided upon these standards, they specify them when buying rolling stock, get them, and use them. Why should not our various truck manufacturing companies use a standard brake attachment; and if they can, why do we not decide upon one, and insist upon its use? As was stated above, the steam railways some time ago settled the matter of "shapes," so this point does not appear in their recent discussion on brake shoes.

As regards "material" they are still undecided; but are unanimous on one fact, viz.: that the best thing for one road is best for all. Is this not true also among our roads?

I will assume here that it is.

The Master Car Builders' Association has spent much time on this matter, and I will now read you in condensed form their last report of 1893.

After an introduction, Mr. Cloud, secretary of the association, goes on to say:

"We find that the annual requirements for brake shoes for cars and engine tenders owned by roads represented in the Association by representative members, is 55,000 tons. It may be said that approximately two-thirds of this metal is worn out in service and that the other one-third is returned as scrap, although this estimate of the average scrap weight is an estimate based on general knowledge, and not on any absolute statistics.

It is perhaps correct to state, that notwithstanding the use of wooden brake shoes in England until a comparatively recent date, the earliest valuable results of experiments on friction of metal brake shoes were presented by Capt. Douglas Galton, to the Institution of Mechanical Engineers of Great Britain some fifteen years ago. The experiments were made with steel-tired wheels, and the results show very clearly the intricate character of the question of brake shoe friction under variable conditions of service in railway trains. In support of this statement, the following table of coefficients of friction at varying speeds with the cast-iron brake blocks on steel tires is given from a paper read by Capt. Galton before the Institution of Mechanical Engineers of Great Britain in April, 1879:

| Number of experiments from which the Means is taken. | VELOCITY.       |                  | CO-EFFICIENT OF FRICTION. |          |        |
|--|-----------------|------------------|---------------------------|----------|--------|
|  | Miles per Hour. | Feet per Second. | Extremes Observed.        |          |        |
|  |                 |                  | Maximum.                  | Minimum. | Means. |
| 12   | 60              | 88               | .123                      | .058     | .074   |
| 67   | 55              | 81               | .136                      | .060     | .111   |
| 55   | 50              | 73               | .153                      | .050     | .116   |
| 77   | 45              | 66               | .179                      | .083     | .127   |
| 70   | 40              | 50               | .194                      | .088     | .140   |
| 80   | 35              | 51               | .197                      | .087     | .142   |
| 94   | 30              | 44               | .196                      | .098     | .164   |
| 70   | 25              | 36 1/2           | .205                      | .108     | .166   |
| 69   | 20              | 29               | .210                      | .133     | .192   |
| 78   | 15              | 22               | .280                      | .131     | .223   |
| 54   | 10              | 14 1/2           | .281                      | .161     | .242   |
| 28   | 7 1/2           | 11               | .325                      | .123     | .244   |
| 20   | Under 5         | Under 7          | .340                      | .156     | .273   |
| .....  | Just moving.    | Just moving.     | .....                     | .....    | .330   |

It will be seen that the co-efficient of the friction is not only variable through a large range under the same speed, but that it varies very greatly with the speed under these conditions, increasing as the speed decreases.

It was also found that the co-efficient of friction decreases rapidly with the increase of time that the shoes were in action upon steel tired wheels when there was no reduction in the speed, as shown in the following table of co-efficient of friction as affected by time, also reported by Captain Galton from a smaller number of experiments:

| SPEED. | Commencement of Experiment. | CO-EFFICIENT OF FRICTION. |                   |                   |                   |
|--------|-----------------------------|---------------------------|-------------------|-------------------|-------------------|
|        |                             | After 5 Seconds.          | After 10 Seconds. | After 15 Seconds. | After 20 Seconds. |
| 20     | .182                        | .152                      | .133              | .116              | .099              |
| 27     | .171                        | .130                      | .110              | .081              | .072              |
| 37     | .152                        | .096                      | .083              | .069              | .....             |
| 47     | .132                        | .080                      | .070              | .....             | .....             |
| 60     | .072                        | .063                      | .058              | .....             | .....             |

It must be remembered that all the experiments above reported by Captain Galton were made with cast iron brake blocks, on steel tired wheels, which is not a condition prevailing generally in the practice of this country, except on many passenger trains.

The most reliable results obtained experimentally by the use of different shoes on chilled wheels and with different brake arrangements at the present time in hand, are those obtained by the Pennsylvania Railroad Company (which furnishes the information) in various tests conducted during the past two years.

Table "B" presents selected runs for the purpose of making comparisons between runs in which the pressure in the brake cylinder varies between close limits of 30½ minimum and 42 lbs. per square inch maximum. In this table "B" the figures have all been reduced on theoretical basis to 40 lbs. pressure to the square inch, thus giving a number of cases which can be very accurately compared with one another. At the bottom of the table the averages are given with each kind of shoe, and the percentage for comparisons.

TABLE "B." BRAKE RESISTANCES.

| No. of Run. | Cast Iron Shoes Pounds of Resistance. | No. of Run. | Composite Shoes Pounds of Resistance. | No. of Run. | Steel Shoes "Z." Pounds of Resistance. | No. of Run. | Steel Shoes "M." Pounds of Resistance. | No. of Run. | Steel Shoes "D." Pounds of Resistance. |

| Per cent average. |                          | Per cent average. |                          | Per cent average. |                           | Per cent average. |                           | Per cent average. |                           |
| 100.00            |                          | 103.87            |                          | 194.16            |                           | 142.69            |                           | 135.33            |                           |

Two tests were made to compare the durability of the cast-iron, composite and the three different grades of steel shoes in continued service, and incidentally the wear of the wheels was also noted.

The car on which the tests were made required sixteen shoes, which were made up as follows in the first test:

- 4 Cast-iron shoes.
- 4 Composite shoes.
- 4 Steel shoes "Z."
- 2 " " "D."
- 2 " " "M."

Grouping the two grades of steel, "M" and "D," together as from one foundry, the total wear of the four shoes of each manufacture was as follows, while the car ran:

| KIND OF SHOES.    | WEAR.          |                        |
|-------------------|----------------|------------------------|
|                   | Actual Pounds. | Percentage Comparison. |
| 4 Cast-iron ..... | 23,530         | 100                    |
| 4 Composite ..... | 11,394         | 48.4                   |
| 4 "Z" Steel.....  | 2,337          | 9.9                    |
| 2 "D" " .....     | 1,680          | 7.1                    |
| 2 "M" " .....     |                |                        |

A second test was made to determine the durability of the shoes, and, if possible, to get a better record as to the relative wear of the wheels, and the following table gives the results, including also a statement of the relative distances run after the application of the brakes, taken from the former tests reported.

Three sets of cast-iron shoes were practically worn out during these tests, and one set of composite shoes, while the steel shoes were not much worn. So far as the wear of the wheels is concerned, the results were somewhat contradictory, and inasmuch as a large portion of the wear of the wheels is from the rail, it would be unsafe to ascribe all the difference to the shoes.

### COMPARATIVE WEAR OF CAST-IRON, COMPOSITE AND STEEL BRAKE SHOES.

| KIND OF SHOES.     | WEAR OF |           |                                       |           | Relative Distance Run after Application of Brakes. Taken from other tests. | REMARKS.              |

| Steel "Z".....     | 8.194   | 8.65      | 2.969                                 | 105.58    | 194.16   | 4 " "                 |

A discussion follows, which Mr. Rhodes initiates by saying:

"The report says that the composite shoe consisted of cast-iron with a small percentage of wrought iron in the rubbing surfaces extending through the shoes, the percentage of wrought iron being somewhat less than seven per cent of the whole surface. I want to call the attention of the association to this point, so that we will not fall into any error. On our line we use a composite shoe, and have for a number of years, on account of the saving which we find by using that shoe. But it is not a shoe of this character. It is not a composite shoe with only seven per cent of wrought iron in it. It has in the neighborhood of 40 per cent of wrought iron. I can readily see that a test made of a shoe with only seven per cent of wrought iron might give entirely different results."

Mr. Marden: I think this matter of metal for brake shoes is one, perhaps, of more importance than we are giving it credit for. It is one in which there is a daily outlay by the various roads, and the outlay may be made more or less as we give it study and as we experiment, perhaps, with metal for use in brake shoes. And it seems to me that it is a matter which ought not to be passed over so lightly. I think our secretary is deserving of credit for the report which he has presented to us, as it contains quite a little that may give us a chance to study during the coming year. We have made, on our road, quite a number of experiments as to different metals for brake shoes, and we find that on steel-tired wheels we cannot run with as good results with the same kind of metal as we can on chilled wheels. In fact, we are using to-day nothing but chilled brake shoes on steel-tired wheels. Other roads, I understand, are using a composite, or some other kind of shoe, perhaps with better results. On cast-iron wheels we are using a composite shoe, and we are also using what is known as a Conglon shoe. I should be very glad to have an extended discussion of this matter of metal for brake shoes and to take further part in it as the discussion progresses.

Mr. Lewis: I agree with Mr. Marden in what he says of the importance of this subject. It has been shown by the report of the secretary that it involves the expenditure of a large amount of money in the annual consumption of brake shoes. The question of consumption

or wear of the metal is one that is worthy of consideration. I do not claim to know very much about the co-efficient of friction or the resistance of the different metals in brake shoes. But we do know that we get good results from the use of all the different varieties of brake shoes mentioned, and there is not any of them that has developed any serious weakness. When you refer to the test you will notice that the consumption of cast-iron shoes is stated to be 23,530 pounds, while the consumption of steel shoes is from 1,680 to 2,337 pounds. In other words, you have used nearly twenty times as much cast iron in the same service as you have of steel. It is assumed, of course, while the mileage is not given, that the mileage given by the different kinds of shoes mentioned in the report was the same. Now, the difference in the cost between the steel, composite or cast iron, is not above a ratio of 2 or 3, while you notice that in the wear the ratio is 1 to 20.

Mr. Waitt: In connection with what Mr. Lewis has said, there is another feature that comes in for consideration—the matter of the length of time that the shoes of various manufactures will wear is offset considerably by the amount of shoe resistance or holding power of the various metals. I notice on page 16 and then again on page 15, the two tables there show that there is a material difference in the resistance between cast iron and steel, the steel in the tests running an average of only 2,049 as against 2430, or only 84 per cent of the holding power of cast iron. It seems to me that this should be taken into consideration, and that we should not base a decision as to what is the best metal for brake shoes entirely upon the wear.

Mr. Sanderson: We made some trials (I think it was four years ago) with some heavy shifting engines, putting cast iron shoes on one side of the engine and steel shoes on the other. We found that the steel shoes outwore six and one-half sets of cast iron shoes. We have been using cast steel shoes since then on the driving wheels on all our larger engines on heavy mountain service, where much sand is used, and we find that the steel shoe cuts down the tires about as fast as they wear on the rails.

Mr. Lewis: In regard to the effect of different metals on the steel tire or on the wheel, we know that the Ross-Meehan shoe is designed to wear the part of the wheel that is not in contact with the rail nearly as fast as the wheel wears where it is in contact with the rail. The fact is that we never have seen a shoe constructed in that way that has worn the wheel as fast as the rail will wear it.

Mr. Sanderson: There is one other point I would like to raise; that is the work that is done in stopping a train by the application of the shoe to the wheel has to be absorbed in some way—disposed of. It is either done by grinding off metal or by producing heat. Is it not better to grind off a little more metal and keep the wheels cooler rather than run the risk of cracked wheels or loose tires?

Mr. Cloud: Does Mr. Sanderson mean to indicate that the more metal that is ground off by different grades of shoes the less would be the heat generated?

Mr. Sanderson: I thought a soft cast iron shoe would let its particles be torn off and would generate less heat in doing it. At the same time the energy would be absorbed in tearing the metal apart rather than producing high heat.

Mr. Cloud: I should like to say, inasmuch as I prepared this report, that I understood the president to desire me to get together some data which might convince the members of the importance of a thorough investigation of this subject. Now, these tests which are reproduced here are from the Pennsylvania Railroad and are not offered at all as conclusive or as of sufficient importance to warrant any deductions whatever, but simply as so much information, which is a mere handful compared with what we ought to have. I have referred in the report to the fact that in dealing with the amount of metal used per year I dealt only with one side of the question and entirely left out of consideration the other and very much more important side of the question, which Mr. Hayward has referred to, namely, the efficiency of the brake. But I could only present to you what I could get in a short time."

The discussion then turns on the method of having experiments made—whether by individual roads, or at the expense of the association.

This ends the report as far as concerns us. The following extracts from letters from two wheel manufacturers and one brake shoe manufacturer will show their views on the question of friction between wheels and shoes.

The first of these is from Mr. Charles V. Slocum, casbier of the New York Car Wheel Works, Buffalo, N. Y., in which he says:

"The best mechanics acknowledge that two metals of extreme hardness coming together with resistance, as in the case of wheel and brake shoe, do not adhere, but will eventually heat and burn.

As you are probably aware, the treads of cast-iron wheels have the hardest surface which it is possible for the manufacturers to provide, and this hardness is absolutely necessary for the service required. This surface cannot be touched by a tool to any extent. It is harder than hard steel, and when brake shoes of the same material are used, or shoes of considerable hardness, friction results instead of wear, with a consequent burning of the treads of wheels, in many instances shortening the life of the latter and putting the railroad company to a great deal of expense in replacement of wheels or in having them refitted; hence it becomes a question of wheels versus brake shoes.

In other words, will railroad companies prefer to buy the harder and more expensive brake shoes for the purpose of economizing in the consumption of the same, or will they prefer to buy softer brake shoes, as, for instance, the ordinary soft casting worth from 1¼ to 2½ cents per pound, according to the quantities purchased, with a total investment per shoe of 20 to 50 cents, or will they prefer to economize in car wheels, which cost from \$3 to \$65 each, according to style, size and kind?

The shoes are very readily replaced, with very little expense. No car wheel can be replaced to any advantage without taking out the truck, pressing off the wheel, pressing another on, replacing it in the truck, and replacing the truck under the car. The expense of replacing one wheel has been variously estimated at from \$2 in steam railroad service up to \$10 in street railroad service, where the motor has also to be removed and the gear taken from the axle.

That, it can be seen, is comparatively expensive, and does not include the cost of the wheel itself burned by the hard brake shoe, nor the cost of the new wheel to take the place of the burned one. Including these two items, a conservative estimate of the cost of replacing a brake burned wheel under a motor car would be \$20, and where a company is not well equipped with facilities for doing the work, the expense would be far greater.

The cost of replacing a brake shoe might possibly be \$1, including the cost of the old and new soft casting and all the labor involved.

Street car wheels are ordinarily guaranteed to run from 25,000 to 35,000 miles in service under ordinary conditions, and will often make double these figures in actual mileage if not actually prevented. Hence it is a question which every master mechanic must decide, as to whether the wheels shall be assisted in giving good service by the use of soft brake shoes, or whether they shall be hindered, and in many cases actually prevented from giving satisfactory results by using friction, instead of resistance, in the stoppage of cars."

The second statement is from the Philadelphia Car Wheel Company, Philadelphia.

"It is a well-known fact that when two metals are very hard and are brought together, they do not adhere, but will heat and burn.

Cast-iron wheels are chilled on the tread, and are made as hard as it is possible to make them, and if the brake shoe is made and chilled in the same manner, instead of adhesion and wear on the brake shoe, we have friction between the two surfaces, which results in the burning of the tread of the wheel, which unfits it for future service.

The difference between replacing new wheels and new brake shoes is so very great that there is no question but that a brake shoe made softer than the wheel is far more preferable and economical than when made with chilled face, and we, of course, would commend the use in every case of a brake shoe made from ordinary iron.

In this connection we would like to call your attention to the flange of motor wheels. A great deal of the wear on wheels has been on the flange, and if this is not made of sufficient thickness, it will chip and break long before the chill is worn from the tread, and much of the rail now in use has been made with a groove too narrow to take in more than ¾ flange, and this is entirely too small for a motor wheel.

We enclose blue print showing a section of our standard motor wheel flange, and trust when the subject of brake shoes is taken up at the convention, that this will be given consideration."

The third is from Mr. Whitcomb, of the Composite Brake Company, cited before. He states: "From observation and discussion in railroad clubs by the steam railway mechanics, I have become strongly of the opinion that a chilled brake shoe should never be used in street railway service, and with but few exceptions they are being condemned and thrown out. They may give more service, but it is usually at the expense of the wheel, and a constant risk of acci-

dent and disaster to the traveling public. In the electric service, for instance, where considerable speed is attained, and frequent and sudden stops necessary, a chilled shoe should be prohibited in my opinion."

In connection with the first two above citations, it is well to note that with us there is not much danger of burning the wheels, but the remarks on wear do apply, and with force.

I now wish to give you some figures which will show the cost of this brake shoe business to us, and therefore its importance.

In round numbers there are on all lines of street railways in the United States, 50,000 cars, including steam and electric motors, cable grip cars, trail and horse cars. These should not properly be lumped, as they include varying factors of weight and speed, varying the brake services required but for the result in view, using low averages, this lump figure will be sufficiently accurate.

Assuming an average mileage of 75 miles per day for all cars, including an allowance made for cars used in rush hours only, and others under repair, the total result would be 3,750,000 car miles per day. Taking the average life of brake shoes at 5,000 car miles, and

an average of 5 shoes per car, there is a daily consumption of 3,750 brake shoes, and an annual consumption of 1,368,750 shoes. At an average weight of 21 pounds each, new, the total weight is 28,743,750 pounds; at 2 cents per pound, amounting to \$574,875. I will deduct from these amounts an average weight, per shoe, of 9 pounds when worn out, amounting to 12,318,750 pounds of scrap, at 1/3 cent per pound, equal to \$41,062, leaving a net balance of \$533,813. This represents what we pay annually for metal actually ground to dust, braking our cars. To this we must add the cost of labor in changing the shoes. Allowing 30 minutes per shoe for replacement and adjustment of rods, etc., and \$2 per ten hours per day for labor, this total amount charge would be \$136,875. Adding this last figure to the net cost of metal gives us the total annual charge of \$670,688 for brake shoes, equal to about \$13.70 per average car, from which you can roughly estimate the cost of this item for your respective roads.

It is self-evident that if you select a metal which will give you a greater car mileage than 5,000 miles; or a shape which will permit you to use more of your 21 lbs. of new shoe than 12 lbs for braking, and therefore, less than 9 lbs. for scrap; or if your shape is readily

adjustable on cars, and your men become familiar with their replacement and save time— if you do any one of these a saving results, and if you do two or all, the saving is so much the more increased.

Now, the first step towards an advance in economical operation is to turn to your accounts and records and locate any leaks.

Can you all do this?

I will hazard the statement that you cannot. William Wharton, Jr. & Co., Incorporated, of Philadelphia, in preparing this paper, sent out 300 circular letters and sets of questions for returns—with stamped and addressed envelopes enclosed—to as many representative street railways in the United States.

These were mailed August 18, and up to September 1 thirty-five had been returned—about 12 per cent.

Of the thirty-five answering replies: 7 sent no information whatever (1-7); 7 stated that they had no records of shoes or wheels, but gave such information as memory supplied probably (8-14); 13 gave records of shoes and wheels—“limited,” “not accurate,” etc. (15-26) two had records of wear of wheels, not of shoes (27-29), and 6 had records of shoes and wheels (30-35). Accompanying is a tabulated list of the replies in the order above indicated: [Page 624.]

The small number of these answers first, and the smaller number giving accurate information, second, does not speak well for the interest the members of this Association show in such matters, or the records kept by them. As a whole the replies are very contradictory.

You will note the wide difference in material in use. It is not possible that this difference can exist and all be right.

Who are in error? In my opinion, a standard shape of shoe proper could be put in practical and immediate use. Out of twenty, four circular replies on this point twenty-two favored such a plan. The principal objection made to it is that the hangers wear and will not hold shoes tightly for any length of time. Is not this largely due to faulty design, as the Master Car Builders' Association standard for some years has consisted of a separate shoe and hanger? I am using the word hanger as meaning the clevis in steady railway practice.

The Graham Equipment Company also uses this standard on their trucks, and in a recent letter on the subject they state: “We have no trouble with hangers wearing out. We find they hold the shoes tight, and so far in our experience of three years we have not yet found a case of the hanger or shoe rattling loose.” The Atlantic Avenue Railway Company uses the Master Car Builders' standard, varying the hanger attachment to fit their trucks. The Electric Traction Company, of Philadelphia, the Baltimore City Passenger Railway Company, and many other lines using the McGuire Truck Company's shoe, or designs similar to the Master Car Builders' standard, vary the hanger to fit different trucks. You will find samples of all the above mentioned shoes among those now on exhibition here. I strongly advocate the adoption of the Master Car Builders' standard by this Association, the hangers make to fit our various trucks. In time we may hope to reach a standard hanger, when the brake beam and attachment are made from one design, which could easily be accomplished.

This standard shoe weighs less than any combined shoe and hanger, and most of the metal in it is available for actual wear, leaving the smallest possible percentage of residue for the scrap pile. You will note the great weight of useless metal required for attachment solely which many of the combined shoes and hangers among those exhibited contain.

The standard further requires but one pattern for right and left shoes for all trucks, and car house men become familiar with it and accustomed to its fitting.

Without further attention to shape, I will proceed to some consideration to material. From conclusions based on the foregoing Master Car Builders' report and letters immediately following it, there appears to be three main conditions involved in the “best material,” viz.: that it should be economical in wear itself, economical as regards wear on wheels and should have a good co-efficient of friction. Different men will vary in opinion as to the relative importance of these three conditions.

It seems to be generally conceded that neither chilled iron or steel are advisable, as they have not a sufficiently firm hold on the wheels and wear them too much.

Soft cast iron, on the other hand, is satisfactory on both these points, but wears out too fast. Various combinations of soft and medium hard cast iron, with wrought iron, chilled iron or wooden segments inserted in the frictional face— from 20 per cent to 40 per cent of the

face—have given the best results in all these respects in street railway service so far. The Lappin and Baltimore Car Wheel Companies' shoes represent the soft and chilled segment type; the Composite Brake Shoe Company's shoe the iron and wood segment type, and the Wharton Company's shoe the wrought and cast iron type. Still another type is the Wharton wood shoe, in which the frictional surface consists of oak cut across the grain. The Pennsylvania Railway Company uses a medium hard or soft, if you please, cast iron mixture for its shoes; but it is well to remember that the pressure of the shoe against the wheel, and the circumferential velocity of the wheel is much greater in steam railway practice than in ours, and the former could not use at all, with safety, material which might do our work.

A chilled iron shoe would burn their wheels, and a wooden shoe would be set on fire. Another point of difference in conditions of the two practices is the normal freedom from dirt and grit on the steam track, and the necessary presence of both on all tracks laid in city streets. This grit undoubtedly increases the frictional co-efficient between the wheel and the shoe on street cars, but also tends to increase the grinding of both.

A. Whitney & Sons, wheel manufacturers of Philadelphia, have designed a shoe having open cuts across the frictional face, to permit this grit to fall out. As the area of the frictional face must necessarily be as great as in others of continuous surface, they practically apply a number of small shoes instead of one large one, and the total amount of grit retained by the former type is probably equal to that retained by the latter, so I cannot see any actual difference in result in this respect between the two. The grit is always with us, and must be considered an ineradicable factor in our problem. In connection with the area of frictional surface, the best practice seems to be for the shoe to be not less than twelve inches long, and to rub on both the tread and flange of the wheel.

Regarding this question of material, I have collected the available information, but am free to confess my inability to suggest final conclusions. We must think and work over the matter for a time.

The object of this paper is to call your attention to the value of standard design in the practical business of squeezing dividends out of the operation of your roads; to show you that steam railways have standard shapes for brake shoes and attachments, and that we should and could have our own; to inform you that our roads, as a whole, are inconsistent in their selection of material for brake shoes; and to lay before you for further consideration the facts known regarding the merits of various materials for this purpose.

Too much stress cannot be put on the value of good records in this and other details. The results will more than repay the trouble and book-keeping costs.

The limited time permissible for the preparation of this paper—about three weeks—will make you lenient in criticising its shortcomings.

I now beg to suggest the appointment of a committee to investigate the subject during the coming year, to make experiments, if deemed advisable, and to report at the next convention. A sum of money should, in my opinion, be appropriated by the association for their use. The Master Car Builders' Association is now having a series of experiments made at the works of the Westinghouse Air Brake Company, on brake shoe material.

THE baneful influence of aldermanic pull was illustrated in a recent case in Brooklyn, where a conductor who had been discharged for careless handling of fares succeeded in being hired over again by the same road. He changed his name, put in a big bundle of recommendations endorsed by leading aldermen, and sent another man to the office under the new name to pass examination. Notwithstanding the cleverness of the scheme, it was soon detected and the offender arrested, charged with obtaining employment under false pretenses.

THE convention emphasized as never before the wonderful advance in ideas and capital invested in American street railways during the past ten years. What other industry can approach it?

## MAIL, EXPRESS AND FREIGHT SERVICE ON STREET RAILROADS.

Report read before the American Street Railway Association by  
Richard McCulloch, Electrical Engineer, St. Louis.

Richard McCulloch was born in St. Louis County, Mo., in 1869. He was educated in the public schools of St. Louis, and at Washington University, of that city, at which institution he took the degree of mining engineer in 1891. He was at intervals connected with street railway work in various ways from an early age. After graduation he served six months on the United States Geological Survey in the west. The following year was spent in Mexico as chemist for the Great Mexican National Smelter Company of Monterey. He spent the winters of 1892 and '93 at the factories of the General Electric Company and began active work as electrician of the Cass Avenue and Fair Grounds Railway of St. Louis, in the spring of '93. He was engineer in charge of the construction of the Baden & St. Louis Railway which laid the seven miles of welded track and is now constructing the Southwestern Railway and re-constructing the Citizens' Railway of which thirteen miles is being changed from cable to electricity.

RICHARD MCCULLOCH.

In beginning a discussion of this service it seems necessary to explain that the first word of the subject is spelled with an "i," because a gentleman from the rural districts of Wisconsin proudly wrote in answer to a circular asking for information regarding the carrying of mails, that "his road sometimes carried females too." He desired, however, that all information given should be regarded as confidential, so the name of this most fortunate road is withheld. That the street railroads of this country operate a heavy freight business has long been the opinion of the itinerant tinware peddler, "the umbrellas to mend man," the lady who takes in washing, and all the merchant princes of the tribes of Israel, notwithstanding the fact that a generation of sweet-tempered conductors have talked themselves hoarse in endeavoring to explain matters differently.

The first feature which strikes one in endeavoring to study a subject such as this, is the great difference existing between what are known as street railroads. We have city roads and suburban roads; we have summer resort roads; we have belt roads operated by different motive powers, some of them almost approaching steam railroads. There are large city systems operating over many miles of track and running hundreds of cars, and there is one road down in North Carolina, from which the statement was received that "This here road is owned, directed, managed, superintended and driven by Yours Truly." All these railroads haul different classes of passengers, bent on different errands, and are operated under different conditions. It is manifestly impossible, therefore, to lay down any fixed rule for mail, express or freight service — to say that it should be put into practice on street railroads or that it should not be put into practice. This is a problem which must be solved for each railroad individually. In this paper it is intended merely to give a general discussion of the question without attempting to solve it.

In order to ascertain as well as possible how much has already been done, a circular asking for information in regard to mail, express and freight service was sent to every street railroad company in North America. Nine hundred and seventy-eight letters were sent out and four hundred and five replies were received. These replies are tabulated below. As a great many railroads were not heard from, it can not be assumed that the table is absolutely correct, but it is probable that most of the railroads having such a service answered the circular. Roads which are enumerated as having express or freight services are only those which have this service fully developed. The carrying of packages by conductors of passenger cars was not called express service, but is enumerated in a separate column. From some of the states, notably Pennsylvania, Rhode Island and Massachusetts, it was reported that the transportation of express and freight by street railroads was prohibited by State Law, and many of the roads answered that their franchises allowed only the transportation of passengers.

The rate charged on express matter was usually five or ten cents per package while the freight rates vary from four to ten cents per one hundred pound. The mail is usually carried either under a direct contract with the Government or under a sub-contract with a mail contractor. The income from the transportation of the mails varies according to the amount of mail, the number of trips per day, and the length of the haul, from \$100 to \$1,000 per annum.

MAIL SERVICE.

That the street railroads of this country are already alive to the possibilities of the mail service is shown by the table. Sixty street railroads are now carrying Uncle Sam's mail, while fifty-one have government contracts. Most of these railways are suburban roads or roads joining towns, but the postal authorities realizing the advantage of quick delivery and collection, are now beginning to make arrangements with the large city systems for transportation of the mails from main postoffices, to branches and for distribution and collection throughout the city.

Various methods of utilizing street railways for this purpose have been proposed by different local postoffice authorities. In one large western city, in which all the roads are controlled by one company, it was proposed to equip one car of each line with a mail receptacle. At stated times, the carriers along the route were to meet this car and drop into the receptacle all the mail collected by them, which was in turn to be taken from the receptacle as the car passed the main postoffice. This plan, however, did not meet with the approval of the great fathers at Washington, and in consequence was abandoned by the local authorities. Any system of this kind would greatly expedite the collection of mails, but the weak point seems to be that no provision is made for their distribution.

The only method of handling a large mail service, in which it is necessary to collect and distribute along the route, and handle it satisfactorily both to the patrons of the road and the postoffice department, seems to be in the use of a separate car, an independent mail car in charge of a railway mail clerk. This system is already in use on street railroads in St. Louis, Brooklyn and several other places, and so far as we can learn is giving excellent satisfaction, both to the railway companies and the postoffice authorities. The mail is quickly and promptly handled, the service is regular and certain, great and small quantities of mail may be collected and distributed with equal facility, the residents along the line are greatly accommodated, and no interruption or inconvenience to the passenger traffic need result.

As an example of such a service, it would probably be interesting to describe the operation of a United States mail car, which has been run by a street railway in St. Louis for some time. The St. Louis and Suburban Railway begins in the business part of the city and runs through the choicest residence and suburban settlements to the town of Florissant, sixteen miles from the center of the city. After leaving the city limits the line penetrates the beautiful Florissant valley, thickly dotted with pleasure resorts, country clubs, summer homes and suburban villas. The down town portion of the road was formerly a cable and the suburban part a narrow gauge steam line, but with the onward march of progress the grip and the locomotive have gone to join the mule car, and the road is now electric throughout its entire length. The mail car makes three trips each day, two through to Florissant and one as far as the city limits. The railroad company furnishes a conductor and motorman, while the postoffice department supplies the mail clerks. The car, which was built especially for this purpose, is equipped with its own motors, and is furnished with the necessary desks, cases, racks for mail bags, etc. At a schedule time it is run up in front of the postoffice and receives the mail put up in pouches from a wagon there to meet it. The mail clerk receives a bag for each station outside the city limits, and for each carrier along the route a bag designated by his number. He also receives all mail which has come in too late for assortment, which is distributed on the car to the proper bags before reaching the first station. Letters are received, cancelled and distributed on this car, just as in the ordinary steam railway mail car. The first stop is at a point about one and a half miles from the postoffice. At this point six carriers meet the car and each carrier receives from the mail clerk

the pouch bearing his number. Another stop is made about two miles out, another two and a half, another three, and another four miles from the postoffice. Any mail for the suburbs is handed to the mail clerk by the carriers and dropped into the proper bag. After the city limits are passed, bags are exchanged at each station just as on a steam railroad. On the return trip the same system is followed until the city limits are reached. Within the city the postoffice department has placed letter-boxes at the principal corners along the line. Each carrier brings the mail collected in his district to the nearest box on the line of the railroad. Stops being made at each box, the mail clerk removes the mail and assort it before arriving at the next station. The letters thus cancelled and assorted are delivered at the main postoffice tied up in bundles ready for shipment. The mail car makes no stops for passengers, and for this reason can easily keep out of the way of the passenger cars. A light freight business is also done on the car. Provisions, light furniture, milk, trunks, etc., are carried and the charges collected by the conductor. The mail service has now been in operation three years. New features are constantly being added to it, and aside from the accommodation afforded the residents of the territory through which the road runs, it is a source of profit to the railroad company.

The system just described seems the best that has yet been devised for the handling of a large mail business. Where the mere carriage of the mails in pouches from the main postoffice to branches, or from depots to postoffices, is undertaken, and there is no attempt made at collection or distribution along the route, there can be no objection to carrying the mail sacks on the front platform, if their number is not too great; but passenger cars should not be stopped and held for mail collections, nor should valuable space within a passenger car be taken up with mail sacks.

The question as to whether or not mail service is called for, depends almost entirely upon local conditions, the length of the road, the territory through which it runs, the proximity of depots and postoffices to the line of the road, and many others. An advantage in estimating the advisability of inaugurating a mail service, is that a certain, fixed income may be assumed, which is not the case with any other service. It is usual in government contracts to pay a certain sum per one hundred pounds per mile, the weight being determined at stated intervals by weighing the mail. For this reason, a certain, fixed income is assured during the interval. A number of cases may be cited in which it would be well for managers to look into the profits which might accrue from a mail service. Large city systems covering various parts of the city, and passing close to postoffices and public buildings would afford great advantages in distributing and collecting the mails. Suburban roads, roads connecting towns, and roads running to depots in the outskirts of the city are other instances of openings for mail service.

An advantage, independent of any financial return, and one which is regarded by many as the one reason for street railways embarking in this service, lies in the prestige of Uncle Sam's name. This point was never so thoroughly illustrated as in the late labor troubles in Chicago. Rioters may have no fear of the city police or of the state militia, both of whom are often entirely in sympathy with them, but they regard, with the greatest awe, a company of regulars armed with Springfield rifles. Uncle Sam will tolerate no interference with the distribution of the mails, and no other point has been so thoroughly impressed upon the dangerous element in our communities during the last year. Some railway managers on securing mail contracts have proposed to paint upon each car, "U. S. Mail," as a kind of official notice that their roads are under the protection of the United States Government. How effective will be the protection against blockades and riots, and how great a moral influence this will exert to prevent strikes and other stoppages remains to be seen.

#### EXPRESS AND FREIGHT SERVICE.

The answers to the circulars showed that thirty-five roads are now engaged in the express business, while fifty-four are hauling freight. As a matter of fact, however, few roads through the country are doing a regular freight business, most of the so-called freight services partaking more of the nature of express. As operated upon street railways the distinction between express and light freight service is so ill-defined that it is deemed best to consider both subjects together.

There are many points in the street railroad as now conducted which make it almost an ideal agent for the transportation of packages and light freight. The great number of points reached by the cars, the absolute certainty with which they run, the thousand and one precautions taken against any stoppage of however short a duration, the rapidity with which distant points are reached and many other causes combine to make the street railroad of to-day a common carrier of exceptional

advantages, when only short distances are considered. Many conditions will suggest themselves to railway managers in which an express or freight service may be made a paying institution. In the case of a town in which the railway station is some distance from the business part of the town, there can be no quicker, safer and better plan of conveying express and freight to some distant point in the heart of the town, than by the street railroad. Whether or not this will pay, depends upon the amount of material, the competition, the distance, and the scope of the street railway franchise. A case often met with through the country is that of two towns connected by an electric railroad, one of which, having no steam railroad, is obliged to get all its supplies through the other town. The installation of a freight service of some kind would at once suggest itself in this case, and the profits would depend upon the size of the town, the character and occupation of the inhabitants, the distance between the towns, etc.

The operation of an express service on large city systems has not been attempted to any great extent, but it has been contended by some enthusiasts on the subject, that a street car express service will eventually take the place of the many city deliveries and city express wagons now in use. As an example of a city road operating an express and freight service involving collection and a house to house delivery, it would be interesting to cite the case of the Southern Railway of St. Louis, which has been operating an express service on this plan for almost two years. The Southern Electric Railway begins in the heart of the city and runs in a southerly direction for seven miles, following the general direction of the river to Carondelet. The territory penetrated is thickly settled for almost the entire distance and in no essential does the road differ from the ordinary city street railway. Three trips per day are made upon schedule time by the express car, which is entirely independent, being mounted upon motors of its own. At the down town end is a receiving station where a clerk receives all express consigned to the company and keeps all the books pertaining to the service. The especial feature of this service, however, is the collection and delivery. This is effected by means of wagons, two of which are kept at the down-town end of the road, and three of which meet the car on all trips at certain points along the line. On receiving notice by mail, telephone, or otherwise, a wagon calls for a package, delivers it at the car, from which it is handed to the proper wagon, and delivered to the address marked on the package. A charge of ten cents per package is made for this delivery, and trunks are taken from houses to the Union Depot, checked, and checks returned, for the sum of fifty cents. A corresponding charge according to size is made for the delivery of large boxes and bundles. A compliment to the efficiency of the service is paid by the large dry goods and clothing houses, who have ceased to run their delivery wagons into this part of the city and now consign all of their bundles to the railroad company. Where formerly one delivery daily was made by the wagons, three are now made by the railway. An interesting feature of the service is that several large factories located in the southern part of the city consign all their freight to the Electric Express. The goods are put on the car, taken to the proper railroad stations, shipped, and the bill of lading returned to the consignor. Packages are received by the express car C. O. D., the charges collected, credited to the proper account, and settlements made at the end of each month. The railway company assumes all the responsibilities of a common carrier, holding itself liable for all loss and damage. This, however, is a contingency which seldom occurs. The service has now been in operation for about two years. It is well patronized both by the residents along the line, and the large retail stores in the center of the city. It does not interfere with the regular running of the cars, and since its inauguration has never failed to pay.

Up to this point we have considered an express and freight service merely as a paying or non-paying institution, to be adopted in the one case and to be rejected in the other. There is another view which may be taken of the case, however, which is in many instances the most proper solution of the problem. This is to regard the establishment of this service merely as an auxiliary to the passenger traffic, to be operated whether or not it pays, in order to gain increased passenger travel. The most notable instances of this sort are the roads which run from the hearts of our large cities out into the suburbs. It is manifestly to the interest of these roads to promote building and settlement along their lines, and how can they better attract builders than by giving their patrons all the advantage of city life—not only in furnishing them with rapid transportation to and from the city, but in aiding them in receiving their provisions and supplies. This calls for some form of express service, and although the receipts from this source may not equal the expenses, the increased passenger receipts and the advertisement given the road must also be taken into account.

In all street railroad practice, the cardinal point of any service, whether mail, freight or express, must be that it does not interfere in the least with the passenger travel, and this point should always be kept in view in the arrangement of such a service. For this reason, we would strongly advocate the use of separate cars, operated by separate motive power and by separate men. In roads between towns, or suburban roads operated on the same plan as a steam railroad, where stops are made only at certain stations, a combination car or a trailer might be used; but in city roads the system of piling trunks and boxes in the passenger cars and on the front platform, and stopping for these to be put on and taken off, is not of the era of the electric railway. Another system, more fitted to the mule and the bobtail, is the custom, yet in vogue in some places, of receiving small packages for transportation and allowing the conductor to deliver them along the route, stopping the car and forcing the passengers to wait. If the addition of a package service renders necessary such a reduction in the efficiency of the passenger service, it is difficult to perceive the gain in accommodation. A passenger car should carry passengers; it should stop and start for passengers alone, and it should reach the end of the road in the shortest possible time.

If mail bags may be thrown on the front platform of a car, carried to their destination and delivered without causing any long stops, this is perhaps the best way of solving a mail service on a small scale, but in a freight or express service it is better that the work should be done with cars especially devoted to such service and by men especially trained for it. A single box car equipped with motors of its own will handle the light freight and express of quite a territory without any interference with the regular running of cars. A twenty-five foot car, equipped with double trucks, supplied with the most approved form of motors and controllers, and fitted up either as a mail car, express car, or combination car, can now be obtained for two thousand to twenty-five hundred dollars. A smaller car mounted on a single truck can be obtained for less money. If heavy freight is to be hauled, it should be carried in motor and trailer cars built especially for this purpose.

If it is proposed to establish a freight or express service, estimates should be made of the amount of business which could be procured, of its reliability, and of the rates which could be charged, taking into account the existing competition. On the other side, the cost of operating such a service should be estimated, allowing liberally for the time the investment is in idleness on account of nothing to do. If a reasonable assurance cannot be obtained of a steady and regular traffic, it is best not to venture into it, for an unreliable trade is liable soon to develop into a losing one. There are cases, however, as has already been pointed out, when it would be good policy to operate such a service at a loss, merely to give accommodation to patrons, and it is possible that a service started for this purpose alone might in a growing community develop into a paying one.

Before leaving the subject of express service, it might not be out of place to give a brief description of a novel form soon to be introduced upon the Union Depot Railroad of St. Louis, in which the freight is to consist of members of the genus homo in a more or less disjointed state. This great railroad system in its ramifications extends to almost all parts of the city, passing nearly all of the city institutions, including the dispensary, city hospital, and several of the other hospitals, and at the desire of the city authorities it is now having built a hospital car. As designed, it is a twenty-five foot body, double truck car, having a double floor filled with asbestos to deaden sound. It is proposed to utilize it primarily in conveying patients from the dispensary to the city and other hospitals. It can also be used in case of a great fire or calamity in which there are many injured, and where the horse ambulances are not capable of handling the work. It is expected that other uses will develop for it after being put into service. The car is to be equipped with stretchers, folding chairs, a tank of water, apparatus for heating water by electricity, an emergency drug store, dressings, instruments, earth closets and all necessary apparatus for taking care of the sick and injured. A surgeon is to be in charge of the car and will accompany it on all its trips. The car is now being built, and the innovation will, no doubt, be watched with a great deal of interest. It is intended by the city authorities to make arrangements to run the car over all the electric tracks in the city, as this will enable them to reach almost any point within the city limits.

Information received from several of the states, as before stated, shows that in some places, the transportation of freight or express over street railroad tracks is prohibited by State Law or municipal ordinance, and it has been suggested that associations of managers of street railroads in those states be formed for the purpose of securing favorable legislation. The enactment of these laws may be due to hostile steam rail-

road influence, or it may be due to a misconception of the nature of the services which street railroads would put in operation. Surely, a smoothly running electric car, moving swiftly onward would not prove such a nuisance as the great lumbering wagons which block the streets of our large cities. Where a freight or express service is needed, the accommodation to the public would be so great that many citizens might be enlisted on the side of the railroads to secure the proper legislation.

In closing, it would perhaps be well to note some of the principal points which, it is hoped, have been brought out in this paper:

- (1) That a mail service involving collection and distribution is best handled on a separate car, operated on the same plan as a United States Railway Mail Car.
- (2) That it is supposed that a great advantage arising from the transportation of the mails, comes from the fact that the road is under the protection of the government, and is thus secure from riots, strikes and blockades.
- (3) That the most promising opening for an express or freight service is a road running between two towns, or a city road running through well-populated suburbs.
- (4) That the question, whether or not such a service will pay, is entirely a local question, and must be estimated for each road separately, under existing conditions.
- (5) That there are cases when it would be advisable to operate such a service, independent of the profits, in order to accommodate the patrons of the road and to induce building along the line of the road.
- (6) That such a service operated upon the ordinary street railroad must not be allowed to interfere in the least with the passenger traffic.
- (7) That in States having laws prohibiting this service, associations of railway managers should be formed to secure favorable legislation.

Five years ago, such an institution as mail, freight or express service on street railroads would not have been thought possible. Such a service has always been considered as a prerogative of the steam railroad, and the fact that some street railroads have already gone into this business and that many others are engaged in investigating its merits, goes to show how eagerly the street railroad is encroaching on the domains of its elder brother. And it is not only in this respect that the electric railway is pushing the steam railroad. Belt lines, suburban lines, dummy lines, summer resort roads, mining roads, and many others, are rapidly being converted to the electric system. Everywhere we see instances of the screech of the locomotive being hushed by the busy hum of the trolley. We peer into the darkness of the future and we see great systems of railroads operated by power houses located in the neighboring coal fields; we see the great cities connected by electric lines, operated at marvelous speed, and perhaps at no distant date will some new "Empire State Express," or "999 Limited," be pointed out as the development of the electric street railroad.

## CURES RHEUMATISM.

There is a belief on the part of many persons that riding in trolley cars will cure rheumatism. They say that there is a certain influence obtained by watching the rails from a front seat in the car as they appear to grow shorter. Europeans are gravely discussing the effects of electric railways on rheumatism. In order to obtain the benefits of the cure the patient must keep one eye on the motor and the other on the trolley.

## ELECTRICITY IN ROAD BUILDING.

During the construction of a branch of the Citizens' Traction Company, Pittsburg, the contractor hit upon a method of using electric power to save time. There was considerable filling required, so a temporary track was laid, trolley wires strung, and a motor car and ordinary flat car pressed into service. He found that the car saved the hire of several teams, several men, and a great deal of time. The idea can be put in practice in other places.

## PASSES.

How They Are Managed by Various Street Railways—The Card Pass—The Coupon Pass—The Best System.

From time to time requests come to the REVIEW from its readers for information in general or particular, as to certain phases of street railway work not down "in the books." One of these requests has been regarding passes, complimentary or employe's. The latter are ordinarily considered a necessity, while the former—well, they are not exactly a necessity, but usually the Street Railway Company is either bulldozed or persuaded into granting them.

We may preface the whole affair by the statement that the best pass is no pass, just as the best Indian is a dead Indian.

Granting, however, that in most cases passes are of necessity a part of the routine of a street railway, they should be discussed and the general consensus of opinion gained, if possible, in regard to their use.

Passes may be divided into four general classes:

1. Complimentaries to officials whose good will is necessary to the smooth running of the road and the interests of the patrons' peace and pleasure. In this class may be rated the favors to the city fathers, the police and fire departments, newspapers and the like. Mail carriers are allowed a government stipend for street railway fare, and unless specified by franchise are not ordinarily carried free.

2. Officers of the road, stockholders and semi-official clerks.

3. Employes of the line and shops, stable, etc., traveling to and from duty.

4. Visitors and occasional favors for particular favors rendered.

IN ST. LOUIS.

Secretary C. N. Duffy, of the Cass Avenue and Fair Grounds Railway Company, operating the Northern Central Railway, the Cass Avenue and Fair Grounds Railway, the Union Railway and the Citizens' Railway, sends specimens of the passes used on that system.

They are broadly employes' badges and complimentaries issued to directors and officials of the road. This is called an official pass, and a specimen is shown in our engraving No. 0 108. It is sometimes issued to others not occupying official position, but no passes are known as complimentaries. All conductors are instructed to accept this unconditionally by whomsoever presented. It is customary for the person presenting this pass to also tear out transportation for any one for whom he wishes transportation that may accompany him. These passes are confined to a limited number of persons.

 CASS AVE. & FAIR GROUNDS,  
 NORTHERN CENTRAL,  
 UNION.  
**PASS BEARER.**  
*Roll McCulloch*  
 GEN'L MANAGER.

Another form of pass put up in books of 300 is shown also. It is number 368. As to this form, Mr. Duffy says:

"The conditions of the use of this style of pass are very plainly expressed, and we endeavor to have these conditions lived up to, but our experience has been that it is extremely difficult to have this done, as the general practice is, especially where the owner of the pass book is known to the conductor of the car, that the owner detach the pass, and not the conductor, notwithstanding the printed conditions on each pass. These conditions we cannot very well control, except to discipline the conductor for violating his instructions, but we can and do control the use of the pass book in the sense that it is not good for transportation except when presented by the party to whom it is issued."

This style is used by superintendents, foremen and heads of departments, members of the detective force of the city police and special officers in citizen's clothes. In St. Louis, firemen and policemen in uniform are carried free. This pass is issued only to members of the police department living on the lines of the system, and each donee is limited to four books a year.

By having each pass numbered, it is possible to tell to some extent whether or no the privilege has been abused. For instance, if two coupons of No. 368 are turned in by a conductor on one trip, the employe is disciplined and the owner of the book blackballed.

In accounting for the passes, two ledgers are kept: one for the official and another for the other form. The pages of the ledgers are numbered to correspond with the numbers on the passes. When holder of official pass 108 takes his hook he is debited with it on page 108 of the official ledger; when the empty cover is returned he is credited with it and a new one issued. One very remarkable thing about the passitem on the Cass avenue and Fair Grounds is the small number of these in use. Mr. Duffy finds that for June, 1894, that the whole number of passengers carried on passes was  $\frac{146}{10000}$  per cent of the total (00.146 per cent)! Some pass ridden managers will envy the Cass avenue line its immunity from this form of street railway misery.

In relation to the improvement in form and method of issuing passes, Mr. Duffy says: This matter is governed altogether by the individual conditions encountered on each road, and, whilst it is no doubt true our own forms could be improved upon, as a general proposition we are opposed to changes, and I do not know of any special disadvantage in the use of our passes, or any special

advantage to be gained in making a change. If I were to follow out my own desires in the matter, I would not under any circumstances issue any kind of pass to any one, either connected with the road or not connected with the road, and I would gladly pay my fare every time I ride on our own cars if we would be enabled to abolish all passes.

The Secretary and Treasurer of the Newark Passenger Railway Company, Newark, N. J., outlines the best system in vogue anywhere in the world. He says: "On January 1st, 1894, this company discontinued the use of passes of all kinds." Happy Newark.

#### THE LOUISVILLE RAILWAY COMPANY,

of Louisville, Ky., thinks that simplicity is the main object in the matter of passes, and use as few as possible, and incur them as little as possible, with regulations. Firemen and police in uniform or with badges are passed at all hours. In cases where newspaper men, directors, and others are complimented they are given blue celluloid tokens representing 5 cent fares. These amounts are charged to "Gratuities" account in expenses.

During school months pupils and teachers are allowed a half-fare, 2½ cents. The token used is a round copper piece the size of a nickel, with a square hole in it. The persons purchasing same must present certificate showing that he or she is a teacher or pupil, together with location of the school, together with the particular line of railway to be used. The time of this ticket is limited to the usual period of going to or returning from school, and only during the school year.

Laborers are furnished daily with yellow or black celluloid tokens, good for passage to and from their homes and places of work on the street railway lines. They are distributed daily by authorized foremen, and strict watch is kept to avoid abusing the privilege. The general officers and their clerks are passed free at all times and on all lines by depositing a red celluloid token. Where transfers are to be taken, a round brass token, like a ring, is used. Directors use either the red token as mentioned or a paper ticket bound in book form. In case of picnics or like excursions a special paper ticket is used. They are issued in quantities to the proper authority of the picnic or excursion at a stipulated rate, according to quantity and distance. These are strictly accounted for on date issued.

#### THE OAKLAND, SAN LEANDRO AND HAYWARD'S ELECTRIC RAILWAY,

of Oakland, Cal., has a superintendent who had at one time sad experience with the pass. His name is Frank M. Leland, and his system is now the acme of simplicity, neatness and dispatch. Mr. Leland says:

"Before starting this road I was connected with some other roads, where the pass system was so extensive as to take in almost any one who felt inclined to ask for the favor. I also noticed that people riding on passes generally expected to occupy the best seats in the car, and

some would even kick at the trouble of showing their passes, and, when by chance they left them at home and struck a strange conductor, they kicked loud and long if they had to pay fare. So when starting this road I ask the officials to try a new way, viz: To not issue passes to any one, and it has worked so well that it is still in force. Would also say that should I ever leave this road and take charge of another I should by all means recommend that the same course be pursued."

The officers of the company ride on unnumbered badges and rule 10 of the rule book is enforced to the letter. It reads:

**RULE 10—WHO RIDE FREE.**—Conductors will pass only the following persons: President, vice-president, secretary, treasurer, attorneys and directors of the company, superintendent and assistant superintendent and all the company's employes when wearing a numbered badge; constables, policemen, town marshals, when on duty in their respective towns; visiting officials of other roads, when in company with an official of this road; ex-employes, when going to secretary's office for deposit if in possession of superintendent's order for same; new employes, when going to make deposit if in possession of superintendent's order to make same; new employes coming from secretary's office with deposit receipt, and no others. Conductors must put down names or number of each person so carried on his trip sheet. If motor-man or conductor, put M. or C. with number; if other employe, number alone.

#### THE SECRETARY

of a prominent Street Railway Company, whose name we forbear to mention, says:

"We are not at all satisfied with our pass system, and would not want any street railway company to say we do so and so. We do issue card passes, and it is a most pernicious practice. We have out between 300 and 400 altogether. The proportion of passes issued to our immense traffic is not so great but that we can afford it, but our way of accomplishing it is very bad. Passengers get in the habit of simply calling their pass numbers to the conductor, and conductors may compel presentation of pass if necessary. The chances are, however, that the conductor doesn't require ocular proof. So very soon after new issues conductors simply pass pass carriers and say nothing, pretending to make an entry on the trip slip. This makes it almost impossible for secret service men to check up the lines. It is my opinion that the only pass should be the coupon pass, so that the conductor may be compelled to show cause for the transportation of every passenger in his car."

#### ON ACCOUNT OF POLITENESS.

"Papa," said Johnny Snaggs. "Well, Johnny?" "What is a miracle, papa?" "Well, Johnny, it is a miracle when I get a seat in the street car.—Pittsburg Chronicle-Telegraph.

## FROM THE DAILY PRESS.

A Few Choice Selections Containing Valuable Information for Review Readers.

If there is anything more amusing under the sun to the technical man than the attempts of the daily press to deal with technical matters it is yet to be discovered. The efforts of a woman to drive a nail are tame sport as compared to the attempts of the average reporter to discourse on electrical and mechanical phenomena.

One of the most important events is the discovery of perpetual motion by two Bay City, Mich., mechanics. The press dispatches read:

BAY CITY, Aug. 20.—Two machinists in this city have patented an air motor, which they claim will revolutionize street railway traffic. The machine operates by suction, and all that is necessary to start it is to pump air into the cylinders when it will continue to run without stopping, replenishing the air in the cylinders with its own motion. The inventors claim to have a complete machine ready for operation, and place a high value on the patents.

Another startling accident was caused by the "exploding" of an electric motor on the line of the Twin City Rapid Transit Company, at St. Paul. Verily, the possibilities of the deadly trolley are as yet undiscovered! A few years ago the motors were not known to do anything worse than buck. The St. Paul Globe, under the scare head "Street Car Explodes," says:

At 2:15 yesterday afternoon a motor exploded on Grand Avenue Car No. 613, while the car was passing the corner of West Fifth and Seventh streets. Adolph Feise, the well-known drum major, was thrown from the car. \* \* \* Mr. Feise was at his usual place of business last night and did not show any serious results from his experience with chained lightning.

The following is the mishap which occurred to a southern road, as related by a local paper:

Last night, the cylinder heads of one of the dynamos of the Electric Railway Company was blown out. The engineer had a very narrow escape from being hit by a large piece of iron, which would have killed him. A conductor by the name of Young, who ran to one of the cars to escape, was given a pretty bad shock. The schedule was badly broken into.

Street railroading has made wonderful progress in the last few years, and it is now reduced to such a fine point that street railways can be made to order and guaranteed to fit. An Ohio paper comments on the situation as follows:

Will P— is in Hicksville, Monday, measuring the town for a street railway. The line will extend from the depot to the fair grounds and cemetery. It is not known that a street railroad is contemplated. Mr. P— is working for a company that is measuring towns and making estimates of the cost of such lines. Mr. P— measured Napoleon, Wednesday, and then went to Warsaw, Ind., and Urbana, Ohio, and measured those towns.

An editor in a small city, on returning from an excursion to Cleveland, had among other notes of the trip:

The fact was remarked that Cleveland's street railroad lines are equipped with larger sized trolley wires than our own line uses. The cars were more frequently too.

The scientific columns of the lay press abound in hidden gems of information, of which the following is a fair specimen:

When electric motors were first applied to cars grave doubts were entertained as to the resultant effects of the extreme jarring on the

poles of the field magnet, in the light of the knowledge that a permanent magnet loses its magnetization by jarring. The law of compensation seems to abound in nature, since it is now proven that the field magnets, which are not permanent magnets, increase in magnetization by the jarring to which they are subjected.

We doubt if Dr. Wilson would recognize his motor truck from the following description, which was sent out by a Tyrone, Pa., correspondent:

An improved electric motor truck has been invented by Dr. James T. Wilson, of Tyrone, which threatens to revolutionize the present street car and in many cases take the place of steam motors. It is on the storage battery system, and can be made from one ounce power up to a hundred horse power if necessary. For street car purposes two motors would be sufficient to make a speed of thirteen miles an hour, although that speed could readily be increased.

A street railroad man, in New Jersey, was interviewed last winter on the subject of electric heaters. We are sorry for him, as he has evidently been misquoted. At least he gives utterance to some very peculiar notions through the medium of the reporter:

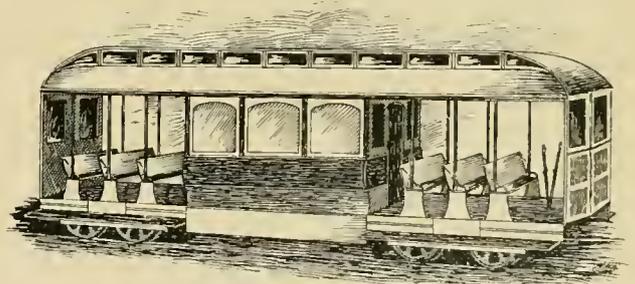

"I would like to have the electric cars heated this winter," he said, "and it may be possible that we will, if the expense is not too much. Car No. 108 is heated by a storage battery in the car, which gets its power from our current. A continuous circuit of copper wire encased in a cast iron pipe runs underneath the seats of the car and the heat from the pipe warms the car. At one time yesterday the thermometer reached 80 degrees in the car. The faster the car glides over the tracks the higher the thermometer gets."

Here is an item in which the laugh seems to be on the other side. It is from a Pacific coast paper:

The flat wheels of the Vernon street cars make such a noise and jar that all the fruit is knocked off the trees. This saves the expense of picking fruit, as well as shaking up the livers of the patrons of the road.

## BLOWS HOT AND COLD.

A car has been assigned and will be put in service in Philadelphia intended to afford at once an open and closed car on the same wheels. Combinations are already in

use in many places where one end was closed and the balance open. This design places the enclosed portion in the center of the car and is readily explained by the illustration.

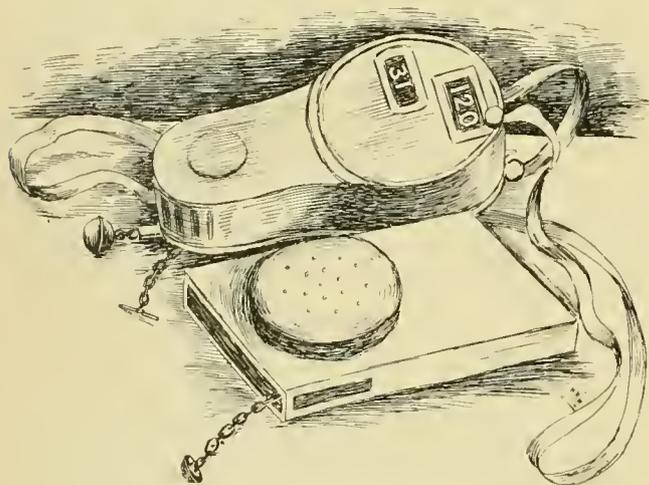

THE suit brought by the Edison Electric Light Company against Westinghouse, Church, Kerr & Company, for infringement of the feeder and main patent, has been decided in favor of the defendant by Judge Acheson, of the United States Circuit Court of Appeals, at Philadelphia.

## THE BROTHER-IN-LAW.

BY A WESTERN MANAGER.

The dishonest street railway conductor, who is anxious to share in the earnings of the company for which he is working, often resorts to many an ingenious way for accomplishing his purpose.

A device which has been used to some extent, but invariably with poor success, for defrauding street railway companies using the portable register, is what is known in street railway vernacular as the "brother-in-law." They are likened unto the plague, generally making their appearance at irregular intervals in the possession of the "professional" conductor, who is as migratory as the duck, and always resulting in the discharge of a number of conductors who are led to believe that with its aid they can increase their daily earnings to such an extent as to make them independent of a railway

THE BROTHER-IN-LAW

corporation. The "brother-in-law" is not protected by patents, and when introduced by the professional conductor is usually taken to some tinker and locksmith whose experience extends to the filing of keys for manufacture and turned out in such quantities as to satisfy the demand. The illustration shows the register accompanied by its "brother-in-law," which is the latest improvement of its kind in my experience. It is constructed of brass about three inches wide, five inches long and nearly an inch in thickness. It has a bell on the inside taken from a small sized alarm clock, which is sounded by pulling a short chain. This "brother-in-law" is worn inside the vest, suspended by a strap or elastic band around the neck, and is invariably accompanied by the regulation register.

The conductor provided with the "brother-in-law" pulls the chain to which is attached a button or knob, thus ringing for the fare, but not registering it. The button is ordinarily thrust through the vest button hole and resembles an ordinary vest button.

It is generally used at night, when the cars are crowded, or at other times when the conditions are most favorable.

There are many different varieties of these "brothers," all constructed for accomplishing the same purpose. An old watch case with a bell inside is sometimes used for the purpose and is operated in the palm of the hand. It does not, however, take the average conductor who invests his money in one of these machines long to find out that he has made a very poor investment, for detection is almost certain. He will, as a general rule, lose his "nerve" before even attempting to use it, and leaves it to the use of his more professional brother who is more hardened in the ways that are dark.

## LOTS OF IT COMING.

Lectricity is comin',  
 We will git it through a slot;  
 'Twill take ye in the street cars  
 Quick ez steam ez like ez not.  
 It's ez fine a style o' travel  
 Ez ye ever come across,  
 An' it means a good vacation  
 Fur the ole gray hoss.

How often hev ye seen him  
 Trudgin' slowly up the hill,  
 Whiles' the kerridge steeds went by him  
 Harnessed up jes' fit ter kill;  
 Never stoppin' ter look sidewise,  
 Nor ter give his head a toss;  
 He hez stuck right down ter duty,  
 Hez the old gray hoss.

Ere long perhaps they'll sell 'im  
 Ter do chores around the farm,  
 Where the roads is sof' ter travel  
 An' the breeze ain' none too warm.  
 So bring on yer apparatus;  
 It won't cause yer any loss,  
 An' it means a good vacation  
 Fur the old gray hoss.

—Washington Star.

## HAD A HEAP TO LEARN.

He was a new man and ran a car for his third or fourth trip down South State street. He, moreover, was highly susceptible to the charms of two pretty shop girls who were his most interesting passengers. In the middle of the car sat an elderly and rather stout colored woman who suddenly arose, jerked the bell, and waited for the car to stop. "Please, let that rope alone, madam," said the new conductor, sharply. "Will you haf de kin'ness den, sah, to 'tend to yo' own biznis, so dat a lady can get off'n de cah when she so desiah, sah, wid out de truble of ringing dis bell he'self. La chile, I was er 'libe fo' yo' was bohn en I tells yo, yo'se got a heap to learn yit 'bout how to treat ladies. I rid in cahs foh yo' ebah gib up yo' nursin' bottle and I knows de juties of yo' to de ladies. Good bye, boy, I gits off heah!" and she disappeared, the broad smiles of the two pretty shop girls following the conductor like an avenging spirit.

"IS NOT A DYNAMO A RESERVOIR?" asked a reporter the other day. "Yes," was the reply; "it's a kind of boiling tank to keep the electricity hot."

## TIME TABLES AND TRAIN SCHEDULE.

### PART III.

The preceding articles upon this important subject have clearly indicated the broader rules upon which time tables are to be founded and the main exceptions to the rule. We have, however, to present this time a few distinctive methods pursued by managers to regulate traffic. The first is from C. A. Denman, superintendent of the Toledo, O., Consolidated Street Railway Company. Mr. Denman has the following formula from which he deduces the "time":

Take the length of the line in feet, divide by number

Take run number 1 and compute through the day on a 56-minute schedule, and start run number 2 as many minutes later as the interval may demand. The Consolidated has a satisfactory train service and operates 80 motor cars and 40 trailers.

### MILWAUKEE'S CONSOLIDATED

lines of the Milwaukee Street Railway Company are numerous, and the skill required to devise running time for all of them is considerable. Manager C. D. Wyman, whose experience cannot be gainsaid, sends us the following remarks on the matter of schedules in general:

"The formula which I have used in making time-

| 11 06  | 11 14                 |             |                          |                            |                          |                            |                          |                           |

of minutes it takes to run the entire length of the line, which will give the number of feet run per minute; multiply by 60, which will give the number of feet run per hour; divide by 5280, which will give the miles per hour. The formula may be expressed:

F

$$— \times 60 \div 5280 = \text{miles run per hour.}$$

M

The two time tables presented, number 1 and number 2, show the method pursued by Mr. Denman. Let one round trip consume 56 minutes, divide that by the number of cars run, which gives the interval between cars.

tables for some years is an old one, but it may be strange to some of your readers. It is as follows:

$$60 \times \text{miles of track.}$$

$$\text{—————} = \text{No. of cars.}$$

$$\text{Speed per hour} \times \text{headway per minute.}$$

Using this formula, the number of cars to be run on any line at any desired headway can be readily ascertained, and this once done due allowances for swings and lay-offs can be introduced. Our rate here is figured at ten miles per hour., which is an averaged rate of six miles in the center of the city and fourteen miles outside of the business precincts."

(Open, red)

TOTAL

TOTAL

GRAND TOTAL.

Superintendent George W. Jewell, in whose hands the time tables are placed, uses a general schedule as shown in our engraving. This gives the number of cars on each line and the headway. A separate week day and Sunday schedule is in vogue.

All time tables are so arranged that the men are given their time for the trip from one end of the line to the other, so many minutes for the round trip. In addition to that, points are designated along the line, varying from 5 to 10 minutes, where the running time may be corrected. On the line, inspectors are employed whose duty it is to see that the cars are kept on "schedule." The conductors are paid by the hour, as are motormen also, and train crews are held strictly responsible for both time and accidents. At the present time there are in use on the system 148 regular cars, besides 30 extras daily. The transfers in Milwaukee are made both by conductors and by transfer men, the former carrying yellow tickets and the latter red ones. There are seven different car stations, with a foreman for each.

The specimen table presented is on the National avenue line, running twenty-two cars. The cars are housed at each end of the line, and are consequently started at each end at the same time, and are pulled into house at night in the same manner. The headway on this table is six minutes.

The time for the cars runs across the table, and the word "end" means the terminus of the line and the time of arrival at or departure from the same. The stars denote the relief time when the "swings" come on to relieve the regulars for meals. The schedule is otherwise self explanatory, and works well on the Milwaukee system.

THE CITIZENS' TRACTION COMPANY, of Pittsburg, under the efficient and economical management of J. E. Rugg, superintendent, gives excellent service. Mr. Rugg gives the following general rules as governing his procedure:

"First: Have as little lay-over time as possible.

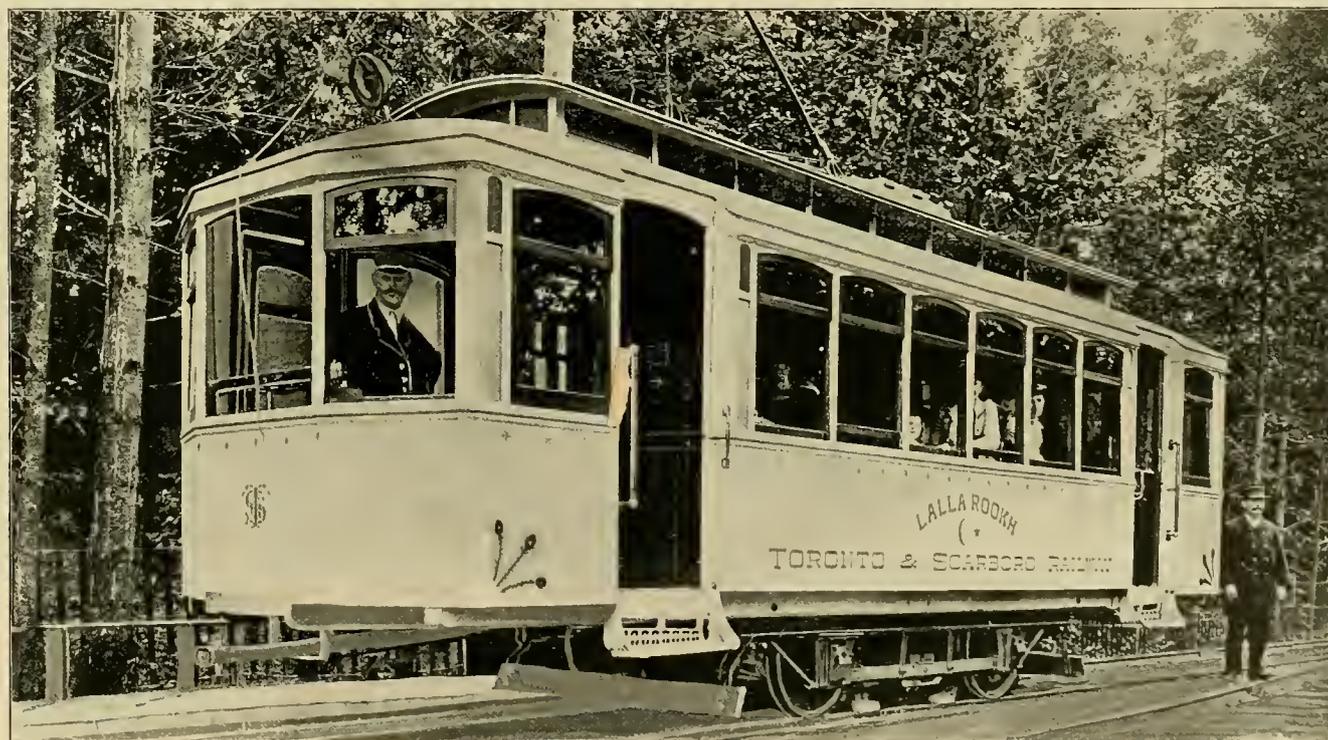

"Second: Meet the requirements of traffic. Carelessly made schedules are likely to be expensive ones, therefore, the man in charge of this work should be carefully selected with a view to his special fitness for the place." Mr. Rugg advocates special Sunday, holiday and Saturday schedules, as well as fair and stormy weather time cards. As to computing headway, he uses the half-trip sheets, as is the practice of Mr. Jewell, of the Chicago City Railway. In relation to the rush trip, he says:

"It is usual to bunch the cars as much as possible to meet the rush travel morning and evening, or at any other time of day occasion may require, but it is not wise to allow too long a time to elapse between cars even if the volume of traffic is not large."

We show herewith a specimen time table of the Citizens' Company on East Liberty street. It is a week-day schedule, cable line, with 10 straight day runs, 16 straight night runs and 10 swings and 10 trippers, in all 36 cars with 46 crews, 361 trips and 3,610 miles run.

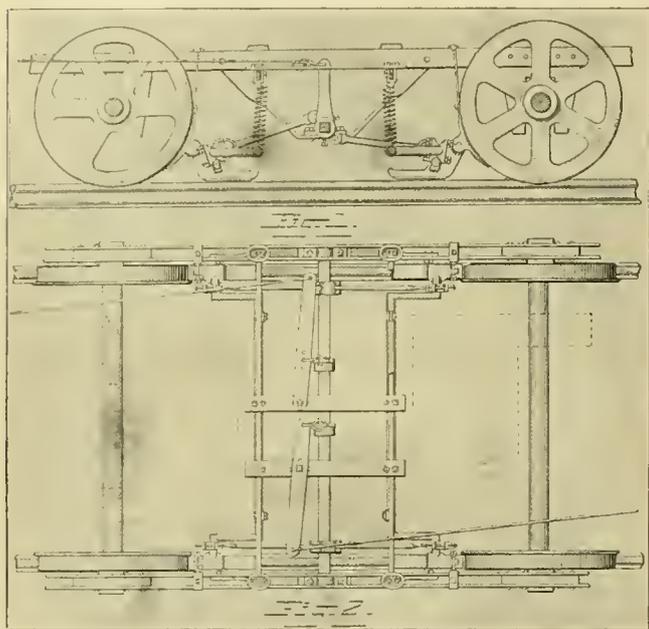

#### THE LALLA ROOKH OF THE TORONTO AND SCARBORO.

A new departure in street car building has been made by the Toronto & Scarboro Electric Railway, which is proving very popular with the public. The specifica-

THE LALLA ROOKH OF THE TORONTO & SCARBORO.

tions as to construction and decoration were prepared by General Manager A. W. Dingman, assisted by the company's engineer, John Gault. The car is 29 feet over all and 8 feet wide. It is divided into three compartments, the central one being 15 feet, and the end ones 7

TANDEM BRAKE—LALLA ROOKH.

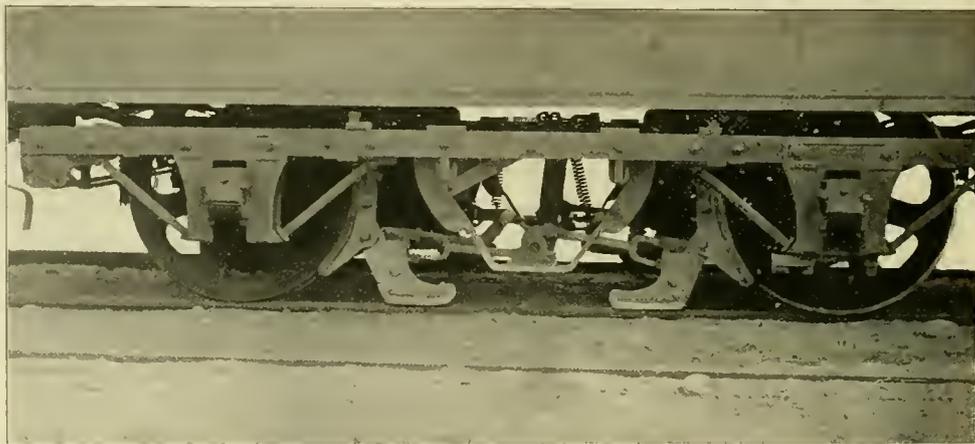

feet each. In the central compartment the seats are reversible and placed crosswise, the same as in the narrow-gauge railway coach. Double sliding doors separate the central compartment from the other parts. The end compartments, or vestibules, have side seats, and wide sliding doors for the ingress and egress of passengers. The central compartment will seat twenty-four, and each end compartment will seat four, making thirty-two in all, and the door construction makes it impossible for a jam to occur when the car is crowded. The interior finish is mahogany panelled, the ceiling birds-eye maple, the windows are plate glass, and the curtains are oakette. Four double electric chandeliers, two in the central and one in each end compartment, give the illumination, with two outside electric headlights. The outside of the car is painted in two shades of white, the decoration is in gold stars and peacock feathers. The car body was built by the Ottawa Car Company, Ottawa, Ont. The truck is a Taylor, made specially heavy for this car, and the two motors are 30-horsepower Westinghouse No. 12, furnished by Ahearn &

Soper, of Ottawa, who are the Canadian agents for the Westinghouse system.

All will be interested in what General Manager Dingman has to say regarding the peculiar form of brake with which his cars are fitted. He says:

"The brake used on this car, and in fact on all the cars of this line, is the tandem brake, which has proved to be with us what I believe every manager is looking for, namely, a brake that will stop a car at any time, on any grade or at any speed, without skidding the wheel. This brake has two shoes, one on the wheel and the other on the rail, both working simultaneously on one shoulder, and with one application of the brake rod. The application of the brake is made by a 12-inch wheel, the same as is used on the ordinary freight car, with the exception that the wheels are nickel plated and the shafts polished steel. A boy 12 years of age can control this car on any grade more easily than a strong man can control a car with the ordinary brake on the level."

Speaking of the car in general, he says: "The 'Lalla Rookh' is universally admired, and the people wait over from the other cars to ride on it. When the windows are lowered, it has the advantage of an open car, and by the arrangement of the seating capacity is considered the most comfortable and cosy coach on commission. By the utilization of the vestibule spaces we have an elegant smoking compartment, where the conductor stands, and an equally fine lookout compartment for ladies where the motorman is. The car will seat thirty-two people comfortably, and will hold all that can crowd in. I can understand that many car builders and managers will say that it is objectionable to have people in with the motorman, but as it is a fact now on nearly all lines that when the car is crowded the motorman is completely surrounded by people at the time of the most danger, the presence of a few people in the vestibule at the time of ordinary traffic, does not, in my opinion, to any

TANDEM BRAKE—LALLA ROOKH.

great extent interfere with the motorman's liberty. On the contrary, the side seats being occupied by passengers, makes it almost impossible for the motorman to be crowded, and it is more comfortable than with the old system of open platform."

## THE OVERHEAD CONSTRUCTION OF THE NEW ORLEANS TRACTION COMPANY.

By B. Willard, Electrical Engineer of the Company.

In the April number of the REVIEW there appeared a description of the electrical construction of the New Orleans Traction Company. This was entirely on paper at that time, but has since developed into a reality, and I take pleasure in placing before REVIEW readers some views taken from various portions of the line, which are the results of plans brought into actual practice. In

FIG. 1.—SECTION SWITCHES.

Figures 4 and 5 of the April issue (reproduced here) was shown a method of making the trolley line sectional and yet maintaining the properties of a continuous wire, by inserting fuses across the section insulators. This has been accomplished somewhat differently than was at first anticipated, by using two switches on one pole, as shown in Figure 1. By following the connections from the feeder wire down to the switch box, it will be seen that the current will be split at a point entering the switch box, part feeding either section on each side of a sectional trolley line insulator which is introduced in the line at that point. Should there be an excess of current required on any one section, every feed wire in the whole system may deliver its share of current to the needed point; thus an even potential is produced at every point on the line, while the greater loss takes place in the feed wires.

Each section box is provided with fuses on either wire leading to its respective sections and a direct short circuit

caused by the breaking of the trolley wire would disconnect only one section. Each section pole carries a lightning arrester so connected as to take care of both the trolley and feed wire. The section boxes and the lower half of the section poles are painted white so that the motorman may distinguish them from other poles and be prepared to shut off the current while passing section insulators in the overhead wires.

B. WILLARD.

For information of the emergency forces each section box contains its respective number and each pole in the section which is controlled by these section boxes is also numbered by what might be called a block system. For example, the poles in the twelfth section would be numbered, 1201, 1202, 1203, 1204, etc. until the next section is reached when the numbers would continue 1301, 1302, 1303, 1304, etc. The emergency forces being acquainted with the various sections throughout the city can respond to the exact spot by simply knowing the number on the nearest pole to where their services may be required.

Figure 2 shows 500,000 circular mil feed line construction leading from the power station. The poles are of special heavy design being sawed out of heart pine lumber; dimensions, 15 inches at the butt and 10 inches at the top set 8 feet in concrete. The cross arms are 3½ inches x 5 inches x 6 feet and contain six pins, all of which are bolted, and support top groove glass insulators for carrying the cables. Figure 3 represents a junction pole showing how feed lines of one road are connected to trunk line feeders. Figure 7 (shown in plan in Figure 6) represents a junction pole showing how the smaller feed wires are connected to 500,000 circular mil cables. It will be seen at this point that there are two large and two small main feed wires ending on one side of the lower frame work (or junction frame). At right angles to these wires are 8 No. 0000 wires leading in another direction which go to their respective "feeding in," sections on the trolley line. All these wires are ended on

FIG. 2.—500,000 CIRCULAR MIL FEED LINE.

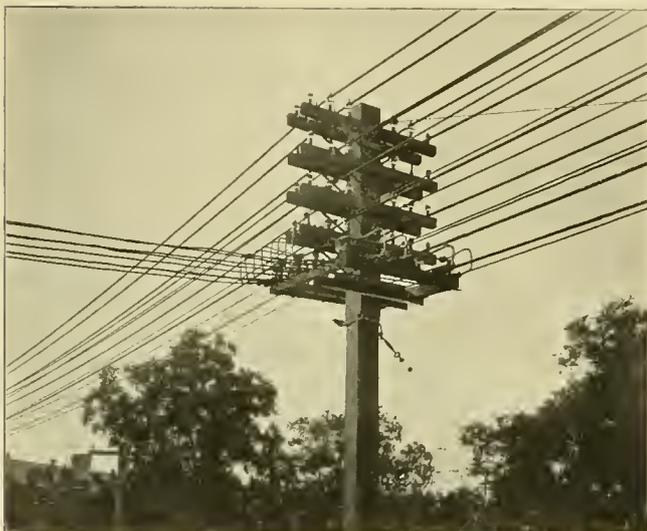

FIG. 7.—JUNCTION POLE

FIG. 8.—STATION TERMINAL.

this junction frame and contains T connections which carry short wires leading to a  $\frac{7}{8}$  inch copper bus rod which encircles the frame; thus making it possible to disconnect any main or branch feeder at a moment's notice, also making a reliable and neat appearing piece of construction. Figure 8 represents a station terminal and anchorage pole. This is very substantially constructed and made to carry a strain of 19,000 pounds with safety. All the wires and cables are dead-ended at this point, in strain insulators capable of sustaining 6,000 pounds each and the whole frame is heavily guyed to two heavy iron anchor stubs, the setting of which required nearly 30 yards of concrete. The main load or strain carried by this frame work is di-

REPORT OF BALTIMORE'S CAR FENDER COMMITTEE.

Some months ago F. C. Latrobe, mayor of Baltimore, John A. Robb, city register, and A. E. Smyrk, city commissioner, were deputed by the city council of Baltimore to make report upon the subject of fenders for street cars, and to select some type or types for the city use. Mendes Cohen, C. E., Baltimore, was made engineer to the commission, and his recently published report is a valuable addition to the literature of street railway devices.

Mr. Cohen says:

"It is somewhat curious that a similar, though by no means identical problem, was pre-

FIGS. 10, 11 AND 12.—TOWER WAGON.

rected to angle iron cross arms "which are not clearly shown in the picture" and each one of these cross arms are so tied together as to bring a general strain on all parts of the structure.

Figures 10, 11 and 12 show the tower wagon in use here for line construction, as well as some of the surroundings through which our cars pass.

Figure 9 shows a motor car on one of the lines constructed by the New Orleans Traction Company, and is a good representation of the general conditions along the several routes now in operation.

PRESIDENT D. F. HENRY, of the Federal Street & Pleasant Valley Railway Company, of Pittsburg, has invented a new non-oscillating truck, of 10-foot wheel base. A trial with a 9-foot base was very successful.

sented for solution some sixty years ago, when the steam railroads of the country, then few in number, found themselves in constant danger, and subjected to much expense from cattle wandering upon the railway tracks, which were then unfenced. The difficulty was first successfully met on the Camden & Amboy Railroad by the construction of a "cow-catcher," as it was called. This consisted of an inclined platform, some five or six feet in length, hinged at the front of the locomotive, at a distance of some fifteen inches above the rails, and extending forward and downward to within a few inches of the rail. Finally, however, cattle owners learned to confine their stock, and the "cow-catcher" developed or rather shrunk into the modern pilot. Now we are met by a very different condition of things. We are called upon to find a car fender

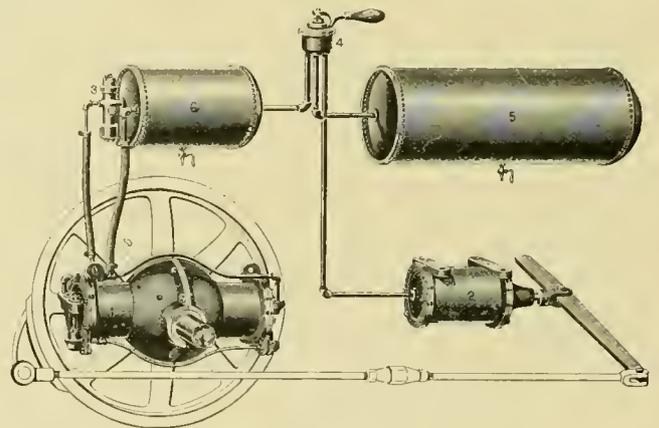

or guard; not to save cattle or dogs, not to brush aside sticks or stones which might throw the car off the rails; not to pick up or throw aside "dummies," but to save, as far as possible, loss of human life, or personal injury to an unfortunate human being, caught in any position, erect or prostrate, upon the tracks of an approaching street railway car. If the car without any protecting device strikes a human figure in erect position the person is certainly knocked down. If the speed be moderate, say not exceeding six miles per hour, the injury sustained by the person in striking the pavement may or may not be serious. The effect of the blow is probably sufficiently stunning to prevent the person recovering himself and getting out of the way of the running gear of the car which follows quickly upon him, and the chances are great that he will be crushed by the wheels. If the speed be high, the force with which the victim strikes the pavement is likely to be sufficient to fracture his skull, and the running gear of the car finishes up the work in a few seconds, unless the victim has fallen clear of the track. It is evident, therefore, that if there is to be an effort made to reduce the amount of injury done in such case, it must tend to save the person from being thrown to the pavement. To effect this, a guard or fender is requisite in front of the car, which shall, if possible, catch and sustain the victim until the car can be stopped. Numerous devices, claiming to effect this result, have been presented, some, of which, likely to prove more efficient than others, will be discussed further on. It is not to be overlooked that the placing of a fender in front of the car may be said to increase the risk of these accidents, which its use is expected at least to mollify. It practically lengthens the car to the extent of its projection, and, therefore, takes up so much more of the public street. It may easily happen that a person imprudently crossing the track in front of an approaching car has miscalculated its speed and distance so narrowly that he is struck by the fender, whereas, if there were no fender, the car would at that instant have been three and a half or four feet distant, far enough, possibly, for him to have cleared it altogether. It may be further said against the use of a front fender that the skeleton frame likely to be used for such purpose in order to save weight will not afford surface enough to be readily and clearly seen, and that its presence will therefore tend to increase the likelihood of accident from miscalculated distance of the approaching car. \* \* \* It is probably requisite that fenders of this class shall be capable of being folded back against the dashboard of the car so as to be out of the way when the car is housed, or its direction reversed. Many of the devices are so arranged as to be readily transferred from one end of the car to the other in the last-named contingency, but the method is undesirable, and to be avoided, if possible."

Mr. Cohen further goes on to express his doubts as to the ability of the projecting fender to pick up people who have fallen on the track, with any degree of certainty. He thinks that there is great danger that such fenders will mount over and crush their victims. Another form

of fender is considered, which is immediately in front of the wheel, and can be adjusted close to the pavement. His opinion is that there should be a combination of the two forms. The wheel guard would, according to his idea, save after the other failed, as it frequently will. Seventy forms of fender had been submitted. He concludes with a classification of the fenders presented and a mention of some particular forms that have elements of success. No particular form is recommended, however, as none of them fill all of his ideas as to requirements. He suggests that there is a tendency to too much complication in present inventions along this line.

#### GENNETT AIR BRAKE COMPANY.

In view of the fact that there are 375,000 Westinghouse air brakes in operation there ought to be no doubt among street railways as to their efficiency. The Gennett Air Brake Company was organized for the exclusive purpose of making street railway air brakes and makes this its business, confining itself to the manufacturing of this one thing. It has a fine plant equipped with machinery built expressly for making air brakes. Following the

GENNETT AIR BRAKE.

example of motors, the air pump has gone through a process of evolution and it is now in a compact form, entirely enclosed, on the axle, and water and dust tight. It is double acting. There is very little friction to it. During the past three months important contracts have been closed in a number of places in this country. The last one was a repeat order from the Buffalo Railway for 25 brakes. A number of cars are also being equipped for New Orleans and Brooklyn, N. Y. General Manager Wessels who has been sick for some time recently returned with health and strength to take up the affairs of the company after a six month's residence in Bermuda. He is a man of unlimited push and will leave nothing unturned to advance the company's interests.

THE Chicago General Street Railway has let contracts for new machinery to go in its new power plant as follows: One 450-horse-power Corliss engine to the Bates Machine Company, Joliet, Ill.; one 300 kilowatt generator to the General Electric Company, and two 200-horse-power boilers to Abendroth & Root.

## SPERRY ON THE ELECTRIC BRAKE.

Few electricians who have seen the beautifully simple and effective Sperry electric brake in daily service on the several roads on which it has been placed, would have realized the immense amount of research and pioneer work which its perfection involved, were it not for the paper which its inventor read before the American Institute of Electrical Engineers, on September 19. The paper is a valuable contribution to electrical literature, not only on account of its bearing on railway work, but on account of certain theoretical considerations. Mr. Sperry began his work on the electric brake in 1882, at which time he studied its application to continuous railway trains. Since then, the apparatus has been constantly undergoing changes until, within the past 18 months, a constantly increasing number of cars have been equipped. The brake, in its perfected form, was described in the August (1894) REVIEW. It acts on the principle of turning the motor into a generator for supplying current to the brake magnets. The original form

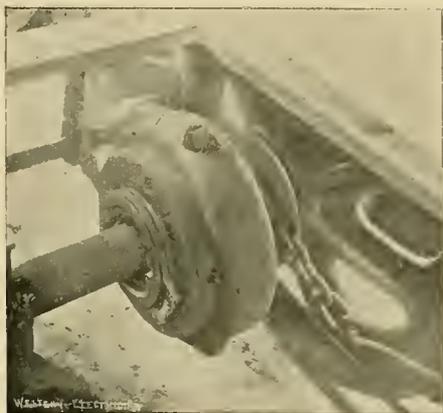

FIG. 1.

of brake magnet is shown in Figure 1, and the present forms in Figures 2 and 3. Mr. Sperry has experimented with a great many forms of magnet for this purpose, and as simple as the present form is, it is the outgrowth of a long study. It was during some preliminary experiments that an unexpected phenomenon was noticed, namely, that the retarding effect when speed is an element, is very much more than would have been expected from the co-efficient of friction due to magnetic attraction or adhesion, this latter being a known and definite quantity. Farther experiment, made to ascertain the cause, showed it to be due to Foucault or eddy currents set up in the masses. The conditions and structure of the brake magnet was therefore varied in a number of particulars, especially such as would be expected to give the greatest result in Foucault currents produced. The result was immediately successful. It was found that the retarding effect of the brake magnet is due very much more to the generation of these currents than to the direct effect of the co-efficient of friction resulting from direct magnetic adhesion, the amount of which can be relied on

accurately when employed by itself. Some of the forms of brake magnets experimented with were provided with numerous poles of opposite polarity, which were worked

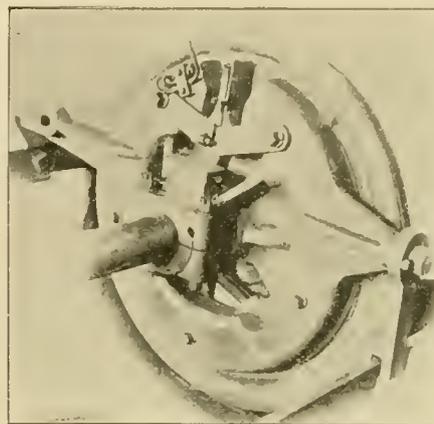

FIG. 2.

upon three different kinds of armature, two of which had radial teeth of different number relative to those in the magnet, and one being a plain disc armature. The toothed armature, while it causes a series of sudden jerks and is also unsatisfactory in the total retardation resulting from a given input is found also upon rupture of the magnetic circuit to impart to the magnet coil certain counter E. M. F.'s which materially cut down the current supply and thus the capacity of the device. A magnet formed of a continuous disk with an annular groove sunk in its face, is found to give satisfactory results, but is much heavier and requires an armature twice as heavy for a given number of lines as the double circuit magnet shown in the figures. Furthermore, the relative rotation between such a magnet and its armature affords no point in the masses where the lines are interrupted or changed, and the Foucault currents, or reactionary effect set up, is very much inferior to that in a magnet where a gap or cessation of magnetic stress is easily produced. As a

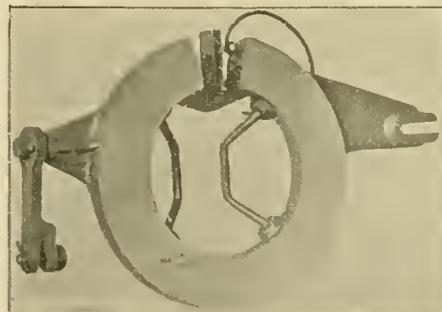

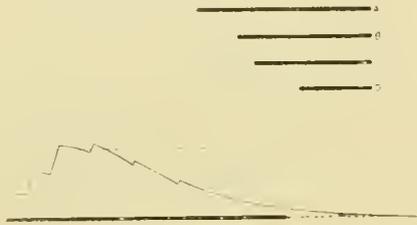

FIG. 3.

result of these investigations the crescent form shown in the figures has been adopted, the opening in the crescent giving the effect referred to, as well as affording an excellent method of attachment and removal of the brake magnet, and at the same time supplying a gap for easily reaching the face for inspection and lubrication.

Thus it is seen that the crescent form is not only about the most convenient one that could be devised from the mechanical standpoint but that there are important electrical reasons for the form adopted.

In developing this system, the point which seemed fraught with the most difficulty, and which has finally received the simplest solution of any in connection with the problem, was that of obtaining always and with absolute certainty, sufficient current at the lowest speeds without the aid of the trolley current. Teaser coils were

FIGS. 4 & 5.

at intervals resorted to, maintaining connection with the trolley circuit. "Artificial teasers" were also used, being a device by means of which the trolley circuit was entirely done away with, and which worked well. Observations made from time to time in connection with these experiments led to an exhaustive investigation of residual magnetism, in consequence of which, structural means were adopted to utilize to the full, the residual magnetism of the motor. This supply is constantly being renewed with every energizing of the car. This method was found to be the simplest as well as the most effective. The connections, and in fact the whole arrangement of the electric brake upon the car, is extremely simple. This is shown by the fact that only one small extra wire needs to be run to the controller in addition to the ordinary wiring of the standard equipment without the electric brake. The certainty of operation is evinced by the fact that 150 of the equipments have been placed, which are making upwards of 10,000 miles daily in regular service. Early in the experimentation a phenomenon was observed in reference to the persistence of the current even after the motor had stopped. This is due to the slow action of the decreasing magnetization, taken together with the reaction or self-induction effect of the fields and any brake coil or coils that may be in the circuit. The movement of the magnetic lines, which persist after, and in fact long after the motion of the motor has ceased, generates potential. In many instances it is possible to draw an arc from the rupture of the brake circuit one second after the motion has ceased, showing the presence of current in the local circuit. Figure 4 has been developed from the average stop to show the curve of current in reference to the motion, the black lines indicating the period of motion during the application of the brake, and the curve indicating the current intensity and its duration. The current flowing after motion ceases, though small, is found exceedingly useful in holding the car from starting itself, even on quite a heavy grade, as only a small quantity of energy added to the already

great friction of quiescence will prevent the car from starting. This persistency of current is also found useful to kill or destroy the magnetism of the brake magnet, in case it is desired to suddenly move the car forward again. The tendency on the part of the windings at the moment of rupture to generate an opposing E. M. F., tends to suddenly free the magnet from its face, a purely accidental feature, which is of great value and utility in this connection. The wonderful energy of the withdrawal of the lines of force, being in its manifestations a phenomenon of magnetic viscosity, is illustrated by the following fact: With a perfectly dry track, a great force is required to shear the adhesion and start the wheels slipping. A car going down a grade under these conditions where no brake magnets are present, will, with a sudden application of the electric brake, generate sufficient current to not only arrest the motion of the wheels, but start them going in the opposite direction, the reverse motion being maintained through an interval truly remarkable, in some instances running as high as one and one-half seconds. It will be borne in mind that all the above phenomena are entirely independent of the central station current, the trolley connection having been severed before the brake is applied.

The current required to be developed to stop a car when no other braking apparatus is used, is found to be only a fraction of that required to accelerate the car in the same interval. This may be easily illustrated by the lines in diagram Figure 5, A being the electrical energy applied in a given acceleration; B the resulting mechanical energy stored in the car after deducting all the wastes in the motor, and between the motor and the momentum; C the average mechanical energy in the car at the time of applying the brake; D being the electrical energy required to be developed for retardation after the efficiency losses have all been provided for out of the quantity C. Thus it will be seen that the so-called efficiency losses act in a two-fold sense, between A and B and between C and D, to reduce the amount of current required to be generated for braking purpose.

As to the effect of the electric brake on the total temperature of the motor the following experiments were made. A car and trailer were operated over the line in regular service 41.1 miles without the brake. The temperature of the atmosphere was noted every half hour during the test, and the temperature carefully taken of all parts of the motor at the end of the run. The succeeding day a similar run was made with the same trailer over the same track and in the same length of time, but with the electric brake in use, braking direct on the simple local circuit without brake magnets. The difference in the average atmospheric temperatures during the two days was six and one half degrees, and the difference in the average temperature of the motor parts was seven degrees, making only a difference of one-half of one degree Centigrade as the total increase of temperature from the use of the brake. Observations in reference to the heat in the rheostat were made, although no temperatures were taken, and no difference could be

observed in reference to the heating of this portion of the equipment. The explanation will be found in the comparatively small amount of current as seen above, and the relative infrequency of its application, and short duration at the time of each application.

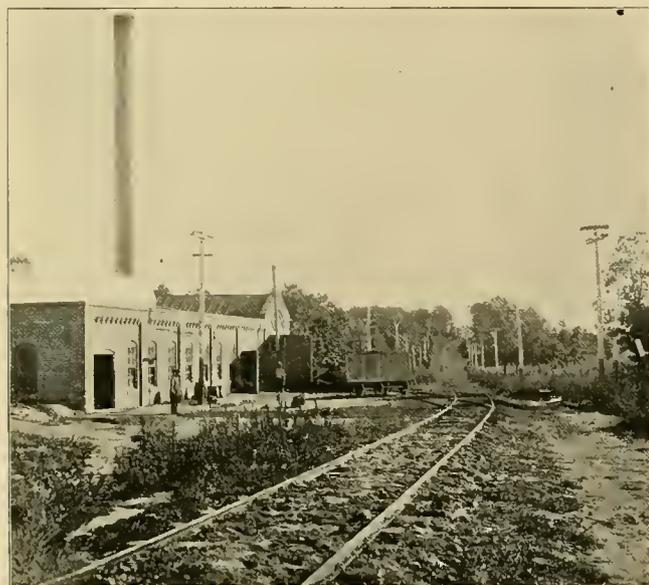

This information regarding the heating of the motor and rheostat when the motor alone is used as a brake and no brake magnets are employed is important, as it has been a popular impression that this use of the motors would cause undue heating of motors and rheostats.

It is safe to say that Mr. Sperry's paper marks an era in electric railway engineering, and that the electric brake will see a more rapid development in the future.

THE TAMA & TOLEDO ELECTRIC RAILWAY.

Two Small Iowa Towns United With a Paying Electric Road.

In view of the present development of the electric railway industry, the little road now running between the towns of Tama and Toledo, Iowa, presents features of great interest. Our readers do not need to be told that the electric railway growth of the future will principally be in the direction of suburban and interurban roads. The railway systems of our large cities are rapidly reaching a point beyond which there can not be much further development unless some use is made of them beyond the carrying of passengers. For the suburban and interurban road, however, there are great possibilities, and in this connection comes the question as to what territories the electric road can run in with profit at present. This is a question of vital and immediate interest to all

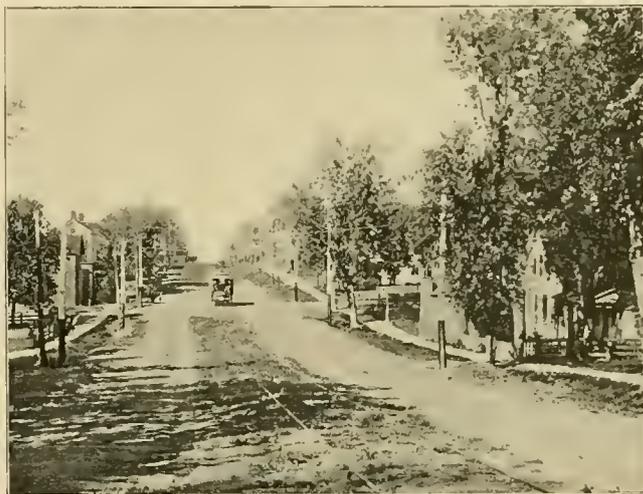

POWER HOUSE.

railway builders and promoters, and it is a question upon which every road now operating in a thinly settled territory throws some light. The Tama and Toledo road is of special interest in this regard because it was built in

a place which to an outsider would seem to be very likely to prove unprofitable.

LOCATION.

The road is two and a half miles long and runs from the center of one town to the center of the other. Each

TOLEDO TERMINUS.

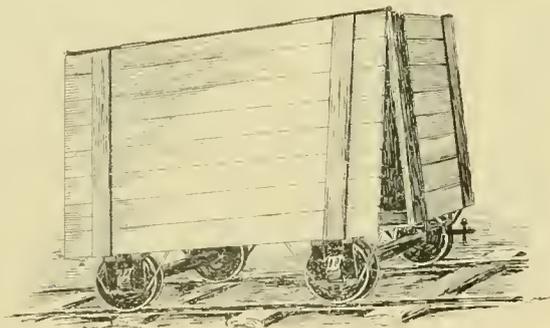

town has about 2,000 inhabitants. The main lines of the Chicago & Northwestern and the Chicago, Milwaukee & St. Paul Railways, from Chicago to Omaha, cross at Tama. A branch of the Northwestern running to northwestern Iowa leaves it at this point and passes through the edge of Toledo. Tama, as will be seen from this, is somewhat of a railroad center. Toledo is the county seat of Tama county, and is more of a residence place than Tama. A college is also located at Toledo, which of course helps swell the traffic between the two places. Practically all of the railroad travel that comes to Toledo comes through Tama. Previous to the starting of the electric road a stage line ran between the two places, and the Northwestern Railway ran a special train morning and evening in addition to the through trains.

TRAFFIC.

July 4, 1894, was the opening day. While it might naturally be supposed that a project of this kind would have to be in operation several years before it would work up traffic enough to pay, such was not the case in this instance, as the road has been a paying investment from the start. The average traffic since the opening has been 300 passengers per day. As a ten-cent fare is charged between the towns this represents about \$30 per day. There are a few five-cent fares collected from those who ride less than half way. This taken, together with the statements made later regarding construction and operation, will show that the investment is an excellent one. Besides the passenger revenue there is an income of about \$3 per day from mail, express and freight. Ten per cent of the entire express charge is received on each express package. Over 4,000 people were carried with two motor cars one Sunday.

## CONSTRUCTION AND OPERATION.

The company is incorporated as the Tama & Toledo Electric Railway & Light Company, and it supplies light to the two towns in addition to running the railway, although it is safe to say that the road could be made to pay were the electric light plant not included. The road is almost straight, with the exception of three curves in Tama. The power house is located in the middle,  $1\frac{1}{2}$  miles from each end. Coal is unloaded into the coal cars of the electric railway at Tama. A profile of the road shows that the general slope from both Tama and Toledo is toward the power house, so that it takes almost no power to haul the coal from Tama, while there is a great

COAL CAR—TAMA &amp; TOLEDO ROAD.

saving in the copper necessary to transmit the current by having the power house at the center of the light and railway systems. In running loaded coal cars from Tama to the power house it is only necessary to start them down the first grade and let them run until it is time to put on brakes at the power house. Except in the town of Tama there is hardly a level place on the route. The heaviest grade is 6 per cent. Twenty-five and thirty miles an hour is sometimes made on the down grades, and as much use as possible is made of momentum for ascending grades. Forty-pound T rail is used with ties three feet apart. A good portion of the right of way had to be bought by the company, but a public highway has now been opened up alongside the tracks, and no doubt within a few years numerous residences will be built along the way. Two or three small cuts and fills had to be made in building the road. Exclusive of the right of way, the construction of the road, including track, track grading and overhead work, cost about \$5,000 per mile. It was built at a time when construction material was very cheap—T rail being at the time \$20 per ton. The overhead construction is all side pole span wire. The entire investment, including the lighting plant for both towns, is said to be about \$56,000. It is of course impossible to separate the light and railway plants so as to find the cost of each. If the railway power plant was constructed by itself and \$150 per horse-power allowed for its cost (which is probably not too low a figure), it would require \$22,500 to build a station having two 75-horse-power engine and dynamo units. Such a station would be sufficient to operate the road under any load that can at present be put upon it,

and would have a reserve sufficient to prevent shutting down the road for any ordinary breakdown. The entire cost of the road and station, according to such a calculation, would be \$35,000, not including rolling stock and right of way expenses. This figure is of course hypothetical, and is nothing more than a guess as to the possible cost of a similar road with a station built entirely for railway work. The station, as it is actually, has of course a financial advantage over one constructed for railway or lighting purposes alone, but there is not much doubt but that the road would pay dividends were there no lighting plant in connection with it.

The ordinary business is handled with one motor car which makes a round trip every forty minutes. As it is possible to make a round trip in twenty minutes, it is evident that it would be easy to give a thirty minute service at a very little extra expenditure for coal and repairs, while the quicker headway would tend to induce more traffic. On special occasions two motor cars are run and a trailer is sometimes improvised by putting seats and a railing on a flat car kept for hauling freight. The rolling stock consists of two box motor cars, equipped with Walker motors, which are giving excellent service, four coal cars, one flat car and one motor baggage car, which has not as yet been used. The coal cars are built with the sides hinged at the top and are run directly in front of the boilers. On being unfastened at the bottom, the greater part of the coal will run out within the fireman's reach without any rehandling.

The entire railway and light plant was constructed under contract by E. B. Hillman & Co., electrical engineers, of Peoria, Ill. The power plant is a neat piece of work, having brick and concrete floors, and employing Ideal engines with the Ideal method of belt transmission. The railway work is done by a 75-horse-power engine and a 50-kilowatt Royal Electric Company generator. The road is under the general management of L. H. Ong.

Johnson—"Say Bill, I didn' see yo' takin' up de collection las' night as usual."

Bill—"No! dey dun insult me by wantin' me to wear one o' dem cash registers."

## SPECIAL PAPER ON "TAXATION."

(Continued from page 610.)

HARRISBURG, PA., Sept. 10, 1894.—Grand Master Sargent, Brotherhood of Locomotive Firemen, said: "I contend that in times like the present, wage workers want the wisest counsellors—men who desire to keep workingmen who can earn their living employed, so that they may contribute a mite to help him who has nothing. They should lend their energies and talents in convincing the hungry toilers of the causes of the great depression and point out a remedy, which certainly is not found by further plunging the avenues of trade into chaos by strikes, applying the blazing torch or in defiance of the laws."—*New York Herald*, Sept. 11, 1894.

### TAXES—WHY AND HOW IS PAYMENT EVADED?

1. Legal honesty is the true standard by which to test the practical moral condition of any people. That this standard is far below the requirements of natural economic law is self-evident. So long as possession of property is considered by practical men to be more desired than good character, the standard of legal honesty will be exceedingly low. While I have an abiding faith in the honesty of purpose, the desire for fair dealing, the sense of justice and the regard for honor that I believe exists in the minds and hearts of a vast majority of men, I do know that the practical effect of contending for gain, in an unceasing war of competition, teaches and compels them to be wise as serpents in seeking and utilizing every advantage that will bring profit to their credit. Present gain is the good practical men seek to win, and in trying to win it, it is not considered to be practicable to inquire what effect the methods used will have on the common welfare, whether or not they are in accord with correct economic principles, or if the profit of one involves a loss for others. The man is prosperous who with clearest judgment utilizes every opportunity to make a gain that he can find, permitting no restraint upon what he does or how it is done, except that he keeps within the law. Such a man cares nothing for economic principles. His mind is never troubled with a desire to see that practical justice is secured for the weakest members of society. His conduct is a product of legal honesty and he helps to fix the standard of legal honesty. Such men never consider whether or not a proposed measure is just; to do that would not be practical business or practical politics. The determining factor is, not the justice of the measure but its promise of profit, advantage, power. By such men, trained by such a business system the enacted laws are written which determine the standard of legal honesty.

2. The practical effect of standardizing conduct by legal honesty; instead of the requirements of natural justice, causes men to place higher value on a present gain in property, than upon good character, causes them to be more intent upon getting that which they think good for themselves than in doing good for others. It blunts their perception of justice and destroys their ability to judge of an action by the principle involved, by which alone its true character can be determined. The standardizing of conduct by a false standard makes it difficult for men to realize that the taking of a dollar from another by unjust indirect methods is in fact and in actual effect a transaction of the same character as the taking of a dollar directly from the victim by brute force. They do not realize that personal rights are invaded as effectually by fraud as by force. For this reason many persons are guilty of acts of injustice by indirection who would be the first to hotly defend their victim from an attack by force.

3. After ages of experience, when practical men learned that greater profits are realized in a society where life and property are safely guarded from plunder by force than where they were not so protected, such plunder was stopped, but the disposition to plunder was not thereby eliminated from human nature. It at once reasserted itself in more subtle and refined methods of plundering by fraud. The time will come when practical men will learn that profits will be far greater when all plundering by fraud is stopped and then it will be stopped. The weakest member of society will then have as perfect protection in the ownership and enjoyment of his just share of the values produced by the joint use of labor and capital, as he now has for his life, and the pursuit of happiness will be less difficult for the masses who toil and are poor.

4. Payments of taxes are evaded because a blunted perception of justice prevents men from seeing that a failure or refusal on their part to pay their just proportionate share for the support of the government, necessarily compels others to pay more than their just

share and that the evasion is fraud on them instead of on the government. Many people think or care so little about the ultimate effect of their conduct upon others, they never know that an evasion of the payment of taxes is a robbery of individuals. They regard the government as an impersonal entity to defraud which has no moral significance. To such an extent is this true, that it is almost impossible to control many persons in their dealings with the government by the same rules of conduct they unhesitatingly obey in their dealings with individuals. In defrauding their friends and neighbors by indirection, through defrauding the government, they feel no restraint from the powerful influences exerted by a clearly expressed public opinion and a discriminating sense of high personal honor. Because of the indirection of the robbery and because of the inability of many to guide themselves by a principle when they cannot directly see the ultimate effect of their actions, an evasion of tax payments is not only considered "good business" by the one who is a gainer by the practice, but is so considered by many persons to whom it may become known, who for the same reasons are unable to see that they have been robbed by the one whose shrewdness they admire.

4. To the class of legally honest tax-dodgers must be added the class of the inherently dishonest, whose greed for gain suffers no restraint from natural or enacted law. They may not know that their act is robbery. They would not care if they did.

5. It is a natural sequence to find tax laws enacted by defective human nature extremely unjust. There is a class of legally honest tax-dodgers who would willingly take their oath that they never dodged the payment of a tax bill. That statement may be exactly true, and yet of all tax-dodgers they are the worst and most dangerous class. It is in response to their demands that unjust tax laws are enacted for the direct purpose of placing a portion of the tax they should pay upon others. They are tax-dodgers in the first place because they evade paying their fair share of taxes, through the operation of legal enactments, and in the second place because the unjust laws enacted for their benefit cause an enormous amount of tax-dodging on the part of those who resort to such action in resentment of the injustice of the law. This class of legal tax-dodgers must be very large, or unjust tax laws could not remain on the statute books a single year. They must be rich, because an attempted change in tax legislation to make it more just is stoutly resisted by them. The poor give no heed to such action only as their prejudices are played upon to incite them to strike at organized capital. These legal tax-dodgers are all very respectable and honest, legally honest people. Some of them may not believe the tax laws to be entirely just, but the law is in their favor. No one expects them to force the tax collector to take more than he asks. They pay what is demanded of them. If the demand on them is less than it should be, and for that reason must be greater on another than it should be, that is not their affair, it is the law, and that is sufficient answer for them. They are the ones who insist that all securities should be taxed as personal property; why? Because their property is in real estate, and if to the total valuation of real estate the total valuation of some securities is added, the rate per cent on the combined total will be less and their tax bills will be smaller. This is all there is of the demand to have securities taxed. It is an effort to make tax-dodging legal, and whenever such a law is enacted this is its effect.

6. The honesty of those who demand the taxation of securities can be easily tested. Stop contending with them and take them at their word. Say to them all right, tax securities, if you wish, but there must be no discrimination. If you tax one, you must tax all, equally. What would be the result of this? The Comptroller's report, State of New York, 1894, gives items for 1893 as follows:

|                                    |                    |
|------------------------------------|--------------------|
| Real estate .....                  | \$3,626,645,093 00 |
| Personal property.....             | 411,413,856 00     |
| Total property valuation.....      | 4,038,058,949 00   |
| State tax, levied for all purposes | 10,418,192 08      |

Rate of tax in mills on each dollar in valuation 2 <sup>5</sup>/<sub>100</sub>

The fact is indisputable that all of this real estate is covered by a security representing its ownership and called a deed. There is no difference in character between a deed and a certificate of stock. They are both securities representing ownership. Neither of them has any value apart from the value of the property the ownership of which they represent. Therefore, it is simple justice, if the property represented by a certificate of stock is taxed, and then the certificate of stock itself is taxed as personal property, or in any other way, to require that deeds representing the ownership of real estate should also be taxed after the real estate had been taxed. Under this ruling

the item of personal property in the above statement would be increased by the entire amount of real estate valuation, and the tax levy on the new total of valuation would be  $1\frac{8}{10}\%$  mills on each dollar of valuation. The real estate owner, however, would pay this rate once on the value of the property and once on its representative, or what would be the equivalent, he could pay  $2\frac{7}{10}\%$  mills on each dollar of valuation on his real estate instead of  $2\frac{1}{10}\%$  as he is now doing. The increased tax on all of the real estate would amount to \$507,630.30. This amount would, of course, be taken from the present tax on personal property, and the tax on the valuation of personal property as it stands in the table would be reduced to  $1\frac{8}{10}\%$  mills on the dollar. This shows a legal evasion of the payment of \$507,630.30 of taxes by real estate owners and the assessment of that amount on that portion of the people who, through honesty or inability to hide their securities, suffer them to be taxed on personal property under the law. It must not be assumed that this illustration is technically correct because there are many things mingled with securities in the general classification of "personal property" that are property, not securities, and would be assessed for taxes under a law providing that all property shall be taxed and that securities shall not be taxed. The illustration is simply intended to show the injustice of the law in classing securities as property for the purpose of taxation, because they are representatives of the ownership of the value of property, and then failing to so class and tax all representatives of the ownership or of the value of property. Such laws produce all of the effects of tax-dodging, and should be known by their true name as tax-dodging measures.

7. When tax-dodging laws are in force their necessary effect must be to tax the man unjustly who standardizes his conduct by the natural law and does not evade taxation. He cannot sign a tax return nor permit one to be made for him purporting to list all the securities he owns which is not a true return. Having all his securities listed there is no relief under the law but to submit and pay the tax assessed upon them. The legal tax-dodger knows the law is not just. He sees that the law itself is dishonest, and therefore esteems himself as legally honest if he can find a way in which to evade the law without subjecting himself to a penalty. I believe that the legal fallacy that the evasion of tax payments is not theft is responsible for nearly all tax-dodging, because it protects tax-dodgers from punishment by imprisonment. To dodge an unjust tax is remarkably easy, when there is no restraint from moral principles upon the many methods that may be employed. To illustrate: "A" being in New York city may have a friend, Mr. "B," in Jersey City, whom he can trust. "A" can give his securities to "B," and then he will not own them on the date of his tax return, nor will they be within the jurisdiction of the state. When it is "B's" turn to get relief, "B" can use "A" in the same way and for the same purpose. This act is as honest as the law, therefore the law cannot punish it. No one should be deluded with the idea that this method of tax-dodging is confined to the very wicked men, as some think them to be, who have been successful enough to own securities. By accident it could not have been by the design of honest men—that laws of adjoining states are so arranged that the returns of farm property are made for a certain month in one state and for a different month in the other state. The returns call for an enumeration of live stock. Result: The legally honest farmers, who it is supposed are to be depended upon to vote for the taxation of securities because they have been permitted to think that they do not own any, drive all their live stock into the adjoining state, for pasturage, of course, and keep it there during the month in which it would have to be listed for taxation if it were on their own farms. Not being on the farms or in the state, the legally honest man can sign a return showing that he has no live stock in the state except that which is exempted by law. The season moves on, and by the processes of nature and the imagination of man, the pasturage has become so much better in the first state to pass through the taxation period, all the live stock that has been driven out of the state to be pastured and evade taxation, is brought back, and with it comes as much more which is the property of the other state that is about to pass through a season of short grass and tax returns.

8. Deep as the economic injustice of dishonest tax laws is, the deeper injury is in the lowering of the standard of honesty by which very many men, it may be a clear majority of men, standardize their conduct. The property gain secured as a result of tax-dodging, whether it is done by direct legal enactment, or by evasion of the law, invariably enriches the dishonest man and robs the honest. All unjust tax laws place a premium upon fraud and place honest deal-

ing at a discount. Is this "good business" for the community? Is it "good business" for those who grow rich on such ill-gotten gain? Make a plain statement of these questions to the people, so there can be no evasion of a correct understanding of their meaning, and ask them to answer whether or not the time to stop plundering by unjust taxation has arrived. Their answer, if secured void of the prejudices and subtle misleadings of political influences, will ring true to the principles of natural justice and will demand the enactment of tax measures that will acknowledge and enforce the equality of all property before the law—dollar with dollar.

#### TAXES—BY WHOM SHOULD THEY BE PAID?

1. During the discussion of the income tax in Congress the argument was advanced that the measure was vicious because it sought to relieve persons having small incomes from the payment of their share of the expenses of government, and that in so doing a foundation would be laid for relieving them of their share of political power. It was claimed that those who pay the expenses of government would govern. This view does not take account of the fact that the government requires two classes of services, both of which are essential to its existence: one is personal and the other financial.

2. After ages of effort to acquire freedom of thought, freedom of speech and freedom of person, the principle that all men are endowed with "equal natural rights, to life, liberty and the pursuit of happiness," has been affirmed and irrevocably fixed in the foundations of the government. Equality of personal rights carries with it, as a necessary resultant, equality of personal duties; therefore for the personal service required by the government all men stand pledged equally, man with man. In its true meaning this pledge does not require each man to render an equal personal service, incapable with the capable. It does require that each man shall render the best service of which he is capable. While capabilities are widely different, the obligation that each shall do his best is laid equally upon every person. The capability of each is the standard by which the personal service he may be required to render is measured.

3. In the process of constructing or reconstructing a government that derives all authority from the consent of the governed, it has been and still is necessary to settle political questions before economic questions can be properly dealt with. Every great movement is based upon an economic principle. While this is true, in the past contention has centered upon political questions having to do with the powers and mechanism of government, and with personal rights. It was necessary that men should acquire their freedom and get the powers and mechanism of government thoroughly under their control before they could institute economic policies designed to establish justice in the control of the great forces by which wealth is produced and distributed. For these reasons economic questions are only now beginning to present themselves for settlement as independent measures. First of its class and generic in its relations is the question of taxation.

4. The principle of the natural right to personal freedom being established, the next step of progress is to establish the principle that all men are endowed with equal natural rights to the ownership and unmolested enjoyment of the full value of their labor. Labor to have value must be expended in the production of something that is valued by others. Equality of property rights carries with it as a necessary resultant, equality of property duties, therefore for the financial service required by the government all property stands pledged equally—dollar with dollar. This pledge does not require each person to render an equal financial service, those owning little with those owning much property. It does require that each shall render the service in proportion to his ability. While the property owned by each is widely different in value, the obligation that each shall contribute according to his ability is laid equally upon every person. The ability of each is the standard by which the financial service he may be required to render is measured. This affirms the principle of equal property rights and equal duties of property for all men. This is the next principle to be irrevocably fixed in the foundation of government. The payment of taxes is a financial service that can be rendered by property only. A recognition of the principle of the equal property rights and duties of property for all men requires that taxation shall be levied upon all property equally. Any departure from this standard must result in taking more than their equitable share from some and less from others; a condition that cannot be permitted to exist if justice is to be established.

5. The necessity for organizing a government to enforce obedience to law in order that men may be protected in the enjoyment of their natural rights, is clear proof that society contains many members whose diseased brains and hearts permit and impel them to take from others by force or fraud that to which they have no right. The ingenuity of man has exhausted itself more completely in efforts to find ways of obtaining property without working for it than in the pursuit of any other object. The effort to obtain value without giving value in return has its counterpart in the effort to retain value while enjoying the benefits for which value must be paid by some one. In one case the fraud is direct, in the other indirect, but the economic result to the victim is the same. In no way can direct fraud be practiced so safely and effectively as by the enactment of unjust tax laws and the evasion of the payment of taxes. Unjust taxation uses the organized power of the government to wrongfully take for its support a greater proportionate share of the property of one than of another. This is an invasion of the personal rights which all honest men are equally interested in resisting and stopping. Unjust tax laws make a government organized to establish justice through the protection of life and property untrue to its purpose, and causes it to become an oppressor at the very point where it was designed to be a protector. The unequal burdens of taxation placed upon the honest to satisfy the demands of, or by reason of the cupidity of, the dishonest, is a tax which may be greatly reduced if not wholly obliterated by means of a wide dissemination of correct economic education.

#### TAXES—HOW CAN A JUST SYSTEM BE ESTABLISHED?

1. Government has no virtue not possessed by the people. It has no sense of justice, no power to discriminate between right and wrong, no standard of honesty other than that contained in the enacted law. A government that derives its powers to govern from the consent of the governed must reflect the vices as well as the virtues of the people. The people are not close students of economic questions and are therefore easily led by dishonest men to do many unjust things simply because they are ignorant of the ultimate effect of such actions. They do not trace the operations and effects of unjust tax legislation, until the fact is as clear to them as the sun at noonday, that all such legislation must give undue advantages to some through placing others at a corresponding disadvantage. When this is made clear to them their sense of honor and fair play can be relied upon to remedy the evil. The desire to escape taxation is born of selfishness and is kept alive by the intuitive disposition fixed in human nature by the tyrannies of the past, to resent or evade every demand made on them by the government. As governments become more just and people become more honest the affirmation will become more universally accepted and voluntarily acted upon, that all men should pay taxes in proportion to the property they own.

2. It is an often repeated remark, heard in every city and state in this country, that it is useless to attempt to secure the enactment of a measure solely on presentation of arguments showing conclusively that it is just and right. I am told everywhere that when legislation is wanted the only way to get it is to buy it. I am sometimes inclined to think that some of the measures persons making such statements have been interested in getting enacted, were not just or right, and that they preferred to buy the legislation they wanted rather than take the risk of defeat through too great publicity. The virus of corruption works rapidly through the body politic. The corrupt do not all hold seats in the State legislature or municipal councils. When all men will refuse to enjoy an advantage, gained by legislative enactment, that they cannot obtain with honor, but little of the legislation that cannot be had without buying it will be asked for. There is a limit to the demands of justice; there is no limit to the demands of corruption.

3. It is not good business to buy corruption. The market can never be cornered. The supply will always be equal to the demand, but no greater. When there is no demand, no reward for corruption, it will not exist. It should also be considered that that which is gained by corruption has no security. It may be taken away by corruption, while that which is gained justly has a sure defence. It can never be taken away by justice. By the establishment of justice the rights of all men are protected. Those who traffic in corruption cannot appeal for protection to just laws. The corrupt do not enact just laws.

4. Buy legislation if you will, but do not delude yourselves with the idea that you have thereby effected a saving or made a permanent gain. The cost of legislation by bargain and sale is many times

greater than that secured through the correct economic education of the people, and does not give a fraction of the satisfaction or security. Here again is a tax unaccounted for and unacknowledged, paid by those who seek unfair advantages through using unfair means. The tax they pay is direct, but the indirect burdens laid on honorable men through the losses and disadvantages they sustain by reason of measures carried by unfair means is incomparably greater. Who can tell where the indirect burdens laid by corrupt legislation begin or end? Who can tell its total cost and why it is paid if there is not a subtle partnership in crime between those who seek and those who grant unfair advantages through legislative enactments?

5. The majority of men are honest in head and heart. Demand only such measures as you can show to them to be just and they will stand with you for the cause of right. Pay you must, but you will find it better business to pay for the correct economic education of the masses and the preservation of your own honor than to buy legislation. The demands of honest and capable men are only those that can be publicly shown and accounted for, and for that reason are much less than the demands of corrupt men. If you do not educate and elect honest men to office you will have to deal with dishonest men in office. You pay taxes not only to support, but to create a government that will establish justice. Without such a government there is no security for life or property, no certainty that correct economic policies can be inaugurated and uninterruptedly carried out. There can be no dependence upon correct economic conditions being established and maintained to induce the highest possible degree of prosperity for individual and public welfare.

6. There are well meaning persons who contend that it is useless to undertake a reform that can be thorough and permanent only through the reformation of human nature. Those who argue thus do not reflect upon what would transpire if their suggestions should be universally acted upon. The tablets upon which the ten commandments are written would again be broken. All effort to establish justice would be abandoned, and civilization would quickly relapse into the barbarism from which it has been evolved by the patient ceaseless work of those who have done, each in his own sphere of action and influence, what he could to reform his own human nature and to assist others in doing the same. Those who refuse to aid a reform because the evils to be contended with are rooted in human nature, must do so because they do not want to reform themselves. A reform to establish justice in taxation must be founded upon the demand that each shall do his fair share and no more. The fair share of each is to so reform his own views that his words, his actions, his influence, his vote, and his just proportion of the expense of educating the masses can always be depended upon for the support of just measures. Those who observe closely will see that the more active they are with words, actions and influence, the less will be the sum required for expenses. A refusal to comply with such a demand can be construed in only one way. It means that the person wishes to dedicate his energies, time and money to money making; to the satisfaction of his desire for power, or to indulgence in his pleasures, while knowing that all success gained by those who carry forward the reform work must operate to his benefit as well as theirs. He is one of the type who are willing to reap where others have sown. This is legal honesty.

7. In undertaking to establish a just system of taxation, the fact must be kept steadily in mind that the forces of evil are entrenched in the existing laws, are cohesive, and have an enormous interest at stake in maintaining and extending the evils upon which they thrive. When those who contend for justice cease to be as vigilant in the discharge of their public duties as they are in looking after their private affairs, the forces of evil make stealthy invasions on personal rights. Corruption grows arrogant on success until its unjust demands strike honest but indolent citizens to the quick. Then these honest citizens suddenly awaken to their duties to find themselves enmeshed in a web of corruption and unjust laws, from which they can escape only by heroic effort and appalling sacrifice. If all honest and intelligent men will always stand banded together, doing active and aggressive work for the cause of just laws and their enforcement, not as a matter of sentiment, but purely as a matter of good business management, they will find that the cost of well directed, continuously sustained effort is not greater than the cost of spasmodic effort, and that the gains from systematic work will be infinitely greater and more satisfactory. As a matter of practical business the effort to establish a just system of taxation should enlist every honest minded man "for the war." No one should think of asking for a

muster out until the victory is completely won. Under such conditions victory is certain. The most difficult obstacle to be overcome is not the evil entrenched in unjust legislation, powerful as that may be, but the paralyzing effect of the apathy of those who will secure the largest proportionate benefit from a just system of taxation, the many who labor and are poor and who, by reason of their ignorance of economic questions, know nothing about the taxes they pay.

8. Every gain made in establishing and protecting the personal rights of the weakest member of society to his life, his liberty and his pursuit of happiness, has been a gain for all who are his superiors in social conditions. So will it be in establishing and protecting his personal right to the ownership and unmolested enjoyment of his just share of all value created by the joint use of labor and capital. Upon such foundation the economic welfare of each individual, of the state of the nation, can be successfully developed. That each shall do his just proportionate share is the foundation principle of just taxation. That each shall do his just proportionate share in spreading and sustaining correct economic education, is the foundation requirement for success in establishing a just system of taxation.

Mr. Foote proposes to provide a just system of taxation thus:

1. All charges for the support of the government and for all other, public purposes are taxes.

2. All property shall be assessed for taxation at its full value in current funds. All exchangeable products upon which labor has been expended, the ownership of which is protected by law, are property. Securities representing the ownership and the value of property are not property and shall not be taxed.

3. The tax levy shall be laid at a uniform rate per cent on the assessed value of all property for the same tax levied within the jurisdiction of the state and of each division thereof.

4. All property assessed for taxation shall be entered in the books of the tax assessor for the tax district in which it is located, in the name of the owner, user, or person having the property in charge.

5. Bills for taxes shall be made in the name of the owner, user, or person having the property in charge, as entered in the assessors' books, and the payment of the same shall be a legal payment for the full amount of the tax bill of any debt or obligation of any kind due from such person to the true owner of the property upon which the levy was made.

6. Tax bills shall be a lien upon the property upon which the levy was made and may be sold for non-payment, as provided by law.

7. Property shall not be taxed in any way except as herein provided. Tax assessments shall be made but once in each year, and the levy for all state, county and municipal taxes shall be entered in the same bill. Charges shall not be made by state, county, municipal or other public authorities, for the support of the government or any other public purpose; except a property tax, for the right or privilege of engaging in any industry, business or vocation.

8. The legislature may exempt the whole of any class of property from taxation, but it shall not make any partial exemption by authorizing a decrease in valuation, or of the rate per cent of a tax levy for one or more classes of property less than the unexempted whole of a class, nor shall it exempt a part of the property of any class.

9. Special assessments and tax levies may be made, in consideration for special benefits accruing from public improvements, upon all property securing an increment of value by reason of such improvements.

10. Fines may be assessed and collected for violations of law; charges may be assessed and collected for costs of courts in all legal procedures; for costs of records on all recorded instruments or documents; for all public inspection, supervision and audits; and license fees may be assessed and collected for the control of all places of public amusement; the regulation or suppression of all immoral practices; the protection of health; and the supervision of public nuisances.

11. The legislature shall not delegate the right to exercise the power of taxation for any purpose, to any public division of the state or other public authority without providing by law that the books of accounts of such division shall be kept as directed by the state comptroller, who shall audit all such accounts annually.

THE Toronto Railway Company paid into the city treasury \$8,332.17 on the Septembr earning of \$104,152.21. Last year the company earned \$92,745.67 and the city's share was \$7,419.67.

## A STANDARD FORM FOR ACCOUNTS FOR STREET RAILWAYS.

A Report to the American Street Railway Association, by H. I. Bettis

MR. PRESIDENT AND GENTLEMEN OF THE AMERICAN STREET RAILWAY ASSOCIATION:—

Your committee on standard forms for street railway accounts begs to submit to you the following as its report:

On September 7 the committee sent to all the members of the association a classification of expenditures, which could be readily adopted for use upon any road, and so arranged that any or all of these accounts can be subdivided to any degree desired by the road adopting them, without impairing its value as a basis for comparative statements. Accompanying this was a circular letter, requesting the accounting officer of the several roads to carefully examine this classification, noting such items as in their opinion are erroneously classified, and also requesting that sample report blanks and special rulings for account books be sent the committee for inspection.

The replies received were in the main very full and complete, and showed an interest in the subject, but the number, compared with the number of members with the association, was very small, and in consequence there was a postal sent out about two weeks later, but with little effect upon the delinquents. The results obtained from the replies received will be taken up later.

Special ruled account books and ruled forms of reports of various kinds are a means to accomplish results. To standardize the means, we must first of all seek the same, or similar results.

If we are seeking uniform results, uniform methods may be employed, and will naturally be employed. Those which are the simplest in form and manner of filling out being preferable.

For this reason the committee urges you to take some steps toward adopting a standard classification, that the end to be accomplished by all will be uniform, and this done, the standardizing of forms and methods of street railway accounting will follow.

At the time the subject was assigned, and until the returns came in from the circular letters, the committee was not aware that a class of accounts had been presented to the association at one of its earlier meetings, in 1884, and long before this committee had even a speaking acquaintance with the street railway business. Had the committee been aware of the fact, it might have understood that its particular function was to prepare a set of blanks, to conform with the classification presented in 1884.

It is perhaps just as well, for with the progress in street railway affairs in the past ten years, the classification presented then, for a road operated entirely by animal power, is nearly out of date, and it would be better to frame one which can be adapted to all classes and kinds of roads, with any or all kinds of motive power, which we believe you will find to be the case of that presented with this report.

In adopting a standard classification as a basis for reports from all roads, we must decide upon the minimum number of accounts into which it can be divided, and yet give all the information that the majority would desire. Each of these accounts must be carefully analyzed, and so closely defined that each particular account shall have at all times the same constituent elements on every road. This much decided, any company wishing any more detail may divide and sub-divide, until there are twice or thrice the number of accounts; but still retaining the distinctive features of each particular group.

With companies formed under the laws of Great Britain, this is provided for by the "Companies Act," by which all railroad corporations are obliged to keep their accounts according to the forms and methods prescribed by the government, and the books are regularly passed upon by a board of examiners, besides annual or semi-annual audits of the assets, liabilities, accounts and vouchers by independent auditors, or chartered accountants. By this system of government supervision and inspection, the methods and reports are necessarily uniform, and afford a means for comparative statements and statistical information, unexcelled by any in the world in precision and accuracy.

In the United States the interstate commission and the railroad commissioners of many states have, to a certain degree, exercised their power in the same direction, demanding yearly reports for publication. In the case of street railways, this information is only taken for purely statistical purposes, and, so far as the street railway interests are concerned, it could be very well dispensed with.

An English writer on this subject says:

"Uniformity in railway accounting in every respect is greatly to be

desired. Much has already been done in this direction, and the periodical reports of our English, Indian, Colonial and foreign railways under English control are models of completeness."

"There is, however, room for improvement. If the able administrators of American railroads could see their way to adopt a more uniform method of compiling their published accounts, setting forth the particulars of capital authorized, raised and expended, revenue earnings and disbursements, assets and liabilities on defined principals, and in a manner intelligible to any ordinary man of business, it would tend greatly to improve the value of sound railway securities."

This is recognized by every thinking man amongst us, especially those who have to do with the securities of our roads, and, yet, in the construction, equipment and operation of our tramways, we are far in advance of any country in the world, and English capitalists have not been slow to perceive this and demonstrate their faith in our work by investing in our street railway properties. Before doing so, they prefer to have the accounts examined by an independent auditor; as is the custom among themselves, nor can we blame them for this business-like proceeding, it has been instilled into them. Were there a more uniform system of reports and accounting, there is no doubt but that the stock and bonds of our wonderful street railroad properties would find an open market abroad.

The classification presented in 1884 was too elaborate for a small company, many directors and managers not caring for information in such minute detail, even on many of our largest and best equipped roads, there being 70 divisions of the operating expenses, while that submitted to you now has but 30, and even this might be simplified. The interests of this committee are first, last and all the time with the owners of the property, the stockholders and their directors, and by conjunction with the bankers who secure a market for their loans and with the bond purchasers.

These are the parties whose money and energy have built up our magnificent structures, and they should receive such information concerning the operation, earnings and expenditures as will enable them to know the value of their investment. The managers and superintendents occasionally look at these monthly reports and are pleased to carry them before the directors in person, if the totals make a good showing, otherwise they are apt to be mailed. Results are what they all want, and it matters but little to them whether the report is divided into 100 distinctive classes of receipts and expenditures, or ten. The road has earned a certain amount, and a certain percentage of that is irrevocably gone, and the sub-division of accounts could not have saved it. This might seem to be an argument in favor of the abolition of everything but the profit and loss account, but we do not go so far as that; we would advocate that the reports be much simplified, and that the standard be simple and concise enough for the smallest road, and the most conservative ideas. The stockholders and directors having invested their precious dollars with others in an enterprise, which has given every promise of noble returns in due time, are anxious to know the results from their venture and from time to time wish for a report which can be compared with those of other companies in the same, or similar fields. The banker, who has your bonds to put upon the market, asks for a statement of your earnings and expenses from the time the road was started. There is perhaps another road similarly situated and with a certain amount of capital, which to his knowledge has issued bonds to a certain amount and this road is not only paying the interest on those bonds but a certain dividend upon its stock. By a comparison of the reports of the two roads, he makes his calculations which are submitted to the dear public, and purchasers for the bonds are readily found. The creditors too, and their name is legion; the supply men, manufacturers of cars, electrical, cable and other machinery, are all interested in your financial reports; the lawyers, judges and receivers sometimes knock at the door for a copy of this valuable document. How necessary then that it should be all that is required of it. Who of all this list cares to go into the minute detail of a lengthy report? Very few, if any. These are the persons who take the greatest interest in our affairs, and they seldom have the time, or inclination to wade through the petty and cumbrous details. Who is it then that has served us this kettle of fish? None of the parties mentioned could have it laid at their door, they don't want it. We hold the divining rod in our hand, and it points to the auditor and accounting officer, the secretary and treasurer, the figure fiend, the statistician, assisted by those managers and superintendents who leave the road to work out its own salvation, while they record its progress or degeneration, as the case may be. Statistics costing us thousands of dollars per year, laid away upon the shelf to gather the dust of ages, and after years of repose, finally consigned to the flames. These statistical fiends appear to believe their only security is in being surrounded with

such a mystery and maze of figures, as will cause their colleagues to hold up their hands in amazement that any human being can exist in an atmosphere of such dense knowledge and remain perfectly sane. Don't understand this committee to imply that all accounting officers are of this class, there are some of them who belong to the same as this committee and are perhaps too lazy to produce so much fire and perform such intricate work, but so long as the stockholders require nothing better we are secure. In making tests our managers often require statistics as to mileage made by special gears, brushes, truck, wheels, trolley wheels, and much other similar information. This is perfectly proper and necessary at times for the good management of the road, but it is a side issue and not to be considered in making up our standard forms.

Not only should we seek uniformity in our reports, but in our methods as well. For instance, we find from the sample pages of some of the account books sent the committee, that it is the custom on some roads, when a bill is paid, to charge it to the account for which the material was used, while on other roads, the charge to expense is made when the material is received, and by others when it is used. This committee holds that the latter is the only correct method, as when material is purchased or paid for, we are simply making an exchange of cash for another form of assets, and there is no expense until the material is used. As an illustration of the incorrectness of the first method, let us take a road which should do a splendid summer business, and during the month of August there is a county fair which makes that month the best of the year. Then, we will suppose, that in the early summer they purchased enough supplies to last them several months, amounting to several thousands of dollars, and the bills all fall due, or are paid, in August; by this method the charge for several months' expense all goes into the expense, of one month. In consequence of such methods the report for August will be very misleading, and whereas it should show up as the best in the year, it is a question if it is not the worst. Charges to expense should be made as closely as possible in the months to which they belong. When we are of one accord on matters like this and can agree upon a classification, the balance of the work of standardizing forms of accounting will be very easy and soon accomplished.

There is but one other point upon which the committee wishes to touch, and that is the construction and equipment accounts. There is a great temptation for managers whose roads are running down on account of bad times, no travel, poor motors, bad track (all of course due to the mismanagement of his predecessor) we repeat, a great temptation to steer as many items as possible into the construction and equipment account. This is downright fraud, but it is done nevertheless.

Nor are the managers and accounting officers wholly to blame for this. Many of the roads are too heavily capitalized in the start, contracts are let with a huge profit for some one, and the road gets whatever may fall to its lot, sometimes only the broken crust. With a capital stock of \$2,000,000, it could be paralleled by a better road, with better equipment for perhaps half the money. Next comes the bonds to the amount of another couple of millions and secured by a mortgage upon the property.

Half built in the first place, and with inferior equipment and with the interest on the funded debt of more than the entire cost of the road, perhaps the officials of the company think that the game must go on, and that the particular part they are to play is to bluff it as long as possible until the receiver calls time.

The committee might dwell at length upon the distinction between the transportation charges and the maintenance charges which were found to be somewhat confused on many of the reports sent in response to our request, but time is too short.

We will say in conclusion, having carefully examined the blank forms and statements sent us, that forty per cent are practically the same as the reports used by the committee, and correspond in general detail with the classification submitted to you.

Thirty per cent have practically the same headings, but in each there are instances where expenditures upon the property or maintenance charges are mingled in a confused way with those expenditures which add nothing to the property either present or future.

In 5 per cent the items are grouped under distinctive headings, but with no regard to the divisions as generally used.

In 25 per cent, although the accounts might be sub-divided to a considerable extent, and some of them have very elaborate statements, the grouping into distinct classes is entirely ignored.

From this you may see that should the association adopt the classification submitted, 30 per cent of the roads would be all right as they stand, and 40 per cent more would need to change but two or three items, principally putting the repairs of the power plant under the same head as repairs of the balance of the equipment where it undoubtedly

belongs. Twenty-five per cent more would but need to arrange their accounts systematically, instead of having them in a jumbled state, as most of them have the charges made to the proper accounts, but not arranged systematically in the reports.

Nearly 40 per cent of those replying to the circulars sent out by the committee expressed their approval of the classification sent them, and also a desire that it should be adopted by the association and none expressed disapproval.

CLASSIFICATION OF EXPENDITURES FOR STREET RAILWAYS.

|  |   |   |   |                                   |
|--|---|---|---|-----------------------------------|
| Construction and Equipment.              | } | 1.— Superintendence and organization.         |   |                                   |
|  |   | 2.— Engineering.                              |   |                                   |
|  |   | 3.— Right of way.                             |   |                                   |
|  |   | 4.— Building construction.                    |   |                                   |
|  |   | 5.— Track and roadway construction.           |   |                                   |
|  |   | 6.— Overhead line construction.               |   |                                   |
|  |   | 7.— Car equipment.                            |   |                                   |
|  |   | 8.— Snow plows and sweepers.                  |   |                                   |
|  |   | 9.— Power station equipment.                  |   |                                   |
|  |   | 10.— Tools and machinery.                     |   |                                   |
|  |   | 11.— Improvements and betterments.            |   |                                   |
|  |   | 12.— Real estate.                             |   |                                   |
| General Operating Expense.               | } | 21.— Salaries general officers and clerks.    |   |                                   |
|  |   | 22.— Miscellaneous Ex. general offices.       |   |                                   |
|  |   | 23.— Insurance.                               |   |                                   |
|  |   | 24.— Legal expense.                           |   |                                   |
|  |   | 25.— Injuries and damages.                    |   |                                   |
|  |   | 26.— Contingent expense.                      |   |                                   |
|  |   | 27.— Park properties.                         |   |                                   |
| Transportation Expense.                  | } | 28.— Car service.                             |   |                                   |
|  |   | 29.— Car house expense.                       |   |                                   |
|  |   | 30.— Lubricants and waste for cars.           |   |                                   |
|  |   | 31.— Supplies.                                |   |                                   |
|  |   | 32.— Wrecking.                                |   |                                   |
|  |   | 33.— Operating power house.                   |   |                                   |
|  |   | 34.— Fuel.                                    |   |                                   |
| Operating Expense.                       | } | 35.— Lubricants and waste for power house.    |   |                                   |
|  |   | 36.— Water.                                   |   |                                   |
|  |   | 37.— Hired power.                             |   |                                   |
|  |   | Maint. of Way and Buildings.                  | } | 38.— Repairs roadway and track.   |
|  |   |   |   | 40.— Renewals of rails.           |
|  |   |   |   | 41.— Renewals of ties.            |
|  |   |   |   | 42.— Repairs and renewals paving. |
| 43.— Repairs and renewals supply, wires. |   |   |   |                                   |
| Maint. of Equipment.                     | } | 44.— Repairs and renewals bld'gs, docks, etc. |   |                                   |
|  |   | 45.— Repairs and renewals overhead lines.     |   |                                   |
|  |   | 46.— Repairs of cars.                         |   |                                   |
|  |   | 47.— Repairs of electric equipment.           |   |                                   |
|  |   | 49.— Repairs of steam plant.                  |   |                                   |
|  |   | 50.— Repairs of electric plant.               |   |                                   |
|  |   | 51.— Repairs of tools and machinery.          |   |                                   |
|  |   | 52.— Miscellaneous expenses.                  |   |                                   |

The classification as given here is not subdivided to the extent that some might think desirable, but sufficiently for any practical purposes, as any further division would be purely statistical.

There are two principal divisions of expenditures, viz: 1. Construction and equipment. 2. Operating expenses. The latter is divided into four groups: 1. General operating expense. 2. Transportation expense. 3. Maintenance of way and buildings. 4. Maintenance of equipment.

The construction and equipment charges only include expenditures which add to the original value of the property.

The first two divisions under the head of operating expense i. e., general operating expense and transportation expense, include only such expenditures as are necessary for operating the road, while the other two divisions, viz: Maintenance of way and buildings and maintenance of equipment, include all expenditures made upon the property itself, necessary to keep it in perfect repair.

These maintenance charges are purely operating expense, but are essentially different from the first two divisions of the operating expense, in that they add materially to the present or future value of the property, while the general and transportation charges do not.

The classification, as presented, is especially prepared for electric railways, but can be easily adapted to use on cable, horse and steam

roads, in fact, has been used successfully on a combination of electric, horse and steam roads.

For use upon horse roads.—All the subdivisions of general operating expense would be the same.

Under the head of transportation expense, for No. 31 would be substituted supplies, including miscellaneous supplies, such as are constantly needed for the operation of horse cars, and could not be chargeable to repairs.

For No. 33 would be substituted stable expense, including wages, stablemen and hostlers.

For No. 34—fuel—would be substituted provender and bedding.

The latter expense in each case being that in horse roads, which is offset by the corresponding expense on electric roads.

Proceeding, we would find that the subdivisions under the head of maintenance of way and buildings are all right for horse railways, except that No. 43 and No. 45 would be omitted.

Under the head of maintenance of equipment, instead of No. 47, No. 49 and No. 50, we would have—renewals of horses, repairs and renewals of harness, shoeing, veterinary services.

To adapt this classification for use on suburban steam roads we would have the general operating expense the same.

Under the head of transportation expense, No. 28 would not include the wages of engineers and firemen—only conductors and brakemen—and for No. 33 would be substituted locomotive service, this being the corresponding expense to operation of power house.

All others would remain unchanged, except that No. 35 would be lubricants and waste for locomotives, instead of power house, and No. 37 hired power would be omitted.

Under the head of maintenance of way and buildings no change would be necessary, except that, as with horse roads, No. 43 and No. 45 would be omitted.

Under the head of maintenance of equipment, for No. 47, No. 49 and No. 50 would be substituted, repairs of locomotives.

Having had no experience with cable roads, the committee cannot say just what substitution would be necessary, but feels very confident that the same classification could easily be adapted for use upon such roads as well.

CONSTRUCTION AND EQUIPMENT ACCOUNTS.

Too much care cannot be exercised in charges to these accounts. Nothing should be charged to Construction and Equipment except that which adds to the first or original cost of the property.

1. Superintendence and Organization Expense.—Salaries of superintendent of construction, assistants, wages of clerks and others employed in the offices of this department. Expense of the office, furniture, fuel, lighting, supplies for office, miscellaneous and personal expense of superintendent and assistants while on business. Includes stationery and printing for this department. Also all expenses of organization not coming under either of the following heads:

2. Engineering.—Wages and expenses of engineers and draughtsmen on preliminary and construction work.

3. Right of Way.—Salaries and expenses of right-of-way agent, together with payments for rights of way, easements, franchises and pole rights.

4. Building Construction.—Cost of buildings, car houses, stations, offices, store houses, power house, repair shops, wharves, coal sheds, etc., etc.; also furniture and fixtures for the same.

To this account should also be charged the cost of land occupied by the buildings mentioned.

Real estate (land and buildings thereon) not used by the road for actual operation must be charged to real estate account.

5. Track and Roadway Construction. Includes the expense of grading, surfacing, ballasting, ditching and paving; the cost of rails, rail chairs, ties and stringers, tie rods, joint fastenings, track spikes, frogs and switches, supplementary wire, tie wires, channel pins, solder and miscellaneous track material; also the cost of distributing and laying the same, with the supplementary wire and its connection.

6. Overhead Construction.—Cost of poles and setting; putting up trolley, feeder and guard wires, including cost of wire and all devices for overhead construction.

7. Car Equipment. Cost of cars built or purchased, including the cost of trucks, wheels, motors, upholstering, painting, lettering, varnishing, etc.

8. Snow Plows and Sweepers.—Cost of snow plows and sweepers built and purchased, including the electrical equipment for the same.

9. Power Station Equipment.—Cost of steam plant, engines, boilers, pumps, piping, shafting and belting, dynamos and switchboard

equipment, together with installation of the same.

10. Tools and Machinery.—Cost of tools and machinery for repair shops, car houses, etc., and expense of setting and placing in running order.

11. Improvements and Betterments.—All expenditures which improve the original plant, and of which a portion should be charged to operating, and a portion to construction expenses.

12. Real Estate.—All land and buildings thereon purchased as an investment and not used by the road for actual operation.

#### GENERAL OPERATING EXPENSES.

21. Salaries of General Officers and Clerks.—In this account are included the salaries of the general officers; the heads of departments connected with the supervision and management of the general business of the road. Salaries of division superintendents and assistants may also be charged to this account.

By general officers are meant officers in charge of departments, and whose jurisdiction extends over the entire road.

This account embraces the salaries of all clerks in the general offices, clerks for heads of departments, and all clerks not hereinafter mentioned.

22. Miscellaneous Expense General Offices.—The expense of heating and lighting the general offices; wages of porters, messengers, etc.; telephone service and all miscellaneous supplies and expenses of the general offices, including the cost of all stationery, books, paper, stamps, pens, pencils, etc.; also cost of all printing of blanks, circulars, statements, tickets, and the cost of advertising.

23. Insurance.—Includes cost of insurance on property of the company, and against injury to employes, and all expenses of collection.

24. Legal Expense.—In this account are included the salaries, fees and expenses of attorneys, witness' fees and other court expenses.

25. Injuries and Damages.—Expenses on account of persons injured, and property damaged, with payments of claims are all chargeable to this account.

Wages of persons while disabled, medical attendance and funeral expenses; also wages of claim agent and others connected with the claim department.

Lawyers' fees and other court expenses are not chargeable to this account; nor are damages to property belonging to the company.

26. Contingent expense.—This account includes the miscellaneous expenses not otherwise provided for. Traveling and other expenses of general officers and assistants, etc., etc.

27. Park Properties.—Includes all running expenses of parks owned or leased by the company.

#### TRANSPORTATION EXPENSES.

28. Car Service.—This account includes the wages of conductors, motormen, starters, aids, inspectors and switchmen; cost of punches, ticket registers, sign sticks, switch sticks and miscellaneous supplies for car service.

The wages of the superintendent of time tables, and chief of conductors, with such clerks as may be under them, should also be charged to this account.

29. Car House Expense.—This account includes the wages of shed foremen, shifters, cleaners, oilers, wipers, laborers, inspectors and watchmen, except such as are employed on repairs of cars.

The cost of fuel, and lighting the car houses and sheds, lanterns and oil for watchmen, tools used by workmen on cars, (cleaning and oiling, and other work except repairs,) are chargeable to this account.

30. Lubricants and Waste for Cars.—Oil, grease, tallow and other lubricants with waste used upon car journals and motors are included in this account.

31. Supplies.—This account includes such supplies as are constantly needed for the operation of the electric cars, but cannot be charged to repairs, such as:—Lamps, fuses, carbon brushes, trolley cord, etc.

32. Wrecking.—Wages of those employed in getting derailed cars on the track, and removing obstructions and wrecks; tools used and all other expense incurred on the same account.

Expense of getting cars back to the car house when broken down on the line, is also chargeable to this account.

33. Operation of Power Houses.—This account includes wages of engineers, firemen, coal shovellers, dynamo men, oilers, cleaners and others employed in the power houses, except when employed upon repairs.

Also the cost of water, water rates, or cost of pumping where the company furnishes its own water works; carbon brushes, fuses, lamps

and other supplies necessary for the daily operation of the power houses, and not otherwise provided for; cost of heating and lighting power houses.

Repairs and renewals of engines, boilers, dynamos, switch-boards and station fixtures are not chargeable to this account. Fuel and lubricants are also chargeable to separate accounts.

34. Fuel.—This account includes the cost of all fuel used in the power houses, with transportation charges on the same.

35. Lubricants and Waste for Power Houses.—Oils, greases, tallow and waste for use in the power houses, for engines, shafting, dynamos, pumps, etc.

36. Water.—Cost of water when taken from local water works companies.

37. Hired Power.—Cost of power when taken from other electric companies.

#### MAINTENANCE OF WAY AND BUILDINGS.

38. Repairs of Roadway and Track.—This account includes all expenditures on account of the roadbed and track, except the cost of rails and ties used, and the cost of repairs and renewals of paving, and the supplementary wire.

It includes tracks laid in buildings, yards, on turntables, wharves, and over bridges; wages of roadmasters, track foremen, laborers, watchmen, and others, while engaged in track repairs and renewals.

It includes cleaning, oiling and sanding track, repairs and renewals of drains under the track, repairs and renewals of planking over bridges, repairs and renewals of frogs and switches, joint fastenings, etc., etc. It also includes repairs of rails, and all work on rails, cutting and drilling, except drilling for tie wires. Also labor expended in taking up track.

The cost of tools, implements, and all supplies used in connection with the track are included in this account.

The expense of removing snow and ice, with the cost of repairs on snow plows and sweepers, may be made a separate account if so desired, but comes under the head of Maintenance of Way.

40. Renewals of Rails.—This account includes the cost of new rails laid in the track, with the transportation charges on the same, less the value of old rails taken up.

The expense of loading, unloading, drilling, cutting, laying and repairing rails is not included in this account.

41. Renewals of Ties.—This account includes the cost of new ties laid in the track and the freight on the same.

The expense of loading, unloading and laying ties is not included in this account.

42. Repairs and Renewals of Paving.—This account embraces all expenditures on account of the paving.

It includes the cost of paving blocks and sand, and the cost of transportation of the same; the wages of pavers, laborers and others, engaged in repairs and renewals of paving; also the cost of tools and other supplies for the same work.

The expense of taking up and relaying paving when necessitated by the repairs on the roadbed, the track and the supplementary wire is not chargeable to this account, but to the account for which expense was incurred.

43. Repairs and Renewals of the Supplementary Wire.—This account includes all expenditures on account of the supplementary wire and its connections.

It includes the cost of the wire, tie connections, channel pins, solder, and other supplies, also tools and implements used in connection with the work of repairing the supplementary wires; wages of solderers, laborers and others engaged upon this work.

The expense of drilling rails for channel pins and tie wire rivets, is also chargeable to this account.

Expense on the supplementary wires, necessitated by the taking up of rails, ties, switches, frogs, etc., is not chargeable to this account, but to repairs of roadway and track.

Expense on the supplementary wires necessitated by the taking up or laying of paving should be charged to the account of paving.

44. Repairs and Renewals of Buildings, Docks and Wharves.—This account includes the cost of repairs and renewals of all buildings, docks and wharves, and of the stationary fixtures and furniture of the same, not otherwise provided for; car houses and sheds, store houses, car shops, repair shops, blacksmith and machine shops, power houses, coal sheds and bins, stations, etc., etc.

Repairs of pits in car houses and shops, cranes in power houses and coal sheds, etc., are embraced in this account.

Repairs of tracks in buildings and on wharves, are not chargeable to this account.

45. Repairs and Renewals of Poles and Overhead Lines. This account includes the cost of repairs and renewals of poles and brackets, with trolley, span, guard and feed wires, with all appliances for suspension and insulation of the same.

#### MAINTENANCE OF EQUIPMENT

46. Repairs of Cars.—This account includes the cost of all repairs on car bodies, painting, varnishing, upholstering, re-lettering cars and car signs; repairs and renewals of the trucks, brakes, brake shoes, axle boxes, springs, track brushes, snow scrapers, pilots, sand boxes, etc.; repairs and renewals of wheels and axles.

The cost of new cars taking the place of old to make the number good, are also chargeable to this account.

On roads using both motor and tow cars, it is sometimes advisable to keep each kind separately.

47. Repairs of Electrical Equipment.—This includes the repairs of motors, their parts and connections, the labor of removing damaged parts and replacing same when repaired.

Armatures, fields, gears, pinions, controllers, switches, trolleys, lightning arresters, brush holders, cables, etc., all come under this head.

New motors or parts purchased or made and put in to replace those damaged or worn out must be charged to this account also.

49. Repairs of Steam Plant.—To this account should be charged all repairs and renewals of the steam plant in the power house, including the boilers, engines, pumps and shafting, repairs and renewals of belts, piping, steam fitting, etc., etc.

50. Repairs of Electrical Plant.—Repairs and renewals of dynamos and their parts; armatures, fields, pulleys, commutators, oilers, bearings and boxes, brush holders, etc., are all chargeable to this account; also labor removing and replacing damaged parts.

Repairs and renewals of the switchboard equipment are also charged to this account, such as repairs and renewals of station switches, rheostats, circuit breakers, ammeters, wiring and connections.

51. Tools and Machinery.—Repairs and renewals of tools and machinery, shafting, boilers, engines, etc., in the shops of the company; also cost of lubricants for the same.

Small tools (not shop fixtures) are chargeable to the account most benefited by them.

52. Miscellaneous Expenses.—To this account should be charged all miscellaneous expense of maintenance of equipment, not otherwise provided for.

THE White-Crosby Company, of Baltimore, has been awarded the contract for the subways for the police and fire alarm telegraph system of Baltimore. The White-Crosby bid was for terra cotta conduits of the "Camp" class. The accepted bid was not the lowest. The contract was let on the grounds of the excellence of the designs submitted, which corresponded most nearly with the specifications. The White-Crosby Company is certainly to be congratulated on its victory in the face of such strong competition. Five bids were submitted.

W. A. BOGARDUS has resigned as general manager of the Brooklyn Heights Railroad Company, and has been elected secretary and treasurer in place of Cyrus P. Smith, resigned on account of ill-health. A saving of 1 per cent on capital stock has recently been made by reducing salaries of officers from president down.

THE Electric Club of Cleveland has elected the following: President, Charles W. Wason; vice-presidents, B. M. Barr, and T. E. Adams; secretary, H. J. Davies; treasurer, E. W. Moore; board of managers, the officers and R. M. Fuller and George W. Cleveland.

#### FAST TIME ON THE BRIGANTINE ROAD.

In our issue of September, 1893, we gave a full description of the Brigantine Transit Company's new line, and mention was made of the peculiar form of cars used and the high speed for which the motors are wound. Superintendent Joseph T. Skerrett writes us of some of the fast time made in actual practice. On account of top heaviness on the trestle, the double deck cars have had the upper deck removed. These cars, it will be remembered, were 38 feet long, mounted on double trucks, with a W. P. 50 motor to each truck. When the upper decks were removed, one motor was taken off each car, leaving but a single motor to the car. The reconstructed cars weighed 23,000 pounds each. As a trial, one of the reconstructed cars ran a measured mile of 5,280 feet, with twenty-seven persons aboard, in one minute, forty-two seconds, including the start from a dead stop, and a full stop at the end. This car has also run  $3\frac{1}{8}$  miles in six minutes, including one stop to throw a switch, a slack up at siding switches, and two dead stops for passengers. The miles were measured in this case also. The regular schedule time from one end of the road to the other ( $6\frac{1}{4}$  miles) is twenty-one minutes, including four stops. This is an average of nearly 18 miles an hour. When behind time cars have made the trip in  $13\frac{1}{2}$  minutes. This is certainly pretty fast running for single equipments.

#### HOW THEY HANDLE THE HOUSE-MOVER AT LINCOLN, NEB.

A house-mover, at Lincoln, Neb., recently seemed determined to get himself into trouble, but was finally subdued by the efforts of C. C. Upham, general manager of the Lincoln street railway. The mover started the house out on to the tracks in the daytime, and declared that he was going down street at all hazards. The street railway obtained a restraining order from the court, stopping him with his house partly in the street and partly on the lot. A deposit was then exacted from him of \$25, to cover the labor of the street railway linemen who should help him during the night. He further agreed that he would do the work entirely at night, between the hours of 12 and 6 A. M., as was originally demanded. Having obtained this agreement, the company asked the court to modify the restraining order in such a way as to permit the house-mover to move his house between the hours of 12 and 6 A. M., and ordering him to work each consecutive night until the house should be clear of the tracks, not allowing him to stop during the moving. The case was set for trial, and under the modified order of the court the mover worked two nights, got his house off the track, and the case was dismissed at the cost of the mover, so that he finally paid not only for the linemen's work, but the small additional court costs. This is the first case of house moving which has given any trouble in Lincoln. Ordinarily, the house movers give notice that they wish to move a house on a certain night, and the linemen collect for their labor at the rate of one and a half times their regular wages.

## A COMMUNICATION.

EDITOR STREET RAILWAY REVIEW:

In the September REVIEW I noticed an editorial claiming the very economical operation of a small electric road viz: 13 cents per car mile per day. Allowing they run 5 E. M. C., 16 hours per day, and average 7 miles per hour or a total of 540 miles, their operating expenses would be about \$70 per day. What proportion of this is power, labor, maintenance, etc., etc. I would like to get the items making this total. I am interested in a road of 5 1-6 miles and using 5 E. M. C., and our figures are very different.

Yours Truly,  
A. B.

The items which go to make up the operating expense referred to are not now before us and in view of another article published this month on the operating expenses of another road, which range from 7 to 8 cents per car mile, it will hardly be necessary to inquire into the figures of the 13 cent road.—EDITOR.

### OPERATING EXPENSES OF THE BEAVER VALLEY TRACTION COMPANY.

An editorial mention was made in the September REVIEW, of a small road, not operating under very favorable conditions, which showed operating expenses of 13 cents per car mile. As a small road is always at a disadvantage over a large one as regards operating expenses, and as this record, compared favorably with many large systems, we were amply justified in considering it a good one. The editorial in question has stirred up the brethren, however, so

H. P. BROWN.

that we are able to show some figures that nearly cut in two the 13 cents record.

Hartford P. Brown, general manager of the Beaver Valley Traction Company, of Beaver Falls, Pa., makes to us a detailed report of the operating expenses of that road per car mile for the past year. The very fact that he is able to make this detailed statement would be proof to any one acquainted with such matters that the road is in good hands even before they learned how good the record was. For the months of January and August, 1894, the operating expenses were as follows:

| ITEMS.                                       | JANUARY, 1894. | CENTS PER<br>CAR MILE. |
|--|----------------|------------------------|

| 12. Building repairs.....                    | —     |
| 13. Line repairs.....                        | 019   |
| 14. Office expenses.....                     | 675   |
| Total.....                                   | 7,021 |

The monthly expenses for the year are as follows:

|                    |           |
|--------------------|-----------|
| July, 1893.....    | 8.8 cents |
| Aug. ".....        | 8.5 "     |
| Sept. ".....       | 7.8 "     |
| Oct. ".....        | 8.5 "     |
| Nov. ".....        | 9.7 "     |
| Dec. ".....        | 8.0 "     |
| January, 1894..... | 6.8 "     |
| February ".....    | 7.5 "     |
| March ".....       | 7.9 "     |
| April ".....       | 7.9 "     |
| May ".....         | 8. "      |
| June ".....        | 8.2 "     |
| July ".....        | 7.7 "     |
| August ".....      | 7.0 "     |

Mr. Brown is willing to back up these figures by allowing an inspection of the books by proper parties or by affidavit. The road operates nine cars during week days from 8 a. m. to 8 p. m., and five cars the balance of the running hours. On Sundays six cars are run until noon, nine until 8 p. m., and five until 11 p. m. The system is three years old. During its first year the operating expenses were 12.5 cents a car mile. At the end of the first year Mr. Brown took charge and has finally succeeded in reducing expenses to the above figures. It is safe to say that the public is as pleased with the management as are the stockholders—at least Mr. Brown is willing to let the verdict rest with the public. The wages paid conductors and motormen are 15 cents an hour.

THE contract for building 7½ miles of track for the Danbury & Bethel, Conn., Horse Railway Company, has been awarded to Wardell Brothers, of New Haven.

THE Pottsville, Pennsylvania, Traction Company, which proposes to build 36 miles of electric line from Tamaqua to Pottsville, St. Clair, Port Carbon and Frackville, is having a contest with the Schuylkill Electric Railway Company, which has franchises on all the best streets in Pottsville and has been trying for franchises in other towns. The Pottsville company has secured franchises from St. Clair, New Philadelphia and Tamaqua, which require the road to be running within a year.

## CLIFFORD L. SNOWDEN.

It is with regret the REVIEW parts with the services of one of the most faithful members of its editorial staff, Clifford L. Snowden, who has been connected with this mag-

CLIFFORD L. SNOWDEN.

azine for nearly four years. He now resigns only to carry out a long cherished plan, and has already entered upon a two years post graduate course, mainly along sociological, economic and psychological lines. He will not drop journalistic work entirely, but will continue a frequent contributor to the REVIEW, and several other publications. Mr. Snowden is a ready, racy writer, not only of prose but of verse and

humor. Many a little poetic gem has flowed from his facile pen. He is a young man, younger than many have supposed, and has made a record with the REVIEW of which he may well feel proud.

It is a pleasant duty to thus bear testimony to faithful, able service, which has ever been ready, willing and untiring. To a large number of the street railway fraternity he is well known personally and all will join the REVIEW in most hearty wishes for his success and happiness, and when he has quaffed the fountain of advance studies may he return to us again.

So here's to your health Clifford, and may you live long and prosper.

H. H. W.

## MARRIED.

Frank S. De Ronde, of the Standard Paint Company, of New York City, was married, October 11, to Miss Kate W. Bennett, at the residence of the bride's parents, Teaneck, Englewood, N. J.

## WAUKESHA ROAD SEEMS ASSURED.

The promoters of the new electric railway at Waukesha, Wis., have succeeded in arousing public enthusiasm. As the result of their energetic efforts subscriptions to the capital stock of the company have come pouring in from solid business men of the city. Already there has been subscribed \$25,000 of the required \$40,000, although only two weeks had elapsed since the subscription books were opened. Tracklaying will, it is said, commence before snow flies. But for the push and enthusiasm of the originators the construction of an electric railway in Waukesha would have been delayed indefinitely, perhaps for years.

## THE WELLS &amp; FRENCH COMPANY TO BUILD STREET CARS.

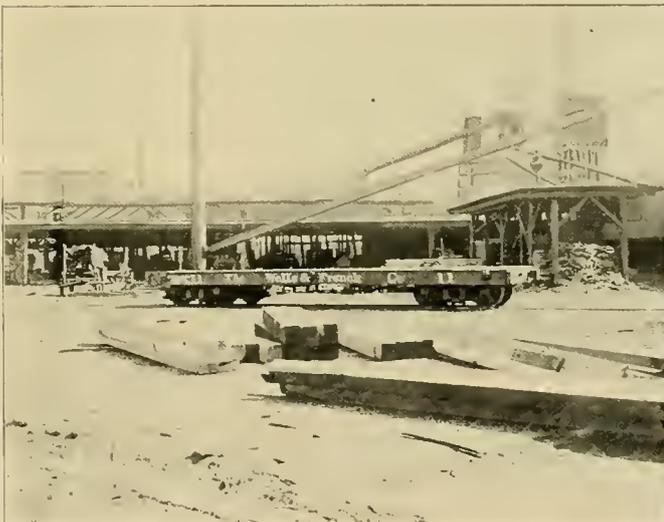

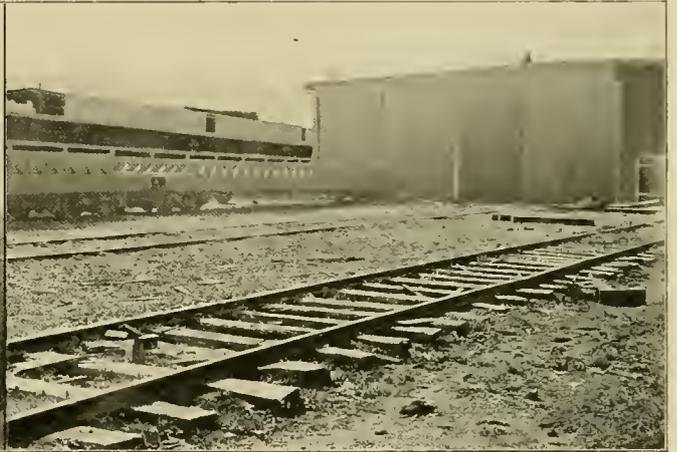

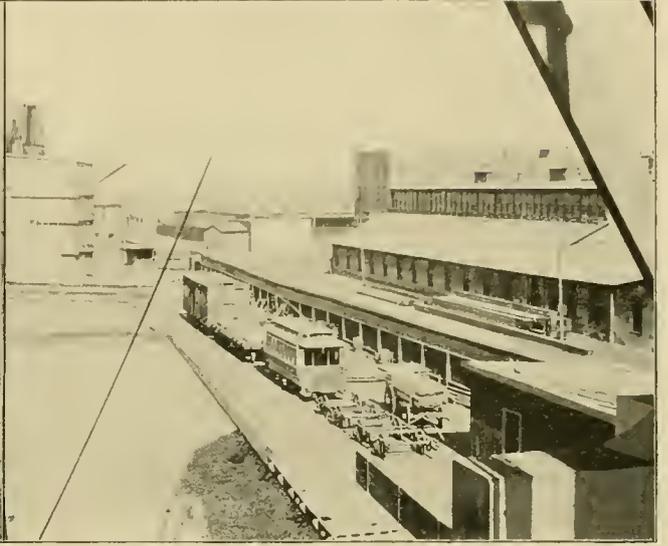

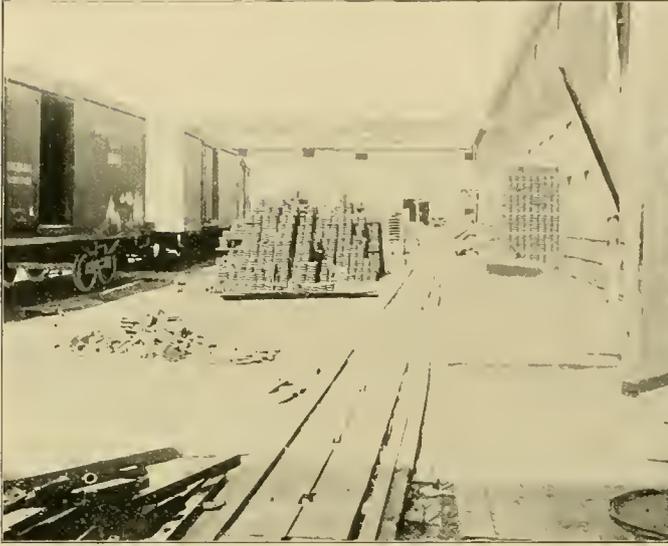

The reputation of the Wells & French Company, of Chicago, as a builder of railway cars is sufficiently well known, and the company needs no introduction. The public will be greatly interested to know that this company has just finished a shop 100x300 feet, solely for the purpose of building street cars. An additional force of draughtsmen and skilled mechanics in this particular branch of car building has already been engaged. If occasion should require, the whole complete plant of the Wells & French Company could be utilized to build street cars. The trucks and metal work will be done in the present large machine shop. A large stock of well-seasoned lumber is always kept on hand to fill orders promptly. The finishing department has facilities to execute the most elaborate car interiors, and is capable of satisfying the most artistic tastes. The Wells & French Company has been in business for 35 years, and its long experience in car building will be a guarantee to prospective purchasers of the superiority of its work. The factory is situated near Blue Island avenue and Paulina street, within easy reach from the city, and covers 27 acres of ground. The sales offices are on the twelfth floor of the Monadnock building, under the direction of E. F. Carry, Jr., who is well known to all street railway men. Augustine W. Wright, who is a well-known authority on street railway matters throughout the United States and abroad, and who is well known to the general public through his contributions to street car literature, and who has been identified with the Wells & French Company for many years, is its consulting engineer. The company is backed up by an almost unlimited capital, and will undoubtedly make its new departure as great a success as its former undertakings.

THE Cortland & Homer Traction Company, Cortland, N. Y., has closed contracts for its entire equipment. Specifications were drawn and contracts placed under the direction of Prof. R. C. Carpenter, of Cornell University. Four compound condensing Watertown engines with pumps, condensers, heaters, and four 100-horse-power boilers manufactured by the Watertown Steam Engine Company, Watertown, N. Y., will be installed.

E. E. DOWNS, superintendent of the Citizens' Street Railway Company, Kalamazoo, Mich., has resigned. He has accepted the management of the new street railway at Battle Creek, Mich., and will have charge of the construction of the road at Battle Creek, which, it is expected, will be in operation early in January.

WAREHAM & HUGHES, Beaver, Pa., have secured the contract for the road to run 15 miles from Benwood to Moundsville. They bid \$200,000.

VIEWS OF THE WELLS & FRENCH STREET CAR FACTORY, CHICAGO.

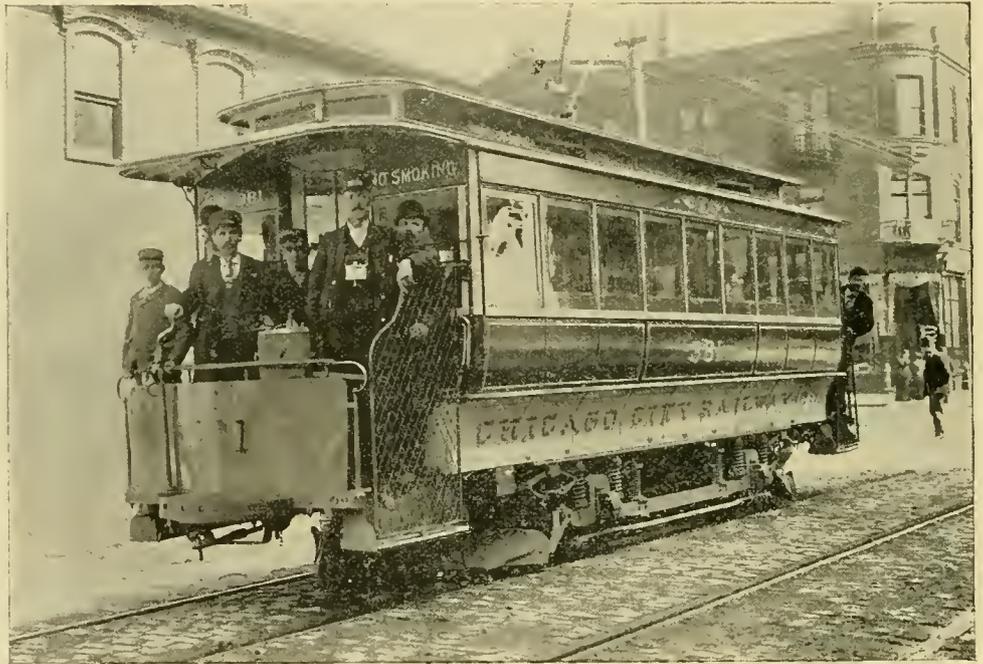

## THE WALKER STREET RAILWAY MOTORS.

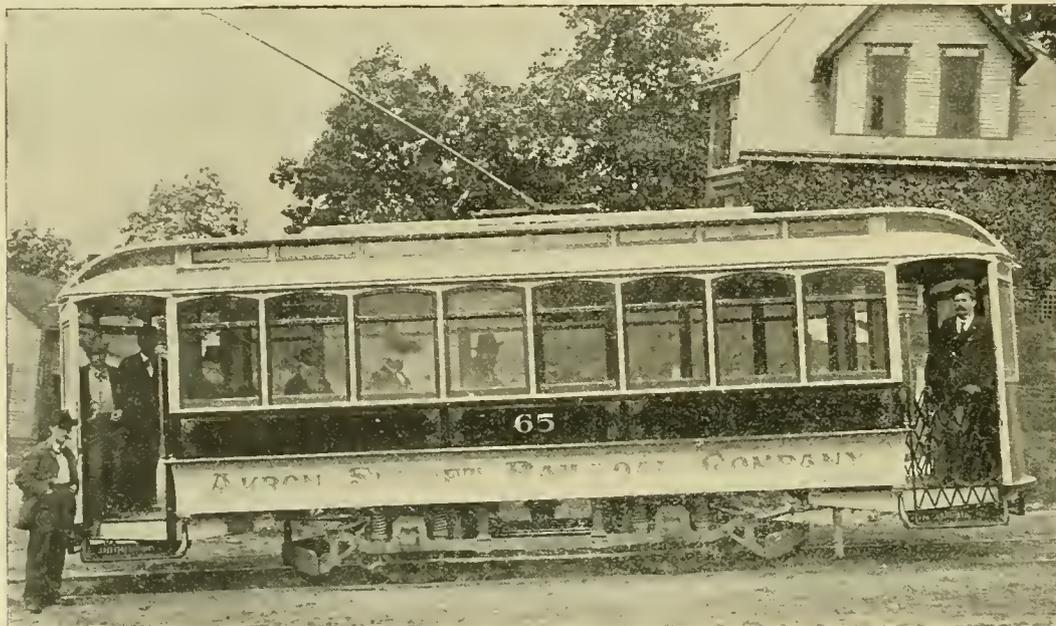

The Walker Manufacturing Company of Cleveland, completed its first street car equipment about July 1, 1894. The fortunate road which received the first consignment was the Hoosic Railway of Hoosic Falls, N. Y., which received three equipments, together with a 200-horse-power generator to be driven by water power. The road was installed by J. H. Vail of the Electrical & Mechanical Engineering and Trading Company. Both the street railway and the construction company are greatly pleased with the motors performance and do not hesitate to make public utterance to that effect. Indeed it was certainly to be expected that the motors would give satisfaction, as they were backed by a manufacturing company of widest reputation as well as by a remarkably good mechanical design. The Walker Manufacturing Company has also furnished the entire equipment for the Althol & Orange Electric railway of Orange, Mass., where they have been giving good results under heavily loaded open trailers. The Passaic & New-

ark Electric Railway Company also has the Walker equipments. This is a road of numerous steam road crossings and consequently the Walker spring suspension

has an excellent chance to show its good qualities. The crossings are run over with remarkable freedom from hammer blows. The spring suspension also has a tendency to prevent disagreeable rumbling. These motors run 166 miles a day and come in cool at night although they are en-

WALKER MOTORS—CHICAGO CITY RAILWAY.

WALKER MOTORS, AKRON.

ark Electric Railway Company also has the Walker equipments. This is a road of numerous steam road crossings and consequently the Walker spring suspension

tirely enclosed. The Tama & Toledo, Iowa, interurban mentioned elsewhere is also getting good service from Walker equipments. The Schuylkill Electric Railway of Pottsville, Pa., is being re-equipped and the standard 25-horse-power equipments have been running for some time under long open cars seating 100 passengers. The grades are as high as 12 per cent. Some 50-horse-power equipments have been ordered for high speed suburban service. One of the Chicago City Railway lines has had a Walker equipment for several months and not a trip has been lost by it. More have been ordered. The Akron, Ohio, Street Railroad, one of the first Sprague roads is being equipped with 25-horse-power Walkers. There is one grade on this road of  $11\frac{1}{2}$  per cent 1,000 feet in length. Superintendent W. D. Chapman says that he has taken

cars up that grade loaded with over 100 passengers and is delighted with the performance of the motors.

These few facts are published because the street railway fraternity will be interested in knowing that the company which so lately entered the railway field and which from the eminence of its technical staff and extent of its manufacturing facilities aroused great expectations is living up to the high standard expected of it.

The facilities of manufacturing the apparatus are unsurpassed in any factory in the United States. The factory covers an area of over 300,000 square feet, and is provided with ground which will permit trebling its capacity on short notice. It is already prepared to turn out ten street railway equipments per day, with the necessary generators to drive them. It is also going largely into the manufacture of industrial power transmitting machinery, such as generators and motors for machine shops and mills, as well as mining machines of all kinds. This

company is especially well fitted for making very large sizes of generators and motors. Plans and patterns are already out for 2,000 and 3,000-horse-power generators, and there are already under construction in the shop, machines ranging from 50 up to 1,000-horse-power. The machines are made to be belt driven for the smaller sizes, and direct coupled to engines for the larger sizes.

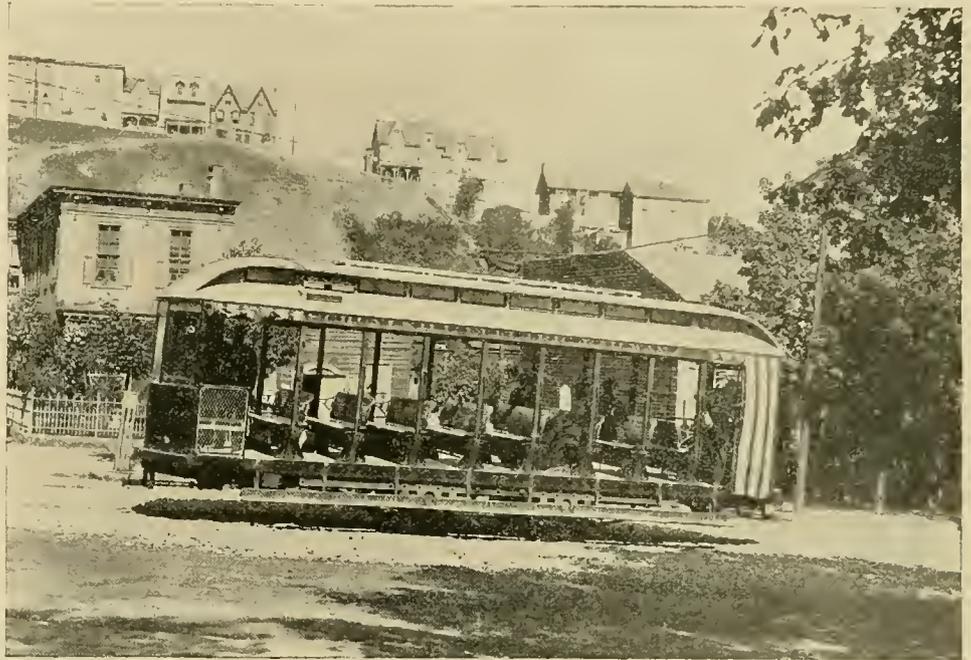

The Walker Manufacturing Company is known throughout the world for its excellent mechanical construction of machinery of all classes, and it is carrying out the same policy of mechanical construction in its electrical machinery, that it has practiced in the past in its cable railway machinery and other classes of work. The introduction of excellent mechanical construction, design, and workmanship, into electric machinery is an absolute essential which is often neglected.

FARMER OATES was taking his first ride in a Buffalo trolley car. When the conductor passed transfer checks, the farmer was overlooked. He amused his fellow passengers by shouting, "See hyar, conductor, ye didn't give no receipt for my nickel."

THE recent health congress at Montreal, recommended the thorough cleaning of floors and cushions of cars. During the famous small pox epidemic, several years ago, in that city, it was said it was safer for citizens to be in the street cars than in their own homes, for the former were fumigated every trip.

## MICANITE FOR COMMUTATORS.

In making or refilling commutators, it is sometimes necessary to apply heat while building, and it often results that bars become loose, cement oozes out, or the oil soaks in. It is claimed these difficulties are avoided by using Micanite

WALKER MOTORS—SCHUYLKILL ELECTRIC RAILWAY

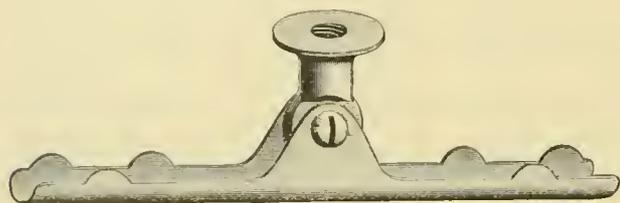

segments or rings, manufactured by the Mica Insulator Company, of 218 Water street, New York. To apply the Micanite it is only necessary to proceed as follows: After assembling the commutator, heat it to about 200° Fahr., when the Micanite will soften. Then tighten the bars or rings as much as possible. The pliability of the Micanite will allow the distribution of unequal strains, and will counteract, to a great extent, any irregularities in the dimensions of other parts of the commutator. Continue the application of heat until the temperature has risen to 400° Fahr., or until the shellac, which will have oozed out here and there, has become dry. No bad results will follow, even though the shellac be partially carbonized. Wait until the shellac is baked dry before retightening, which may be done while hot or cold, but preferably in both states.

The heating of the commutator presents no difficulty, even where proper arrangements are not at hand. The commutator may be placed for a few minutes inside the door of a boiler furnace, upon a gasoline stove, or upon a plate placed over a blacksmith's forge.

THE Electric Switch & Trolley Company, Newark, N. J., has been incorporated with \$500,000 capital by Emile Rieser and Joseph Campbell, New York, and George W. Littell, Crawford, N. J., incorporators. The company proposes to acquire patents for electrical improvements and to sell and manufacture electric switches, motors and cars.

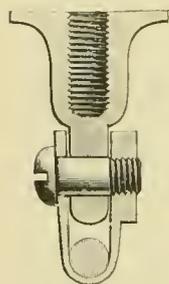

### THE JEWELL TROLLEY SLING.

A rather peculiar method of avoiding the disastrous hammering effect of the trolley head on the insulators of bracket and center pole construction is embodied in what

JEWELL TROLLEY SLING.

the makers designate as the Jewell trolley sling. Arrangements for manufacturing it have been made by the Ohio Brass Company. The lug into which the hanger stud is threaded is swiveled in the body of the ear so as to admit of an oscillatory motion when the trolley wheel passes under it. This it is claimed eases the motion of the wheel so that there is very little hammering. In putting them on the wire the swivel bolt is taken out and the lug removed. The wire is put in the groove and the lips which are shown in the side view are bent over it to hold it in place. The lug and bolts are then replaced and the ear fastened to the insulator. No soldering or special tools are required and these slings can be put up very quickly. Its standard length is nine inches, and a composition brass metal is used.

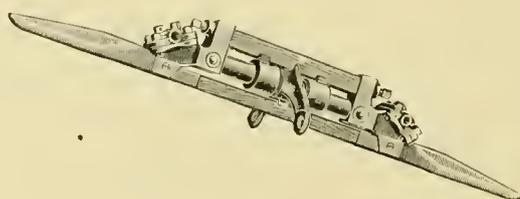

### THE EMPLOYEES CONVENTION.

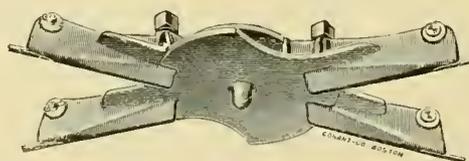

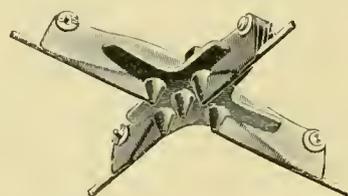

The third annual convention of the Amalgamated Association of Street Railway Employees, was held at Milwaukee, the week of October 8. Forty-two local unions having a membership of 30,000 were represented. The most startling business transacted was the expulsion on account of mismanagement, of William J. Law, the first president, for 99 years; at the end of that period he may be reinstated, but it is doubtful, if, when he makes application, it will be found that "the punishment fits the crime." It was decided to make a strike the last resort in case of a difference between employer and employee. This will make it necessary for each local union to hereafter submit its strike resolutions to the executive council of the association, and secure its sanction before declaring a strike. The per capita tax was reduced from 8 to 7 cents. Headquarters will be Detroit. The officers are: President, W. D. Mahone; vice-president, Rezin Orr, of Fort Worth; second vice-president, Charles Thomas, of Duluth; third vice-president, J. A. Nickerson, of Milwaukee; secretary-treasurer, M. G. Moore, Detroit, secretary of the local organization; trustees, W. S. Heninger, of Toledo; E. S. Ingram, of Indianapolis, and R. K. Curtiss, of Milwaukee.

### ANDERSON OVERHEAD SPECIAL WORK.

All engineers familiar with overhead construction and electric railway operation know the value of a practical straight under running frog and crossing, to avoid the dipping and consequent sparking of the trolley wheel in passing under them, and also to avoid the tendency for the trolley to jump off at such places. The great trouble is to make a frog that will remain straight under running

SECTION INSULATOR.

FROGS AND CROSSINGS.

when the tension of the trolley wire is put on it. A. & J. M. Anderson, of Boston, have, after experiment, devised a form of frog and crossing that it is claimed will not buckle under tension. It is not heavy and clumsy and no soldering is necessary. An electric railroad man of much experience says that they are the greatest improvement in trolley line fixtures he has noted for some time. The new section insulator is also flush under running.

THE Camden Horse Railway Company, Camden, N. J., has recently placed an order for two 350-horsepower vertical compound engines with the Ball Engine Company, Erie, Pa.

WE note with pleasure that the popular secretary of the New England Club, Francis M. Curtis, has acquired the New England agency of the celebrated Scarritt seats, of St. Louis. Mr. Curtis' office is located at 103 Milk street, Boston, and his postoffice address is box 1576. He would be very much pleased to give any information respecting these popular seats.

THE "MICHIGAN" OVERHEAD MATERIAL.

This is the name of a complete line of overhead material that has been in use on various railroads for the past two years, during which time the different devices have been subjected to the most severe test, possible, and have

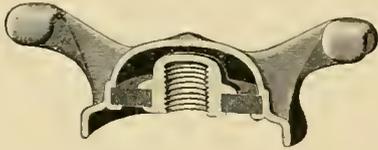

FIG. 1.

FIG. 2.

proved their merit. The devices comprising this line are all the inventions of practical men who have had years of experience in erecting and operating trolley lines, and who, consequently, thoroughly understand and appreciate the practical requirements to be met. As the span wire

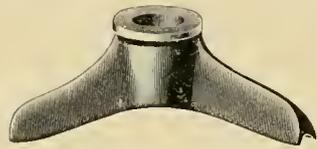

FIG. 3.

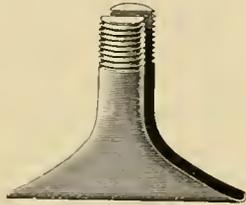

FIG. 4.

hanger is used more than any other overhead device, it is consequently the most important item of all, and the illustrations in this article are compliant to that particular device, which is shown in three sets of views; First, all apart; Second, partly assembled and third completely assembled and in place on the wire. In the first set;

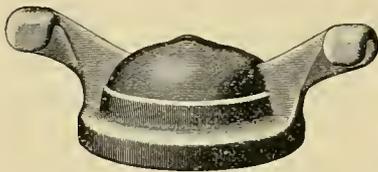

FIG. 5.

Figure 1 is a sectional view of the bell, and shows also the inside insulating washer and the nut; Figure 2 shows the outside insulating washer; Figure 3, the saddle

and Figure 4, the clamp. The inside insulating washer is held in place against the shoulder in the bell by means of lugs which are cast onto the bell and then clinched against the under side of washer, these being shown in Figure 1 as projecting inward from bell on the under side of washer. The nut shown in Figure 1 fits into a square hole in the insulating washer and is held in place by its flanged head on top and cast lugs underneath, which are also clenched against the under side of washer. In

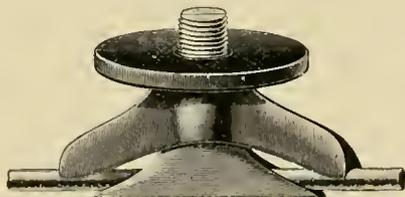

FIG. 6.

the second set of illustrations, Figure 5 shows the outside view of bell, and Figure 6 the view of clamp saddle and lower insulating washer, all in place on the trolley wire, ready for the bell to be screwed down for the purpose of

clamping the wire. As is plainly shown, the clamp is a split screw, stirrup shaped, which passes completely around the wire, and which, when the bell is screwed down on the complete clamp, draws the wire upwards in the center. As, however, the saddle holds the wire down at the outer end of the clamp, it will be seen that a slight rounding bend is thus formed in the wire and that the clamp just fills, this bend, thus preserving a perfectly straight lower side of wire and clamp, so that there is not the slightest shoulder for trolley wheels to strike against. This feature is one of the greatest importance, and not only secures a

strong grip on the trolley wire, but also results in a much longer life for trolley wheels and harps. In the third set of views, Figure 7 is a sectional view of the complete hanger in place on the

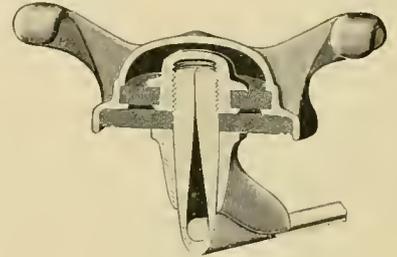

FIG. 7.

wire, and Figure 8, an outside view of same. These hangers as well as the other devices included in this line of overhead material, are made both in brass and malleable iron. This line of overhead material also includes single and double curve, barn, swinging and bracket hangers; also section insulators, splicing plates, switches cross-overs and the other devices that go to make up a complete line. All of these have been designed so as to

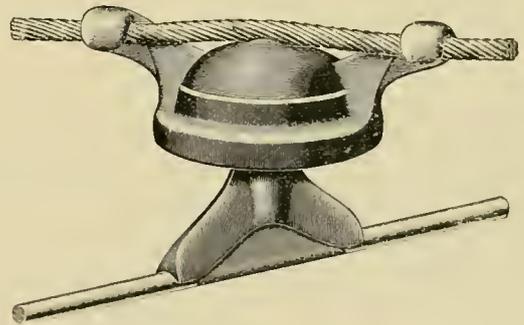

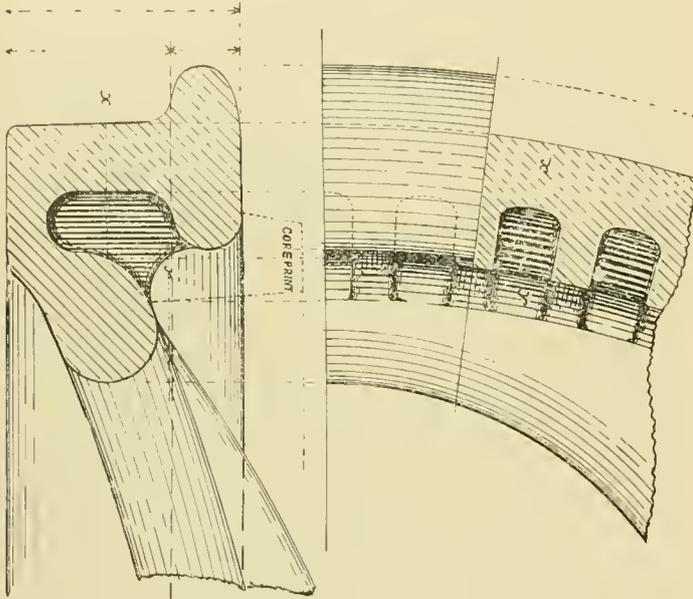

FIG. 8.

avoid shoulders and projections which trolley wheels might strike against, and also, so as to allow of their being quickly put in place on the wires without the use of any special tools. In these respects it is claimed that they are superior to any other yet designed. This line is manufactured by the Michigan Electric Company of Detroit, Mich.

THE Link-Belt Machinery Company, of Chicago, has recently sold standard water tube safety boilers to the Mutual Electric Light & Power Company, Chicago, 600-horse-power; Plainwell Church Furniture Company, Plainwell, Mich., 100-horse-power; Pittsburgh High School, Pittsburg, Pa., 250-horse-power; Institute for Feeble-minded, Pittsburg, Pa., 800-horse-power, and Detroit Chamber of Commerce, Detroit, Mich., 800-horse-power.

## A NEW CAR WHEEL.

A Whitney & Sons, of Philadelphia, are making a type of car wheel that is the most radical departure from common forms that has been introduced for some time, but the name of the makers is a guarantee that it is not without much merit. It is the invention of L. R. Faight, the mechanical engineer of the above concern. Its con-

THE NEW WHITNEY CAR WHEEL.

struction will be readily seen from the illustrations. The rim is divided into a series of cavities or cells. These cells diminish the heavy body of metal usually massed in the rim but it is said does not decrease its strength. The first advantage claimed for this form of rim is that the heat of the mass of the metal in the rim and spokes is not conducted so easily to the tread when the wheel is being cast, and hence there is a better chance of getting a deep, durable, uniform chill on the tread. In casting a heavy wheel the large amount of metal in the rim communicates so much heat to the tread that there is a tendency to reduce the depth and hardness of the chill so that weight is obtained at the expense of durability, whereas, the heavier wheel ought really to have the harder tread. The second claim made for it is that the rim is more elastic under the strains and concussions of service. On the principle that small castings are more dense than large ones, the light section of the rim reduces tendencies to blow holes and shrinkage cavities

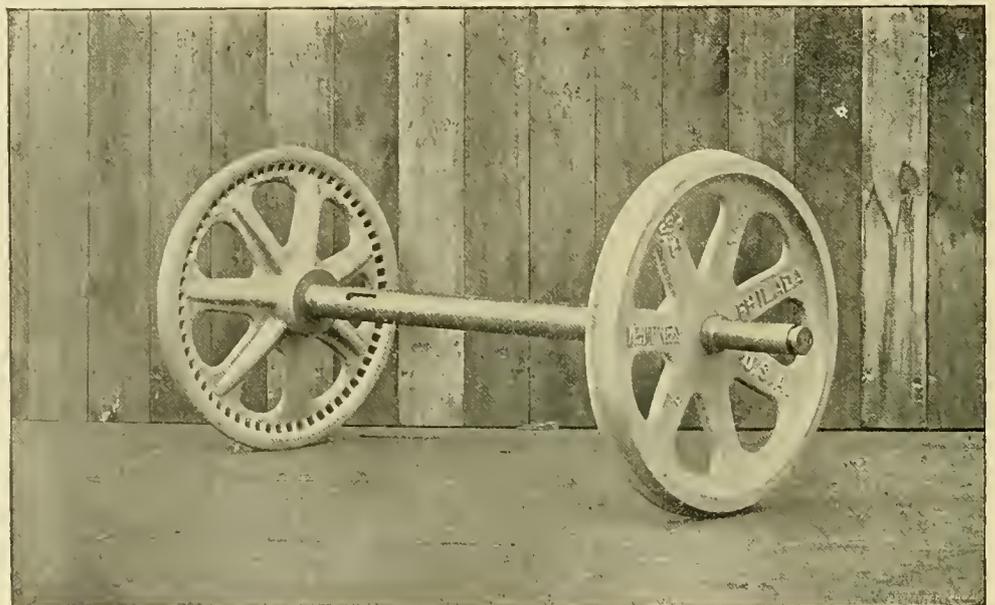

as well as giving a better chill. A further claim is made that the cellular section reduces the shrinkage strain on the wheel at time of casting and also tends to prevent crack'ng due to the heating from the use of brakes. Wheels of this form are considered stronger for the same weight than the ordinary form. The principle is applicable to all forms of cast iron and steel wheels.

## BALTIMORE FENDER ORDINANCE.

As there is so much agitation in various places in regard to car fenders, we print herewith the Baltimore ordinance. On page 639 will be found the report of the committee of the city council on fenders.

SECTION 1. Be it enacted and ordained by the mayor and city council of Baltimore. That all city passenger railway companies using any of the streets of Baltimore for the purpose of running thereon street railway cars propelled by any species of mechanical traction, shall provide for each car or train of cars, a car fender or fenders, with both front and wheel guards, of a design which the mayor, register and city commissioner shall have certified in writing over their signatures, to, in their judgment, comply with the requirements set forth in the report made to the commission appointed under the provisions of resolutions of the mayor and city council, No. 184, approved April 28, 1894, by Mendes Cohen, engineer to said commission.

SECTION 2. And be it further enacted and ordained. That a failure on the part of any of said companies to comply with the provisions of this ordinance within three months after the date of its approval, shall subject such company so in default to a fine or penalty of five dollars a day for each and every car operated without said fender or fenders, said fines to be collected as other fines and penalties for violation of city ordinances are collected.

THE NEW WHITNEY CAR WHEEL.

**THE FULTON TRUCK AND FOUNDRY COMPANY.**

The Fulton Truck and Foundry Company was incorporated December 12, 1893, as a successor to the Fulton Foundry Company of Cleveland, a concern already well and favorably known to the street railway trade.

W. E. HAYCOX.

The company immediately started to build a machine and truck shop on its land at Mansfield, O. The building is brick with slate roof, 60 by 175 feet, and trucks and other street railway supplies are now being manufactured in large quantities. Interior and exterior views of the building

are presented herewith. Trucks have been or are being prepared to ship to the Passaic & Newark; Tiffin, O., Street Railway; Marion, O., Street Railway; Citizens' Electric Railway, Mansfield; Bay Cities Consolidated; Syracuse, N. Y., Street Railway; Card Electric Company, Mansfield; and Cumberland Valley Traction Company, Harrisburg, Pa.

W. E. Haycox, president and general manager, is by birth an Englishman, but came to this country in 1874, and for three years worked on a farm. He then in 1877, became a driver on an East Cleveland street car, from which he rapidly worked his way up to the position of assistant superintendent. In 1888 he left Cleveland

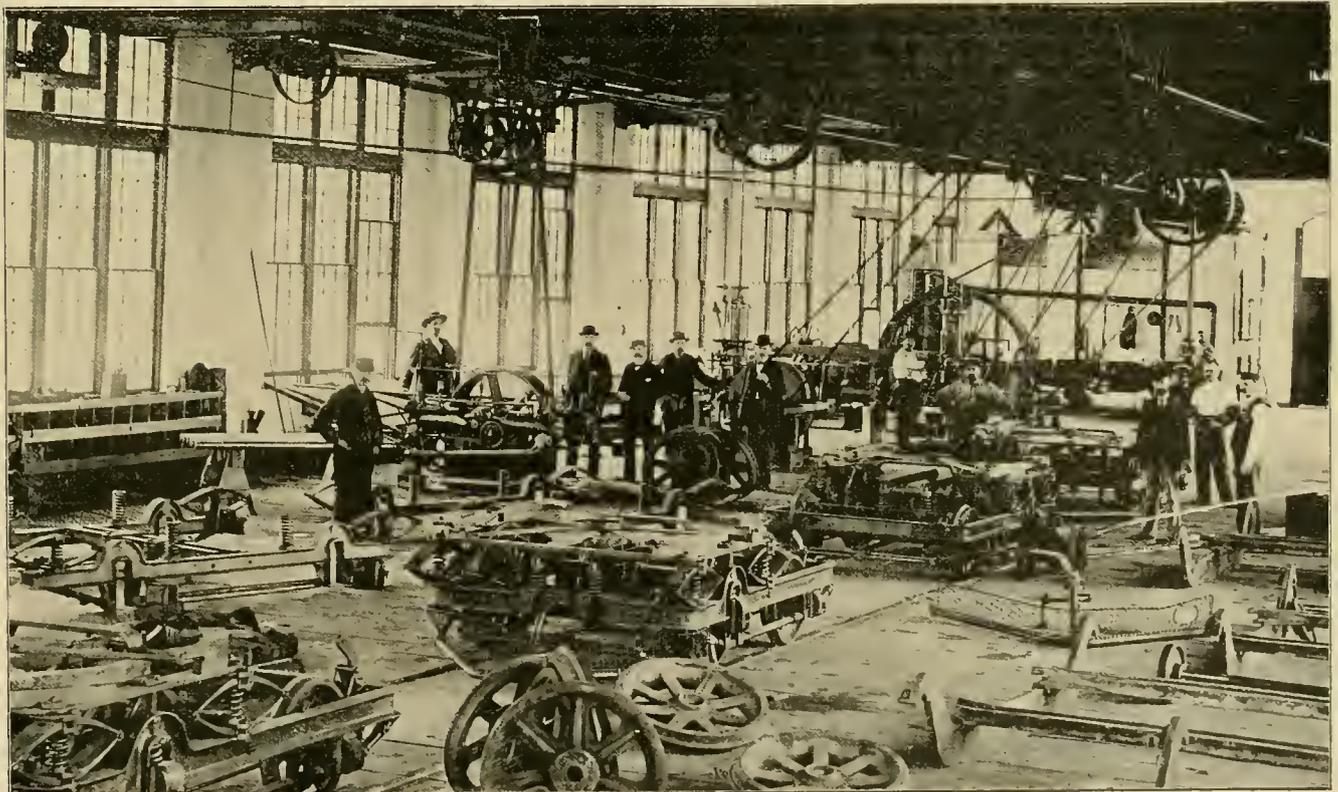

much to the regret of his friends, and took charge of the Utica Belt Line, which he brought up to a dividend paying basis, and later changed it to electricity. Finally Mr. Haycox refused the management of a large system to join the Fulton Foundry Company. His long experience in street railway management makes him an ideal manager for this manufacturing company.

M. B. Bushnell, vice-president, is a native of Mansfield. He was born in 1837, and received an education in the common schools with one year at Dennison University and one at Norwalk Institute. He began business life as clerk in a station on the Pennsylvania system. He rose through the positions of assistant yard master and dispatcher to that of passenger conductor and finally took the agency of the Atlantic & Great Western, at Mansfield, which position he resigned to become cashier of the Richmond National Bank of that place. During the last twenty-five years he has been an active and liberal contributor to the securing of industries to locate in Mansfield, and is a stockholder in many home enterprises.

M. B. BUSHNELL.

C. J. Langdon, secretary and treasurer, has served a longer term with the Fulton Company than the two previous gentlemen, having entered its service in 1881. He began as a telegraph operator at the age of fifteen, and for some held time a position of trust on the C. C. C. & I.

INTERIOR MACHINE SHOP—FULTON TRUCK AND FOUNDRY COMPANY.

Railroad. His executive ability has done much for the company.

Frank A. Rogers, special sales agent, accepted that position with the Fulton Truck & Foundry Company last August, after having filled a similar place with the Brush and Short Electric Companies of Cleveland, for several years. Mr. Rogers engaged with the Brush Electric Company in 1881, as foreman of the arc lamp department in the shops. In 1886 he went on the road

F. A. ROGERS.

as sales agent for the same company, and when the Short Electric Railway Company was organized in 1890, he became special sales agent for

it. It is hard to see how the sales department could be in better hands as all who know Mr. Rogers and his railway experience can testify.

The company and its officers have hundreds of friends in the railway field and those who have occasion to deal with them in the future will, as in the past, have no cause to regret it.

#### NEW YORK TO VOTE FOR RAPID TRANSIT.

New York City will vote on the question of municipal construction of a rapid transit road at the election, November 6th.

The route that has been accepted by the new commission, subject to such changes as they may consider it advisable to make, is as follows: Starting from a loop at the South Ferry, thence up Broadway with a three-track road to City Hall Park and Brooklyn Bridge, where there is to be another loop, and thence up Broadway with four tracks to Union Square, where there will be another loop, and the east side line will branch off and run up Fourth avenue to Fortieth street, and thence to Madison avenue and Forty-second street. The main line will continue up Broadway and the Boulevard with four tracks to One Hundred and Twenty-first street.

Across the Manhattan Valley from One Hundred and Twenty-first street to One Hundred and Thirty-fourth

street the road will be a viaduct, thence by tunnel to One Hundred and Fifty-sixth street, viaduct again to One Hundred and Fifty-ninth street, thence by tunnel under the Boulevard and Eleventh avenue to the King's Bridge road and to the north city line.

Above One Hundred and Ninetieth street there will be only two tracks. The road will be carried over the ship canal by a bridge fifty feet above the high-water mark. The motive power will be electricity or some other power not requiring combustion in the tunnel. The trains are to have a maximum speed of forty miles an hour.

#### NEW PUBLICATIONS.

THE Paige Iron Works is sending out an eight-page folder, giving views of special work laid down in the shop.

SIEMENS & HALSKE, of America, now have ready for distribution catalogs of multipolar and bi-polar dynamos and motors.

THE Engineering Magazine for October inaugurates a department entitled a "Review of the Industrial Press," which aims to occupy the same field with reference to industrial literature that the Review of Reviews does to the political and literary field. As it appears in the current issue it serves to give the general reader an idea of what is going on in the industrial world, but the trade press has grown to such proportions that it seems impossible to completely cover the field.

CENTRAL Station Book-Keeping, by Horatio A. Foster; W. J. Johnston Company, New York, publishers. Price \$2.50. This is, we believe, one of the first books ever published on the subject, and it is one in which there is a great field for effort. Very few electric roads or light plants have systems of keeping accounts which show the relative cost of different items. In the book are a number of forms which are the result of an examination of several hundred forms and which include the best points of all. Special attention is given to electric railway station accounts.

TELEPHONE Handbook, by Herbert Laws Webb, Electrician Publishing Company, Chicago. Price \$1. This is a little book full of useful information to all having anything to do with telephones, and companies having private lines would do well to have one in stock.

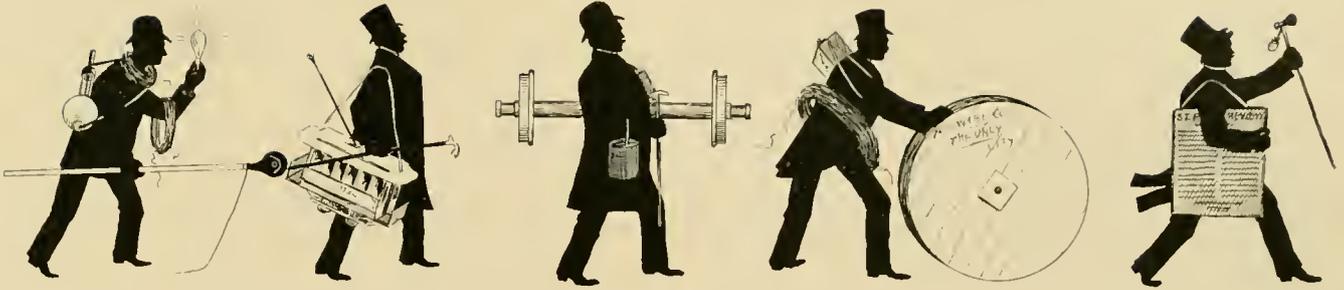

ELECTRIC Lighting Plants, by W. J. Buckley; Wm. Johnston Printing Company, Chicago. A work giving details as to the cost of installing and operating electric light plants has long been wanted and this book supplies that demand.

PRACTICAL Notes on Rope Driving is the title of a little pamphlet published by the Street Railway Journal, New York. It gives information on a subject little understood in America.

THE Western Electric Company has prepared for the trade a very complete catalogue of electric railway supplies. It includes not only everything necessary to the equipment of an electric line, but a full stock of repair parts. The new department of this company is no less complete than the older ones, and it is well known how complete that is.

MACHINERY, a low-priced, technical journal, for mechanics generally, edited by W. H. Colvin, W. H. Wakeman and Walter H. Cheney, published monthly, by the Industrial Press, New York, has reached us. The aim of the editors is to make a first-class paper, and the first number is a good one.

THE Hamilton and Lindenwald Electric Transit Company, Hamilton, Ohio, has secured a temporary injunction against McCarthy & Seegers, sewer contractors, who were using an engine for excavating purposes, which would obstruct travel.

(Continued from page 596.)

The company was represented by W. F. Zimmerman, assistant general manager, of New York, W. C. Clark, general agent of Pittsburg; A. J. Wurtz, E. E., of Pittsburg; W. J. Longman, purchasing agent; B. F. Stewart, of Chicago; E. N. Heinrik, Guido Pantaleoni of St. Louis; R. S. Brown, of Boston; C. A. Bragg, of Philadelphia; D. A. Tonkin and Frank Gordon, of Charlotte, N. C.; as well as several others.

THE Brownell Car Company, St. Louis, was represented by its popular general sales agent, Wilbur B. Allen.

D. B. DEANE, of the Terre Haute Car & Manufacturing Company, circulated among the delegates and supply men.

J. H. STEDMAN, Rochester, N. Y., exhibited 42 kinds of the Stedman ticket, which has been adopted by 143 roads.

R. W. HOLLIS, Atlanta, had on exhibition an automatic motor starter and safety switch, an automatic electric elevator controller, and a combination switch and rheostat.

J. H. ALLEN, business manager of "Dixie," was among the callers on the REVIEW, as were H. M. Davis, advertising manager of Electric Power, and F. B. Vandergriff, the Car.

THE Keller Printing Company, New York, had various styles of fare, transfer and time limit tickets, under the supervision of J. F. Bushe, manager of the railroad ticket department.

THE Chicago Truck people were disappointed in getting their exhibits ready in time, but were represented by President Graham, who did good missionary work and made many friends.

THE Harris Life Guard Company, Boston, exhibited a combination centrifugal action fender and snow sweeper, consisting of revolving brooms. H. E. Harris, the inventor was in attendance.

THE Street Railway Journal was represented by James H. McGraw, C. B. Fairchild, Edward Caldwell, H. W. Pool, W. H. Taylor, R. F. Outcault, New York, and John D. Bennett, Chicago.

W. H. TAYLOR represented Pratt & Letchworth, Buffalo, but had no special exhibit. He made himself known, however, and reports good results.

GEORGE C. BAILEY, general manager of Western territory for John Roebling's Sons Company, was a constant visitor at the convention, renewing old acquaintances and making new ones.

DORNER & DUTTON, Cleveland, had their truck in operation in the Walker Manufacturing Company's exhibit, and it is described in that connection. W. A. Dutton and John Pugh were present.

S. M. BALZER New York, represented by H. J. Winser, general manager, showed the Vernon fare register, which is an adaptation for street car use of the register on the gates of the World's Columbian Exposition, Chicago.

ARTHUR S. PARTRIDGE, St. Louis, was there with a full line of supplies. He made glad all comers with a package of blue lead pencils. His exhibit was tastefully arranged and was constantly thronged with visitors.

THE Bragg Fender Company, Troy, N. Y., represented by Dr. F. A. Bragg, general manager, had a model of its fender which bolts to the truck, and is independent of the car. There is a spring in front to protect the draw bar.

H. E. LOWE, Macon, Ga., showed a shifting switch operated by pressing a button on the front platform of a car, which makes connection on a plate in the track, moving the switch. Two plates can be used, one for right and the other for left.

THE Cutler Electrical Manufacturing Company, Philadelphia, had the new C. S. automatic cut out switch, for motors and circuits. There is no arcing when opened, and there is a protection to the fuse. Walter H. Harrington was in attendance.

THE R. C. Crawford Company, Pittsburg, showed five different styles of its celebrated fenders, both wheel guard and pick-up fenders. R. C. Crawford says he has sold 2,500 of these fenders since January 1, and showed photographs of cars equipped with the Crawford fender. He gave as souvenirs memorandum books and street car tickets.

THE New York Electrical Works, New York, showed a regular line of overhead supplies and switches, for regular and emergency work. The feature was a mechanical clutch circuit breaker, samples of which were distributed. C. W. Van Fleet was in charge.

THE John Stephenson Company made no exhibit this year, and as long as Mr. Pugh continues to attend and do the honors there is little need of cars and tracks. He distributed a pocket steel tape line, which was one of the neatest and most acceptable souvenirs.

THE Jewell Belting Company, Hartford, Conn., showed samples of its 69 inch 3 ply railway dynamo belt, bell cords and other styles of belting, and belt dressing, and distributed snake skin pocket books, one of the finest and most expensive souvenirs of the convention.

THE Chapman Valve Manufacturing Company, Boston, Chicago, and works at Indian Orchard, Springfield, Mass., showed high pressure steam valves in ten different sizes and combinations. The representatives were Edmund W. Buss, Chicago, and E. L. Ross, Springfield.

THE Hartford Woven Wire Mattress Company, Hartford, Conn., showed various styles of street car seats, and was particularly proud of an improved armless reversible seat, without foot rest, leaving an open space for cleaning cars. H. F. Evans, Western agent, was in attendance.

LEVI DEDERICK, Albany, N. Y., showed his dual street car fender, which consists of a curved fender near the track to catch bodies on the ground, and a flexible rope mesh arrangement for catching persons who may be standing. Mr. Dederick and George Poe, were showing the device.

LINBURG, SICKEL & Co., Trenton, N. J., showed a Trenton trolley wagon, which is hand made, of good material, strong and easy to handle. J. R. McCardle, who represents the company, said the wagon could be placed outside the tracks and would not interfere with the running of cars when in use.

THE W. Whitney & Sons Car Wheel Works, Philadelphia, showed a pair of 36-inch wheels for electric service, a pair of 30-inch cellular wheels, which were left with the Atlanta Consolidated, and various forms of horse car and cable car wheels. Frederick A. Lex was in attendance, and the exhibit was well arranged.

THE Wadhams Oil & Grease Company, Milwaukee, Wis., had an operative exhibit consisting of colored boys in uniform, greasing the curves of the Atlanta Consolidated Company. The badger and graphite motor lubricants and graphite for curves were shown. E. A. Wadhams, president; G. A. Streeter and A. J. Moan were in attendance.

THE Safety Clutch Brake Company, Philadelphia, had a platform fitted with two styles of brakes. One was a hand brake with ratchet at the platform, and the other had the ratchet at the handle. The work is done with the clutch at the seventh point. E. V. Faucett, vice-president and general manager, explained the device.

THE St. Louis Register Company, St. Louis, showed its security register in three styles. There was the single register, and two for double deckers connected together, and two for vestibule and double end cars. A register was shown in combination for two classes of fares, or cash and transfer. James W. Allison and Gustavus Rein were in charge.

J. H. GRAHAM & Co., New York, selling agents for the Storm Manufacturing Company, Newark, N. J., showed its sleet-cutting trolley wheel, which was fully described and illustrated in the September issue of the REVIEW. C. A. Hoagland, who was in attendance, had a great many inquiries for prices which will undoubtedly lead to some nice orders.

THE Modemann Car Fender Company, New York, showed a fender which was recently tested so satisfactorily in Brooklyn, and exhibited photographs of the test when a woman and a man were picked up uninjured. Benjamin Hendrickson, who was in attendance, was disappointed because he could not show the fender in operation on a car, as he expected.

LEONHARDT Pneumatic Safety Car Fender Company, Baltimore, showed a fender with iron frame, rope meshes, and the bottom of frame and dash protected with rubber tubes filled with air. A model of a car, with fender attached, and dolls as crew, attracted the ladies especially. William Leonhardt, president, and W. M. Ritterhouse, treasurer, explained the points.

THE New England Engineering Company, Waterbury, Conn., had a Breed emergency wagon, which is very light and strong, easy to raise and lower, one man with one hand being able to raise it in nine seconds, and if he be the driver be on top ready to work within one minute. It can be drawn with one horse. A. O. Shephardson, treasurer, was in attendance.

THE General Agency Company, New York, showed a full line of the George C. Dressel Company's electric and oil headlights and signal lights. George Dressel has been manufacturing headlights for steam railroads for thirty years. His dragon headlights are used on several street railroads in New York and vicinity. J. R. Ellicott, president, represented the General Agency Company.

THE Creaghead Engineering Company, Cincinnati, exhibited a full line of overhead line appliances and pole brackets, also photographs of work in various parts of the country. G. R. Scrugham, superintendent of construc-

tion, explained to visitors the various points of advantage in the Craghead apparatus. It is claimed that the flexible pole bracket prevents hammering, saves trolley poles, prevents arcing and is noiseless.

THE Russ Car Fender Company, Washington, had a model of a car fender which differs from all that were shown. It has been selected by the commissioners for trial on the Georgetown Railway. As soon as an object 15 pounds or heavier is struck, a spring is released, the fender opens like a gate and pushes the object off the track, and at the same time takes the trolley from the wire, and puts on brake in a half revolution of wheels.

THE Lewis & Fowler Manufacturing Company, Brooklyn, showed the improved register, which totalizes 100,000 fares. An inside and outside view was shown. F. A. Morrell and George W. Whipp, who were in charge took several orders for sweepers. The acme car jack for power houses, car houses and shop work, said to raise seven or eight tons, was exhibited. The parlor car heater with mahogany box and nickel plated trimmings was also shown.

WILLIAM T. SILVER & Co., New York, did not have an exhibit, but what was just as good, Mr. Silver saw everybody and gave to each a glass penholder and pen to remind them that he manufactured graduated coil and elliptic springs for all styles of electric cable and horse car trucks, a patent ratchet brake handle and car fender. The pen is a good one and one of them wrote nearly half of these exhibit items, and still shows no signs of wear or weakness.

JACKSON & SHARP COMPANY, Wilmington, Delaware, had a fine exhibit, consisting of one long open, new style, on four wheels; and a closed car; both running constantly between hotels and convention grounds. The open car has inclosed space at each end, for motorman, and was very tastefully decorated. The storm curtains were specially well arranged, and the car was an easy rider. President Jackson was present, assisted by George Pratt, general sales agent.

THE Young Lock Nut Company, New York, showed the Brownley injector without a valve, the Brownley brake shoe and the Young lock nut. R. D. Stewart, who was in charge, also represented the Technic Electric Works, Philadelphia, which showed the Tech rail bond and a new safety hanger for trolley lines, which provides for a break in the trolley wire by an insulated joint, which makes the fallen wire dead, so that it can be picked up without danger.

THE Barney & Smith Car Company, Dayton, O., was represented by A. M. Kittredge, superintendent, and James M. Hopkins. Two 18-foot vestibule closed cars, with plate glass windows, mounted on Barney & Smith trucks, were in operation on the local lines. One was of the pattern recently adopted by the City Railway

Company, of Dayton, a double vestibule with rear door in corner. The other was the regular standard car of the Cincinnati Street Railway Company.

THE McGuire Manufacturing Company, Chicago, showed in operation one double truck car equipped with McGuire's adjustable traction truck; also a car with Columbian AT suspension. There was on exhibition in the hall a pair of adjustable traction trucks, a Columbian car heater, and on one of the cars in operation, an air brake. W. J. Cooke, vice-president, and J. A. Hanna, were the representatives. Penwipers were distributed as souvenirs. The McGuire exhibit was very favorably received.

THE Benedict & Burnham Manufacturing Company, New York, manufacturers of pure Lake Superior copper trolley feeder and magnet wires, showed the Benedict brand of copper solid feed wire, and a patented rail bond of one piece, which, though it has only been on the market a year, has been adopted by 50 of the largest roads. It is made of any size wire, and any length, covering all sizes of fish plates. Edwin H. Oswald and J. H. Woodward, looked after the interests of the company.

SMITH, of New York, had samples of a full line of combination electric, candle and oil lamps, electric and kerosene headlights. A patent ratchet raises the wick without tearing it, and locks so that the wick does not rise on account of jolting and smoke, nor drop and go out. An electric headlight clutch was shown, which permits the lamp to be placed in any position. A three-light, 22-inch silver reflector was on exhibition, which is the largest in the world. Thomas C. Millen was in attendance.

THE Card Electric Company, Mansfield, O., showed a 35 horse power single motor operating the double imperial Fulton Truck & Foundry Company's trucks, and a double motor, for interurban roads, having large heavy cars. A new quick throw pneumatic switch, for heavy currents, was exhibited in combination with a quick throw pneumatic blow out, which throws a jet of air across the arc. The representatives were, Reid Carpenter, president; George F. Card, electrician; John F. Card, superintendent.

THE Standard Railway Supply Company, Chicago, Garson Myers, president, in attendance, showed its standard car stove as applied to car seats avoiding cutting the seat. The case containing stove is suspended directly over the seat, and is held rigidly in position there by means of fastenings at seat back and seat rail. Mr. Myers says there are 15,000 of these stoves now in use all over the country. He also exhibited the "gilt edge" steel gongs, track scrapers, adjustable track brush holders, and line material. Mr. Myers is western agent for the R. D. Nuttall Company, manufacturers of gears, pinions and trolleys.

THE Fuel Economiser Company, Matteawan, N. Y., showed specimen castings. This apparatus has been applied to a great many large power plants of electric and cable roads. Owing to the varying demands for power in these two classes of roads, the economiser is of special importance, as it holds in reserve at all times, a large volume of water at the evaporative point ready for immediate delivery to the boilers. B. Pearson, the representative of the company, says the works were kept busy even in the dull season.

THE Sterling Company, Chicago, had the only boiler exhibit, which was in charge of Thomas Deegan, secretary. A model of the Stirling water tube boiler was shown under steam and pressure. The heads of the drum were glass, enabling one to look into the interior of the boiler and note the generation of steam and circulation of water. The manner of receiving the water in the rear upper drum, the coldest part of the boiler, was seen, also the descent through the rear bank of tubes, allowing it to be brought up to steam heat before going into circulation.

THE Brooklyn Car-Wood & Veneer Works, Brooklyn, showed ceiling, plain, decorated and finished, which is made of oak veneered on poplar, and distributed wooden cards on which were shown illustrations of doors, sash, panels, etc. In connection with this exhibit was that of the Veneer Seating & Church Furniture Company, Brooklyn, showing depot seats, side seating perforated and slat, railroad car back, settee backs in veneer, and specimen advertising cards as in use on the principal lines in the vicinity of New York. W. B. Le Van, Jr., was in charge.

THE Western Telephone Construction Company had in operation a 50-telephone switch board, with various styles of telephones with magnetic transmitters. The switch board requires only a small space. There were also exhibited head 'phones with band, night alarm, six telephones of different designs, and two desk 'phones of new styles. One has a jointed arm and the other is an adjustable standing 'phone, taking only a small space and being much lighter than the long distance stand. George F. Stutch, vice-president of the company, did the honors of the occasion.

THE International Register Company, Chicago, had a working exhibit of stationary and portable fare registers. Its novelty was an aluminum stationary register in numeral form, the first ever shown. It has a satin-finish aluminum dial, which is said to be better than painted or enamel, as it always retains the same appearance. Another dial with the mechanism exposed was next to the finished specimen on the sample board, which also contained many styles of the portable registers. The mechanism in the new stationary machine is identically the same with that which has proven so satisfactory in the portable. The new aluminum stationary register was used in the Brill car No. 100. H. H. Englund, secretary and manager, represented the company.

THE Berlin Iron Bridge Company, East Berlin, Conn., had constructed a power house or car barn 20x20 with capacity for two cars. The roof was lined with the Berlin patented anti-condensation roof lining. There was also shown a section of the lining showing its construction. John M. Field, assistant engineer, who superintended the erection of the building was greatly pleased at the results of the exhibit, which attracted a great deal of attention, and secured several orders. A book of 54 pages containing testimonials from customers of the company was distributed.

THE Pennsylvania Steel Company, Steelton, Pa., showed all styles of steam and street railway work, both built and solid. The principal samples were cast steel work, switches, frogs and mates of 9-inch girder rail construction. A pyramid of rail sections from 4½-inch to 9-inch girder stood at one side of the entrance to the exhibit. There were tie plates and braces and a right angle crossing of 90 degrees, 9-inch construction. An exceedingly fine piece of work was a 9-inch groove rail curved to a radius of 6½ degrees, making a complete reverse curve. There was also shown a steam and street railroad crossing, Pennsylvania standard. The representatives were: Edmund H. Smith, treasurer; John F. Ostrom, sales agent; Charles S. Clark, Boston; Mason D. Pratt, Street Railway engineer and Charles W. Reinoehl.

THE R. D. Nuttall Company, Allegheny, Pa., showed gears, pinions, mechanical overhead work and its trolley, of which there are 10,000 to 12,000 in use. This trolley has side rods, in place of chains, with adjusting nuts on the end, with an improved double bolted socket. The foot is arranged to catch any oil that may drip. It is the lowest trolley in the market. A special feature of the exhibit was a collection of malleable iron gears, one of which had been severely hammered with a sledge, but its teeth were in splendid shape, and demonstrated that the Nuttall malleable gears can stand almost any kind of work. These gears are used by Walker, Westinghouse, General Electric, and other motors. The representatives were: President, F. A. Estep, Arthur S. Partridge, St. Louis; C. N. Wood, Boston; Charles J. Mayer, Philadelphia.

THE Hale & Kilburn Manufacturing Company, Philadelphia, was represented by its genial southern agent, B. B. Pilson, Richmond, Va., a Virginian by birth, and a handsome and cultured gentleman, who was with the Southern Railway Company for many years. He also represents in the south the Ajax Metal Company, Philadelphia; the Railroad Signal Lamp & Lantern Company, New York, and the Weir Frog Company, Cincinnati. The Hale & Kilburn Company showed rattan plush and wilton carpet seating and sample of construction. The walkover seat was its newest design, which is so arranged that a steam car can be demolished in twenty-five minutes. The back slips out and is reversible, so that both sides and back can be made new by simply turning them over.

This style of seat makes it possible to clean cars more thoroughly and keep them cleaner than where the old style of seat is used.

THE Georgia Equipment Company, Atlanta, was the only purely southern exhibit in the hall, and was tastefully decorated with cotton plants, showing boles bursted and ready to burst. J. T. Voss is president and Woodford Brooks, secretary and treasurer of the company, which handles goods of the Hubley Manufacturing Company, Lancaster, Pa.; R. Woodman Manufacturing Supply Company, Boston; Wheeler Reflector Company, Boston; Car Equipment Company, Philadelphia; Empire Electric Insulation Company, Schenectady, New York; Beacon Vacuum Pump & Electrical Company, Boston; Independent Electrical Company, Chicago; New Haven Register Company, New Haven, Conn.; R. Bliss Manufacturing Company, Patucket, R. I.; Washburn-Moen Company, Chicago; Whitney Electrical Instrument Company, Penacook, N. H.

THE Ohio Brass Company, Mansfield, O., was represented by C. K. King, manager of the railway department. The conspicuous feature was a well arranged sample board showing a full line of electric railway supplies, construction material, line devices and car material. One of the specialties was a reversible adjustable track brush holder, by which the motor man can swing off, or raise the broom from the rail as desired, there being no thumb, or set screws necessary, for it is self locking and automatic in action. Woods flexible pole bracket, the Spillman trolley car, Jewel trolley swing, a pneumatic quick "break" switch, using an air blast to blow out the arc, the Ohio trolley, simple in action and of few parts, which can be assembled or dismantled without the aid of tools. A new trolley hanger is shown in which the insulated parts are covered with metal much lighter and said to be more easily handled than many other hangers.

THE Paige Iron Works, Chicago, represented by Alonzo W. Page, president, and E. S. Nethercut, engineer, had an exhibit that attracted a great deal of attention. A section of the track was shown, illustrating Terre Haute Street Railway Construction, consisting of Illinois Steel Company 6 inch 72 pound shanghai T rail, on steel ties, and in brick pavement, to show that T rail can be perfectly used in large cities and paved streets. There was also shown a three way switch, of Illinois Steel Company's 60 pound shanghai T rail. A branch off of Illinois Steel Company's 79 pound girder rail, and a standard steam and street railway crossing, with steam railway tracks undisturbed was shown, the latter having an open throat for both lines. A portion of this work was laid on Daniel's steel ties, used by the Terre Haute Street Railway Company, and manufactured by the Daniel's Steel Tie Company, Youngstown, O. Several Wheeler suspension joints were also shown, together with photographs of work in construction on setting up floor of works.

THE following supply men were also present: Franklin E. Huntress, Boston, representing Laconia Car Company, Laconia, N. H., E. H. Allen, Allen Electric Supply and Car Equipment Company, Philadelphia; G. Frederick Collins, Valentine & Co., New York, Chicago, Boston; R. J. Mercur, New York Car Wheel works, Buffalo, N. Y., John Howard Yardly, vice-president, Philadelphia Car Wheel Co., Philadelphia; Charles E. Bibber, vice-president Cutter Electrical Manufacturing Company, Philadelphia; Charles A. Schieren, Jr., Charles A. Schieren & Co., N. Y., Edwin H. Oswald, Benedict & Burnham Manufacturing Company, N. Y., J. C. Stainwald, Chicago, representing the Standard Paint Company, N. Y., H. H. Harrison, White, Crosby Company, Buffalo; Mark D. Batchelder Company, Atlanta; Thomas A. Hurley, Holmes, Booth & Haydens, Waterbury, Conn., W. H. Taylor, Pratt & Letchworth, Buffalo, N. Y., C. A. Peterson, assistant general manager Thiel's Detective Service, St. Louis.

THE General Electric Company's exhibit was thronged all the time, and a little book was distributed, giving a catalogue of devices shown. There were GE-800 motors in machinery hall and on the lines of the Atlanta Consolidated Street Railway Company, forms "K" and "K R" controllers, switches, with the magnetic blow-out principle, fuses, lightning arresters, generator and feeder panels, total current cut-outs, underground feeding tubing, three-wire system, line material, the "Thompson '93" arc lamp, Thompson recording watt-meter and literature, describing standard apparatus for electric railway service, electric underground tubing for railroad feeders, three-wire system for electric railways, feeder panels for electric railways, supply material catalogue No. 7504, Thompson's '93 arc lamps, and Thompson's recording wattmeters. The representatives were: W. J. Clark, manager railway department, New York; A. K. Baylor, New York; J. R. Lovejoy, W. B. Potter, H. C. Wirt, G. E. Hoffman, Schenectady, N. Y.; T. P. Bailey, Chicago; H. J. Crowley, Philadelphia; F. M. Kimball, Boston; George Rosenthal, St. Louis; H. H. Corson, Nashville, Tenn.; A. F. Giles, D. R. Bullen, Atlanta office.

THE Genett Air Brake Company, New York, N. Y. had an interesting exhibit arranged by E. J. Wessels, general manager, and George S. Lee, master mechanic, showing the development of the air brake. The original air brake pump was shown, marking the commencement of air brake on surface lines; the former open style pump used with double reduction motors, now unnecessary, since single reduction motors have appeared. The enclosed double acting pump, which differs from all other pumps in this respect, as they are only single acting, was exhibited. The special feature was a combination grip and brake device, enabling the gripman to apply grip or brake separately or to work them together. There was also a collection of detail parts of the entire brake outfit and brake hose. In active operation was one heavy double truck 30-foot car on the Atlanta Consolidated

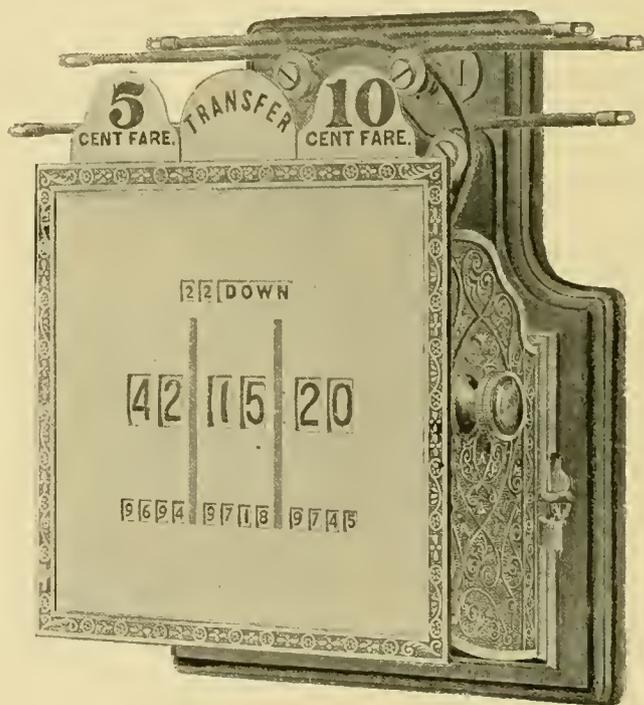

Road, equipped with the Gennett brake. This car, No. 60, is the heaviest and most difficult to run in Atlanta. Car No. 24, also equipped with Gennett brake and a testing guage, followed car No. 60, marking every compression, and a watt meter, showing the small amount of power consumption. The World's Fair award, the only one received by any company for air brakes on surface roads, was shown, together with eccentrics, guages and controlling valves.

THE Peckham Motor Truck & Wheel Company, Kingston, N. Y., New York City, Chicago and Boston, occupied considerable space with a most interesting exhibit, which attracted so many visitors that E. Peckham, president; W. H. Wilkinson, superintendent; and W. E. Cooke, manager of the Chicago office, who were constantly in attendance, were kept busy all the time. An extended and an extra long extension truck were shown. The side frames are constructed of all steel bars, so secured to the pedestals that no shearing strains come on the rivets by which they are secured. No bolts are used in the construction of the side frames, except to hold the spring pockets and wheel pieces in place. The side frames are supported upon the journal boxes by graduated spiral springs, which sustain all the weight of the car body and one-half the weight of the motors which are suspended from the side frame. The Peckham trucks were in use on some of the exhibition cars and demonstrated all that was claimed for them. The Peckham interchangeable "cushioned" motor wheels, in which all the webs are interchangeable, and a malleable iron hub pressed upon the axle by a hydraulic pressure of 35 tons to the square inch, and an elastic rubber cushion, was also shown. An elegant pocket-book for holding currency was distributed.

J. G. BRILL & Co., Philadelphia, had an exhibit that was seen before the exposition building was reached, and which was constantly in the minds of the visitors, for it took many of them to the meeting place, and brought them back to the hotels again. Three new cars were run between the hotels and the exposition grounds. One was an 18 foot on a No. 21 B truck; another was 20 feet long on double maximum traction trucks. This was an open car, and was built for the Coronado Electric Railway Company, San Diego, Cal., having been stopped in transit, and diverted to Atlanta for exhibition purposes. In the exposition building, was shown a Hall No. 21 B. truck, for single truck cars, a No. 22 maximum traction truck, truck forgings, truck frames and truck complete. There was a section of car with moveable vestibule, which can be taken off in summer and put on when desired. This section was fitted with a new device in a brake, the brake mechanism of which can be attached to the car as it stands, without moving the shaft, when the vestibule is put on the car. The open end showed the Brill track scrapers, sand boxes, life guard or fender. A full line of Brill's jacks, sample steps, and

various small devices used in the construction and operation of cars. On a single truck, in the hall, was shown a one-half elliptic spring under the boxes, a new invention. The representatives were: John A. Brill, vice-president; F. C. Randall, M. E. Curwen, George M. Haskell, Samuel M. Curwen, William H. Heulings.

THE New Haven Register Company, New Haven, Conn., had a handsome exhibit stand, showing the different styles of New Haven fare registers. The latest is a triple machine, which registers three classes of fares, 5, 10, 15 cents; 10, 20, 30 cents; or two fares and transfer. The ringing device of this register has three different sounds of bells, one for each class of fare to be registered, and consists of a specially arranged rod in combination with one cord. The number of trips is shown, together with totals for each variety of fares up to 10,000 each. The trip register can be set at zero without disturbing the total, and there is a lock, which can be set when the conductor is obliged to leave the car, so

THE TRIPLE REGISTER.

that mischievous persons cannot ring up fares. A double fare register is shown, which works in the same manner as the triple machine. Single fare registers with small face, and also with the Philadelphia dial, were exhibited. The New Haven fare registers are in use on the cars of the Atlanta Consolidated Road, and attracted the favorable notice of all visitors, as well as those at the booth in the hall. Registers were shown in antique copper and bronze, bronze polished and lacquered and nickle finish. In the last eighteen months the New Haven registers have been adopted by over 160 leading street railway lines, including the Philadelphia Traction Company North Hudson County, Rochester, N. Y., Oakland Montreal, Toronto and London. The World's Fair award

was shown, and a handsome inkstand and paper weight were given as souvenirs. The representatives were: F. Coleman Boyd, vice-president and general manager, and John S. Bradley, secretary and treasurer.

THE Consolidated Traction Company of Jersey City, New Jersey, have ordered twenty Columbian trucks from the McGuire Manufacturing Company, Chicago.

WILLIAM WHARTON, JR., & CO. (Inc.), Philadelphia, was represented by Powell Evans, foundry sales agent. Sections of standard 9-inch girder rail, 90 pounds to the yard guard rail were shown, brace tie plates, chains "unbroken mainline" switches, derailing device, Columbian transfer table, and a collection of brake shoes to illustrate the paper read by D. F. Henry and Powell Evans.

THE Quaker City Car Equipment Company, Philadelphia, showed a life guard trolley brake and slack adjuster, which at all conditions of wear of shoe keeps the chain perfectly taut, and the brakeman never throws crank more than one-half or three-quarters of a revolution to put on full power of brake. J. E. Loughridge, vice-president and general manager, explained the device.

THE Walker Manufacturing Company, Cleveland, O., had about the most interesting electrical exhibit at the convention, and not only was the exhibit valuable and instructive in itself, but there were enough representatives of the company in attendance to explain everything. There was shown a 200-horse-power generator running a motor on a Dorner & Dutton truck; a complete car equipment of 30-horse-power motors: two series-parallel controllers, rheostats, cut out boxes, lightning arresters; a single motor open, showing the internal construction. Those in attendance were S. H. Short, electrical engineer; H. McL. Harding, New York; R. M. Bayliss, in charge of exhibit; B. N. Barr and James Atkinson, central office, Cleveland; Frank Kohler and G. A. E. Kohler, Chicago.

THE Johnson Company, Johnstown, Pa., had an exhibit of sections of girder rails and T rails and slot rails, for cable railways. The special feature and latest production is "guaranteed construction," which takes in frogs at crossing points and mates and switches. It consists of a cast steel box of full depth of rail, in which is set a steel plate, tempered by Prof. Harvey's process. This is the place where there is the greatest wear and least life in ordinary switch plates. A bath of hard babbitt metal and zinc is put in, holding the plates tightly in place in the cast steel box. In case of renewing any portion of the switch, it is only necessary to remove wooden pin, draw out the tempered plate, plane up and put back again. This form of construction is guaranteed for a certain per cent of the cost of work. A Du Pont truck was shown, in which it is only necessary to slacken up four bolts in order to lift car body and remove the truck from under it. The frame is of rolled steel and

the truck is of simple construction with few parts. In removing body, it is unnecessary to remove the motors, which rest on the bars all the time. After the body is removed, the wheels can be lifted over top of the truck, which is left where it is. Ernie Du Pont, the inventor, is general manager of the Louisville Street Railway, which has used the truck five years. The representatives were Daniel Coolidge, vice-president; William W. Kingston, Eugene Thomas, E. B. Entwisle, chief engineer; W. E. Boughton, Philadelphia; E. O. Evans, Boston; O. C. Evans, Cincinnati; A. S. Littlefield, Chicago; H. C. Evans, New York.

#### LESSON OF THE EXHIBITS.

Everyone acknowledged that the exhibition of appliances was the best that has been made since the American Street Railway Association has been in existence. There were 78 firms represented with tastefully arranged booths, but there were besides many supply men whose goods were of such a nature, that required no exhibition spaces, as they were specialties, or well known articles. Each was complete, but the conspicuous feature was the entire absence of anything exclusively pertaining to horse railways. The majority of the supplies were for electric

lines, which shows that the end of horse lines is rapidly approaching,

Perhaps the exhibits attracting most attention were those of the track and crossing men. The truck manufacturers were close seconds, if not on an equal basis. T rail construction was shown in various forms, there being very little girder rail shown, illustrating the fact that T rail is growing rapidly in use, and that it is only a question of a short time when the girder rail will be almost entirely superseded.

The tendency of the age as shown by truck construction and car fittings, is to economize space and to simplify parts, so that cars can be taken apart, repaired and reconstructed, if necessary, in a short space of time, without heavy expense, or moving the parts to various sections of the shops.

The line supply men had very interesting exhibits, almost each one having some new specialty. Fender men were represented in large numbers, as were the fare register manufacturers, the jingle of whose bells was incessant. Considerable interest was manifested in elec-

tric heaters, and one firm reports a sale to Rome, Ga. Other exhibitors expressed themselves as more than pleased with the result of the exhibition, as many orders were taken.

Just a word about next year's convention at Montreal. Some feeling existed on the part of the supply men, in regard to going across the border, because of difficulty, real or imagined, of getting stuff over on account of the duties. The Montreal gentlemen and the members of the committee say they are confident that everything can be arranged, so that it will be no more difficult to get goods to Canada than to any part of the United States. Goods should be consigned to the secretary of the Association, marked "samples, no commercial value, to be returned." A special custom house officer will be assigned to the exhibition place, and there will be no trouble. Definite information will be furnished later.

## TRANSFERS ON STREET RAILWAYS.

A Report to the American Street Railway Association by J. N. Beckley, President Rochester Railway Company.

The carrying of a passenger from any part of a city, reached by the lines of a street railway, to any other part of such city, reached by the lines of the same railway, for a single fare, is, speaking broadly, a new thing in street railway operation. Ten years, even five years ago, the manager who had the temerity to advise his board of directors to establish a liberal transfer system would have, probably, been regarded as unfit for his position. To-day the most successful companies have come to realize that in this matter of transfers, as well as in other matters, it pays to treat the riding public liberally.

One of the most important things to do, and to do promptly, is to educate the average man and woman to ride. That this is largely a matter of education every street railway manager knows. When a new line is opened, even through a thickly settled district, the people for some time continue to walk. Bad weather, the necessity of haste or some other thing induces a person to ride once. The next time he rides with less inducement, especially if the cars are clean, the service prompt, and if he does not have to pay more than five cents to get to his destination. So the habit grows, and soon the rule is to ride, when, before, it was the exception. A liberal transfer system, properly guarded to prevent fraud, pays. This is, I think, now generally recognized. Local conditions and arrangements of lines must be considered in determining the regulations to be adopted. The rules intended to safeguard the company are important. Perhaps equally important is the making of rules broad enough to encourage riding.

If a transfer system is adopted, it is best not to hedge it in too much by narrow restrictions or to so complicate its details as to involve labor and expend money unnecessarily. It is expedient also to appear to be making most liberal concessions to the public, especially as such concessions, presumptive or real, conduce to our own benefit. The punching "to and from," the limit of privilege to use at absolute junctions as fixed spots, different forms, and even different colors for different issuing lines, may in most cases be avoided. If we secure a proper form of ticket, we can be protected in less complicated ways, and it is usually possible with careful arrangements to cover all requirements in one form. If series and consecutive numbers be employed, we can easily trace all issues by them instead of by old methods. If we use the series and consecutive numbers, we allot a certain quantity of tickets to each conductor and follow him by them and should avoid minor details that interfere with or complicate the more important ones.

The ticket should be of liberal size to permit legible type and prevent crowded matter.

It should be bound in pads of 100, and the pad be so exactly arranged as to permit punching ten or more in one action of the punch. This feature permits canceling the month and day, and often the time, ten or more at once and accurately, and frequently several of the same destination. It is of great advantage to secure full "month," "days" and "time" space on each ticket, that can be accurately and quickly punched,

and it forestalls the waste, expense and detail consequent upon daily dated tickets, while it gives equal protection without delay anywhere.

The subject matter ingeniously arranged can and should comprehend in one form all needed rules. "Good for this current trip—at point of change—on next car after time canceled—to destination punched," illustrates this. "Subject to rules of company," covers several dozen words of the old form with equal rigidity. Special conditions may vary this, but in most cases it is restriction enough.

"A series number"—"conductor's number"—"run" of "car" number, or some such designation on each ticket, will identify the issuer perfectly, and the consecutive number will trace the issue, hold it to sequence in use, and prevent tampering and fraud. We have some 200 conductors. Each has a stock of 25,000 tickets to begin with, renewed as used. Our transfer department has 250 compartments on the wall of the room to hold these tickets (thus providing for increase in conductors) each of 25,000 capacity, so they are all systematically arranged in simple order, one compartment for the tickets of each conductor. The conductor turns in his unused transfers at the end of the day's work, and they are put in his compartment, and given out to him on beginning work next day. A simple record book keeps this account; one double page for each conductor covers his transactions for the whole year, and shows at a glance each individual transfer account, for comparison or aggregating statistics.

Forenoon and afternoon are distinguished by light and black print in the destination blocks, and by the system we use we get month and day, one punching each (but always preliminary, the conductor keeping these punched ahead in readiness), and one punch for time (even hour or ten minute interval) and one for destination. I need not explain that such a ticket supplants the expensive duplex form—for it is equally protective—nor enter upon any argument in favor of the absolute need of a short time limit. The day limit, a. m. or p. m. limit, or even the hour limit, is of a by-gone day, too leaky to be considered, and very few companies now use it.

It is important, in my judgment, to arrange the form clearly, each section; name, rules, time, days, months, destination, series and consecutive number, to have a distinctive and spacious position and be clearly defined by itself, not scattered about. It is also very important, in order to foster accuracy with rapidity, to so far arrange the reading matter that the ticket shall be punched and read as punched, all one way, being held by thumb and finger of the left hand and punched with the right. Inverting and twisting the ticket not only takes time, delaying traffic, but increases inaccuracy. The ticket should be arranged in every detail so as to be within the mental grasp of the average conductor, and so as to make it easier for him to go right than to go wrong, easier to be quick than compelled to be slow. Regular horizontal and vertical lines soon fix themselves on the dullest intellect, but scattered details, hopping about a ticket, often puzzle the brighter ones.

In order that all punching may be done before tearing off the ticket from the stub, and that all possible advantage of the pad form and multiple punching can be secured, all sections to be punched should be arranged on the lower side and right hand end if possible.

The pad form saves counting the 100s, while the consecutive number counts the broken pads. The pad form is most convenient in handling in the office or on the cars, and saves time wherever used in giving out, in issuing or receiving or in taking stock. The use of the months is not important. If there be room for them there is no objection, as with the pad form they are no obstacle to quick service, as they can be punched in advance of use. Many companies omit them, as the other restrictions practically give little opportunity for fraudulent use after thirty days. By beginning the consecutive number of each pad at 0, 100, 200, etc., we save complication in subtracting, as then the consecutive number on the upper remaining ticket instantly shows how many tickets have been removed.

The consecutive number is not only useful in counting, but compels proper use of the tickets. In conjunction with the time table, each ticket must show when turned in that it was issued in sequence of number and in sequence of time. No. 6,230, say, is issued at 9:30 A. M. Nos. 6,231 and 6,232 may not be returned at all, but if they are, they must show issue in direct sequence of time. If not so, the series number tells us instantly who issued the ticket, and the man is spotted and the wrong exposed, for tickets cannot be abstracted and punched for future use as they will not fall within proper time limit, and in proper sequence. We make conductors note on the daily car report the consecutive number of the transfer with which the day's work begins and the consecutive number with which it ends. At the close of each trip each conductor turns in the transfers taken in on such trip in a special trip envelope, dropping them in a box prepared for that peculiar purpose.

This box is placed at our grand junction, which all cars pass, but a number of such boxes could be used where different conditions obtain. We know at once who wrongly issued a transfer, who received it and when it was done. A notice in our cars requires the passenger to ask for a transfer when fare is paid. This rule enables the conductor to issue transfers at his convenience, and distributes the labor of so doing instead of massing it at certain junctions, with confusion and delay.

Nor is it necessary to resort to tickets on a roll or in metal clasps or such device for protection. The roll method necessitates single issues, singly punched, and loses the advantage of multiple punching, while it delays traffic and increases chances of error. The metal bound tickets add expense, but do not increase protection. Tickets may be just as easily abstracted in advance of proper use as in the pad form—so they may in the roll, for that matter. Real protection lies only in the system, not in the binding. Conductors cannot sell, trade or exchange transfers with series, consecutive numbers and time table without detection, and if the transfers be turned in on every trip, detection is a very simple process, requiring no elaborate and costly inspection.

A special register for transfers, and so eliminating their cash value, does not help us. It confuses the conductor and paralyzes the spotter, and without a protected form of ticket, conductors can collect fares and ring them up on the register, and turn in each other's transfers to balance the account.

By putting the transfer business into the hands of the conductors, we cater to the convenience of passengers, and we obviate delays in traffic, consequent upon stopping cars to transfer. We save the large expense of transfer agents, and, in my judgment, do not increase leakage, for it is as easy for transfer agents to stand in with conductors to defraud the company, as it is for conductors to combine with each other. The numerous and continual frauds perpetrated upon transfer agents, by people who get transfers without having paid any fare, is too well understood to require discussion.

We have adopted a system of "faces identification" for moral effect, and especially for use at the noon hour, when abuse in transfers is most frequent. As soon as we have converted our stock of tickets to the new form, we shall put them into effect. They are, I understand, now in use in Minneapolis, St. Paul, New Haven, Binghamton and Scranton.

In conclusion, I need only add that our liberal system of transfer has proved a good investment, and that our form of ticket is efficient and protective. Simple, convenient and safe, yet systematic, distinct and business-like, it protects our interests, while it saves us all former waste and a vast amount of useless labor.

SATURDAY AT CHATTANOOGA.

No better day could have been made for seeing Lookout Mountain and Missionary Ridge, than Saturday, when bright and early the New York, Boston and Chicago parties found cars waiting to take them to Lookout Mountain. They were guests of the Chattanooga Electric Railway Company, S. W. Devine receiver, and Warner S. McCall, general superintendent; Capt. H. S. Chamberlain, president of the Union Railway Company, and the Chattanooga Chamber of Commerce. The climb of the mountain was made by the standard gauge road, which landed them at the inn. Point Lookout and other places of note were visited. Henry C. Payne, ex-president of the association, was invaluable, as his graphic descriptions of the battles, and the positions of the troops, made everybody realize as nearly as possible at this late day, what really occurred. Senator Willard Warner, who has lived at Chattanooga since the war, and was a member of General Sherman's staff, was present at all the battles, and gave an interesting talk.

Luncheon was served at the inn, and a ride was taken in the narrow gage to the upper terminus of the incline. This is directly above the site of the "Battle in the Clouds." By means of the incline, the mountain was descended. Cars were taken to Missionary Ridge where

Mr. Payne and Senator Warner again described the battles. The National Cemetery was visited, where 13,000 soldiers lie buried, many of them known by number only, the names having never been discovered. The fighting occurred in November, so that a splendid idea was obtained of the situation, except that only when the cemetery was visited, did the visitors begin to realize and only in a small degree, the awful and terrible sight that must have been seen from those beautiful heights the day after the battle.

In the evening, at the suggestion of H. P. Bradford, general manager of the Cincinnati Inclined Plane Railway Company, the Chicago, Boston and New York parties that attended the Atlanta convention, who visited Chattanooga on the invitation of the Chattanooga Company, and were treated so handsomely, met in the railroad depot to appoint a committee to draft resolutions expressing their gratitude at the handsome entertainment that had been provided for them. Col. J. H. Cunningham, president of the Massachusetts Street Railway Association, and one of the new vice-presidents of the American Street Railway Association presided. The following committee was appointed: H. O. Nourse, of the Scarritt Car Seating Company, St. Louis and Chicago, James W. Nagle of "The Car," H. J. Kenfield, of the STREET RAILWAY REVIEW; John D. Bennett of the Street Railway Journal, M. J. Sullivan, Electrical World; Charles Pierce, Electrical Review; T. C. Martin, Electrical Engineer and W. F. Collins, Western Electrician. After these resolutions are prepared they will be given to the various journals represented at the convention for publication.

SUNDAY AT CINCINNATI.

The Chicago contingent was pleasantly entertained at Cincinnati. John Harris, general superintendent of the Cincinnati Street Railway Company, and Bayard Kilgour took a party in a carriage ride to the various power stations of the company, and through the fine residence sections. The company is building a new power house on Depot street. This station will be equipped with 10 General Electric, 600 Kilowatt generators, working in pairs, direct connected to 5 McIntosh & Seymour tandem compound engines of 2,300 horse-power each, connections being made by means of a clutch coupling. Seven Abendroth & Root Manufacturing Company's boilers of 500 horse-power each, arranged in pairs, are being put in, fitted with Roney automatic stokers. The boilers are arranged for artificial draft, the apparatus being furnished by Westinghouse, Church, Kerr & Co. The power generated in the Brighton station is 2,170 kilowatts; East End, 1,306 kilowatts; Hunt street, 1,726; total 5,202 kilowatts. The new Depot street and Cummingville stations, the first having 12 multipolar 300 and the second 10 multipolar 300, and the direct connected 800 to be installed in the Brighton station, brings the total to 12,602 Kilowatts. The motor equipment now in use consists of 277 motors, being 28 F. 40; 35 S. R. G., 30; 50 W. P. 50; 14 Westinghouse; 20 Sperry 10 h. p.; 150 G.

E. 800. Orders for additional equipments have been given for 85 G. E. 800; 35 G. E. 1,200; bringing the total equipment up to 397 motors. With the exception of a very few miles, all overhead construction is of double trolley. Current is now being carried a maximum distance of 6 miles. The extensions now being built will, when finished, terminate 15 miles from the power house. On one of these long lines the multiphase system will be installed. Its results will be watched with a great deal of interest, as it will be the first installed in this country.

The gentlemen who were entertained were: J. M. Atkinson and D. M. Barr, the Walker Manufacturing Company, Cleveland; W. E. Haycox, F. A. Rogers, the Fulton Truck & Foundry Company, Mansfield, O.; Joseph E. Lockwood, Michigan Electric Company, Detroit; George W. Baumhoff, general superintendent Taylor Avenue Railway Company, St. Louis; John Harris, Bayard Kilgour and two members of the REVIEW staff.

### CONVENTION NOTES.

One of the most delightful entertainments of the convention was furnished to the REVIEW party at Chattanooga, Tuesday evening. Superintendent Warner S. McCall, general superintendent of the Chattanooga Electric Railway Company, had a private car in waiting to take the Chicago party to Lookout Mountain. It was a beautiful ride in the moonlight, the air was soft and balmy, but on the heights 1,700 feet above the city it was quite cold. It was a sight that will never be forgotten. Mr. McCall received the grateful thanks of all the fortunate

THE REVIEW'S CHATTANOOGA ORCHESTRA.

participants in his hospitality, which was all the more appreciated because of its informality. Some of the party discovered three darkies, one with a guitar, one with a banjo, and one with a piece of two-inch gas pipe, two and a-half feet long. A concert was given by these players, which was very greatly enjoyed, as much on account of its novelty as anything else. The gas pipe fellow used a coupling for a mouthpiece, and played a bass accompaniment that sounded like a slide trombone. His cheeks puffed way out, and the tears gushed from his eyes, he blew so hard. The party consisted of: Mr.

and Mrs. W. S. Dimmock, general superintendent, Omaha & Council Bluffs Railway & Bridge Company, Council Bluffs, Ia.; Mr. and Mrs. A. M. Turner, secretary and treasurer, Hammond Electric Street Railway Company, Hammond, Ind.; Mr. and Mrs. Edwin A. Smith, Consolidated Car Heating Company, Chicago; Mr. and Mrs. M. J. Sullivan, Electrical World Chicago; Mr. and Mrs. H. H. Windsor, STREET RAILWAY REVIEW, Chicago; J. W. Meaker, Meaker Manufacturing Company, Chicago; Alonzo W. Paige, Paige Iron Works, Chicago; George F. Stitch, vice-president Western Telephone Construction Company, Chicago; Max A. Berg, secretary, Wallace Electric Company, Chicago; James Partridge, Partridge Carbon Company, Sandusky, O.; W. F. Collins, Western Electrician, Chicago; W. H. Taylor, Pratt & Letchworth, Buffalo; H. J. Somerset, Winnipeg Electric Railway, Winnipeg, Can.; John D. Bennett, Street Railway Journal; A. Hoffman, Milwaukee; Mr. and Mrs. T. H. McLean, Indianapolis; Elmer A. Sperry, Cleveland.

Friday afternoon several ladies and gentlemen rode out to the cotton fields at Decatur. On the return the motorman just to show them what he could do gave them the fastest time they had ever ridden on an electric line. He started at the top of a hill with 13 per cent grade about a mile long and put on all the current. Old steam railroad men said that the speed was not less than 60 miles an hour, and at the bottom was a curve which was ridden in safety.

COULD weather have been finer ?

C. E. STUMP, was in attendance looking after the interest of the Street Railway Gazette.

McNAMARA BROS., Fairhaven, Vt., who deal in slate for switch boards distributed a paper weight.

W. W. KINGSTON and Joel Hurt of the local committee, covered themselves with glory in their successful efforts to keep the ball rolling.

THE Duff Manufacturing Company, Allegheny, Pa., distributed glass paper weights, advertising the Barrett patent compound lever, track and oil well jacks.

THURSDAY afternoon the delegates took special cars and were taken about the city, going to the top of the Equitable building, and visiting the capitol and a cotton press.

PRESIDENT PAYNE's party came in a special car and included Mrs. Payne; her niece, Miss Margaret Jones; General Manager C. D. Wyman and Charles L. Jones, purchasing agent.

S. J. WICK ably represented his company, the Electric Railway Equipment Company, of Cincinnati, and threw light along the path of all seekers after the truth of the long line of this company's supplies.

THE plan to extend the convention hereafter to four days will be appreciated by all. The work has now assumed such magnitude that three days are as inadequate as formerly they were too long.

JAMES PARTRIDGE represented the Partridge Carbon Company, Sandusky, O. Although he had no space in the hall, he became acquainted with many people who use his carbons, and reports several orders.

STREET railway men who did not receive the little souvenir, "Coons in the hole," may have one mailed to them by addressing the Scarritt Car Seat Company, St. Louis, Mo., or H. O. Nourse, 941, Rookery, Chicago.

THE trip through Kentucky, Tennessee and Georgia was a revelation to northern guests. Nature seemed to have decked herself in Sunday raiment, and from Cincinnati to Atlanta the valleys and mountains shone in one prolonged blaze of glory.

EDWARD BEADLE who never misses a convention but whose absence would have been a regret to lots of people, was present though making no exhibit of the Railway Register Manufacturing Company. In fact, there is little need to do so, so well known are these excellent machines.

BOTH the Aragon and Kimball houses did themselves proud in service, menu, and general comfort of guests. At no city have the delegates been better cared for and in some not nearly as well. The visitors carry away very pleasant recollections, and many will return this winter for a longer stay.

MORRIS, TASKER & CO., Philadelphia, have been made sole manufacturers of the Duggan Patent adjustable Pipe Bracket, considered by many managers the best, cheapest and simplest on the market. The price has lately been greatly reduced, and they can be purchased direct from the manufacturers, or from the Burnham & Duggan Railway Appliance Company of Boston.

THE advantages of having the "whole show under one roof" was appreciated, but another year it would be well in assigning exhibit spaces to locate such displays as make no noise nearest the convention hall; for instance, track, overhead, or lamp supplies, instead of motors and fare registers both of which latter must necessarily make considerable racket if illustrating the operation of their machines, and that is what they come for. There really is no need of placing the noisy exhibits so near the session room, as there are always plenty of silent displays.

JOHN PUGH, he of small frame, but big heart, has accepted the general eastern agency for those successful manufacturers of street railway trucks, track cleaners, wheels, gears, etc., Dorner & Dutton, of Cleveland. Mr. Pugh is an old settler—for a young man—in the street

railway supply business, having served in the several departments in the John Stephenson Company, in 1871, and has been connected with the street railway trade ever since. His acquaintance is equalled by but few, and his popularity is fully equal to its extent. His friends gladly congratulate both Mr. Pugh and his company on this new connection and wish him continued and ever increasing success.

#### A BRILLIANT BANQUET

The great social feature of conventions has always centered in the annual banquet, and the years as they have gathered in number have maintained a commendable opinion of pleasant rivalry, which has aimed on making each dinner as good or better than its predecessors. Hence it is no small undertaking in any city, to provide a menu and speakers, which shall attain to the high standard so long established.

Atlanta, however, was fully equal to the emergency, and the table, the service, and entire management of the occasion was all the heart could wish. The feast was spread in the spacious dining room of the Kimball house, which was profusely decorated with hundreds of flags, flowers and potted plants. Promptly at nine o'clock four hundred of the "400" were seated, and the dining commenced.

After the feasting, President Payne called on J. H. Stedman, of Rochester, who responded in verse. The next speaker was Howard E. W. Palmer, of Atlanta, whose toast "Atlanta" awakened great applause.

C. Densmore Wyman, of Milwaukee, whose after dinner speeches are always excellent, followed with "Our Association," and surely no more appropriate selection could have been made than in the assignment of this toast.

"The Street Car as a Factor of Civilization" was responded to by Lewis Perrine, of Trenton, who traced the evolution of the street car.

Capt. Harry Jackson, spoke on "The Railroads and the Law," and closed with an eloquent tribute to the unseen element.

"The New South" was portrayed by Hon. Lionel C. Levy, of Columbus, who showed how the race problem was working out its own solution, and concluded with an enthusiastic prophecy of the future.

"The Technical Press" was responded to by J. H. McGraw, of the Street Railway Journal, who set forth the good work of the trade journal. He was frequently applauded.

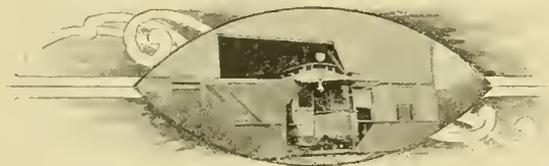

The speech of the evening was made by a newspaper man, Lucien L. Knight, of Atlanta, who responded to "the Local Press" from whose remarks the following is an extract:

"If you will excuse the platitude we live in the brightest era of the world's development—an era that has witnessed the sublimest miracle since man became a living soul; for electricity on every hand is writing the peroration of the century. The pressure of a button now starts a factory into motion and causes a myriad flame to leap into a carnival of light. A single wire, stretched along the highway, carries from city to city the message of the human voice and guides the progress of the locomotive dashing along as if in the exercise of its own volition. Oceans

have been wiped away and continents united until Europe lies across the common, and Asia is beyond the forests that guards the frontier of the neighborhood. Science has illuminated the night with her soft witchery and pilfered the eternal birthright of the stars. Like the moping owl, the moon has herself lodged complaint against the trespasser that seeks to "molest her ancient solitary reign." \* \* \* \*

"In conclusion, sir, my interpretation of this banquet and this splendid gathering is this: That Georgia stands shoulder to shoulder with New England; that we of the south allied with you under the banner of progress are as ready to cope with you in peace as we have already vied with you in war; that we are ready to strike hands with you in fraternal combat, and to struggle with you in thrif as we have in chivalry. Though we may differ in politics we are one patriotism; though we may scatter with the increase of our children we are one in the blood of our fathers, differing as in the blooms that wrap your northern hills as in the flowers that deck our southern fields, but in love and destiny and high resolve forever mingling like the common stars that charm the vision of the stilly night as they drift to the breaking of the day."

"Our Country" appropriately closed the program, and F. G. du Bignon, of Atlanta, was called on to reply, being frequently interrupted by loud applause. President Payne then proposed the health of Mr. Hurt, the president elect, which brought the evening to a close, and as the banqueters dispersed were surprised to find it 2 o'clock Friday morning.

#### LIST OF STREET RAILWAY MEN.

Akamann, J. N., Worcester, Mass.  
 Allen, J. P., St. Louis.  
 Adams, J. T., Atlanta.  
 Atken, J. W., Carbondale, Pa.  
 Adkin, J., St. Louis.  
 Baker, R. F., Washington, D. C.  
 Barnes, C. E., Plymouth, Mass.  
 Bailey, T. P., Kalamazoo, Mich.  
 Belden, D. A., Aurora, Ill.  
 Burg, E. H., Harrisburg, Pa.  
 Brown, N. W. L., Atlanta.  
 Bradford, H. B., Cincinnati.  
 Brown, O. B., Cincinnati.  
 Breed, E. S., New Britain, Conn.  
 Bridges, F., Dayton, O.  
 Baumhott, J. W., St. Louis.

#### LIST OF SUPPLY MEN.

In addition to those who had space in the exhibition hall, were noted the following representatives of supply houses:

American Car Company, St. Louis.—E. J. Lawless.  
 Anniston Cordage Company, Anniston, Ala.—F. W. Jones.  
 American Iron & Bolt Company, Cincinnati.—G. M. Ball.  
 American Electric Manufacturing Company, St. Louis.—J. F. Gerliman.  
 Abendroth & Root Manufacturing Company, New York. P. McLaren, general manager.  
 American Engineering Company, Atlanta, Ga. C. H. Williams, G. Mays Ball.  
 George C. Ball & Co., Birmingham and Atlanta.—S. Mays Ball.  
 Bruner Brick Filler Company, Pontiac, Ill.—H. C. Bruner.  
 Brownell Car Company, St. Louis, Mo.—W. B. Allen.  
 Binghamton Wagon Company, Binghamton, N. Y.—J. H. McConathy.  
 Bushnell Manufacturing Company, Easton, Pa. E. M. Bushnell.  
 W. R. Brixey, New York.—T. G. Felder.  
 Mark D. Bachelord Co., Atlanta, Ga.—M. D. Bachelord.  
 B. & B. Manufacturing Company, New York.—E. M. Oswald.  
 Buckeye Engine Company, Salem, O.—G. A. Barnard.  
 Carnegie Steel Company, Atlanta, Ga.—W. M. Kelly.  
 G. S. Colgate Co., New York.—G. H. Colgate.  
 The Car, Philadelphia.—F. B. Vandegriff, W. E. Douglas.  
 Composite Brake Shoe Company, Boston.—G. C. Ewing.  
 Car Equipment Company, Philadelphia.—E. H. Allen.  
 Columbia Incandescent Lamp Company, St. Louis.—J. H. Rhoetemel, president  
 Central Union Brass Company, St. Louis.—T. C. White.  
 Dreher Manufacturing Company, New York.—H. H. Foster.  
 J. M. Emerson & Son, New York. C. S. Lyle.  
 Electric Publishing Company, Chicago.—E. L. Powers.  
 Electric Railway Equipment Company, Cincinnati.—S. J. Wick.  
 Electric Power Company, New York. H. A. Foster.  
 Fairburn Engineering Company, Chicago.—J. M. Cobbs.  
 A. French Spring Company, Pittsburg.—P. T. French.  
 E. S. Greeley Co., New York.—F. A. Magee.  
 Hughes Fare Register Company, New York.—E. Pecker.  
 Hoppes Manufacturing Company, Springfield, O.—W. H. Fisher.  
 Heine Safety Boiler Company, St. Louis.—E. D. Meir.  
 Hooper & Townsend, Philadelphia.—F. R. Case.  
 International Register Company, Chicago.—A. H. Englund.  
 Johns-Pratt Company, Hartford, Conn.—E. D. Hatch, H. Liscomb.  
 Jackson & Sharp Company, Wilmington, Del.—G. E. Pratt, J. H. Jackson.  
 Morris Tasker & Co., Philadelphia.—C. F. Flanders, S. Bowmann.  
 Morton K. Moore, Atlanta.—H. C. Harnady.  
 New Process Rawhide Company Syracuse.—A. C. Vosburgh.

New York Leather Belting Company.—H. Fairbrother.  
 Okonite Company, New York.—W. L. Candee.  
 Pettingill-Andrews Company, Boston.—F. X. Cicott.  
 Pomeroy & Fisher, New York.—J. Pomeroy.  
 Safety Car Heating & Lighting Company.—W. St. John.  
 Quaker City Car Equipment Company, Philadelphia.—J. E. Loughthide.  
 Railway Register Manufacturing Company, New York.—Ed Beadle.  
 Robinson Radial Car Truck Company, Boston.—W. Robinson.  
 Standard Underground Cable Company, Pittsburg.—F. G. Degeubardt.  
 Sterling Supply Company, New York.—J. H. Carson.  
 Southern Electric Works, Atlanta.—Fred Miles.  
 Sargent & Lundy, Chicago.—B. J. Jones.  
 Stanwood Manufacturing Company, Chicago.—T. H. Stanwood.  
 Vacuum Oil Company, Boston.—E. A. Record.

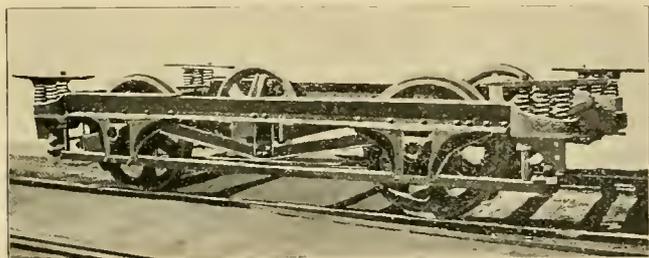

## A DESERVED HONOR.

At the meeting of the board of directors of the Meaker Manufacturing Company, October 23d, a deserved recognition was made of the services of John Meaker, Jr., in his unanimous election as secretary of the company. The REVIEW knows a great many young men who are rapidly coming to the front, but among them all there is none who more commands the respect and confidence of his friends and business associates than the gentleman named. The election is given as a recognition of able effort, and we congratulate the company and Mr. Meaker on a mutually desirable relation.

## THE LACONIA STANDARD TRUCK.

The big fire which last June carried away the street car department of the Laconia, N. H. Car Company, in no way discouraged that enterprising concern, and as soon as the ruins cooled sufficiently, work of reconstruction

LACONIA STANDARD TRUCK.

was begun. The rebuilt shops are larger and with even greater facilities than before, and in the steam car department have a capacity of 175 first-class passenger coaches and 2,000 freight cars per annum; while in the electric department the capacity is 700 car bodies and 1,000 standard trucks. The car wheel works have a capacity of 15,000 wheels per year. The Standard Truck has been adopted by the West End road of Boston, on which lines 150 have gone into service since last March. The

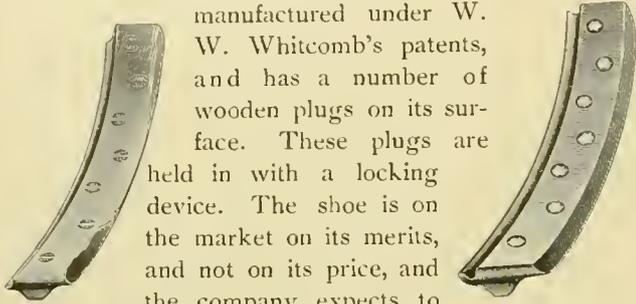

features of the truck are simplicity of construction, low cost of repairs; a quick, powerful brake; material and workmanship of the highest order; rivets are all hot Norway iron; affords smooth steady riding. The photographs of this truck attracted much attention at Atlanta convention. Over 200 have been sold within the last six months.

THE Consolidated Car Heating Company, Albany, N. Y., which manufactures the Pope light, which, it says, is interchangeable with the "Pintsch," has added considerably to its plant and is about to manufacture on a large scale, lamps for compressed oil gas, and fittings. The compressed gas plant of the latest pattern recently erected, shows most excellent results, 17,600 cubic feet of 50-candle-power gas having been obtained from 160 gallons of oil, that is, 110 feet per gallon, heretofore the usual make having been under 90 feet. The Consolidated Car Heating Company is preparing to notify railway men from all over the country to witness an exhibit of Pope lighting apparatus at Albany, carrying out a similar plan to the one it established in 1892, with reference to steam heating apparatus, when special trains were run hourly between Albany and Troy during two days, for the inspection and investigation by prominent railway officials from all parts of this country and Canada to observe the operation of the Sewall coupler and commingler storage systems.

THE Mather Electric Company, of Manchester, Conn., reports a large number of orders on hand for its new multipolar generators for railway work. One of its 180 kilowatt improved new type multipolar railway generators, with complete station equipment, was sold to the Hartford & West Hartford Horse Railway Company, for the Hartford, Conn., power house. The generator is to replace a 200 kilowatt generator of Philadelphia manufacture, which, after a two weeks' attempt on the part of its makers to make run successfully, was thrown out. In thirty-six hours, after placing the order, the Mather Electric Company had the road running successfully in that short time, having removed the old and installed the new generator, which has given such perfect satisfaction to the purchaser that the Hartford & West Hartford Horse Railway Company has just placed a second contract with the Mather Company for two more 180 kilowatt generators with station equipment. The Mather Company has also sold, through its well-known western contractor, J. Holt Gates, of Chicago, a 100 kilowatt direct connected generator to the South Chicago City Railway Company, Chicago, Ill., and a 75 kilowatt generator to the Bloomington City Railway Company, Bloomington, Ill.; also a 100 kilowatt generator to John Jermin, of Scranton, Penn., for electric tramway. The Mather Electric Company is now installing two 100 kilowatt generators, with complete station equipment, in the new power station of the Danbury and Bethel Horse Railway Company, of Danbury, Conn., which road the company expects to have running in a few weeks.

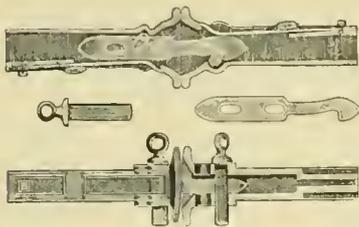

## COMPOSITE BRAKE SHOES.

The composite brake shoe, made by the Composite Brake Shoe Company, of 620 Atlantic avenue, Boston, Mass., is meeting with a well deserved favor among electric railways. It is manufactured under W. W. Whitcomb's patents, and has a number of wooden plugs on its surface. These plugs are held in with a locking device. The shoe is on the market on its merits, and not on its price, and the company expects to get business in places where merit and not low first cost is the prime object. To meet the demand remote from New England, arrangements have been made to have shoes made at Philadelphia and at Pittsburg. The exclusive license for the Pacific Coast has been granted to Edwin F. Tucker, of Tucker & Stein, at San Francisco, Cal., who will manufacture for that part of the country.

## VANDORN AUTOMATIC DRAW BAR.

The Fitzgerald-Van Dorn Company, Lincoln Neb., is supplying elevated, cable, electric and street railways with an automatic drawbar illustrated herewith. It is claimed by the manufacturers that the cars couple solidly together. The link answers a double purpose, one end being auto-

matic, while the other makes a common pin and link coupling, and will couple to any other class of draw bars. There is said to be no buckling sideways when backing up. In addition to the

device shown, the company makes one with a ball and socket joint attachment to take up lost motion, and an ingenious bar for going up mountain roads to do away with the rolling motion of the cars. The company has a contract for furnishing draw bars to the Metropolitan Elevated Railway Company, Chicago.

P. F. LEACH, of the Cushion Car Wheel Company, called on the REVIEW.

**WARDWELL BROTHERS,**  
**Electric · Railway · Builders,**  
 NEW HAVEN, CONN.

BOX 868.

Will make proposals for the Construction of all Classes of Street Railway Tracks, Power Houses, Etc.

## PERSONALS.

H. G. MANNING has resigned his position as superintendent of the Watertown, N. Y., Street Railway.

CHARLES D. HAINES, who was president of the Owasso & Corunna Street Railway Company, Owasso, Mich., has been renominated for congress.

E. H. MATHER, late of the General Electric Company, has been made superintendent of the New Haven, Conn., Street Railway Company. Mr. Mather formerly resided in Schenectady, N. Y.

C. C. CALDWELL, the electrical engineer, is making an exhibit of electrical and mechanical, railroad and marine photographs, at the Rushville, Ind., fair. He made, by invitation, a similar exhibit at the state fair.

JAMES S. ALVES, president of the Henderson, Ky., Street Railway Company, sustained a heavy loss recently by the burning of his residence. The fire broke out soon after midnight and but for a faithful servant the sleeping family would have been burned to death.

CHARLES CLEMINSHAW, president of the Troy, N. Y., City Railway Company, was recently thrown from a car, sustaining a partial dislocation and sprain of the left ankle. The company was experimenting with a patent guard, which caught on the roadbed, bringing the car to a sudden stop and throwing out Mr. Cleminshaw.

## Half Fare.

Via the Baltimore & Ohio Railroad.

On November 6th and December 4th, the Baltimore & Ohio Railroad will sell Home-seekers' Excursion Tickets from Chicago to Winchester, Harrisburg, Staunton and Lexington, Va., and intermediate points at rate of one first-class limited fare for the round trip. Tickets will be sold only on the above dates, and they will be good for return 30 days from date of sale.

Complete information relating to lands for sale can be secured by addressing M. V. Richards Land and Immigration Agent, Baltimore, Md.

For further particulars in relation to tickets, rates, sleeping-car accommodations, etc., apply to any B. & O. R. R. Agent, or L. S. Allen, A. G. P. A., Room No. 411, Grand Central Passenger Station, Chicago.

**C. E. LOSS & CO.,**  
**General Railway Contractors.**

Estimates made on all classes of Engineering Work.

621 Pullman Bldg. CHICAGO.

Editor.

F. S. KENFIELD,  
Business Manager.

### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW.

269 Dearborn Street, Chicago.

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4.                      NOVEMBER 15, 1894                      NO. 11.

It is stated that in a large western city there were two parallel lines of horse cars. A year ago each did about the same amount of business. Last spring one of the lines was converted to electricity, and now the ratio of travel is as 10 to 1 in favor of the electric line.

It is a pleasure to note the increasing tendency among city authorities to prohibit the use of the guard wire over trolley lines. Electric railway men have been opposed to them from the start, but city officers, actuated by ignorance and by the telephone companies, thought they knew better, and insisted on them. Time has proved that the electric railway men were right and that there are more accidents with guard wires than without them. Now that this is realized, some cities are going to the other extreme and prohibiting them, where the city electrician is a wide-awake and progressive man, who is willing to base his decisions on practical results and not on theoretical considerations or political pull.

THE chartering of special cars for an evening's ride and for theater parties and other similar purposes is a recent development in the electric railway field, which with a little encouragement on the part of superintendents, ought to become general over the country. The movement began in Philadelphia, where hundreds of special cars were chartered during the summer for "Trolley-ho" parties. The West End System, of Bos-

ton, has put on an elegantly fitted up car for theater parties, and so the work goes on. The idea is popular because it gives people a great deal better accommodations than they could get anywhere else, even for more money. The price can be very reasonable and still give a good return to the company.

A WORD of warning is in place just now to the builders of interurban roads. There is a great temptation to throw down 30 or 40-pound rails and a few ties under each length and let the track go at that. Many interurban roads will graduate from the same school of experience that city railways have been through as regards too light track. A piece of interurban track recently under our notice which has been in use less than six months and which consists of 40-pound rails on ties three feet apart has given down under a 20 minute service, so that the speed has had to be noticeably reduced. What its condition will be six months hence can only be surmised, but it is safe to guess that at least it will not be any better. And yet the laying of light track goes on, and the owners and builders seem to think that by some miraculous process the laws of the universe will be suspended in their particular case so that the building of a light track is not a waste of money.

AN average of four or five cases of cars taking fire from electrical causes are reported to us every month. To this should be added three or four cases more of employes and passengers getting shocks from parts of the car which ought never to be alive. While we have never heard of a serious accident from this cause, there must be something radically wrong with the general run of car wiring which admits of so many cases of this kind coming to public notice. Car wiring is often not as carefully done as 50-volt incandescent light wiring, although it must stand ten times the voltage. Setting fire to cars and treating passengers to free shocks is not conducive to inducing traffic among the timid members of the community, and the money spent in repairs of cars that have been set on fire might be better spent in better wiring in the first place. In this connection it is a good plan when overhauling or building cars to see that all metal work within passengers' reach is permanently and positively grounded by a connection with the truck frame.

ON the principle that wholesale prices are cheaper than retail, and that a large business can be conducted more economically than a small, it would be expected that a large street railway could be operated cheaper than a small one, but owing to the great differences in the prices of labor in small and large cities, and the other expenditures which operation in a large city entails and that in a small city does not, the reverse is proved to be the case. The publication of the operating expenses of several small roads, which have appeared in our last three issues, (and the end is not yet) show the lowest figures ever made public. Practically nothing has been published on

the expenses of small roads heretofore. Indeed it was impossible to obtain such figures, because very few of them kept itemized accounts, and still fewer figured results so that they could be compared. The fact that the small roads are now beginning to show up figures, proves that they are getting into better hands, and that an era of good management is dawning on them.

WE have been requested by Mendes Cohen, the engineer of the Baltimore car fender commission, to add a few thoughts to our necessarily limited abstract of his report on fenders which appeared in our October number. Although he appreciates fully the objections to fenders extending in front of the car, he thinks that the present danger of throwing the victim down and fracturing his skull on the pavement is sufficient to warrant their use, and, as stated in our abstract, he advocates the use of both wheel guard and projecting fender. On account of the liability of the scoop to fail in its work, he advocates the reduction of speed at crossings, "so as to better enable the timid or nervous person to effect the crossing in safety." Just what speed he recommends is not stated. We presume that this should be scientifically determined by the personal equation of whatever "timid or nervous" person happens to be on the crossing when a car is coming. About two miles an hour would be enough for some people and twenty-five an hour would be none too much for others. In order to know what is the proper speed for each individual, all motormen should be mind readers. On our part, we would recommend that cars be run fast enough to scare timid and nervous people so that they will not take any risks in crossing.

HERE is a little problem in arithmetic that is somewhat startling in its results at first sight, but which shows admirably the importance of speed, not only to good service, but to economical operation. An electric car running eighteen hours a day for 340 days of a year, with conductor's and motormen's wages at 20 cents an hour each, will require \$2,448 for trainmen's wages for the year. If horses do the same work, the speed will be about one half slower and two cars will be necessary, so that on the same basis \$4,896 will be taken for trainmen's wages. Very good electric cars, with complete equipment, can at present be bought for \$2,000 and under, and as the yearly saving in wages of trainmen by electric traction was seen to be \$2,448, the startling fact is deduced that the electric car saves more than its entire first cost every year by the reduction of trainmen's wages due to the increased speed. In other words, a road could completely wear out its electric cars every year and save money over horse traction on wages alone to say nothing of other items. It is not necessary to use this argument in support of electric traction, because as was said at convention, the introduction of electricity is an accomplished fact and street railway men no longer discuss its advantages or disadvantages as compared to other methods. The matter is mentioned here simply to show what

an important factor a large daily mileage per car is in economic operation. There is such a thing as overdoing the work required of a car, but the mistakes in management are usually in the other direction.

It seems to us that in the report of the executive committee the reference to those lines which had withdrawn from membership in the association during the past year was unnecessarily severe. The clause referred to reads: "The following companies have withdrawn; several of them having gone into the hands of receivers or leased to other companies, *and nearly all of them being very weak financially.*" The italics are our own and designate the words in question. It seems to us an ungenerous and uncalled for slur on ex-members whom the association was only too glad to add to its list and take their initiation fee of \$50, and while some or all of the member companies so withdrawing may have been passing through deep waters, there was no necessity for thus emphasizing their distress and holding them up to public gaze. A small road with its small income has to practice economies that the large and rich lines know nothing of, and we can easily see how such companies are going to think twice before sending in their application for a membership from which they cannot in some future stress of retrenchment withdraw without being classed as "being very weak financially." Section XVIII of the by-laws expressly provides for member companies withdrawing at any time they see fit, by giving written notice and paying up all dues. It reads as follows:

"Any member may retire from membership by giving written notice to that effect to the secretary and the payment of all annual dues to that date, but shall remain a member and liable to the payment of annual dues till such payments are made, except as hereinbefore provided."

Which goes to show the intent always was that members were always at liberty to sever their connection, and express provision was made therefor. As already stated, we consider the allusion uncalled for.

A VERY sensible suggestion was made the writer by a prominent exhibitor when at the recent convention. It was that the allotment of space be made in such a manner that the very large and heavy exhibits be placed with a view to easy and economical unloading from cars or trucks. Some of the heaviest displays at Atlanta were farthest from the unloading point, and in one case pointed out to us the expense to the exhibitor was fifty dollars for moving his display into place after it was landed in the building. The same expense was experienced in moving out. This could easily have been avoided by a little forethought on the part of somebody. Possibly it was the location selected by the exhibitor, but doubtless he would as willingly have taken a more convenient place had he known in advance the trouble and expense involved. Another suggestion which has previously been urged by the REVIEW, is that some well-known supply man who has attended several conventions be included

in the committee of local arrangement for exhibits, and that in announcing the plan of exhibit hall, the necessary information be given out which will enable exhibitors to select understandingly. It would also be an advantage to place exhibits of similar character in groups so that railway men can the better make comparisons of one with another. Heretofore the rule has always been to parcel out the space regardless of class, and first come was first served. But it was shown at Atlanta that it is possible to have all spaces practically of equal desirability, and all locations were good. We believe if the rail, fare register, overhead material and similar displays, of which there are always several of each, could be grouped together, the result would be not only more effective, but would insure an examination of all exhibits of any given class in which the delegate was specially interested and desirous of informing himself. We are not the only ones who would like to see the plan tried next year at Montreal.

LARGE street railway companies are being annually bled by a species of parasite inventor, and the sooner the nuisance is suppressed the better. It was for such a purpose that a committee was appointed at the convention on recommendation of M. K. Bowen, for the purpose of forming a protective association of some kind. The state of affairs can be best illustrated by citing a conversation which took place some time ago between the writer and the superintendent of a road which had its own extensive shops and which makes a great many of its own supplies. Some devices were in use which were made by the company and which were different, and in the opinion of the officers superior to anything that could be obtained in the open market, or had been used anywhere else, although their chief superiority was strength and simplicity. The writer was intending to give the REVIEW readers the benefit of a published description of these devices, but a request was made by the superintendent that nothing be published. As that gentleman is not in the habit of hiding his light under a bushel, and like all other truly progressive railway men is generally willing to give other managers the benefit of his experience, we were somewhat surprised, but on learning his reasons were fully convinced that they were legitimate ones. Several years ago the company in question made some simple appliances which could not be obtained in the market and which any mechanic of ordinary ability could design. Neither was there any great novelty in the use to which they were put. Nevertheless, within a week of the time that a description of them appeared in print, notifications began to swarm in from "dog-in-the-manger" inventors, saying that the articles were patented and demanding a royalty. The sum asked was usually not large, and rather than enter into an expensive patent litigation with each of the various claimants the royalty was in most cases paid. The aggregate of the royalties amounted to a good deal. Theoretically litigation was the proper course, but payment without lawsuit was no doubt the cheapest. Now

it is evident that not more than one or two of the many patents were anything more than worthless. The company we know is perfectly willing to pay a royalty on genuine inventions which involve something more than taking out a set of patent papers. Anyone acquainted with the patent office issues knows that there are a multitude of worthless patents, and unless some concerted action is taken these fake inventors will continue their blood sucking operations indefinitely. They toil not, neither do they spin, but they collect royalty just the same. We do not want to discourage those inventors who have spent thought, time, money and investigation on their inventions, but when a half a dozen different men can obtain patents on the same device and the said device has cost them practically nothing beyond the cost of taking out a patent, it can not be fair for each to collect a royalty. It is from such sharks that protection is needed.

PAVING next to the rails is given a great deal of attention by some companies. By others it is practically neglected. Neglect of this matter of detail is the most gross carelessness. As long as the paving is below the level of the tread or ball of the rail, well and good. The trouble is that the reverse is liable to be the case. Unless special care is taken, almost any form of block pavement will be laid so as to leave the rail below the level of the paving. We have seen it  $1\frac{1}{2}$  inches below. The result is bad in every way. The rail is down in a sort of ditch of its own, and whatever dirt falls on it stays there. This means that on an average American street, from twenty to fifty per cent more power will be required. Not only this, but the poor electrical contact between rails and wheels jerks the motors and makes the lights flicker. Indeed there is often more light under the car than in it, on a bad track. Not least of the troubles that come from too high paving are those undreamed of until winter sets in, and the superintendent wakes up some clear, cold morning, after a previous day's thaw, and finds the road frozen up as tight as a brick. If he does not find it so frozen up, it is because cars have been running frequently enough during the night to keep it clear. It is next to impossible to give a good service during the winter with such paving. Not only is too high paving bad from the company's standpoint, but it is bad from the public standpoint. A rail slightly above the street level is infinitely better and easier for vehicles than one below the general level. If the blocks are above the rail they are liable to work loose, and in any event the company's paving will only last a fraction of the time it otherwise would. A rail head level with the paving can be thoroughly cleaned with track brushes. If it is below, it never can be so cleaned, but must be swept off with hand brooms. As this is a course that is not likely to be resorted to, it goes without saying that the track is never clean. Add to these objections the one that teamsters are not as willing to turn out when in a rut an inch and a half deep as they would otherwise be, and altogether the low rail has a very bad case against it.

# IN THE POWER HOUSE

*This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances, are expected to give their views and experiences on subjects within the range of the department.*

THE neatness and discipline on a man of war ought to be copied in every power plant large or small. It is the "Oh well, what's the use of being so particular" engineer that has the most trouble. Slovenliness in details will cover up other defects which would be noticed if nothing was allowed to remain out of order. Safety from fire, and the successful operation of electrical machinery both demand that things be kept clean and in order. A man is not fit for a position as engineer in an electric railway power station unless he is naturally neat in his habits. It is not his fault if he is born otherwise and he may be a conscientious and hard worker, but he is simply not cut out for being the engineer of such a plant and that settles it.

\*\*\*

THE question as to whether the generator is less reliable than the engine is an important one when it comes to railway power station design. If it is true that the generator, as built at present, is as reliable and no more likely to be broken down than the engine, the sooner the practice of having more generators than engines in a power plant is abandoned the better. Small generators are less efficient than large ones, and more expensive in proportion to their output, as well. If a company puts in two 100-kilowatt generators to each engine, and a 200-kilowatt generator to each engine will do as well, it is making an expensive mistake. The whole question lies with the relative reliability of engine and generator, the idea being that if two generators are connected to each engine and one of them breaks down, the engine can still help the station with the other generator. Two generators are twice as liable to break down as one, so that the supposed advantage of reliability is somewhat deceiving. The tendency at present is undoubtedly toward placing as much confidence in the generator as in the engine. Generators are much more reliable than a few years ago. There are still a few plants that give more than one generator to each engine, but their number is growing steadily less.

A PROMINENT electric light man once said that polished surfaces around stations do not pay dividends. That is very true and when polished surfaces make additional work that would not be required if they were painted over, by all means paint them. However, as machinery must be kept clean and it certainly is just as easy to wipe over a polished surface as over a painted one, there is not much to choose between paint and polish.

\*\*\*

A SMALL road six months ago found itself face to face with the following conditions: A line four miles long with a good traffic; a temporary power plant with a 100 kilowatt generator; a high speed engine of corresponding size belted to it and two return flue boilers. The station has been pulling five and six motor cars ever since and has been inoperative only forty minutes during running hours. Of course there have been some hair breadth escapes from the misfortune of a shut down and nothing but a grim determination to keep cars moving at all costs has made the record possible. On one or two occasions it was found advisable to keep a stream of city water running through the engine bearings, but a miss is as good as a mile and the trolley has been kept alive. Dynamos and high speed engines are not such ridiculously unreliable mechanisms after all.

\*\*\*

THE writer recently had the pleasure of looking at the results of some tests, made by the engineer of a plant, to determine the accuracy of several makes of indicator springs at various pressures. The results were not such as to make one place implicit faith in indicator cards, unless previous tests proved the indicator to be all right. The results of the tests spoken of showed errors in tolerably well known makes of indicators of from one to ten pounds from the bottom to the top of the scale. The indicated horse-power, as figured from cards taken by such indicators, would be something wonderful, and it is not hard to imagine a case in which the indicated horse-power of an engine would be lower than the output of the dynamo it drives. The lesson that the tests taught was twofold. First, get a good indicator, and second, keep it clean. Results obtained from a first-class and reliable indicator when dirty showed a far worse error than any that were obtained from the most inaccurate indicators when clean.

THE following appeared in the correspondence column of the London Electrician:

SIR: As the question of employing high speed flywheels as accumulators of energy for electric traction has been raised in your columns by Mr. Archibald Sharp, perhaps I may be allowed to point out that in Vol. CXII. of the proceedings of the Institution of Civil Engineers for June, 1893, in the correspondence on Dr. E. Hopkinson's Paper on the South London Railway, I called attention to this very point, and suggested the advantage of employing for traction purposes engines of the steam turbine type, running, say, about 4,000 revolutions per minute, fitted with solid cylinder fly-wheels, say 3 feet diameter and 3 feet wide, and weighing about six tons.

A single fly-wheel of this description would store sufficient energy to maintain 66 H. P. for two minutes with a 5 per cent. variation in speed, and, of course, a proportionally greater horse power when the periods of variation between the maximum and minimum loads were less than two minutes, or, again, where a larger variation in speed than 5 per cent. was permissible.

A 3 foot wheel, running at 4,000 revolutions per minute, would have a peripheral speed of about 666 feet per second, but if of solid steel, would I believe, be quite safe, as I understand that considerably higher speeds are actually used with the similar fly-wheels employed for propelling the Howell torpedo. In any case, absolute safety could be attained by employing several wheels of smaller diameter arranged all upon the same axis.

No properly designed hydraulic power system is nowadays constructed without its accumulator, and, the conditions as to rapidly varying load with very short periods of maximum demand being analogous, it seems that plants for electric traction, as also perhaps those for electric welding, should be similarly equipped. For these, high speed fly-wheels on the engines or dynamos seem to be the most convenient arrangement for this purpose.—Yours, &c.,

A. A. C. SWINTON.

66, Victoria Street, S. W., August 11, 1894.

THE exhaust injector is a device which has been on the market for a long time but is not seen very frequently among street railway power stations. In view of the fact that it is used in all the power stations of the Chicago City Railway, including the new electric station now being finished, it may be of interest here to quote from a paper read before a Chicago engineers association some time ago by Leander Haines, assistant engineer of that company.

"When first brought before the public, some eight or ten years ago, the exhaust injector did not meet with the great amount of enthusiasm among engineers that one might have expected; and yet when the ordinary injector was first brought out, the engineering world was taken by storm, as it were, but this can, I think, be better accounted for, because engineers did not at that time understand its principles, and many do not at the present day believe that the exhaust injector can accomplish its work with steam at atmospheric pressure. The statement appears too good to be true. Many engineers reach the hasty conclusion that an injector must have pressure of steam to operate it, and that this pressure must be supplied from the exhaust pipe, which would then act as back pressure on the piston of the engine; hence, under such conditions, there could be no economy by its adoption. Perhaps the most important point to be noticed in connection with the exhaust injector is its perfectly automatic action. When the conditions for working are right, with plenty of steam and water to meet the requirements, the injector will work steadily; but supposing that the conditions vary, as, for instance, the engine is running at varying speeds; then, when the supply of exhaust steam is too little for the supply of water, the injector ceases to work, but so soon as the engine again supplies the requisite or usual amount of steam, the injector again re-starts itself without any manipulation whatever, and will continue to work until steam is shut off from the engine, or the supply greatly reduced. When steam is wholly shut off the injector will suck all of the steam from the pipe, and the result is as remarkable to witness as it is beautiful to contemplate. The power or ability of these injectors to do work when using exhaust steam, is a point on which many engineers stumble, for they cannot clearly see how steam with no apparent pressure can compel water to enter a boiler against a pressure of from 75 to 90 pounds of steam. The following explanation of the operation of the exhaust injector will assist in making this problem more clearly understood.

Steam at atmospheric pressure will rush into a vacuum with a velocity of 1,888 feet per second, while steam at 110 pounds pressure, flowing through an open pipe into the atmosphere will have the same velocity. From this we learn that steam at no pressure in the atmosphere will flow into a vacuum with about the same energy as steam of 110 pounds pressure escaping freely into the atmosphere. To understand this clearly, we must consider that in one case, the steam in its escape strikes nothing, while, in the case of the higher pressure steam, it comes in contact with air, which, acting as a cushion, retards its flow, so that its effective energy is reduced. This is the key to the mystery of the exhaust injector, and I trust it has been made sufficiently plain for your comprehension. The velocity of steam given above may be verified by consulting any standard author on the theories of heat and steam.

#### Heating Feed Water in Condensing Stations.

BY B. J. ARNOLD, CONSULTING ENGINEER, CHICAGO.

I noticed in your September issue a letter from G. H. Leonard, of the Newton and Boston Railway Company, in which he asks for suggestions regarding the best way of heating feed water for railway stations when using compound condensing engines. The plan which has been followed by myself and others with good results, is to deliver the feed water into a tubular heater through which the exhaust steam from the condenser cylinders and the boiler feed pumps passes on its way to the atmosphere. The feed water is here heated to about 135 degrees. From this heater it is lead into a fuel economizer composed of vertical cast iron pipes around which the heated gases from the furnaces pass on their way to the stack. In this economizer the feed water is raised to 300 degrees Fahr., before it enters the boilers, if they are set with ample stack capacity.

In many stations now operating, if a pyrometer is placed in the smoke stack in the rear of the boilers, it will be found that the escaping gases range from 450 to 700 degrees, and generally about 600. With gases at this temperature the economizer will be found to effect a very material saving in fuel.

#### Sawdust Fuel and Other Matters.

BY AN ENGINEER OF A SMALL STATION.

We have made a great saving in fuel this summer by using sawdust. In May last we put in a chain conveyor to take the sawdust from the car door and feed it into the furnace by spouts from overhead on each side of each boiler. This is no new thing but it is new to most plants except saw mills. We have run our line since June 1, at a cost of \$5.25 per day of 18 hours, for fuel, with 11 miles of track and 10 motor cars running all the time, and trailers when needed, so that it will be seen that our fuel bill has been light for five months past. We use a 240 horse-power Allis corliss condensing engine and return flue boilers 66 inches by 16 feet. The station has been running since August 1893, and uses artesian well water that is very hard. For scale we use kerosene oil, feeding it by the drop at the rate of one quart a day. We feel a little proud of our engine performance. Since we started the plant August 4, 1893 we have run

every day from 16 to 18 hours, making an average of over 550 hours per month, and with one engine and two generators the cars have never been stopped during running hours more than a few minutes, the only cause of delay being the opening of the circuit breaker by overload, short circuit on the line, or lightning, except once when the station was shut down at 8 p. m. until the next morning. During fair week here we ran 25 well loaded cars with the above outfit. There is a Heine water tube boiler in this city and after seeing the sediment taken out of it this fall after two years use I am free to confess that the tubular are the best. There is a great claim as to the water evaporation of water tube boilers which we fail to "see" as we believe there is more circulation without any more steam. I have known of some instances of this kind. For fire purposes we like a good duplex steam pump with hose at hand but the main thing is to have a perforated steam pipe under every part of the roof and over the generators. This will put out fire without wetting the plant. No under the floor wiring for me. Overhead is the safest from water or grease from scrubbing the floor, and safest from grounds. I would use simple condensing corliss engines in all railway work over 100 horse-power and under 600 horse-power. They are quicker to feel variations of load than compound, and cheaper to run than high speed. Any number of generators can be run from one engine with proper clutches but it is better to have reserve power than to depend on one engine although the engine is more reliable than any generator that I know of.

\* \* \*

#### Direct Connected Units.

BY "ONE OF THE OLD SCHOOL."

Everything at present seems to be going to direct connected generators, and while we will probably be laughed at, there are still a few of us that are a little doubtful about direct connection being the unqualified blessing it is cracked up to be by manufacturers and constructing engineers. By direct connection I mean the placing of the armature on the engine shaft. I am willing to admit that a belt drive is a nuisance, and that a rope drive is a nuisance, but it is still an open question in my mind whether there are not features about direct connection that are nearly as bad as belt or rope drive. I know a number of practical operating engineers who are opposed to it on the ground that they have never yet seen a direct connected unit that was running in what could be called a satisfactory manner. Now, this is certainly a serious charge, and rather takes the breath away from some people who have been lead to believe that direct connection is beyond all doubt the best thing, so that it behooves us to investigate a little. The first impression of a man entering a station where direct connected railway generators are at work, is that there is an Indiana frog pond somewhere in the vicinity, and that several hundred varieties of frogs are yelling at the top of their voices.

After a little investigation, however, he finds that it is the commutators and carbon brushes. After more investigation he finds that the brushes spark badly under changes of load, and that the commutator, unless it is a new one, is in a generally demoralized condition. If it is not in such a condition it is because it has been turned down about six times to what would have been once if it was a direct connected machine. Belts cost something to maintain, but how about the commutator, which is the most expensive part of a direct connected generator? The commutator on a belt driven generator will last at least five years in daily railway service, if well taken care of, and probably much longer. I doubt very much if the commutator of a direct connected generator would last three years in daily railway service under similar conditions.

Now, what is the cause of all this? It is simply the fact that it is impossible to adjust an engine on a railway load, so that there will be no play or pound in the bearings at any time. When the armature is on the engine shaft this slight movement acts to slightly change the relative position of commutator and brushes each revolution, and trouble with the commutator soon begins. I know some one will say that an engineer has no business to let his engine pound, but with a railway load it is an impossibility to avoid it a part of the time. Beside the commutator trouble there are continual shocks on an engine when direct connected. Variations come quick as a flash, and there is absolutely nothing to cushion them. With a direct connected unit, especially in the smaller sizes, the oil that is always flying around an engine gets on the generator, and we all know what that means.

I know of some engineers operating stations that are unqualifiedly in favor of direct connection for all sizes of units, and I stand ready to be convinced myself, and would like very much to hear more from the other side of the house, and especially from engineers who are actually operating direct connected railway generators at present.

#### THE HOFFMAN CASTING PROCESS AT ST. LOUIS.

Visitors to the convention will remember the exhibit made by A. Hoffman, of the Falk Manufacturing Company of Milwaukee, which consisted in showing in actual operation his process of casting rail ends together and as would naturally be expected the process attracted a great deal of attention, because if it proves to be what its inventor claims it to be, it will do away with electric welding of rail joints on account of being cheaper than the welding process. Three miles of track are being supplied with these cast joints on one of the National Railway Company's lines in St. Louis. As it will be done under the same conditions as the welded track laid there last spring, the coming winter will afford an excellent opportunity to compare the two methods as well as to determine the effect of cold on a continuous rail.

## CONSTRUCTION AND OPERATION OF SMALL STREET RAILWAYS.

A Paper read before the Michigan Street Railway Association by  
W. Worth Bean.

Construction, maintenance and operation of small street railways is the subject on which the president has requested me, as a committee of one, to prepare a paper to be read at this meeting.

First. In the construction of small street railways as much care must be taken and even more than in the building of large street railways. Proper and substantial road beds must be prepared in order to receive the ties and rails. White oak ties of the best quality should be used, varying from two feet to two feet eight inch centers. Ties 5 by 7 inches and 5 by 8 inches 7 feet long, should be used according to weight and height of rails, except joint ties, which should be 6 by 12 inches 7 feet long. Every tie should be thoroughly tamped. Steel rails of girder and T pattern and first-class splices and nuts and bolts should only be used, according to location and surroundings and rails put to perfect gauge and the track lined and surfaced in the best possible manner. The writer finds in sandy districts that 3 inch by 10 inch and 3 inch by 12 inch pine plank 12 to 16 feet long, properly nailed to cross ties, and plank 3 inches by 12 inches wide placed on the outside of the rails makes a thorough and complete construction, which braces the track in every way, and also makes an excellent road for wagons and buggies to cross over and drive on. If permitted by city councils the head of the rail should extend at least one-half inch above the plank and the grade of the street. The greatest error that has prevailed heretofore, with few exceptions, has been the cheap and imperfect manner with which small street railways have been constructed. The idea has been to see how cheap a small street railway could be built by having hemlock and cedar ties of small dimensions placed too far apart, and rails of too light a pattern, both put down in the cheapest possible manner, so that all that can be said is that a street railway has been constructed. Curves and switches should also be made of T and girder rails of the latest and best approved patterns, and constructed in the best possible way known to street railway building. Great care should be taken to see that every joint is thoroughly bonded with large, soft-drawn copper wire and channel pins of the best manufacture. From experiments already made and the actual construction of tracks in Boston and St. Louis, it seems that the era of a new day has dawned upon us by the use of the continuous rail and the eliminating of bond wires, the splice bars, nuts and bolts, and sinking of joints which is so disastrous to tracks and cars. With electrolysis eating and corroding the water and gas pipes in various cities as published in different journals, the breaking and disconnecting of bond wires at the joints and return current going in the ground, which costs money at the coal pile, it is hoped the year of jubilee has come in the construction of street railways. If

the streets through which small street railway tracks are laid, or are to be laid, are paved, or are to be paved in a short time, brick or asphaltum should be used with the continuous rail (provided the company has the necessary funds) which to the mind of the writer, would almost be a perfect track.

OVERHEAD CONSTRUCTION.—The overhead construction of an electric railway should be put up of the best and most substantial material that can be bought. Iron poles ought to be set in the business portion of the city, and cedar in other parts. Switches, frogs and overhead curves should be of the safest and best construction. Feeder wires of large size, with good insulation, should be put on the poles in a substantial manner, and lightning arresters connected at short distances along the line or where feeders are connected with the trolley.

SECOND—MAINTENANCE.—In keeping in repair street railway tracks, the first important thing to observe and do is to keep the tracks at perfect gauge at all times as well as in line and surface. The bond wires should be tested by taking instrument readings at frequent intervals, and defective ones should be replaced at once, for economy at the coal bin or oil tank. If the continuous rail is used, only gauging, lining and surfacing need be done. Road bed and tracks should be well drained and kept free of snow and ice, so that water can not settle around the ties, and lower the joints and rails by motor and trail cars passing over the same. Frequent inspection should be given the lightning arresters and overhead construction, and all kept in good repair.

THIRD—OPERATION.—Last, but not least. The operation of small street railways has a checkered career. In the first instance, to build and maintain a small street railway, as above described, or as some railways have been constructed, and operate them with economy, is what presidents, general managers, superintendents, directors and stockholders have been looking for. In operating a street railway in summer, there are two motives for keeping the rail free from dirt and sprinkling the track: First, that the motors may be kept clean and in perfect order. Second, that the passengers may not have a cloud of dust following them by day and night, and making their lives unbearable, as well as spoiling their clothes. This is all different from operating in winter, when sleet and snow fall on the tracks and trolley in all their force and fury, and all the vehicles in your particular community seem to be on the tracks in front of the cars to cover the rails, that have just been cleaned, with snow. It is then that a manager thinks his burdens are more than he can bear. To make a small street railway a dividend payer, and to have genuine and unadulterated business fun, add 100 arc lights and 2,000 incandescent lights to your street railway service, and put a telephone in the station and one in your house, and then you have a first-class electric circus. I am a firm believer in the electric car heater after two winters' service, and do not see how electric heaters can be dispensed with. Great care should be taken in the selection of motormen and conductors, and all reasonable rules rigidly enforced to prevent accidents from front end

of cars, and to look carefully after passengers at rear end of cars, and, most important of all, collect and register all fares. The oasis in the desert, if there be such, for the manager, is to provide for the entertainment of passengers along and at the ends of the lines, to keep up the revenue, and make the stockholders financially happy.

The past summer the writer has had comedy companies, distribution of groceries, bands of music, picnics, dances, etc., at the pavilion terminus of his line, and they have all largely increased the revenue of the company.

As each year rolls by, it is to be hoped our ways and means will not be exhausted to largely increase travel, in the operation of small street railways, which are so essential to small towns and suburban districts and the entire growing population. The writer commenced the construction and operation of a small street railway in Kentucky in 1879, and is much pleased with the great strides made in the street railway field in so short a time.

foliage and American beauty roses. The guests were 150 from Rock Island and 20 from Chicago.

Kind friends remembered Mr. and Mrs. Kenfield with many costly presents. The bride's father handed them a check for \$5,000. The groom's gift to the bride was a diamond ornament, which she wore at her throat. The bride's father, Edward D. Sweeney, is a prominent citizen of Rock Island, both financially and socially. He is a member of the firm of Sweeney & Walker, the oldest firm of attorneys in the city. Among his clients is the Chicago, Burlington & Quincy Railroad Company. Mr. and Mrs. Kenfield are traveling in the south. They will make Chicago their home on their return, which will be in December.

### TWO HANDSOME CARS.

Two handsome cars were sent to Atlanta by the Barney & Smith Car Company, Dayton, O., and run on the

TWO BARNEY & SMITH CARS.

### KENFIELD—SWEENEY.

On October 24, Fred Standish Kenfield, of the REVIEW, relinquished the joy of single blessedness for the comforts and greater blessings of married life. The young lady of his choice was Miss Amy Sweeney, one of the belles of Rock Island, Ill. It was a very pretty wedding, having been solemnized in the home of the bride. The parlors were decorated in white and gold. In the south parlor was a temporary altar, where the bridal party met, and the nuptial knot was tied by Rev. F. W. Merrill. The maid of honor was Miss Marion Lobdell, of Chicago, while Hiram J. Kenfield was the best man. The Misses Bessie and Gracie Noftsker, cousins of the bride, preceded the bridal party, and formed an aisle with white satin ribbon. The dining room in which the wedding supper was served was decorated with autumn

Atlanta Consolidated lines during the convention. Car 575 was built for the Cincinnati Street Railway Company and the view shown is the rear end of the car. Car 230 is one of the cars recently completed for the City Railway Company, of Dayton, showing the front end with round vestibule. Both of the cars are mounted on Barney & Smith standard double spring trucks. The cars are finished in cherry with plate glass windows and upholstered with spring cushion. The cars caused much favorable comment on account of the easy riding.

### MILEY—LAVELLE.

Charles E. Miley, superintendent of the Springfield Railway Company, was married recently to Miss Agnes Lavelle, at St. Raphaels' Church, in Springfield, Ohio.

A COMPARISON OF RHEOSTAT AND SERIES-PARALLEL CONTROL.

We show herewith some curves giving the results of tests made by the engineering department of the General Electric Company on the comparative current required with rheostat and with series-parallel control. Figure 1 is the typical starting curve obtained from the two methods. The rheostat is of course the one showing the heaviest current at first. We are informed by the engineering department of the above company "that the conditions were exactly the same in both tests, the same motorman operated the car, and the start, so far as could be observed, was identical in each case. The speed at

wasted with rheostat control. This occurs only to a limited extent with series-parallel controllers. When 22.5 miles an hour is reached, in the curve Figure 2, the motors are in parallel with all resistance cut out, and require, of course, the same power. A saving of 40 per cent is shown in favor of the series-parallel control on the lower speeds, which amounts to a good deal in most cities, as different running speeds are usually absolutely necessary.

The power required in starting with series-parallel control is very nearly that required for running at full speed, the only jump that the current takes being when the motors are thrown from series to parallel.

The points on the type "K" controller are as follows:  
 1. Motors in series and all resistance in circuit.

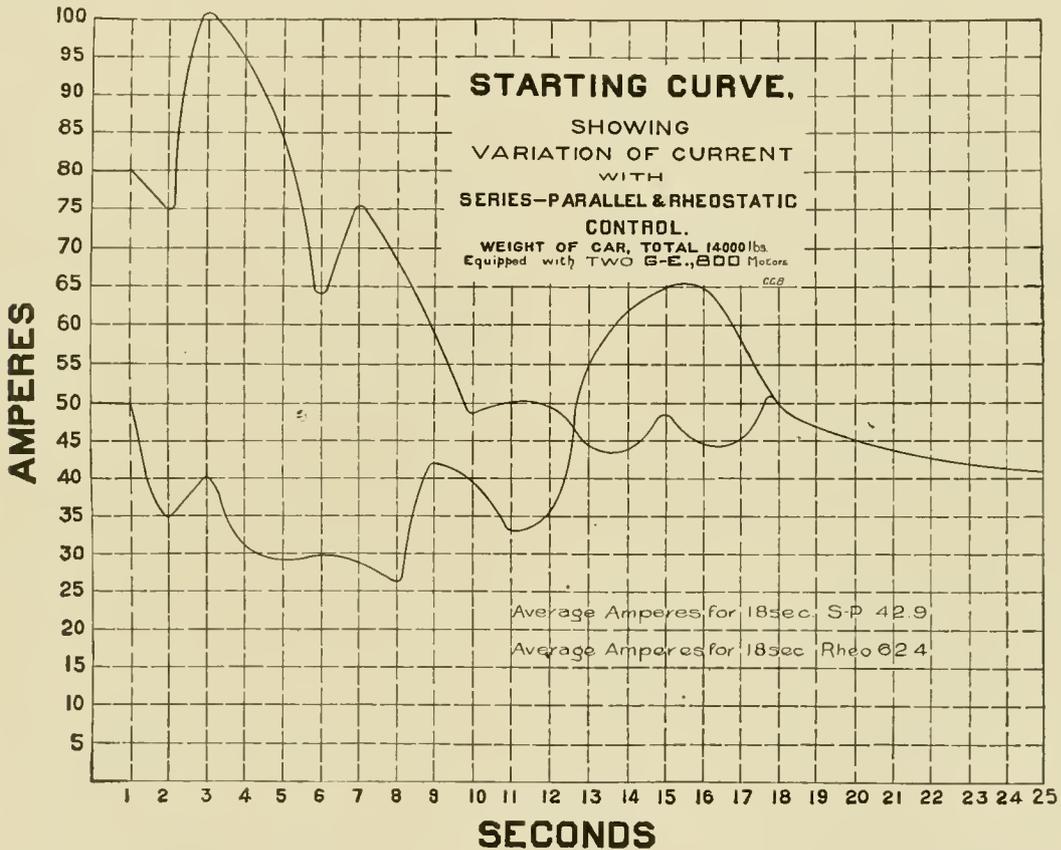

FIG. 1.—RHEOSTAT AND SERIES-PARALLEL CONTROL.

the end of 25 seconds was approximately 22 miles an hour. The same car was used for both tests, being wired for both the "K" controller and rheostat. The car itself was 16 feet, closed; weight, with load, about 14,000 pounds. In the starting curve, Figure 1, the time occupied in starting was 18 seconds. This, while good practice, is, perhaps, a longer time than usually taken, and on starts made in 10 seconds, the curves were, of course, considerably higher for both rheostat and series-parallel, but each had the same characteristics and the comparative energy for each was the same as in the 18 seconds' start."

Figure 2 shows the comparative power taken at different running speeds by rheostat and type "K" controllers. For the slower speeds much power has to be

2. Motors in series and half resistance in.
  3. Motors in series; resistance all out.
  4. Motors in series and a shunt around the fields.
  5. Same as 2.
  6. One motor cut out; the other in series with half the resistance.
  7. Same as 6.
  8. Motors in parallel; half the resistance in.
  9. Motors in parallel; no resistance.
  10. Motors in parallel; shunt around fields.
- Points 5, 6 and 7 are simply transition points.

The use of the field shunt (which takes the place of the field loop formerly used by this company) makes it possible to have four running positions with which there is no resistance in circuit where otherwise there

would be only two. This is an aid to the economy and smoothness of starting, as well as an efficient

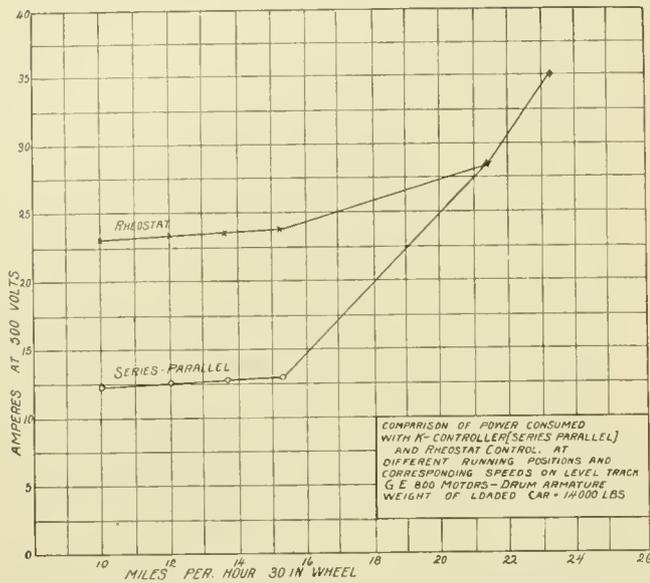

FIG. 2.—RHEOSTAT AND SERIES-PARALLEL CONTROL.

arrangement for use on crowded streets where several speeds are desired.

### MECHANICAL POWER NEEDED IN CALCUTTA.

There seems to be a pressing need for electric or cable lines in Calcutta, judging from the following taken from the last number of *Indian Engineering*, published in that city. It says: "The regularly recurring hot season brings in its train a list of casualties among the Tramway Company's horses in Calcutta, as well as other places where this system of locomotion is in vogue, which is heart-rending. But apart from this, which is practically rather a shareholder's point of view, there is much to be advanced from the point of view of the public against relying upon beasts of burden for the regularity and certainty of their reaching their places of business, considering the value and increasing importance of every moment of time. In such centers as Calcutta, Bombay, Madras, etc., nothing short of mechanical power should be insisted upon for the working of tramways since such power is unaffected by weather, and journeys may be timed with fair accuracy, which it is impossible to do when animal power is relied upon. The daily traveler by tram in Calcutta knows only too well by the stoppages which result from the use of too fresh or too stale horses just when pressed for time, or by the snail pace rendered necessary in the hot weather, what the inconveniences of the present system are, and he is fully entitled to have a grumble when he reads of electric and cable tramways adopted in places where nearly everything is in favor of animal power. There seems to be no potent reason why the tramways in Calcutta should not be converted into cable, if not into electric, tramways to the much greater convenience of the public using them."

### PENALTY FOR OBSTRUCTING STREET RAILWAY TRACKS IN OHIO.

The penalty in Ohio for willfully obstructing street railway tracks is severe, and under the revised statutes reads as follows:

"That it shall be unlawful for any person or persons, without proper authority, to place any obstruction upon any railroad, or any street railway, or any cable railway in this state, or displace, injure or destroy anything appertaining thereto, or interfere with, remove, displace or disarrange any rail, cross tie, switch, side-track, locomotive, car or train of cars, or other property appertaining to any such railroad, street railway or cable railway, or interfere with, remove, displace or disarrange any flag, lamp or other signal attached to or employed upon any railroad, street railway, or cable railway, or upon any railroad car or train of cars, or upon any street railway or cable railway car, locomotive, switch or other property appertaining to any such railroad, street railway or cable railway, or remove from, disarrange or destroy any lock, fastening, coupling or attachment on any track, car, switch, stand, tool house, depot or property of any such railroad, street railway or cable railway. Any person violating any of the provisions of this section shall, upon conviction thereof, be fined not more than five hundred nor less than twenty-five dollars, and imprisoned in the penitentiary not more than ten years or in the county jail not less than thirty days."

### SHE HAD GROWN.

Two women got in a street car, says the *New York Sun*, one with a long legged little girl. She gave the conductor two fares.

"Five cents more. You'll have to pay for that child, ma'am."

"Pay for Laury? Well! well!"

She opened a leather purse to look for pennies. With difficulty they were fished out separately. Meanwhile she discoursed:

"D'ye see, Laury? I'm payin' for you. Ye can't sit on mammy's lap any more. She's always climbin' for my knee."

Addressing the car: "She's our only one. Laury, ye must tell your paw, you're a little lady now; ye've been paid for. Ye can't sit on mammy's knee no more. Dear me, how time flies." She took in the car with a comprehensive glance, then turned on her friend by her side. "It don't seem no time at all since Laury was born. Rebecca, you remember, or was you away from home? It was that warm. But Laury's a little lady now. She's been paid for."

The long legged girl leaned shyly against her mother, who put her arm around the child and pressed her to her side. The amused smile of the car changed to one of sympathy, and a lonely old fellow in the corner with speckled silk stockings had a tear in his eye.

ELLIS COMPANY'S SELLING AGENTS.

The Ellis Manufacturing Company, Philadelphia, manufacturers of the Hansell equalizing motor truck, for electric or cable railways, have a corps of bright selling agents, who, singularly, have all had a long experience in the iron and steel business. L. S. Boomer, the Chicago representative, has his office at 647 Rookery. He began his business career in 1872, in the bridge business, continuing for ten years, being a portion of the time a partner with his father in a large Canadian contract, and latterly, with the American Bridge Works, of which he was secretary. His next field was with the Gautier steel department of the Cambria Iron Company, and Park Brother & Co., Pittsburg. In 1891 Mr. Boomer returned to Chicago, having secured the agency for several leading Eastern steel manufacturers, and has since devoted his time to working up business for these interests.

L. S. BOOMER.

Harrington, Robinson & Co., 10 Oliver street, Boston, are the New England agents. The firm consists of George W. Harrington and John C. Robinson, who succeeded to the business of Arthur G. Tompkins, in whose employ they had been, and Joseph A. Brainerd. Mr. Robinson, who has charge of the railroad department, will come in direct contact with the customers of the Ellis Manufacturing Company. Those who know him need no introduction, but there may be a few to whom his likeness may be unfamiliar. The firm also represents William Wharton, Jr., & Co., (incorp.) Philadelphia; Wharton Switch Company, Jenkintown; Glasgow Iron Company, Pottstown, Pa.; A. & P. Roberts, Morris,

respected Virginia families, his father being the late Dr. Minnegerode, one of Richmond's most honored Presbyterian ministers.

J. T. Dudley, 136 Liberty street, New York, is also an iron and steel man who represents the Ellis Manufacturing Company in New York and the upper part of New Jersey. He is a young man who has made for himself a position among the best salesmen in his line, and a host of valuable acquaintances.

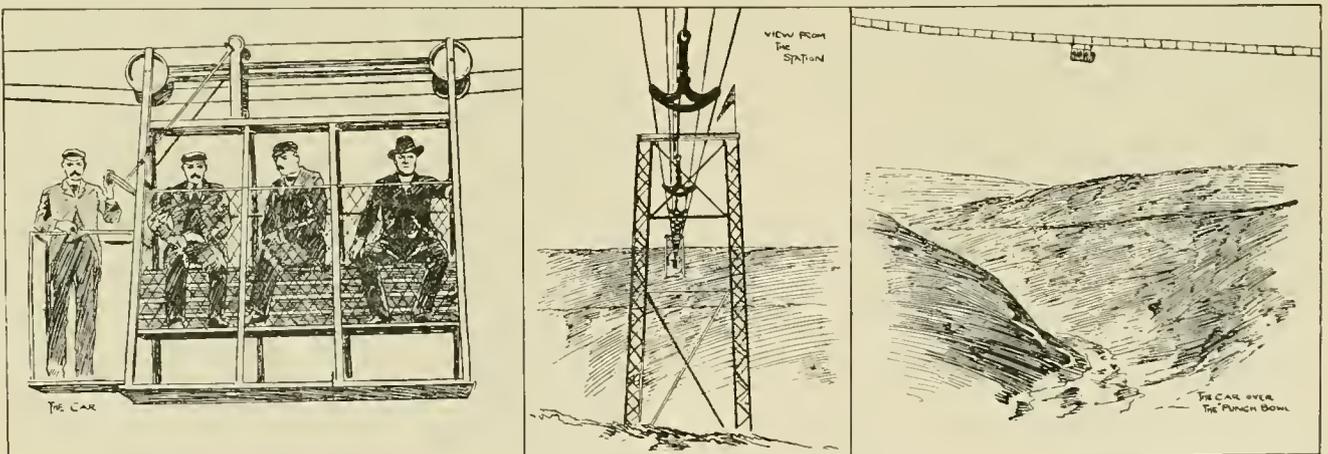

J. C. ROBINSON.

AERIAL CABLE IN ENGLAND.

There has recently commenced operation, at Brighton, England, an aerial cable way, built by the Telpher Cable & Cliff Railway Syndicate, upon plans made by W. J. Brewer, C. E., the inventor. The line spans the Devil's Dyke, and is 230 feet above the valley. A sort of suspension bridge is used to support the cable. The supporting pillars are 650 feet apart, and the bridge is further supported by anchors, 1,200 feet apart, buried in cement on each slope. The journey from hill to hill requires 2 1/4 minutes. It is said that when the cable is slack, there is a swaying motion similar to that of a vessel at sea. The cable is endless, and the motive power is an oil engine.

The company intends to build several branches over other valleys in the vicinity. The value of this system is said to consist in the cheapness of construction as compared with the cost of bridges spanning distances across rivers or between mountains, where difficult engineering problems exist, that would be expensive to overcome.

AERIAL TRANSPORTATION, BRIGHTON, ENGLAND.

Tasker & Co. and Hoopes & Townsend, Philadelphia. William Minnegerode, 216 South Fourth street, Philadelphia, is one of the best known gentlemen in the iron and steel trade in the Southern states, having been in business and located at different times in Richmond and Lynchburg, Va.; Atlanta, New Orleans and Birmingham, Ala. He comes from one of the oldest and highly

This new system of transportation is attracting a great deal of attention in England, resulting in many interesting speculations regarding its future development. Some sanguine people even venture the opinion that it is the solution of the problem concerning the bridging of the British Channel, which has been fruitful of so much discussion, and productive of many foolish plans.

## STREET RAILWAY MAIL SERVICE.

The recent inauguration and successful operation of a mail service on the lines of the Atlantic Avenue Railroad Company in Brooklyn and its suburbs, is another demonstration of the utility of street cars in carrying local mails. As at St. Louis, the service has been proved a

BROOKLYN MAIL CAR.

great convenience to the public, an economy to the government and a source of profit to the railway company. Managers who contemplate establishing a mail service will be interested in reading an account of its inception, for which the REVIEW is indebted to President Benjamin Norton, of the company, and Postmaster A. T. Sullivan, of Brooklyn.

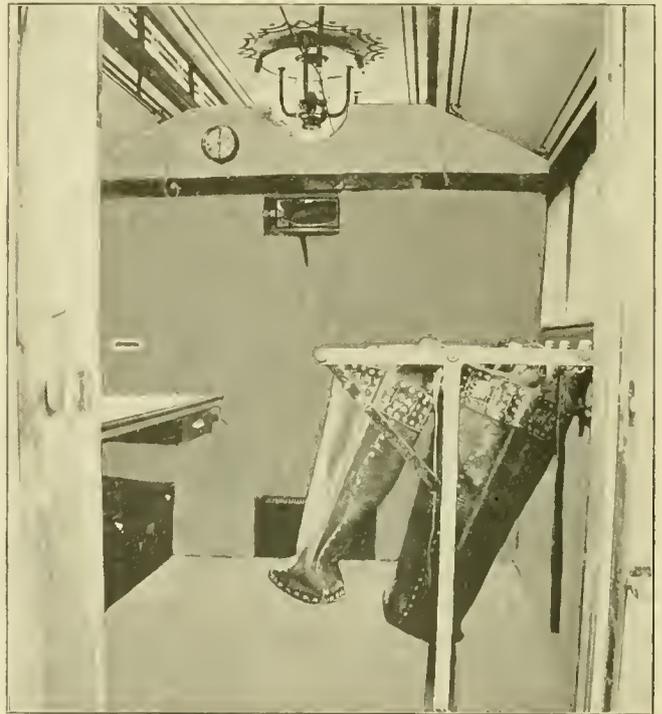

The idea originated with Mr. Sullivan over a year ago. He obtained the sanction of the postoffice department at Washington and conferred with representatives of the Atlantic Avenue Railroad Company. The company's officials met him more than half way and have cordially co-operated with him from the beginning. Designs were furnished for two special cars by Postmaster Sullivan and the railway mail department, and the company built the cars. A motorman and conductor are furnished by the company and the clerk who handles the mail is a regular employe of the postoffice department.

The car is twenty-eight feet long and is divided into two equal sections by a partition across the middle. Its exterior and the interior of the mail section are shown in the engravings. The forward half is fitted up for the railway mail service, with iron racks for the pouches, a distributing table extending all along one side for the sorting and stamping of mail matter, and with a set of pigeon holes for distributing. The windows are protected by wire netting, so that they may be opened in warm weather without the possibility of any mail matter being blown out and lost. All exposed woodwork is of polished maple and the roof is finished in white enamel with gilt ornaments. The car is warmed by electric heaters. The outside of the car is finished in white enamel with red stripes. The lettering on the side is in gold. Both cars are alike inside and outside and the cost of each was \$1,900.

Three trips are made daily, delivering to and receiving mail from nine postoffices between the main office in Brooklyn and Coney Island, besides given partial service to two other stations. Owing to an injunction restraining the company from running through cars to Coney Island, it has been necessary to transfer the mail at one point from car No. 101 to No. 102, but now that the line has become a mail route, the company may obtain a counter injunction to prevent the obstruction of the United States mails. The car runs on a schedule. At a certain hour in the morning it arrives at the general postoffice to receive the sacks and pouches. Stops are made at twelve points at certain hours to deliver the sacks of outgoing mails to carriers who are in waiting, and to receive from them the incoming mail. All of the mail received on the car is stamped by the clerk and distributed to the respective pigeon holes and sacks, thus effecting a saving of time, which is one of the principal objects of the postoffice department.

The trial trip was attended by representatives of the postoffice department and of the Atlantic Avenue Railroad Company. Schedule time was made and the mail was handled without a hitch.

The street railways of Pittsburg, Pa., are co-operating with the postoffice department to give that city a better mail service. As yet the improvement in the service extends only to the use of regular cars as carriers of

INTERIOR MAIL CAR.

mails from one station to another. In time special cars may be employed, as at Brooklyn, on which to distribute mail matter en route.

The first of Pittsburg's numerous traction companies to receive the honor of carrying Uncle Sam's mail is the Pittsburg Traction. G. W. Elkins, president of the com-

pany, has accepted a proposition of the government to transfer the mail from the central postoffice to Station A in East Liberty, a distance of five and one-half miles. The contract becomes effective November 15. The mail pouches are carried on the platforms beside the gripmen and motormen, in whose custody they are. Every employe of the company will be sworn into the government service, and each car carrying mail bears the inscription "U. S. Mail."

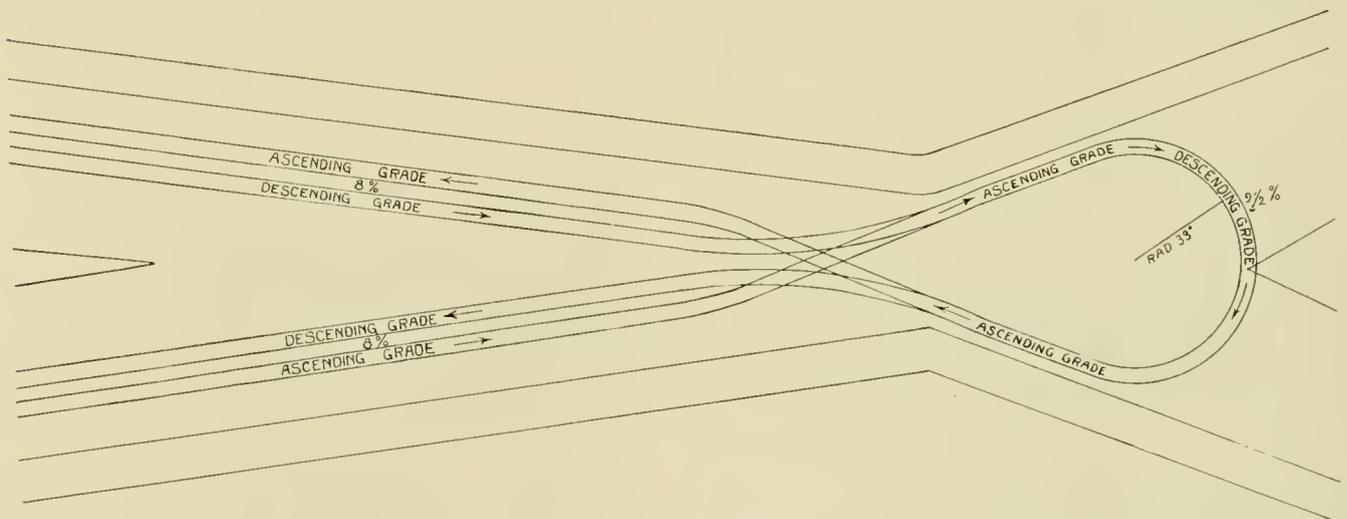

The next to carry mail will be the Citizens' Traction Company and the Birmingham Traction Company. Contracts with these two companies have been submitted to the department at Washington for approval, and they will begin carrying mail not later than January 1, 1895, between the general office and Stations B and C.

Negotiations are now being carried on with the Allegheny Traction Company for the transfer of mail from the Pittsburg to the Allegheny office. This com-

declaring that each company has acted nobly in the endeavor to give the city of Pittsburg an improved mail service.

A PECULIAR CURVE AT CINCINNATI.

The accompanying plan of a piece of special work recently put in at the intersection of Glenway and Wilder avenues at Cincinnati shows a peculiar method of avoiding a switchback or a heavy curve on a grade. Both the up and down cars make the loop in the same way and the curve is entirely on the down grade. If this curve had not been put in as it is, it would have been necessary to have either a switchback and change ends at this point or else have a curve on a very steep grade. The special work was made by the Johnson Company, Johnstown, Pa. This construction has attracted a great deal of attention from experts on account of its novelty.

PECULIAR CURVE, CINCINNATI.

pany may also undertake to carry the mail between the Allegheny general office and sub stations of that office.

President John G. Holmes, of the Citizens' Traction Company, has offered to carry letter boxes on cars of his line. His proposal will probably be adopted, as Postmaster O'Donnell is in favor of it.

The prime mover in promoting street car mail service in Pittsburg has been John C. O'Donnell. A consultation between Mr. O'Donnell and J. M. Masten, assistant superintendent of the railway mail service, representing the government, and prominent street railway men of Pittsburg, resulted in the best of feeling upon the subject. Col. G. W. Elkins and C. L. Magee, especially, became warm advocates of the plans broached by the postal authorities, and enlisted others in the cause. As a result of the good feeling between the postal authorities and the traction people, the Duquesne, the Fifth Avenue, the Citizens' and the Birmingham Traction Companies have agreed to carry special delivery messengers free while on duty. Postmaster O'Donnell considers himself greatly indebted to the traction managers for their hearty co-operation and energetic assistance,

TOLEDO, OHIO, ENDORSES T RAIL.

The prediction in the REVIEW that the use of brick filler would now lead to a very general adoption of T rail in places where it has heretofore been denied has already been fulfilled at Toledo, Ohio. The city council have authorized the laying of the 70-pound, seven inch shanghai T rail made by the Illinois Steel Company in connection with the special brick filler manufactured by H. C. Bruner, Pontiac, Ills. The track so laid cannot fail to not only furnish a strong and durable construction, but will please the public and save a great deal of tearing up of streets to get at joints.

FIFTY-THREE passengers on the Suburban Traction Company's, Newark, N. J., Orange line, had a narrow escape from death recently. The car was on the Eagle Rock Division, and while ascending a steep grade at Valley Way the wheels began to slide. On striking the curve a wheel flange broke, and the car upset. Several were bruised and trampled by the excited crowd, but no one was fatally hurt.

## OPERATING EXPENSES OF THE PORTSMOUTH, O., STREET RAILROAD.

BY S. P. BAIRD, SUPERINTENDENT.

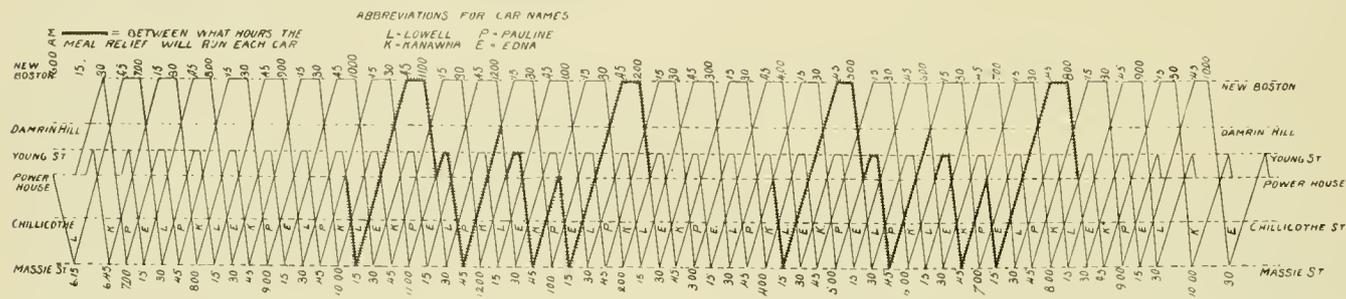

I saw an editorial in the September number of the STREET RAILWAY REVIEW on the phenomenally low cost of operating some small electric railroad (not named). I think that the Portsmouth Street Railroad & Light Company operates its road and light plant as well and as economically as any other company operates any plant of equal size.

We have five miles of single track road (with three diamond turn-outs), all of which is of 45-pound steel rail (two miles of girder and three miles of T). We have four curves of 55-foot radius, one of 45-foot radius, and one curve into the power house and car barn of 35-foot radius. Curves are of 76-pound guard rail. Our gauge is standard. Our power house is on the line, very near the center, and in full view of the crossing of our tracks with three steam railroads, also in full view of the center

side the city limits to New Boston, but between May 1 and October 21, 1894, we ran every car through, giving 15-minute service to New Boston, the fair grounds and summer gardens. During seven months our cars run 160 miles on short days and 180 miles on long days. It takes just one hour to make a round trip in summer. During five months of cold weather our cars will average 132 miles each per day. The average mileage of each car during the summer is 170. Thus, 170 miles multiplied by 4, the number of motor cars, equals 680 motor car miles per day; adding the trail car mileage, 680, gives a total of 1,360 car miles per day. The total mileage per day during five winter months is  $132 \times 4 = 528$  miles.

By our time table it will be seen that we have only five crews at work each day. Our men are required to rest one day in six. This we accomplish by having what we call the "day relief crew" which runs the different cars in succession.

Our operating expenses are as follows during cold weather:

switch. We have in our plant one 80-kilowatt Westing-house generator, direct belted to a 14x14 Ball & Wood engine, running 290 revolutions per minute; three 50-light Thomson-Houston arc machines, driven by means of a countershaft by a 14x14 Buckeye engine; one 100-kilowatt alternator for incandescent lighting, driven by a 14x14 Ball & Wood engine running 310 revolutions, and two 66-inch by 18-foot return tubular boilers; nominal rating, 125 horse power; set with shaking grates.

Our overhead work is of No. 0 hard drawn wire, without any feeders. Our track is double bonded with No. 0 iron with channel pins and is grounded by means of an 8-foot iron rod every third joint. It is cross bonded at each ground rod. Three miles are of span wire construction and two miles of bracket construction. We run our cars fifteen minutes apart from 6 o'clock a. m. to 9:30 p. m., and thirty minutes apart till 10:30 o'clock p. m. During the winter cars run without trailers. During the summer we run one large 8-seat open trailer with each motor. From 6 o'clock a. m. till 10 o'clock p. m. we run a car every fifteen minutes, and from 10 till 12 o'clock p. m. we run one car every thirty minutes.

I show herewith our new winter time table, which is now in force, a copy being posted in each car. It will be observed that we have only a 30-minute service out-

|                           |       |           |        |
|---------------------------|-------|-----------|--------|
| 5 motormen,               | - - - | at \$1 50 | \$7 50 |
| 5 conductors,             | - - - | " 1 00    | 5 00   |
| 1 engineer,               | - - - | " 1 66    | 1 66   |
| 1 engineer,               | - - - | " 1 33    | 1 33   |
| 1 fireman                 | - - - | " 1 00    | 1 00   |
| 1 trackman                | - - - | " 1 00    | 1 00   |
| 2 1/2 tons coal,          | - - - | " 0 90    | 2 25   |
| Oil and waste             | - - - | - - -     | 0 33   |
| Repairs, 528 car miles,   | - - - | at .0025  | 1 32   |
| Water, at \$200 per annum | - - - | - - -     | 0 55   |

|                          |       |         |
|--------------------------|-------|---------|
| Total operating expense, | - - - | \$21 94 |
| Cost, per car mile       | - - - | .0415   |

Our fixed charges are as follows:

|  |       |         |
|--|-------|---------|
| Insurance, at 2 per cent on \$30,000,            | - - - | \$ 1 66 |
| Interest on bonds, \$70,000,                     | - - - | 11 66   |
| Depreciation, at 5 per cent on \$90,000,         | - - - | 12 50   |
| Office expenses, tickets, superintendence, etc., | - - - | 16 00   |

|                         |       |         |
|-------------------------|-------|---------|
| Total fixed charges,    | - - - | \$41 82 |
| Grand total             | - - - | 63 76   |
| Total cost per car mile | - - - | .1207   |

Our expenses during the summer are the same, with the exception of an additional ton of coal and five additional conductors, making the cost of operating: \$27.84

$\div 680 = \$0.0404$  per car mile, if we wish to charge all the expense to the motor cars, or  $\$27.84 \div 1,360 = \$0.02045$  per car mile, if we wish to charge the trail cars with one half the expenses.

We have four motor cars with 16-foot bodies and two 30-horse-power motors on each car, with series-parallel controllers; also seven Brill open trailers. During the county fair this year on the big day we hauled 10,000 people, one motor car with two trailers taking out 350 persons, 130 on one trailer, 127 on the other and 93 on the motor car. Our one 80-kilowatt generator handled this heavy traffic without having the circuit breaker out once, besides handling about 50 horse-power in stationary motors. We accomplished this by carefully explaining the whole system to each motorman and urging the necessity of being saving of power.

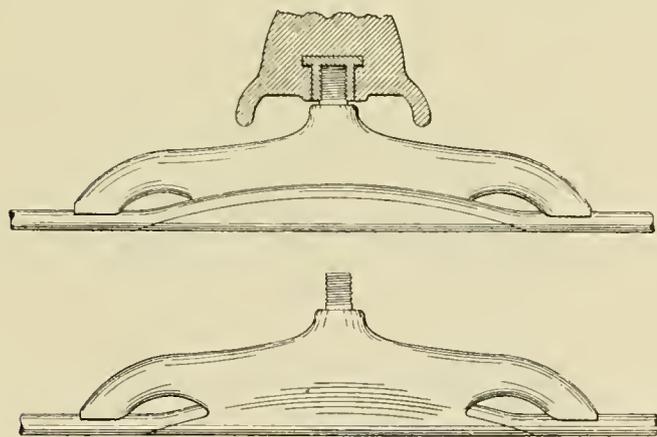

Besides our street railroad plant we operate 150 arc lights, the city fire alarm system (50 miles of wire with 40 boxes) and the incandescent light plant, which in all require two men not already enumerated, one horse and trimmer's cart, besides four tons of coal additional each day, with carbons, etc.

We make a systematic inspection of engines each week by means of an indicator; and also keep close tab on coal, oil, repairs, etc.

I think this is an exceptionally fine showing, and feel proud of it.

#### WALKER TROLLEY HANGER.

A trolley wire clamp similar in principle to some others recently brought out is the subject of a patent recently issued to I. B. Walker, superintendent of the Sioux City

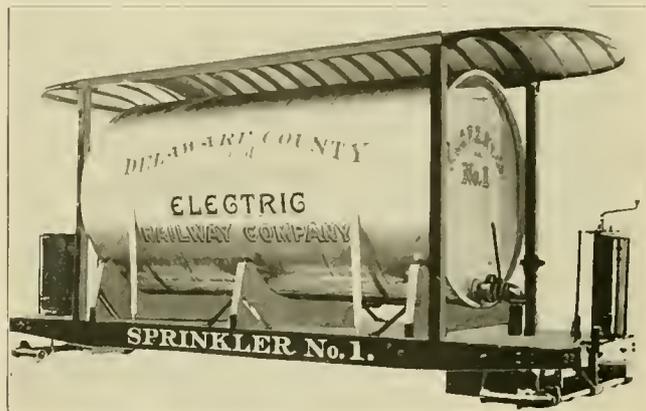

Traction Company. The clamp gives the wire a slight bend as it passes through, and presents a level surface to the trolley wheel. Unlike some employing a similar principle, the clip consists of a single piece.

THE Stirling Company, Chicago, has placed the largest boiler order on record. A contract has been closed for 8,000-horse-power water tube boilers for the West Chicago Street Railroad Company, which will cost nearly \$100,000.

#### JACKSON & SHARP NEW SPRINKLER.

The Jackson & Sharp Company, Wilmington, Del., has a new style of sprinkling motor car, one of which has been built for the Delaware County & Philadelphia Electric Railway Company. The car has a new controlling

JACKSON & SHARP SPRINKLER.

device for sprinkling. Perforated pipes, all connected with the same main, are underneath the platform, and are controlled in such a way that the water may be confined between the rails, sprinkled on each side, or in both combinations, at will. The motorman has control of the levers that operate the valves.

#### FLINGS AT NEW YORK.

SINCE the adoption of electrical cars in Brooklyn it has been the pleasant jest of the people of that city that, when they felt like taking a trip into the country, they could go over to New York and ride in the horse cars. The holding up of the New York car the other night by highwaymen has probably induced the Brooklyn people to favor some less perilous form of rustic diversion.—Buffalo Courier.

APROPOS of the holding up of street cars, a correspondent suggests that people have no business to ride in the street cars in this town after early candle light, and also that those wealthy persons who go about with watch chains exposed are throwing temptation in the way of our "ruling classes," and should refrain from doing so. There may be something in this.—New York Advertiser.

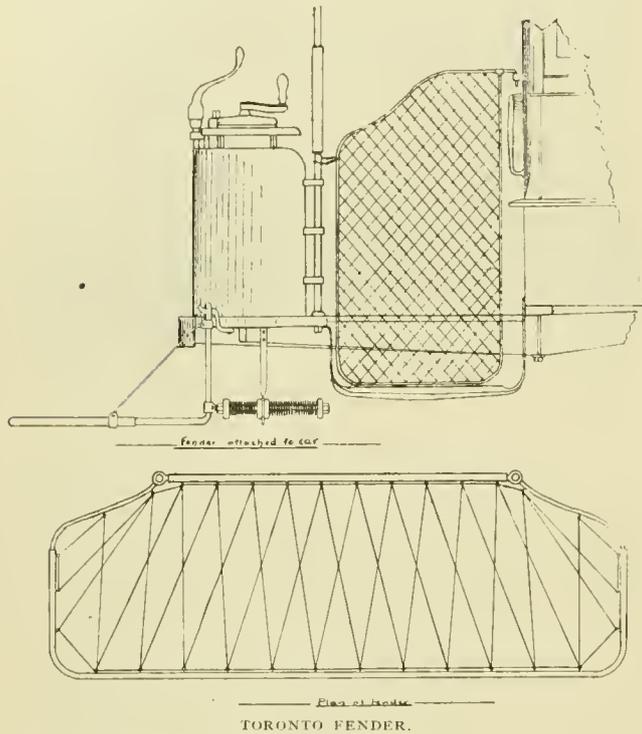

STREET cars are now held up in this city, officers of the United States navy are assaulted and robbed, gangs of hoodlums roam about at will plundering houses and picking pockets.—New York Commercial Advertiser.

What! in New York? Where are the police?—Chicago Dispatch.

THE installation of electric power has left the Allegheny, Pa., Traction Company with only one horse railway, and on this line only one horse and one car are used.

### THE STANDARD FENDER OF THE TORONTO RAILWAY.

The mention of fenders to a street railway man is liable to be the occasion of a fit of weariness, as it brings to his mind several thousand devices which flit across his mental vision with an indistinctness caused only by the

fact that it is impossible for the human mind to remember the details of so many similar appliances. One of the few roads to come to any definite conclusion and actually adopt a certain form of fender, is the Toronto railway. The fender used is shown in the accompanying illustration, for which we are indebted to C. E. A. Carr, of that company. It is similar to the one used at Buffalo.

### EFFECT OF ELECTRIC ROADS.

Steam railroads in the Eastern States are feeling the effect of the inter-urban electric street railway lines, which have cut into their passenger traffic to a large extent. The annual report of the New York, New Haven & Hartford Railroad says: "The construction of electric railroads in the neighborhood of our property continues throughout all its territory. Wherever they seriously reduce the revenue of this property, we shall be compelled to lessen local service in a corresponding degree."

It is reported that the travel between Boston and Malden, on the Boston & Maine road, has fallen off fifty per cent since the parallel electric road was opened. Another road in Massachusetts, which formerly carried about 300 to 400 passengers a day, carries about 75. The Reading Railroad has cut off trains from the Gloucester branch of the Atlantic City Railroad until

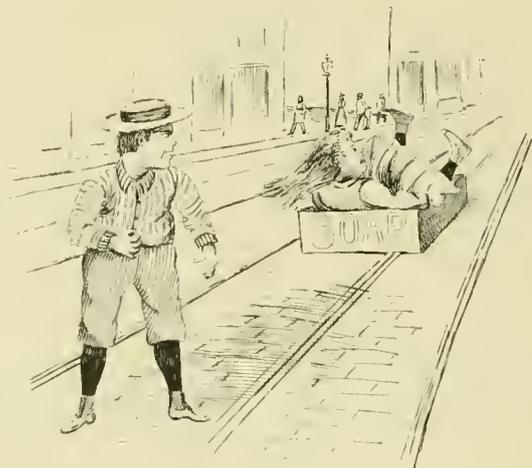

there are only six trains each way daily, and four on Sunday, while formerly there were 19 and 13, all on account of the Camden, Gloucester & Woodbury trolley line, which gives excellent service. Two trains in each direction were also cut off the Middletown and Hummelstown and the Williamstown branch. Other roads are cutting off trains in a similar manner. Even in California, especially in Alameda county, the electric lines receive the bulk of the suburban patronage. The Long Island Railroad (steam) is laying additional tracks for rapid transit between Long Island City and Flushing, and will make the fare five cents, instead of twenty and thirty-five cents, the present rate. Approaching electric railway competition is the cause.

### THREE OF A KIND.

Three Brooklyn conductors were hurt the same day in a similar manner at about the same hour. Each was adjusting his trolley pole and was thrown over the tail board, striking the ground with his head. The result was two fractured skulls and a severe scalp wound.

### GAVE BABY A RIDE.

Tin cans, dead dogs, and other articles have been sent down the tracks of cable roads by mischievous small boys, who have let strings down the slot, which, having become entangled with the cable, drag the object clattering down the track. Out on Blue Island avenue the other day, a seven-year-old gamin hit upon the plan of giving his baby sister a nice ride. So he gets a soap box, takes off the cover, and attaches four wires to the

GAVE BABY A RIDE.

bottom of the box. Baby's wagon is complete, and the youngster, who doesn't enjoy tending baby, which is the great cross of many a boy's life, took the box and his sister to the center of the track. Lifting her in, he dangled the four wires down the slot. They caught the cable, and away went the "special." A policeman sent in a call for the patrol wagon, which caught up with the baby and rescued her, after a chase of three blocks.

THE PASS SYSTEM.

CONCLUSION.

In the October REVIEW was an article on passes, the thorn in the flesh of all street railway corporations. There is a general movement to cut down passes to the lowest point, which means an issue of free transportation to employes and only to them, when engaged on company business. Employes are passed on their badges, carmen wearing them on their caps, and other employes such as power station men, office men, etc., are all furnished with service badges, which are pinned to the coat. The conductor is compelled to record the number of the badge.

Other roads furnish passes to city officials and newspaper men in coupon book form, 100 coupons to a book. One coupon is detached by the conductor and turned in by him for one fare rung up. These coupon books are similar to that illustrated on page 629 of the October REVIEW, except that pages contain three, four or five coupons. In some cases the name of the holder is stamped on each coupon, which has the signature of the president or other officer, and all have the condition that the book shall be taken up if another besides the person to whom it was issued, attempts to use it.

The Davenport & Rock Island Railway Company, Davenport, Ia., passes employes on cap badges and service badges. Books are issued to members of the city council and newspaper men. They are accounted for in the manner described above.

The Hartford Street Railway Company, Hartford, Conn., uses a form of ticket for conductors, motormen, etc., good for six rides a day. Conductors punch the tickets, each punch having a different die, ring up on register same as cash fare, and record pass number on the back of day card. Foremen of outside laborers are furnished with coupon tickets which they give their men as required. These coupons read, "Employe, good on any line," and are numbered. The day card is arranged for 15 trips. Each trip has two spaces "in" and "out," and the conductor is required to report starting time, car number, passengers, passes, transfers, free tickets, 5 cent tickets, press and letter carrier, and cash fares. The reverse is similarly arranged and shows number of transfers issued on each trip with pass numbers. On the bottom is shown "first transfer to issue to-morrow" and "first transfer issued to-day," the difference between these numbers should show number of transfers issued and is a check on trip reports. A single form of transfer four inches long, has been recently adopted and has given satisfaction to conductors, passengers and company. They are numbered consecutively, and the conductor keeps a stub. On one edge are the names of the different lines. On the other three sides are hours from 5 a. m. to 11 p. m. Each hour has four squares in which are the figures 15, 30, 45 and in the other a. m. or p. m. In the center is the following:

"Issued on line punched. Good for one continuous ride over any other line, if used within 15 minutes of time punched or on first car. In case of controversy about

transfer ticket, passenger agrees to pay fare and to apply within 3 days for redress at the office of the company." As a border to these words is an arrangement of the numbers of the days of the month. The reverse is used for advertising purposes.

The City & Suburban Railway Company, Baltimore, Md., uses the coupon system exclusively for employes and complimentary passes. The books are signed by the president and general manager, and the name of the holder is stamped on each coupon. The tickets are accounted for in the report under "dead heads." A record is kept of all books issued, and the return of covers is requested, which are renewed or not as the company sees fit, motormen and conductors are passed when they have on coat, cap and coat and cap badges. Shopmen are given tickets twice a day by the store-keeper or time keeper, and are good only on date of issue.

The Washington & Georgetown Railroad Company, Washington, D. C., issues complimentary coupon books,

HARTFORD EMPLOYEES' TICKET.

also two checks each day to each employe, good only on date of issue. Conductors detach coupons and punch them with bell punch. Employe's checks are also taken up and punched. They are turned in and counted the same as transfers.

The Detroit Citizens' Street Railway Company, Detroit, Mich., issues coupon books to employes. All other passes were withdrawn December, 1892. The following conditions accompany the book:

"Transfers will not be issued on coupon tickets.

"When coupons in this book are used, or if not used by January 20, 1895, or should you leave the employ of the company, return the book to your superintendent.

"This book is issued for the use of and as an accommodation to the holder only, and coupons therefrom will not be accepted in payment of fare of any other person. A violation of this rule will be deemed sufficient grounds for discharge.

"This book being issued to you gratuitously, it is expected you will comply with the conditions, and use every means to avoid its being lost. In order to make the holder doubly careful, in case a book is lost, he will be required to pay \$2 to his superintendent before another book will be furnished him."

The Duluth Street Railway Company, Duluth, Minn., uses the coupon system for employes and others. It

also has a transfer system similar to that adopted May 1, by the Minneapolis Street Railway Company, and illustrated on page 337 of the June REVIEW. There is practically no trading of transfers.

The Federal Street & Pleasant Valley Passenger Railway Company, Pittsburg, Pa., issues books of 200 employes' tickets to each foreman, with which his account is charged, and credited as the tickets come back through the conductors. There is no check, except the superintendent's personal knowledge of the demands that should be made upon the foreman. There are 400 employes, and the average is 200 tickets a day. From an approved list about 300 tickets a day are issued as required by ordinances and 200 to others. They are issued in books of 100 consecutively numbered from 1 to 100. The treasurer charges his account with 5,000 books, as per the opening and closing numbers of the series, which are issued according to number, so the record shows an unbroken list of numbers, and the stock of books always begins with the next higher number than that shown on the book. When tickets are returned through the conductors they are sorted and credited to the person to whom issued.

The Los Angeles Consolidated Electric Railway Company, Los Angeles, Cal., withdrew all complimentary passes the first of the year. Having only employes' tickets, matters have been simplified very much, and the new plan has been satisfactory. Tickets good for 60 rides are issued to employes, which are punched by conductors who report number on each trip. Conductors and motormen are passed on badges. The employe signs the ticket, agreeing that the company shall not be liable for injury to his person or property.

The Birmingham Railway & Electric Company, Birmingham, Ala., operates an electric line and three separate steam or suburban dummy lines, making four different divisions, each of which is operated as if it were a separate company. On the electric line no complimentary passes are issued except to the mayor, heads of city departments and newspaper men. Every passenger must put money or a ticket in the box. On the dummy lines, which carry freight, complimentary are given to merchants to influence patronage. Conductors of the

steam roads are compelled to report each trip the total number of passengers, number of cash fares; number of tickets; number of passes; and names of all persons riding without money or tickets, officers of the road, or employes going to or from work.

The Toronto Railway Company, Toronto, Can., issues a 52 ride monthly commutation ticket. The purchaser must subscribe to these conditions in the presence of a witness, who must also sign:

"Not good after date of expiration shown on face, even if any strips remain uncanceled, and refund will not be made on such uncanceled strips.

"Not transferable, and must be presented to conductor for each trip, or ordinary fare will be collected for which no refund will be made.

"If lost or stolen will not be replaced by a duplicate ticket under any circumstances.

"Conductor will take up all tickets presented after expiration."

## A STANDARD MONTHLY REPORT.

The engravings which occupy the three following pages are reproduced from the monthly report sheets recommended by H. I. Bettis, at the Atlanta convention, as a standard form. The items correspond with those given in the classification published with Mr. Bettis' report, printed in our October number. The report sheet consists of four pages, of which the report proper occupies three pages, and the first page is left blank, with the exception of a memorandum which comes face up when the report is folded, for convenience in filing.

## FARES ARE REDUCED IN KEOKUK, IA.

Cheap fares have been voluntarily inaugurated in Keokuk, Ia., by the Gate City Electric Street Railway Company, as an inducement to the people to ride. Tickets have been placed on sale, with merchants only, at the rate of eight for twenty-five cents. Persons not provided with these tickets will be required to pay five cents. Unused tickets will be redeemed. The low fare is expected to greatly extend the growing practice of retail merchants giving car tickets to such of their customers as have to ride to reach their places of business.

It is strange how an unusual occurrence is followed by others of a similar character, which usually come in threes. A big fire is frequently the forerunner two others even more damaging, and then there is rest. Horrible casualties go according to this rule, and an example is given of its control in the following. Early in October a woman in San Francisco stole \$5,000 from her husband and eloped with a motorman. On the same day in Beaver Falls, Pa., a motorman stole the pretty wife of a rolling-mill man together with his savings. Two days later a motorman on the Windsor Beach Electric Railway, Rochester, eloped with a farmer's daughter and \$1,350.

## EARNINGS AND EXPENSES.

### ADVERTISING POINTS OF INTEREST.

The REVIEW has always advocated the advertising of points of interest on street railway lines by means of folders similar to the method that has grown so familiar on account of its general use by steam roads. One of the handsomest received by the REVIEW is an eight page folder of the Niagara Falls, Park & River Railway, Niagara Falls, Can. The inside eight pages are lithographed in several colors, showing views of many interesting points and of the road in operation, which are here reproduced, except as to coloring. From a scenic standpoint this line is an ideal road, but other lines have as many points of interest which should be made to create traffic. This folder describes the various places to be seen, giving

Armstrong, the well-known electrical expert of Chicago, to work out the technical details. The outfit as now arranged consists of an ordinary 1,000-volt alternator driven by a high speed engine on the car. This alternator furnishes current to a step-up transformer which gives a voltage of from 5,000 to 40,000 volts. One pole of the transformer is grounded and the other is connected to wire brushes which are fixed at such a distance above the track that they strike the tops of the weeds as the car moves along. The action of the apparatus is remarkable. The weeds having the most sap in them tumble over at once, and in time dry up, showing them to be killed by the first shock. The principal cause for this action is that the current heats the sap in the weeds to such an extent that they are literally cooked. Weeds

prices where fees are charged, and other information, which shows the people of the country that the famous "Niagara Falls hackman" need be no longer feared.

### KILLING WEEDS BY ELECTRICITY.

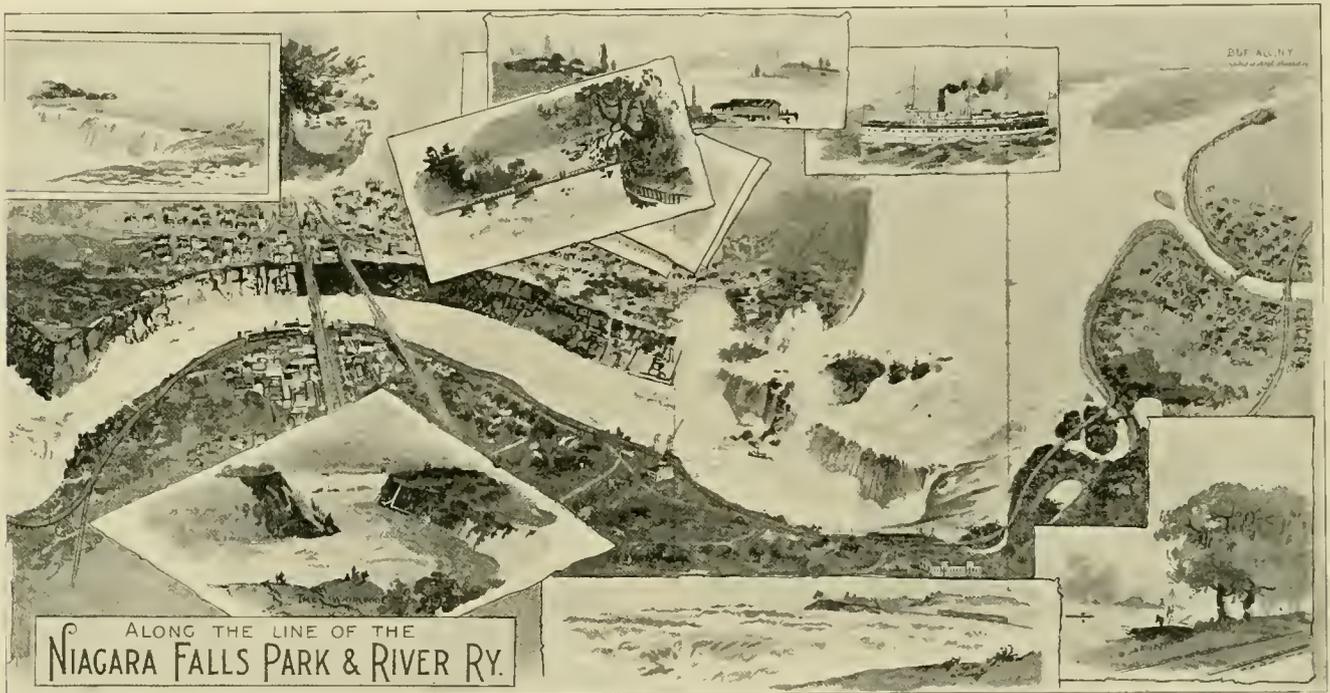

Although managers are just now more interested in the prospect of bucking snow in the immediate future than in the possibility of killing weeds by electricity in the remote future, it will not be out of place here to briefly recount some of the work done in this direction along some of the southern divisions of the Illinois Central, as this method of weed killing may some day be used on the interurban lines which are multiplying throughout the country. The weed killer used on the Illinois Central was originally thought of by A. A. Sharp, superintendent of the Yazoo & Mississippi Valley division, who secured patents on it, and employed C. G.

pulled up immediately after the car has been along are too hot to handle, even at the roots. The arcing between brushes and weeds as the car goes along also destroys some. About 16,000 volts has been found the best pressure for ordinary work. It can be done with as low a voltage as 6,000, but not as well, while over 16,000 is more than is usually necessary. Different kinds of vegetation require different voltages. The car used last season had brushes to the width of the ties and required 80 kilowatts when running six miles an hour. The faster the work is done the greater the energy required, as the weeds fall over when struck, and the faster the car goes the more are struck in a given time. A car is now being fitted up with a 200-kilowatt alternator and transformer, so that lack of power will be no hindrance to rapid work in the future. In some places the keeping of the road-bed clear of weeds by hand is an important item, amount-

ing to \$60 per mile of track per year. The electric method certainly ought to cost less than this, as it absolutely kills what vegetation it strikes, so that it can not come up again from the root. After the first few times, therefore, it is not necessary to go over the track very often. The Great Northern Railroad will experiment with one next season. If the plan is tried on electric interurbans, a flat car having a motor generator and step-up transformer run from the trolley wire could be fitted up without a great deal of outlay. The capacity of the apparatus required depends on the speed it is proposed to run at over the road, and if it was practicable to do the work slowly the motor and generator could be small.

### TROLLEY CAR SPEED.

How to calculate the speed of a trolley car is an interesting problem to anyone in the business, who happens to be riding faster or slower than he is accustomed. It also has a fascination to the passenger with an enquiring mind. Various ways have been suggested, but the simplest is to note the number of feet the car goes a minute and divide by 88, which will give you the number of miles an hour, or rate of speed. A car moving at the rate of one mile an hour will pass over 88 feet a minute. A speed of 176 feet a minute is at the rate of 2 miles an hour; 352 feet, 4 miles; 528 feet, 6 miles; 704

ADVERTISING POINTS OF INTEREST.

### HAS GONE TO KANSAS CITY.

In the Woodland avenue power house of the Kansas City Cable Railway Company has been installed an engine which has been seen by more people than any engine in the world. On November 1, 1893, this engine finished its work in Machinery Hall, at the World's Fair. It is known as the Reynold's-Corliss type, and is capable of developing 2,000 horse-power. The foundations are 42 feet long. The engine weighs 150 tons.

Several changes have been made in the engine to adapt it to its new work. It will drive all the ropes of the Ninth street system, except Summit street, being nearly 100,000 feet of cable. The old engines will be coupled together for use interchangeably with the new one. New cars will be put on the Ninth street incline, and plans have been prepared for a tunnel from Washington street toward the depot. Ten freight cars were necessary to transport the engine. The balance wheel weighs 75 tons.

feet, 8 miles; 880 feet, 10 miles; 1,320 feet, 15 miles; 1,760 feet, 20 miles; 2,200 feet, 25 miles; 2,640 feet, 30 miles; 3,520 feet, 40 miles; 4,400 feet, 50 miles; 5,280 feet, 60 miles. If poles are set regularly at equal distances, it is easy to calculate the distance the car goes in a given time.

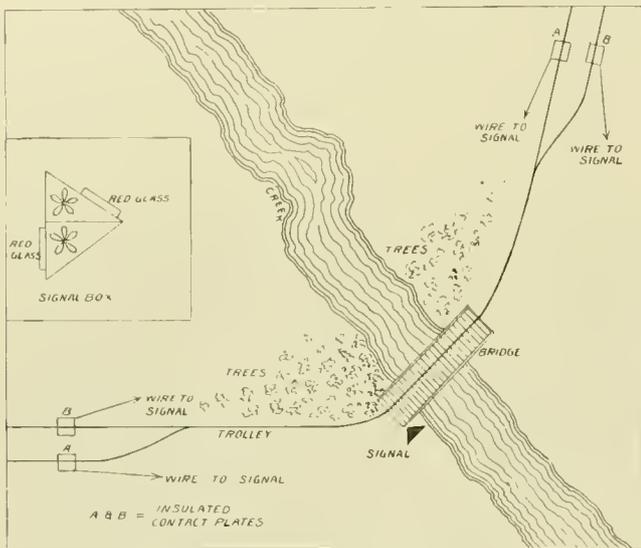

A rather complicated method is going the rounds of the press, which is based upon the purring sound caused by the meshing of the gear and pinion teeth. In order to calculate by this plan it is necessary to carry along a tuning fork or a seven-octave piano. If the tone is the same pitch as "middle C," which makes 264 vibrations a second, the teeth are meshing at the rate of 264 a second. If the number of teeth on the gear is known, together with the diameter of the car wheel, the rate of speed can be ascertained.

The number of 30-foot rail lengths passed over in twenty seconds will give the speed in miles per hour, approximately. Here is certainly given enough information for a satisfactory determining of car speed.

### WALKER'S BLOCK SIGNAL AT SIOUX CITY.

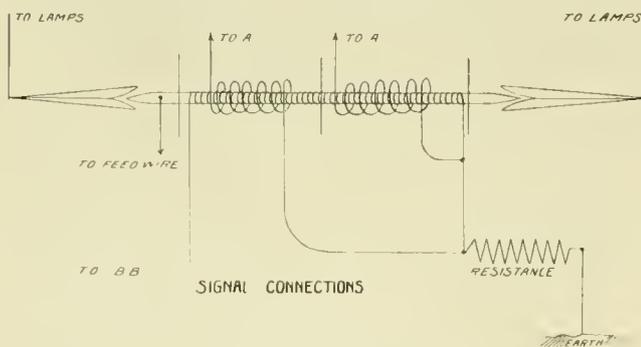

Among the numerous other new devices that the ingenuity of Superintendent I. B. Walker of the Sioux City Traction Company has brought before the street railway world is a block signal recently put in operation at a bridge on one of his lines. The bridge is single track

light to cars coming the opposite direction. When the car has crossed the bridge and again enters the double track another contact hanger is passed which sends another current bringing the solenoid to a central position and puts the signal lights out. Thus, unless the signal shows a red light the track is clear. It is a very simple arrangement and has the advantage of being cut out except when a car is on the single track.

WALKER BLOCK SIGNAL.

while there is a double track on each side of it. There is also a turn near the bridge and trees obstruct the view so that a motorman coming onto the bridge can not see whether there is another car approaching on the single track and there is great danger of a collision unless the conductor walks ahead for some distance. The arrangement of bridge and tracks can be seen from a glance at

WALKER BLOCK SIGNAL.

the engraving. The signal box is on one corner of the bridge where it can be seen from both ends of the single track. On the double track near each switch is a special trolley wire hanger having an insulated contact plate arranged so that when a trolley wheel passes along it makes a contact which sends a momentary current over the wire to the signal box. At the signal box is a magnet wound with three coils as herewith shown. When a car passes this hanger a current is sent through the magnet so that the plunger in the coil is brought over to make contact with the lamp circuit which displays a red

### TREATMENT FOR ELECTRIC SHOCKS.

The London Lancet gives some directions for the treatment of persons severely shocked that may be of a little use to men on electric railway work, although shocks from 500-volt circuits will rarely be as severe as those implied in the rules. The rules will, however, give new men a general idea of some of the precautions to be employed. One of the principal difficulties is in getting a man off a live wire, and this operation is well covered by the instructions. The treatment after this is done is much the same as for drowning.

The rules are:

First—Break the circuit at once if there be any interrupter close at hand and you know how to use it. If not, lose no time, but proceed to rule 2.

Second—Do not touch the man's body with your bare hands, but if India rubber gloves are not at hand pull him off the cable by his coat tail, or fold your coat or some such dry article into two or three thicknesses, and, using this as a pad to take hold of the body, pull it away from the circuit and resort to rule 5.

Third—If unable to get him off, raise with covered hands that part of the body which is touching the earth, or one of the poles of circuit; this will break the circuit, and it will usually be thus possible to get him easily away, and, if so, proceed to rule 5.

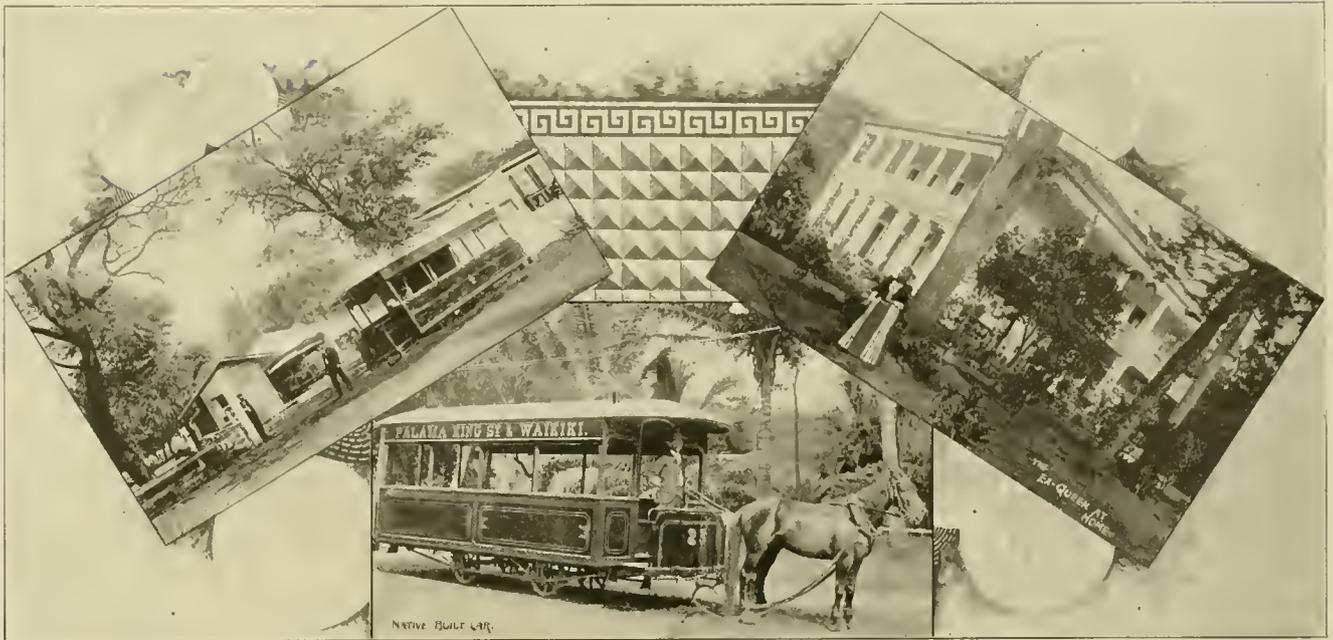

Fourth—If still unsuccessful, make another pad, and, placing it between the ground and that part of the body in contact with the ground, continue your efforts to detach him.

Fifth—Having pulled him away from the cable, free his neck from clothing, and treat the case as one of drowning, one method being as follows:

Sixth—Open his mouth, and taking hold of the front part of the tongue with your fingers (covered with a handkerchief, if you have one), draw the tongue forward, and gradually let it go back sixteen times a minute. Be sure that the root of the tongue is acted upon and drawn forward. If the teeth are clenched and you cannot get them apart with your fingers, gently separate them with the handle of a pocket knife or by a small piece of wood, cork, etc.

Seventh—Resist the efforts of the bystanders to pour stimulants down his throat until a medical man arrives and "takes over" the case.

A DAM forty feet high will be built to furnish water power for the new electric railroad, which is to run between Batavia and Lakeside, N. Y.

**ELECTRIC RAILWAY FOR THE SANDWICH ISLANDS.**

Sometime ago the REVIEW published a detailed description of the street railway at Honolulu, together with quite a collection of views of that interesting city, taken expressly for the article. A correspondent for this magazine, now en route to the Old World, sends the interesting information that when in Honolulu a few weeks since he met T. Hofman, of San Jose, Cal., who is there projecting an extensive system of electric lines.

The many points of far-famed interest in which the island abounds, and the, at present, exceedingly poor facilities for visitors to reach these attractions, opens up a promising field of usefulness for the electric car. In the same connection it is intended to convert the present horse car system of Honolulu to electric.

H. Pain, a successful manager and a most genial gentleman, is managing director of the Hawaiian street railway, and we present his portrait herewith. In the group of illustrations will be found a glimpse of the company's car house, and a home-made car, "No. 25," which was made in the company's own shop, entirely of native material and with native labor. Most of the 25 cars, however, were built in San Francisco. There are 12 miles of track, on which 80 employes and 190 horses are used, and last year the road transported one and one-half millions

H. PAIN.

of passengers. The line was opened in 1889. The view of the former residence of the ex-queen shows the native foliage, and was taken when that much talked of ruler was in power. She is now spoken of as Mrs. Dominis.

Another cut shows the rocky road now traveled by tourists and others, but which is a part of the proposed route of the electric railway, the construction of which will form a most interesting piece of electrical engineering. In this picture the road in the foreground may be faintly traced at the right as it winds far up the mountain side.

CONDUCTORS and motormen of the Quincy, Ill., line are said to resemble each other so closely, that passengers meeting cars think they have lost the company's representatives with whom they started.

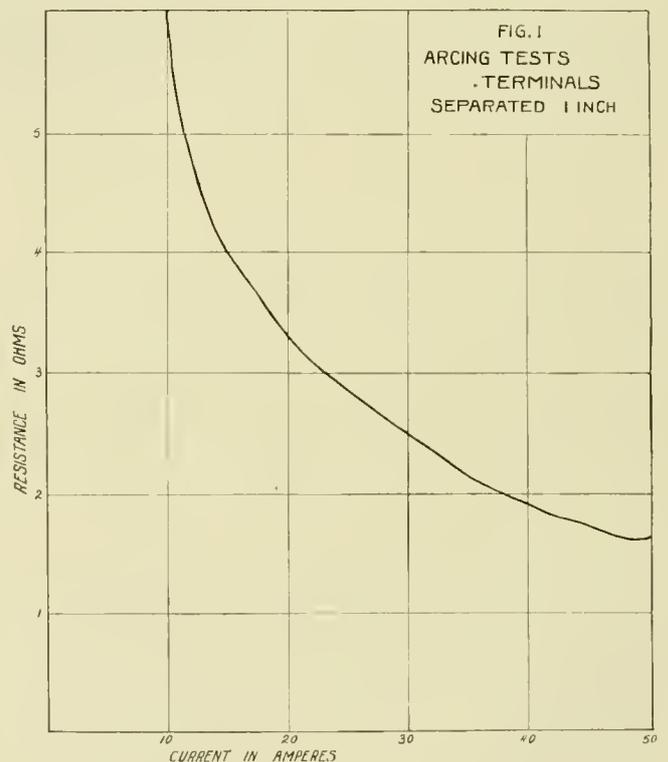

ABSURDITY OF THE RECENT RULES ADOPTED BY  
THE UNDERWRITERS' INTERNATIONAL ELEC-  
TRIC ASSOCIATION, COVERING THE USE  
OF 500-VOLT FUSES.

BY W. E. HARRINGTON, CAMDEN HORSE RAILROAD.

The writer recently received a pamphlet from the "Board of Fire Underwriters" containing a description of a series of tests to determine the safe length of fuses of different capacities in amperes for 500-volt circuits. The deductions from the above tests were formulated as rules of practice for users of 500-volt circuits. The tests were conducted by a committee representative of the several "Boards of Fire Underwriters" throughout the United States. A copy of the tests and tabulated results are attached as an appendix to this paper. A careful perusal of the appendix will show that great care was observed by those conducting the tests in question, and if the practical use of fuses, particularly the conditions under which a fuse "blows," were in any wise similar to the requirements as prescribed, then the tests and results would not be open to criticism. Unfortunately, the "blowing" of a fuse is an accident, and an accident is an occurrence over which we have no control. It is just as likely for a "short circuit" to occur on a circuit containing a ten ampere fuse, as it is to have a condition of circuit wherein just the ten amperes (the minimum current required to "blow" the fuse) will flow. The sole animus for making the tests was to determine the dimensions of fuse blocks that would overcome the arcing phenomena attendant upon the "blowing" of 500-volt fuses in lower voltage fuse blocks, the only type heretofore available for use. As will be noticed, the tabulated results state specifically the safe lengths in inches for different capacity fuses, ranging in size from 10 amperes to 100 amperes in 10 ampere steps. Further, the results as obtained, were based on the one condition that the current in amperes flowing at the time of fusion was the minimum current causing fusion. In addition to the foregoing, attention is called to the better protection afforded by using a bridge.

The writer intends to demonstrate, by both the results of practice and specially conducted tests, the absurdity of promulgating the results of such incomplete tests as the basis for formulating rules in the matter of the protection of 500-volt circuits. Since the arc accompanying the "blowing" of a fuse is the thing to be avoided, or rather mitigated, tests were conducted with a view of determining the properties of an arc under the same conditions as regards length, with different currents. Pieces of No. 8 copper wire were cut and mounted horizontally, an inch apart longitudinally. An arc was established between these terminals with ten amperes. Note was taken of the ohmic resistance. Next, twenty amperes were caused to flow, and again note was taken of the ohmic resistance. This process was repeated for currents in ten ampere steps to fifty amperes, in each instance note being taken of the ohmic resistance. Curve marked Fig. 1 shows

graphically the relation borne by current flowing through the arcing interval of one inch, and its corresponding ohmic resistance. It will be noticed, and to this fact the writer would draw particular attention, that the ohmic resistance drops off very rapidly as the current increases. The results, as obtained, show beyond a peradventure of a doubt, that under conditions of a short circuit the ohmic resistance of the arc is negligible. The decrease in resistance in the arc as the current increases is unquestionably due to the greater volume and therefore greater cross section of the gas formed, as it does not seem possible the specific ohmic resistance of the gases should materially vary. It is interesting here to make note of the fact that the slightest movement of the air in the vicinity of the arc caused a variation in the resistance. The foregoing

establishes positively that if a given length break in a fuse block protects for one maximum current, it may not for greater currents. The entire and sole cause of the protection afforded in a break caused by fusion is due directly to the resistance interposed in the circuit by such fusion, and the tests show that such resistance becomes less as the current grows greater. In order to read the almost instantaneous currents due to short circuits, a magnetic circuit breaker of the "C-S" automatic type was taken and calibrated to open on different adjustments, ranging from 38 amperes to 400 amperes. Different lengths of No. 30 copper wire were tested in series with the "C-S" circuit breaker directly across the 500-volt bus bars of the switch-board of the Camden Horse Railroad Company, thus making an absolute "short circuit." In every instance, for each length of the No. 30 copper wire, ranging from one inch to eight

inches, with and without bridge, the "C-S" circuit breaker set for 400 amperes was opened upon making a short circuit.

Here is an exceedingly interesting state of affairs. A copper wire which will fuse upon the passage of about two amperes, allowing 400 amperes to pass upon a short circuit, and then not protecting the circuit in which it was placed, for the magnetic circuit breaker opening was the immediate cause of the breaking of the arc established by the "blowing" of the fuse. This latter deduction is deceiving. As a No. 30 copper wire will really only permit the passage of 40 amperes upon a short circuit, the question naturally arises: How did 400 amperes come to flow? The answer is readily given. This excessive current flows not through the fuse, but through the arc maintained at the expense of the terminals, the fuse simply playing the role of establishing an arc. In a long series of experiments covering another field of research, but wherein almost innumerable fuses of different capacities and lengths were employed in making 500-volt short circuits, in no instance was the circuit protected by the fuse but by the opening of the main magnetic switch-board circuit breakers. In many instances fuses made of No. 22 copper wire, 6 inches long, have opened circuit breakers requiring 800 amperes to open.

There exists a popular misconception of the action of bridges. A bridge is an additional protection, as it increases the length of the arc, other dimensions remaining the same, but as we approach short circuits the little additional length due to the bridge does not figure, and the repeated tests made by the writer emphatically confirm this fact. The ideal and not impracticable fuse block for the protection of 500-volt circuits is not one with a great breaking distance, neither one with a bridge, but one with protected terminals. This type permits the blowing of the fuse only, without the attendant arcing, always vicious and destructive of the terminals.

In conclusion, a 500-volt circuit is not protected by the forms of cut-outs recommended by the International Electric Association. Further, it is absolutely dangerous to adopt such precaution, as the continued arcing which would ensue in event of a short circuit would easily ignite any inflammable material in the immediate vicinity. This latter claim is confirmed by the frequent instances of car and car house fires.

#### APPENDIX.

UNDERWRITERS' INTERNATIONAL ELECTRIC ASSOCIATION—Secretary's Office, 55 Kilby Street—Second Report of the Electrical Committee.

BOSTON, MASS., June 15, 1894.

LENGTHS OF FUSES.—The following result of tests to determine the length of arcs maintained on 500-volt circuits when carrying currents ranging in amount from 10 to 100 amperes, will be interesting, and give data which will enable inspectors to judge of the length of fuse necessary for various amperages in such circuits.

GENERAL DESCRIPTION.—A special slate fuse block one inch thick, three inches wide and twelve inches long

was used, with heavy composition terminals, one of which was fastened to a brass strap embracing the block, making it possible to adjust the length between terminals at will. A water resistance for regulating the current was connected in series with the fuse block. Fuses of various sizes were placed in the block in a vertical position, and a steady current maintained till they melted. Beginning with 10 amperes, observations were taken at intervals of 10 up to 100 amperes.

METHOD FOLLOWED IN MAKING TESTS.—The test throughout was conducted in the following manner: At each interval of ten amperes, the terminals were at first placed close enough together to establish an arc when the fuse melted. The distance between them was then increased a quarter of an inch, and if arcing again took place the operation was repeated until no arc was formed. When this point was reached, two more fuses were melted under the same amount of current, and if no arcing occurred in the three successive trials it was considered a safe length for fuses whose melting point corresponds to the current used. At every point the largest fuse was used that could be melted within about five minutes; for it was found that when a fuse melted quickly, no arc occurred at distances at which heavier fuses readily maintained one. Whenever even a momentary arc was formed that distance was regarded as unsafe, and longer ones taken till no arc occurred on three trials.

COVERED FUSES.—Tests were made to ascertain what effect enclosing the fuse in a box had on the arcing distance. It was found that covered fuses should have at least a quarter of an inch more length between terminals, while a half inch would be more satisfactory.

EFFECT OF BRIDGE BETWEEN TERMINALS.—The terminals were moved to within  $1\frac{1}{2}$  inches of each other, and an asbestos-covered bridge, the width of the fuse block and  $2\frac{1}{2}$  inches high, placed between them. With 100 amperes there was no tendency to arc; whereas, with a straight fuse, 4 inches was the minimum length at which no arcing occurred. Instead of nearly all the fuse melting, as was the case with straight fuses, only about an inch or less dropped out. By employing a bridge of proper material, it is thus possible to use a much shorter fuse block. Such a block is in every respect as safe as the ordinary form, and obviates the vicious fusing that occurs with straight fuses on 500 volt currents.

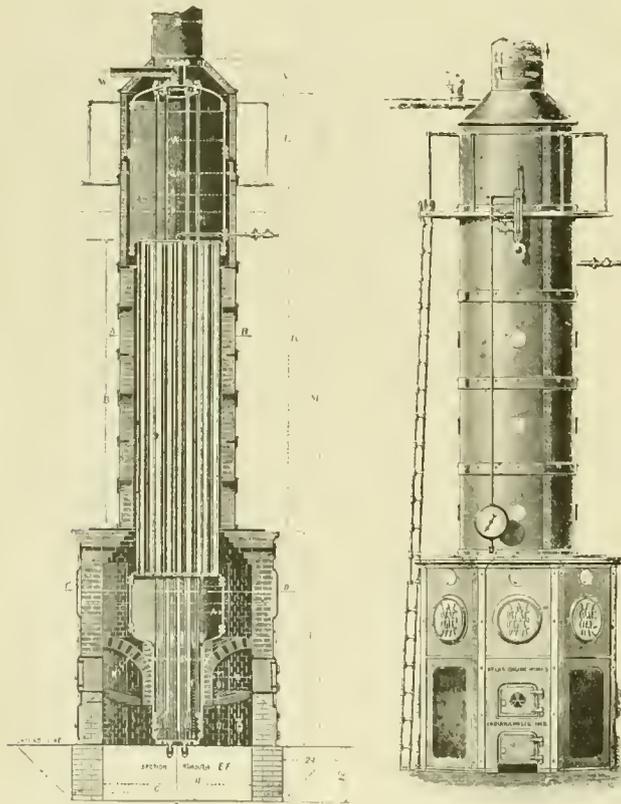

EFFECT OF EXCESSIVE CURRENT ON SMALL FUSES.—In order to determine the effect of large currents on small fuses, a current of 150 amperes was passed through a fuse rated to melt at 10 amperes. The length of the fuse on the first trial was one-half inch, the safe length determined by the foregoing experiments. This length was increased by one-half inch steps up to one and one-half inches, and the effect noticed at each length. In no case was a continuous arc maintained, although with the one-half inch fuse the flash was quite bad, burning the terminals slightly. The same results were obtained on all of the longer lengths. This tends to show that on circuits of a large capacity the only safe fuse is either one provided with a suitable bridge or one of excessive length.

DATA.—The following data give the maximum length between terminals at which arcing occurs, the minimum lengths at which no arcing was observed, and the safe lengths on 500 volt circuits for fuses whose melting points are identical with the various current strengths designated:

| Ampere. | Maximum Length at which arcing occurred | Minimum Length at which no arc was observed. | Safe Lengths.     |
|---------|---|--|-------------------|
| 10      | $\frac{1}{4}$ inch                      | $\frac{1}{2}$ inch                           | 1 inch.           |
| 20      | $\frac{1}{2}$ "                         | $\frac{3}{4}$ "                              | 2 "               |
| 30      | 2 "                                     | 2 "  | 2 $\frac{3}{4}$ " |
| 40      | 2 "                                     | 2 $\frac{1}{4}$ "                            | 3 $\frac{3}{8}$ " |
| 50      | 2 $\frac{1}{4}$ "                       | 2 $\frac{1}{2}$ "                            | 3 $\frac{1}{2}$ " |
| 60      | 3 "                                     | 3 $\frac{1}{4}$ "                            | 3 $\frac{3}{4}$ " |
| 70      | 3 "                                     | 3 $\frac{1}{4}$ "                            | 4 "               |
| 80      | 3 $\frac{1}{4}$ "                       | 3 $\frac{1}{2}$ "                            | 4 $\frac{1}{2}$ " |

| 100     | 3 $\frac{3}{4}$ "                       | 4 "  | 4 $\frac{1}{2}$ " |

### NEW WATER TUBE BOILER.

A new vertical high pressure water tube boiler has been designed and manufactured by the Atlas Engine Works, Indianapolis, Ind. It is mounted in an upright position within a casing lined with fire brick. The lower

NEW VERTICAL WATER TUBE BOILERS.

part is a drum of inverted bottle form, the central portion of less diameter extending below the grate, and is enclosed in fire brick, while the main portion is held at a considerable height above the fire. Mid height of the boiler is a set of vertical tubes. The upper part is a drum in which a liberal surface is presented for the disengagement of the steam from the water.

The manufacturers say the descent of the water through the central tubes is promoted by a set of telescoping tubes

extending the water tubes to near the bottom of the water leg, which may be slipped up into the water tubes out of the way whenever necessary to enter the water leg for cleaning or repairs. It is claimed that when extended downward to be thoroughly efficient these tubes protect the central set of tubes from being effected by the large volume of steam generated in the exterior portion of the lower drum which rises through the series of tubes above, insuring an active upward current of steam and water through those tubes. It is said that further steam is generated in the tubes by the circulation of the gaseous products of combustion through the spaces between them.

The steam and water thus rising, separate in the upper drum, and the steam is carried away for use, while the water descends through the central tubes of the series. It is claimed that only a small quantity of steam is generated in the central tubes, which is carried down by the central current, and moving outward in the lower portion rises and contributes to the vigor of the strong rising columns in the tubes near the periphery of the series.

Between the central portion of the boiler and the annular furnace is a non-conducting protection which prevents the fire from being too much cooled along the edge, the makers say, and allows all portions of the grate surface to be about equally efficient, while the fire brick also preserves that portion of the boiler from being overheated in any exigency. The annular grate is slightly inclined inward, and the annular furnace is fed, cleaned, etc., through doors in the outward casing. A perforated protection of fire brick is extended over the fire. The masonry wall is extended inward at mid-height of the tubes, so that it comes nearly in contact with the outermost tubes. The gaseous products of combustion are deflected inward, circulate around the tubes, and are finally carried out through a central stack at the top.

The Dewey Electric Signal Company, 26 and 28 Cortlandt street, New York, has furnished an equipment of electric push buttons for the cars of the Niagara Falls & Suspension Bridge Street Railway Company. The push buttons operate the signal bells and the alarm gong. Those operating the signals are placed at different points throughout the inside of the car in convenient reach of the passengers. Those operating the gong are placed in the floor of the car at each end where the motorman can press them with his foot. As long as he keeps his foot upon the button the gong continues ringing, thus doing away with the continual up and down movement of the foot and enabling him to concentrate his attention upon the controller and brake. Moreover only one gong is required. The officers of the Dewey Electric Signal Company are Arthur M. Dodge, president; F. G. Ingersoll, vice-president and general manager, and Geo. B. Hollister, secretary and treasurer. The foregoing and J. F. Tams, Charles H. Duell and Edward B. Lyman compose the board of directors.

## TIME TABLES AND TRAIN SCHEDULES.

### PART IV.

The time cards of the Cincinnati Street Railway Company are all made out by John Harris, superintendent. We illustrate the one in use on the Eighth Street Electric line. Sixteen cars are run morning and evening and 12 cars during the day. The card shows extras, Nos. 13, 14, 15 and 16, which make three trips in the morning and four trips in the evening, to relieve regular cars dur-

ing heavy travel. The evening extras leave at 4:05, 4:15, 4:23, 4:33, p. m. Cars are run under 2, 3 and 4 minutes headway.

The Consolidated Traction Company, Newark, N. J., uses the form shown herewith on its New York division.

The Metropolitan Street Railway Company, New York City, in making up time tables and computing headway, is governed by the amount and direction of travel at different times of the day, based upon reports of travel by hours covering the day and taking several days in succession.

# REQUEST ARTICLES.

Articles under this head are prepared at the request of street railway men who have expressed desires to see articles compiled on the subjects taken up.

## ARE GUARD WIRES DESIRABLE?

"The majority of street railway men will answer the above question with an emphatic, no. City officers will be found divided on the subject. Telephone companies are generally in favor of them, for the same reason that they are in favor of double trolleys; because they permit telephone companies to carry on business in a more slipshod manner than would be the case were they used.

The following letters from men who have had abundant experience with guard wires present the case in a very clear and practical manner.

M. R. McAdoo, manager of the Paterson Railway Company, Paterson, N. J., after a painful experience with the guard wire nuisance, says:

"I am most decidedly against guard wires for the reason that they are directly over the trolley wires, and as they are always coming down no matter how securely they are put up, they are then, when down, necessarily from their location, always charged. So far as protection against having live wires of the other companies such as electric light and telephone, on the ground, and lying across the trolley wire, should there be no guard wires, is concerned, I do not think this would occur nearly so often as live wires on account of broken guard wires. I have recently had a great deal of trouble which bears me out in this statement. I have also recently discovered that it is the telephone companies who are prodding up the city councils to require guard wires, as it facilitates the stringing and handling of their wires when in process of construction. This may apply more or less to the electric light companies. I feel satisfied, that if the city councils understood the subject to any extent they would agree that it is more protection to the telephone companies and other corporations than it is to any passengers on the street."

Maurice Hoopes, electrical engineer of the Lynn & Boston Railroad has the following to say on the subject. His opinions are also endorsed by Superintendent E. C. Foster.

"Our experience is wholly in favor of the absence of guard wires. Our Salem division has guard wires throughout, whereas the Lynn and Chelsea divisions have none. Capt. Hillar, the Lynn city electrician, is very decided in his opinion that they are not only useless, but dangerous, and would not allow us to erect them if we desired to. In Salem our lines are of more recent con-

struction, and hence in better condition, than in Lynn. Notwithstanding this we have more emergency calls in Salem than in Lynn, largely because of trouble with guard wires.

"The troubles caused by guard wires are due to their breaking, or being broken by trolley poles, and coming down on the trolley wires and into the street, and to an occasional section becoming alive, from defective insulation, and charging wires being pulled over it by linemen engaged in erecting other wires. Decidedly the better way to avoid danger from other wires becoming alive from trolley wires is for the owners to erect and maintain them in such a way as to make the chances of their coming down few. In cases where trolley wires pass under trunk lines of light iron telephone wires it may be well to protect them, for the one span, with guard wires, making them heavy and strong, with poles stiff enough to carry them. Undoubtedly the practice of putting up guard wires over all trolley wires, whether needed or not, results in much more damage and danger than their entire absence does, and while there may be a few spans in each city where their use would be advantageous, there are very few."

Richard McCulloch, electrical engineer of the Cass avenue & Fair Grounds Railway, of St. Louis, confirms the opinion of the two preceding gentlemen:

"The city authorities here do not compel us to erect guard wires except where a telephone or lighting wire crosses above us, and except in the down town district there is very little guard wire up. Of course, the object of the guard wire is to prevent a telephone wire from being charged from the railway circuit in case it should break and fall across the trolley wire. The telephone company in this city evidently does not believe in the efficacy of this preventative as it has recently adopted the plan of placing fuses on all its telephones. However well the line construction may be done, any increase in the number of wires put up adds to the danger of their breaking and getting charged. We use insulated steel wire for guard wire and try to have the guard wires thoroughly insulated from the poles and from the trolley, but every now and then the trolley pole flies off the wire or a strain insulator breaks and the result is a loose dangling wire, although no material harm may be done. In conclusion I would state that it seems to me that guard wires as a safety device are a failure, as they more often get us into trouble than keep us out of it. Furthermore, the system itself, seems to imply a loose construction on the part of telephone and lighting companies which it would not be well to encourage."

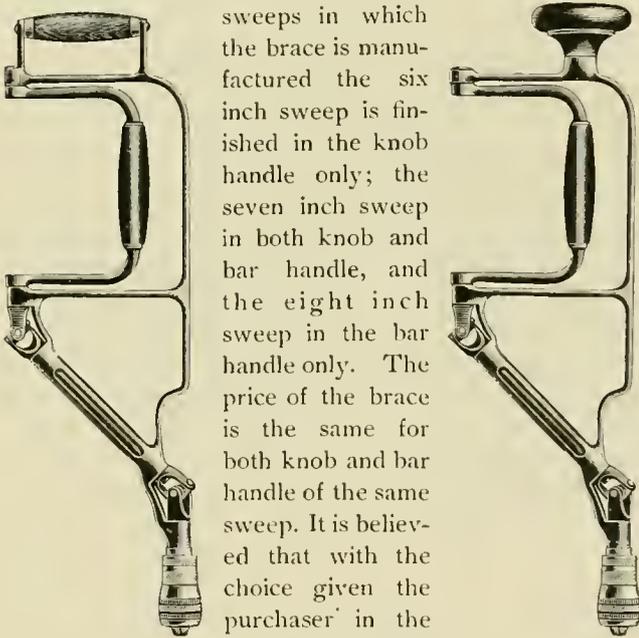

The general conclusions to be drawn from these opinions are:

1. Guard wires cause more trouble than they prevent. It would certainly be to the interest of electric railways to erect guard wires if they would prevent the railway from getting into trouble either from interruptions of traffic or damage suits. As long as the practical experience of railways demonstrates that they are a failure as a safety precaution no theory to the contrary should be considered for an instant.

2. The way to prevent accidents is by better construction of electric light, telephone and telegraph lines, and not by guard wires. Better construction of this class of overhead lines will not only prevent crosses with trolley lines but will eliminate a great many accidents not connected with trolley wire crosses.

THE UNIVERSAL BRACE-BAR HANDLE.

The Universal Brace, manufactured by the National Manufacturing Company, Wilkesbarre, Pa., is now made in the two styles of handle as shown in cuts here-

with. Of the three sweeps in which the brace is manufactured the six inch sweep is finished in the knob handle only; the seven inch sweep in both knob and bar handle, and the eight inch sweep in the bar handle only. The price of the brace is the same for both knob and bar handle of the same sweep. It is believed that with the choice given the purchaser in the style of handle, the

universal brace will satisfy the wants of the trade, however exacting. The purpose of the Universal Brace, as will readily appear, is described as being for boring and screw driving in angles and corners, close to washboards and walls, and in all places difficult or impossible to reach with the ordinary brace. The universal brace does the work of the ordinary brace and its special work besides. The brace is held in any desired position with one hand, and the crank-arm turns a right angle with the frame. All parts are simple and durable. In case of damage any part can be duplicated."

PASSES have been cut off by the Pittsburg, Allegheny & Manchester Company and the Pleasant Valley Company, both of Pittsburg.

GENETT BRAKES IN ACTION.

Probably no car in Atlanta carried more passengers during the convention than the one shown here, which was equipped with the Genett air brakes with double action pumps, manufactured by the Genett Air Brake Company, New York City. The brakes worked perfectly, under not particularly favorable circumstances.

The many heavy grades gave a good opportunity for the demonstration of its utility, which gave greater satisfaction to the investigators than if the tests had been made on level track. Tests were made to satisfy the most ingenious whims of the street car men, who were determined to find its weak points. General Manager E. J. Wessels was well pleased with the work of his brake. The car had McGuire trucks.

QUAKER CITY SIAMESE TWINS.

Peter A. B. Widener and William L. Elkins, the trolley and cable kings of Philadelphia, are certainly entitled to the pseudonym which has been conferred upon them by their fellow townsmen of the Siamese Twins of the Quaker City.

They are united in business and in social matters.

Their mansions are situated opposite each other on North Broad street, and each is engaging the other in friendly rivalry as to which shall eventually own the greatest art collection in the United States.

When one goes to Europe the other goes, too. Their tours in the United States are made in company. When one has business in New York the other has business there also.

According to this rule they both appeared at the Waldorf last week, and, if those who should know are to be believed, their consanguinity of spirit extended even to the items of their meals.

In their case, evidently, the beautiful aphorism of Richard Swiveller, Esq., is amply verified, and the wing of friendship is never likely to moult a feather.

THE new electric railway at Depere, Wis., will have two engines of 100 horse-power each.

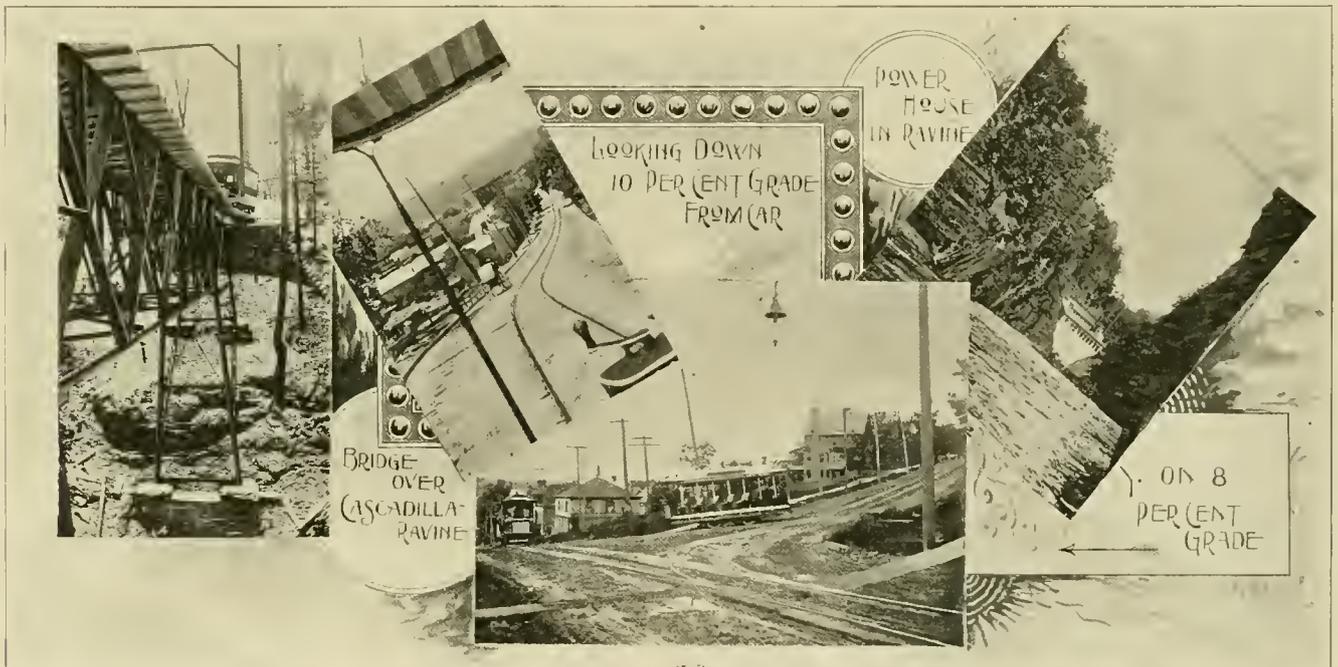

## THE ELECTRIC STREET RAILWAY AT ITHACA, N. Y.

BY JOHN C. TRAUTWINE, THIRD.

The city of Ithaca, N. Y., situated a mile or two south of Cayuga Lake, lies chiefly upon a low plain which stretches southward from the head or southern end of the lake. Immediately to the east of the town rises East Hill, upon the brow of which, and about 400 to 500 feet above the lake, or 800 feet above the sea, is located the world renowned Cornell University, commanding a beautiful view over the town and the lake. The erection of the college buildings on the hill has naturally caused the town to extend in that direction. The Ithaca Street Railway Company's system consists chiefly of three lines radiating from the intersection of State and Tioga streets,

were run over a curve with a radius of 40 feet, and with a grade of about 8 per cent at State and Eddy streets; but as the curve and grade were found to be too severe for cars going up, a "Y" was added, and this also affords a passing point for the cars. In the view, a down car is seen waiting on the curve, while another car, on the left, is seen coming up, to reverse on the "Y" and proceed up the hill on the track shown on the right. The branch crossing Cascadilla Ravine to the University campus, is carried by an iron bridge, built in 1893, by the Croton Bridge and Manufacturing Company. The ravine is 40 or 50 feet deep, and about 125 feet wide. The bridge, 35 feet high from the tops of the foundation piers, is about 140 feet long. It has five openings, the central one being spanned by a Warren truss, 61 feet long and 10 feet deep. The other spans are each 20 feet long and are formed of 15-inch "I" beams. The bridge

in the heart of the town. Two of the lines occupy the level portions of the town, one running westward along State street to the stations of the Lehigh Valley and the Delaware, Lackawanna & Western Railroads, and the other northward to the steamboat landing, with a recently constructed branch to a pleasure resort on the lake shore. The third line, running eastward, climbs East Hill via State and Eddy streets, to the station of the Elmira, Cortland & Northern Railroad. A short branch from this line crosses the Cascadilla Ravine and enters the college campus, but only for a very short distance, as its presence might interfere with the electrical work carried on in some of the college buildings. The profile shows the line between the Lehigh Valley Railroad station and the campus. For several hundred feet on the hill, the grade is between 9 and 10.5 per cent. The accompanying photograph was made from the car while running down the 10.5 per cent grade. At first, both the up and the down cars

is on a 5 per cent grade. Brackets on each side of the bridge support wooden poles which carry the supports for the trolley wire. The branch to the lake crosses Fall creek by a through, Pratt truss, single span, skew bridge, built by the same company. During late years, cars have been run regularly, every day, in spite of the heavy snows which frequently fall. The track cleaners are often sufficient to remove the snow, but it is sometimes necessary to employ men with shovels, or a plow without wheels is dragged over the track by four or six horses. No electric plow has been used. Sand is carried on all the cars, and most of the closed cars are well heated by electric stoves. On the hill cars, brake shoes last about two weeks. The Ithaca Street Railway Company controls not only the electric road described, which comprises the entire street railway system of Ithaca, but also all the electric lighting of the town, for which it has about one hundred arc and two or three thousand incan-

descent lamps. The power house occupies a recess formed by blasting in the right bank of the Ithaca gorge, through which runs Fall creek. A photographic view of the gorge and power house is shown herewith. Water is diverted from the creek and led through a pipe 5 feet in diameter and about 600 feet long, to the turbines under the power house, with a head of nearly 100 feet. As there are, in the ravine, numerous natural falls, one of which may be seen to the right of the power house, it was not necessary to build a dam. The speed of the turbines is maintained uniform by means of governors which control valves in the pipes, admitting more or less

TALE OF A \$5 GOLD PIECE.

These \$5 gold pieces which our government has coined for us, cause this long suffering people a deal of annoyance, still there is no one but would enjoy having his trouble multiplied by the possession of more gold. They are always being mistaken for nickels or pennies, but seldom are nickels mistaken for gold pieces.

A man in Chicago gave a \$5 gold piece to a street car conductor under the impression that it was a nickel. He did not discover his mistake until after he had left the car and entered his home. Immediately he set off for the car barns to hunt up the conductor, but it was of no use, for he could not remember the number of the car nor the appearance of the conductor. In vain did he rack his brains to recall some particular circumstance that would serve to identify them, and was forced to return home, expecting never to see his \$5 again. His wife went shopping next day with a neighbor. In paying for a purchase the neighbor handed the salesman a \$5 gold piece.

"Oh, those dreadful gold pieces," exclaimed the wife of the man who had been unfortunate.

"Don't say that," said the neighbor, "my husband received this in change last evening on a street car. He gave the conductor a quarter and received, as he supposed, four nickels in change. After coming home he discovered that one of the nickels was this gold piece."

"It is strange, but my husband was the victim of a similar mistake last evening. He paid one to a conductor, thinking it was a nickel."

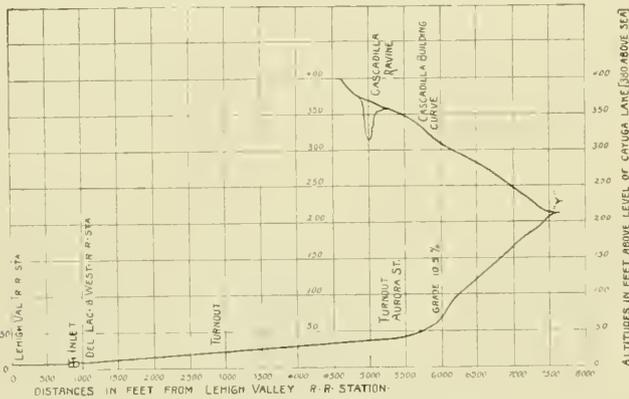

"I wonder if my husband received your husband's gold piece."

"Impossible."

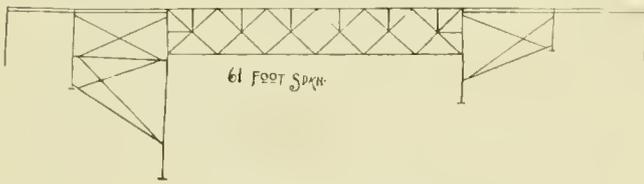

It was possible just the same, for when the two men came together and compared notes, it was found that both had ridden on the same car that evening, one in front and the other on the rear platform. There seemed to be no reasonable doubt that the conductor had received the gold piece for a nickel and given it out for a nickel. The money was returned to its rightful owner. This story is vouched for as being true, however strange it may seem. For a story of remarkable coincidence it equals the pleasant fiction of the man who caught a fish that had in its stomach a ring which he had accidentally dropped into the sea years before.

TAR AS FUEL.

Tar is being tried as fuel for steam boilers by the Melbourne Tramways Company, of Melbourne, Australia. The tar is kept melted by a coil of exhaust steam pipes in a large tank. Thence it is pumped through a strainer and up to the feed tanks over the boilers. From these tanks the liquid tar passes through a 2-inch pipe into the furnace, where it is blown into spray by a steam jet and completely burned. The tar and steam pipes have flexible joints at the furnace door plate, so they can be easily swung back as the furnace door is opened.

PROFILE OF ROAD.

BRIDGE ACROSS RAVINE.

water, as required. An inclined plane was used to lower the building material from the higher ground to the site of the power house. It is still used for lowering coal for a Ball engine of two or three hundred horse-power. This engine is used on those rare occasions when the water of the gorge is too low to run the turbines, or when the turbines or the upper end of the pipe become clogged with sticks or ice.

CHICAGO COMPANIES' LICENSE FEES.

Chicago street railway companies have paid into the city treasurer \$51,731.42, for license fees, during the first three quarters of the year. The license fee is \$50 per car a year. The Chicago City Railway Company and the West Chicago Street Railroad Company run quite evenly, the former paying \$15,249.38, and the latter \$15,228.29. The North Chicago Street Railroad Company paid \$8,576.25; Calumet Electric Railway Company, \$1,718.25; North Shore Railway Company, \$213.25; Lake Street Elevated Railway Company, \$4,000; Chicago South Side Rapid Transit Company (Alley L), \$6,750.

The Mission Street electric line, San Francisco, was opened to traffic September 15.

## THE EVOLUTION OF ELECTRIC TRACTION.

Abstract of a Paper Before the Brooklyn Electrical Society, by  
William Clinton Burling.

It has been said that "The civilization of a country may be gaged by its methods and means of communication," and if countries, cannot times be considered by the same standard? If so, this, the last quarter of the nineteenth century, is the highest civilization the world has ever seen, and one nation, America, may be said to lead the world in the invention of such methods and means.

Still, there was one class of transportation that remained practically the same, from its inception until within the last few years, and that is the street railway. Beginning with horse<sup>s</sup> as its motive power, over fifty years passed without an essential change in the method of propulsion. Many attempts have been made to displace the horse by mechanical contrivances, applied in the shape of steam, compressed air, gas, cable, etc., but it is safe to say the electric railway is the one that will, and, in fact, has superseded, all other means of car propulsion in the majority of our city streets. This noiseless, tractable form of energy, devoid of all smoke, cinders, ashes, disagreeable odors, and noxious gases, and with its great reliability of operation, is far superior to any other system now in existence.

Although the cable possesses many of the good qualities of the electric motor, the latter far surpasses it, in that the road does not depend entirely upon the integrity of a continuous cable, from power station to end of road and back, wherein any stoppage means total interruption of traffic, and any damage in one part disables the whole line. No catching of grip in loose strands and cars running away is found with the electric road. The speed is much more under the control of the motorman, and the cars can be run in either direction, on the same track. Also there is not as much difficulty with switches and cross overs. These are only a few of the great advantages of electric railroads.

The first attempt at an electric railroad seems to have been made by Thomas Davenport, an American blacksmith, residing at Brandon, Vt., who, in 1835, built a small circular railroad in Springfield, Mass. This same man, in 1840, printed the first newspaper ever run out on a press using electricity as its motive power. It was called the "Electro-Magnet and Mechanic's Intelligencer." In 1837, Richard Davidson, a Scotchman, built an electric locomotive weighing five tons, which he claimed to have run on the Edinburgh & Glasgow Railway, and to have attained a speed of four miles per hour. Some seem to throw doubts on this motor ever having moved his 5-ton locomotive any distance whatever. In the fall of 1845 the Mechanics' Magazine, of England, published a letter signed "J. M.," which, as far as I can learn, is the first expressed idea as to the practicability of an electric railroad system, operated with a power station. The writer of the letter argued in support of his idea as follows: "Suppose we have a railway ten miles long,

and at one terminus is placed an enormous stationary galvanic battery. Might we not make the rails themselves the conducting lines of the battery, the wheels being so arranged as to break the connection when required. A rotating magnet might revolve by the electro-magnetism thus communicated. Perhaps some fertile brain may take the hint, and bring forth soon the ideal electric railway." A fertile brain in this country did work out the idea, and, in 1846, John B. Lilly\* exhibited, in Pittsburg, Pa., a model of an electric car, which was driven by a current passing along one rail, up through the motor, and down the other rail. This seems to be the first record of the approach to our present system of power stations.

Professor Page, of the Smithsonian Institute, at Washington, aided by an appropriation from congress, constructed an electro-magnetic locomotive, about forty-five years ago, which was claimed to be of 16-horse-power, and provided with 100 Grove's nitric acid cells, the platinum plates of which were eleven inches square. An experimental trip with this novel machine was made on April 29, 1851, between Washington and Bladensburg, 5½ miles, on the Washington branch of the B. & O. Railroad. It started very slowly, so that a boy with ease could keep pace with it. The speed soon increased, however, and before half the distance was traveled it was said to have attained a speed of nineteen miles an hour. It only continued at this speed over about one mile of track, however, before some of the battery cells cracked, the fluids became intermixed, and the current stopped. These and other pioneer experiments in electric railroading did not prove commercially successful, though they demonstrated the possibilities of electricity as a motive power. Not until the invention of the dynamo did electric railroading become a practical possibility. The early experiments, as shown, were carried on with primary batteries as the source of power, and with motors which gave but small efficiency, and it was not until 1873, when Gramme discovered by accident, that the dynamo could be used as a motor, that it was made possible to operate electric railways commercially. A little anecdote in connection with this discovery of the motor may be of interest. It is said that at the Vienna Exposition of 1873, Gramme had several dynamos on exhibition, and a careless workman, in setting two of them up, connected their wires together. When the belt was applied to one, to the surprise of the workman the second dynamo's armature began to rotate in the opposite direction to the one to which the belt was applied. He soon reported the matter to Gramme, and this accidental discovery may be said to have completely revolutionized all forms of electric motive power. Although several electricians experimented in a small way after this discovery, but little practical advance was made in electric railroading until 1879, when Dr. Werner Siemens built the first economically operated electric railway, at the Berlin Exposition. This consisted of a narrow gage line, laid in a circle, some 900 yards in circumference. A third rail was placed between the tracks, and insulated on wooden

\*For full description see STREET RAILWAY REVIEW for March, 1893.

blocks placed above the ground, from which, even in wet weather, there was but little chance of leakage. The car tracks were used for return conductors. On this road was run a motor which was capable of exerting five horse-power, and which drew two or three trail cars, with a capacity of twenty or thirty persons. During the summer 100,000 persons were carried on this road, and it was considered on all sides a success. Thomas A. Edison was the first inventor to build a dynamo electric railroad in this country. In the spring of 1880, at the expense of Henry Villard, he constructed a short line at Menlo Park, N. J. It was a success, and people from far and wide came to see it. In the next year, 1881, Dr. Siemens built a line at Lichterfeld. This was the pioneer street railway constructed for regular passenger service. In this same year, he, and Mr. Halske also, exhibited at the International Electrical Exhibit in Paris another electric railway. In 1883 Stephen D. Field exhibited an electric locomotive at the exhibition of railway appliances in Chicago, while in the same year an electric line six miles long was constructed between Port Rush and Bush-Mills, Ireland. This was built on a 3-rail system, the main conducting rail being placed near the fence, on wooden posts eighteen inches high, for the purpose of insulating it from the ground. This is the first record to be found of the conductor being raised in the air, and seems to be the first idea the Europeans had of raising their conductor above the ground, and utilizing the air for an insulator. An American, Dr. Joseph R. Finney, of Pittsburg, Pa., a year earlier, in the summer of 1882, designed the first overhead trolley, using a wire as the conductor. He was also one of the first in this country to conceive the idea of placing the motor directly on the passenger car. From this it will be seen that our own country has made greater progress than all the rest of the world included in the application of electricity to railroads. The first electric street railroad opened in America, for actual commercial service, was a line between Baltimore and Hampden, Md., two miles long, which was put in operation September 1, 1885. The electric machinery was designed by Leo Daft. In May, 1887, two years later, T. C. Martin read a paper before the American Institute of Electrical Engineers, in which he showed that there were then in operation in the United States thirteen electric railroads. In 1890 there were about 250 railroads equipped with electric power. Now to see cars propelled by horses is the exception, and nearly every railroad line so propelled is considering the use of some form of electricity for its motive power in the near future.

In the matter of carrying current to the cars, the first overhead trolleys in Europe used a slotted tube. Contact was made by a sliding piece of metal, running inside the tube, and connected with the car by a flexible cable. In this country Dr. Finney had given us the idea of using wire, that was generally adopted for overhead conductors, and the example set by us has been followed all over the world.

In the first overhead trolley construction in this coun-

try, the trolley wheels, or contact trucks, as they were sometimes called, consisted of a small carriage or truck, which ran on top of the wire and was connected with the car by a flexible cable. It took an enormous amount of experimenting before what appears to us to-day so simple, the under contact trolley, with its arm, springs, and wheel, was evolved.

It was soon found that an individual electric locomotive for every street car would be a great waste of money and loss of power. Inventors, therefore, turned their attention to placing the motor directly on the passenger car. At first they placed the motor on the platform, or inside the car, and connected it with the axle by sprocket and chain. But this took too much space otherwise available for passengers, besides too much loss of power. So inventive genius tried placing the motor under the body of the car. Although this now seems to us very simple, it proved no easy task. The truck had but a limited amount of available space for a motor, and the early motors were not as compact as at present. Economy of weight and space, as well as of power, required that the motors be run at high speed, and as the wheels revolved at a comparatively low rate, it is evident that some means of reducing speed was necessary. A long line of experiments was carried on, until now we have the slow speed multipolar single reduction motor. Most of our cars to-day are supplied with two motors, a few of the advantages of which are that the speed can be changed with less loss of power, by connecting up the motors in parallel or series, or by running one motor alone. The power can also be communicated evenly to both pairs of wheels. A few years ago, William Baxter, Jr., conceived the novel idea of enclosing the motor entirely within the car wheel, thus relieving the axles of all strain due to the weight of the motors. This idea has not been adopted to any great extent, on account of having to run the motor at low speed.

The storage battery has raised great hopes as a means of car propulsion, but the investors in this system have met with sad disappointments. More money has probably been lost in attempts to develop this system than any other form of electric car traction.

Many inventors have taken out patents embodying the principle of a closed conduit with contact points placed inside an open conduit. These, on short experimental lines, built on favorable conditions, have appeared to work well. The great number of moving parts, however, and the liability of their getting out of order, besides their inaccessibility, makes investors hesitate in putting money in them.

The Bentley-Knight system was tried in New York a few years ago. In this construction a conduit was placed alongside one of the car rails, and two conductors were used, one placed under each slot rail and in close proximity to it. This system failed through the insulation and drainage both being insufficient. The Siemens-Halske system has proven successful in Buda-Pesth, but it is questionable whether it would work satisfactorily in our climate. In this system the conduit is very large,

thus getting ample drainage and plenty of room for air insulation. There are two rails used as conductors, one on each side, supported by insulators fastened to the side walls of the conduit. This system, I believe, has not been tried in this country.

The Love system, in use in Washington and Chicago, consists of a conduit similar in size to that used for cable roads. Flat slot rails are used, from which there is a projection downward along the slot opening, which protects the wires from drippings which may come from the street. Two wires are used in this system, being held by insulators about four inches below each slot rail. This system has not seemed to work quite satisfactorily, however. I can best quote from a paper read before the American Institute of Electrical Engineers, in New York, by a prominent electrical engineer recently:

“With regard to the Love conduit, I have had the good fortune to examine the only two roads operated on this system, the road in Chicago and the road in Washington. The former is 1 5/8 miles long, circumventing several blocks. I made several trips, and on three trips we were shut down from one cause and another twenty-three times. I do not consider it a success. In Washington, however, the road is vastly improved, and is run on a street where the conditions are far better than in Chicago. The street is beautifully paved with asphalt. The road started on March 2, 1893. It has not been all plain sailing with them there. They have had trouble largely from mechanical difficulties, so far as I can see. The slot rail turns down along slot opening, and the trolley wheels come very close to the iron, and there is evidence that sparks pass from wheels to the iron. I found that trolley wheels lasted but ten days. I do not claim the Love conduit is a success by any means, but in my judgment it is to-day the nearest approach to a successful conduit system of any that has been put to actual test of street traffic.”

Mr. Griffen, of the Electrical Conduit Traction Equipment Company, visited Washington last fall to inspect this system, but while he was there found it inoperative during the whole time.

CHARLES K. LAWRENCE IN PRISON.

Charles K. Lawrence is now serving a sentence of two years and five months in the Auburn, N. Y., prison, for embezzling a street railroad valued at \$25,000. In 1891 he was given a contract to rebuild the Lockport Street Railroad, six miles long. He tore up the old rails, with the understanding that he was to relay entirely new ones. The cars, he said, would have to be almost refitted, so he shipped them to Buffalo. From that point cars and rails were shipped to Marion, Ind. Soon afterward Lawrence left town.

Lawrence was arrested in Erie, Pa., brought to Lockport, tried, convicted, and, in June, 1892, was sentenced for two years and five months. He was in jail three or four months pending an appeal, which resulted in his

release. The railway company appealed, and received a decision confirming the first. Detectives were put on the track of Lawrence, who was captured after a long search. He is now wearing stripes.

ROUTED THE MILITIA.

Tacoma, Wash., has a street car conductor who successfully put to route seventy members of the militia in full uniform. About 7 o'clock in the evening Conductor Bybee of the Old Town line caught a load of seventy members of the militia. They behaved like ordinary passengers until he began to collect the fare. The first man refused to pay, and the others rallied to his support, saying they were going to run the car to suit themselves.

Like a great strategist, Conductor Bybee let them have their way for a time, as he did not care to tie up the entire line. When he got to a convenient switch, he side-tracked the car. Taking the switch iron in his hand, he ordered himself to “fall in.”

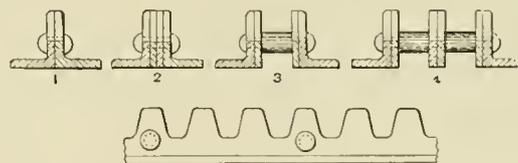

The reconoitering party reported the enemy in camp, but without pickets. With this information it was decided to make sudden attack, and with all the force, paying no attention to the rear. The order to advance was given, and the enemy being taken by surprise, hesitated and was soon in full retreat.

Conductor Bybee, having won the first skirmish, decided to change his position, so he started the car, placing a rear guard on the platform. The enemy rallied and made an advance but was repulsed.

RACK RAIL FOR MOUNTAIN ROADS.

La Societe Anonyme d'Ougree, of Ougree, Belgium, has introduced a new rack rail for mountain roads, which consists of two angle bars with or without iron plates being interposed. They are connected by rivets or bolts in which the teeth have been cut out. The rail is illustrated by the Railroad Gazette.

When only a low resistance is necessary, the rail con-

sists of two angle-irons, as in Figure 1, but iron plates are interposed between and bolted up with angle irons as in Figure 2, when the resistance is great. These plates can be increased as desired. Figures 3 and 4 show the angle irons not bolted close together, but spacers are used on the bolts, and the whole forms a double or triple rack rail. The rails can be laid on either wood or iron sleepers. It is claimed that the rail can be economically and rapidly manufactured and is quite safe on account of the transverse section of each tooth being composed of several elements.

## SELLING POWER FOR OUTDOOR AND FARMING PURPOSES.

Although the action of the insurance companies has practically prohibited the selling of power for stationary motors in insured buildings, there is still open a large field for stationary motors run from trolley circuits, outdoors and around the farm in small uninsured buildings. They are now being used in many places to run stone crushers for paving contractors, for making excavations, and for running brick and farm machinery. As far as we can learn, the first farm to make use of electric power was the "Crystal Hill" farm, near Catasauqua, Pa., while the first farmer to use power from a railway circuit on his farm was Hon. Jeremiah Roth, of Allentown, Pa.

Mr. Roth is the proprietor of the Allentown Stock Farm, which is located near the city limits of Allentown.

SCENE AT CRYSTAL HILL FARM.

He has always been one of the most progressive farmers in the locality, as is manifested by the fact that he is president of the Lehigh County Agricultural Society, which is a leading one of the state. He is also an ex-member of the Pennsylvania legislature. The power used on his farm is taken from the circuit of the Allentown & Lehigh Valley Traction Company. He has erected poles and wires for a distance of 3,300 feet, installed a 15-horse-power motor, and is running all his farm machinery around the barn with it. The motor is placed in a building back of the barn and is belted to a shaft, which shaft is supplied with pulleys for transmitting the power to various kinds of machinery. Thrashing, cutting feed, grinding grain, shelling corn, pumping water and sawing wood are done in this way. He also has electric lights in a barn 50 by 208 feet. The current is sold by meter, at eight cents per 1,000 watt-hours. After having tried electric power, Mr. Roth would by no means go back to steam or horse power. He says that it is cheaper than steam or horse power, and there is the advantage over steam of less danger from fire. He recommends it to other farmers as being the best system in existence.

Although there has for the last three or four years been much talk about supplying power to farmers along the routes of electric railways, such talk has principally been in the prospectuses of "fake" electric roads or in the pages of magazines. As far as we know at present, the Allentown & Lehigh Valley Traction Company was the first to actually sell power for this purpose. Since

Mr. Roth has put in electric power, a number of other farmers in the vicinity have become interested and A. F. Walter, cashier of the road writes us that they have had several other calls from farmers along the line, and expect in the near future to install other motors for this same kind of service. The road extends through sixteen good-sized towns, with a prosperous farming country between each, so that there is an excellent prospect for a good business.

HON. JEREMIAH ROTH.

The other installation spoken of at Catasauqua, Pa., while not run from a railway circuit, is interesting in this connection, as showing what can be done along this line. The "Crystal Hill" farm and dairy, near Catasauqua, handles a large amount of ensilage or corn fodder, and several years ago erected five large silos or special bins for storing it. These silos had a capacity of 1,000 tons. The expense of preparing the fodder for these silos was very great when done by horse-power, and steam power was used for some time, but coal had to be hauled a long distance by teams, and an engineer hired, so that although it was cheaper than horse power, the item of expense for power was still large. In October, 1892, W. M. Morrison, an electrical contractor of Catasauqua, induced the proprietors of the farm to try electric power. A 220-volt circuit was run from the terminus of the Catasauqua Light & Power Company's lines, making the total distance of transmission  $2\frac{1}{4}$  miles.

The first installation on the farm consisted of a 5-horse-power Crocker-Wheeler motor, which was used to operate the butter churns, a cream separator, milk aerator, bottle washer, and ceiling fans during hot weather, the same line being used to furnish current to lamps installed throughout the various buildings, and which are furnished with abundant light. The first installation having proved so successful, both in cheapening the cost of production and in operating the various utensils, it was decided to replace the 25-horse-power engine and boiler with a C.

ELECTRIC POWER, CRYSTAL HILL FARM.

& C motor (10 h.-p.), which soon demonstrated its superiority over the engine. About seventy head of Holstein milch cows are fed on this ensilage during the year, and the adoption of electric motor power has cheapened the cost of this food (ensilage) 65 cents per ton, it having cost \$1.50 per ton previously, but now is it stored in the silos at a cost of 85 cents. Thrashing and wood sawing are also performed by this motor, and the proprietors say that cleaner work on the thrashing machine they have never accomplished, as no grains are broken, by variable speed. These people are great advocates of this power, and have induced farmers in the vicinity to adopt the same method.

#### TRUE STORIES HEARD AT CONVENTION.

A well known street railroader from the east was in Kansas City the other day, and strolling along the street came upon a horse auction. Although his own lines have been converted into electric he still felt a kindly interest in his old friend the horse, and paused to watch the sale.

"Lot 17," cried the auctioneer, "What am I bid for lot 17?"

To all appearances "Lot 17" was a pretty little pony, with long mane and tail and a kindly face, and the subject of these lines bethought himself that it would be a great scheme to purchase the little equine for his small boy at home. So he bid ten dollars, and raised back several times by easy stages until seventy-five dollars was reached, when he stopped and so did every one else. He stepped up to the captain's office and planked down the funds and was assured he had secured a great bargain. He remarked he was satisfied, and taking hold of the halter, started away.

"Where are you going?" yelled the attendant, "and what shall I do with them?"

"Do with what them?" rejoined our man.

"Why, the balance of the lot, of course."

"What balance of what lot?"

The look of disgust that came over the horseman would have frosted a cabbage. "We want you to get your hosses out of here, so we can make room for more. You don't suppose we are going to board 'em until you get good and ready to ship, do you?" By this time the stable hands had lined up eleven as fine little bronchos as one could wish, which, with the one already led out, made an even dozen, and constituted "Lot 17."

Our friend has been busy giving horses away where he found a chance, ever since.

\* \* \*

"This reminds me of an experience which occurred when I was in Sioux City, last month," said the president of one of the largest street railway supply houses. "I had an hour to wait for the train and sauntered up the street. At a corner a crowd was gathered where the sheriff was selling out a lot of furniture and things to satisfy a judgment. Just as I edged into the crowd, a fine-looking carriage horse was trotted up, and the auc-

tioneer called for a starter. I thought it would be fun to bid a few times and drop out before a selling price was reached, so I sung out 'Twenty-five dollars.'

"Quicker than I can tell it, the auctioneer cried: 'I'm bid twenty-five; one, two, three, and sold for twenty-five. Here you are; next.'

"Well, it simply took my breath away, for I was several hundred miles away from home, and had as much use for a horse as a superintendent has for a car-starter. But the animal was certainly a fine one, and I concluded I would sell him at a great sacrifice for about fifty dollars, and clean up twenty-five dollars for my hour's time. So I smilingly paid the price and led him away, remarking it was a great bargain. Everybody else seemed pleased, too, and evidently envied my good fortune. So I started down the street, satchel in one hand, leading the horse with the other, offering the bargain to every one I met. No one seemed much interested, and when I stated the price, fifty dollars, looked at me in such a strange way I began to feel uncomfortable; and, then, a policeman sauntered along after, until it began to dawn on me that they took me for a horse thief. No one would buy. It lacked but fifteen minutes of train time. I got desperate, and asked for an offer. Finally, when I had just four minutes left, I struck a stranger and closed the trade at ten dollars. Then I ran three blocks, caught the rear car just as it pulled out, and sank back exhausted in the seat. I know more now than I did about horses, and next time I'll bet they don't get any such horse on me."

\* \* \*

"Tell you what happened to me," said a fat man, whose name is known to every street car man in the country, "I was in a sleeper the other night. Had a berth in the middle of the car, which was crowded. I had a fine sleep and, awakened in the morning feeling as fine as a fiddle. I made myself as agreeable as possible to the other passengers, who, however, all seemed worn and weary, and not at all inclined to be sociable. Finally, when all the berths had been made up, a dignified looking man took his silk hat in his hand and passing from passenger to passenger, spoke a word, upon which, each with great alacrity, went down in his pocket and deposited a coin in the hat. When all had been so visited he came to me and pouring out the money on my seat, said:

'My friend, this is for you.'

'But I don't want it,' I replied. 'What's it for?'

'A small token of our obligation for the music you rendered, and to which we listened all last night.'

"My wife has always insisted I snored, but now I believe it. I put enough money with the collection to get a box of fine cigars, and after the next station was reached we all smoked and peace was restored. Now I ride in the day time."

\* \* \*

"Those horse stories," said a listener, "remind me of an incident that occurred, when we sold a lot of horses,

having changed the equipment of our lines. A peddler secured two horses at fifty cents apiece. He started to take them home, but when he had gone about a mile, one of the horses fell down and died. That was in the days before the city authorities made a business of removing dead animals. Next day the peddler came to our office and wanted \$5 to pay for removing the horse from the street. He didn't care for the loss of his horse and fifty cents, but he did object to paying the \$5."

\* \* \*

"Do you gentlemen know what it costs to run a road in the smaller cities of this state?" asked the superintendent of a Georgia line.

"If you don't you will be surprised. We pay our conductors a dollar a day. They are recruited from the class known as poor white trash. If we were to pay them \$1.50 a day, they would be so rich at the end of the week that they would lay off for a week to spend their money. We have learned this fact by bitter experience. The second week we ran our road we were without help. If we pay our men only enough to live on, we can keep them steadily at work.

"Track laborers," he continued, "receive 75 cents a week and board. The board consists of molasses, bacon gravy and bread. When the men come to the table the first man pours the molasses on his plate, passes the pitcher to his neighbor, puts bacon gravy on top of the molasses, takes a piece of bread and sops it in the mixture. He continues the process until he has 'licked the platter clean,' when his meal is finished."

\* \* \*

Speaking of created travel, W. S. Dimmock, general superintendent of the Omaha & Council Bluffs Railway & Bridge Company, Council Bluffs, Ia., told how his company made Kelly's Commonweal Army earn it some money last summer. Great objection was made by the citizens to the arrival of the army, but Mr. Dimmock has a long head, and gave permission to use some of the company's vacant property for a camp. The camp was on the outskirts of the city, so it was desirable to keep the army there for a few days, in order to give everybody a chance to visit the camp.

"We not only furnished the camp," said Mr. Dimmock, "but we gave out rations. Our expectations were realized, for the people flocked to see the army. The eastern railroads refused to furnish a train to carry the army out of town. This got the laboring element up in arms, and about 5,000 of them started to march from Omaha. We heard of it, and thought they might try to capture our cars, so we sent them all over to the Council Bluffs side, and shut off the current.

"By this time the crowd had got to the entrance to the bridge. We could have kept them out, but there would have been bloodshed. When I learned that they were not after our cars, but simply wanted to cross the river, it flashed over me that these were citizens of Omaha, and they were going to live there, and would be

patrons of the road. Here was a chance to make friends. I also knew that they had to walk six or seven miles, and would be tired out when they got ready to return home, and would be glad of the ride, which was the only way they could get back. I figured they would do no harm if permitted to cross, and, if resisted, they would be enemies of our company and a bloody battle would result, for they were all crowded into a small space, and we had a force of policemen ready to shoot. I made a speech to them, and told them we would let them pass over the bridge free of charge, although we were entitled to toll. They cheered the company and marched over the bridge. But we caught them that night, and the two following nights, having permitted them to cross free in the day time. We had plenty of cars at the Council Bluffs end of the bridge, and every mother's son paid his little ten cents for a ride home, and there were several thousands of 'em, to. Some days after it began to dawn on the laboring element that the company had been coining money."

\* \* \*

Mr. Dimmock's story reminded George W. Baumhoff, general superintendent of the Lindell Railway Company, St. Louis, of a neat stroke that loaded his cars on October 6. He had a boat race between two women in tights, at Forest Park, which drew 30,000 people, 25,000 of whom rode on his line. One week later the women rowed a race on the Mississippi river, which attracted 75,000 people. The expense was only \$300. Mr. Baumhoff says next season he intends to have some swimming matches between women.

#### MONTREAL'S ANNUAL STATEMENT.

The Montreal Street Railway declared, on November 8, its semi-annual dividend of 4 per cent, and gives out the following statement, the best in its history:

|  | 1894        | 1893.      |
|--|-------------|------------|
| Income per year, per cent of capital . . . . . | 9.69        | 8.17       |

THAT enterprising publication "Dixie" devoted to the interests of southern industry is at work on a movement to extend trade into South America and Mexico by means of international expositions. A circular letter has been sent out to the leading manufacturers asking whether they would co-operate in such a movement. Six hundred and sixteen have professed a willingness to exhibit. The majority of those who were willing thus to co-operate already do some business in the countries mentioned and recognize the value of such expositions to their trade.

LA CROSSE AND ONALASKA STREET RAILWAY.

One of the most enterprising of the many solid manufacturing towns of Wisconsin is La Crosse, the French origin of which is betrayed in its name. It has been an

transit. Since the change traffic has increased 100 per cent.

Mr. Canterbury being in feeble health resigned the presidency in favor of Hon. Frank Pooler of Onalaska, under whose management it is now operated, with Peter Valier as superintendent.

F. POOLER.

J. B. CANTERBURY.

P. VALIER.

B. E. EDWARDS.

important place from its earliest days as a commercial point and enjoys a reputation far in advance of its population.

One of the prominent features that has helped advertise the city is its remarkably efficient system of electric railway which is loyally supported by the 20,000 inhabitants of the town.

The line of the La Crosse City Railway comprehends 11 miles of standard gauge track laid with 48 pound T and 58 and 66 pound girder rail; 11 motor cars and 10 trail cars equipped a la General Electric. In connection with the line is a branch to the suburban village of Onalaska three miles distant. This line was built four years ago by J. B. Canterbury of La Crosse, more as a real estate venture than as an investment. The traffic on the branch seemed so profitable, however, that just recently the track was bonded, wire run and power rented of the City Railway and the Onalaskans now enjoy electric

The beginning of street cars in La Crosse dates back to 1879, when a few prominent citizens, for philanthropy's sake, thought they would build a mile and a half of horse car track from what is known as South La Crosse to North La Crosse. It was operated by horse power for six or seven years with wonderful success, paying 40 per cent on the investment.

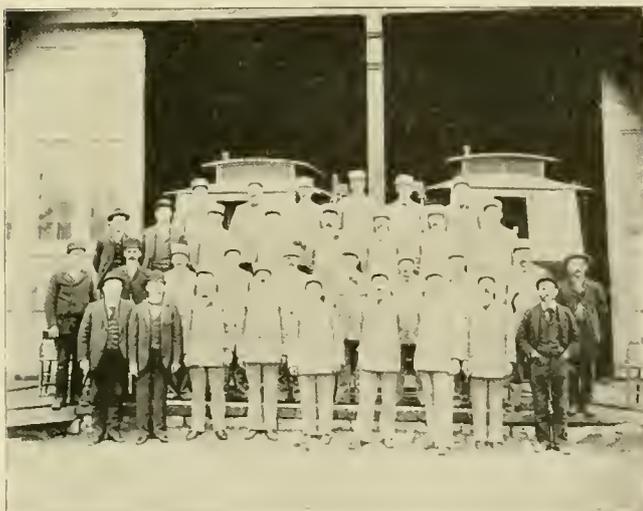

The road was finally sold to B. E. Edwards, W. W. Cargill, G. C. Hixon, Henry Gund and others, for ten times the original cost, and new organization effected.

The line was then extended all over the city. It was operated by horse power until 1893, when electricity was adopted as stated.

The management is composed of pushing, enthusiastic men who believe in La Crosse and electricity. They are by name: B. E. Edwards, president; W. W. Cargill, vice-president; G. H. Clark, treasurer; H. E. West, secretary and Peter Valier, superintendent.

W. W. CARGILL.

VIEWS OF THE LA CROSSE & ONALASKA STREET RAILWAY.

President Edwards is a pushing young business man, and to his wise counsel much of the success of the fine system is due. He is interested both patriotically and financially in many large enterprises.

Vice-president Cargill is another financier of ability. He is head of the large grain firm of W. W. Cargill & Co., which has branches in many cities of the northwest. He is energetic and progressive.

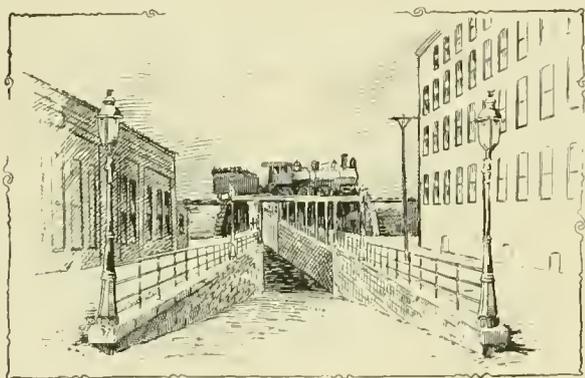

Peter Valier, superintendent, is a self-made man of Canadian extraction. He began with a meager education and by dint of pluck and ability has made himself a first-rate electric railway builder and manager. He is responsible for the smooth mechanical running of the system.

J. B. Canterbury is of Irish birth, an ex-Union soldier and an active citizen in every good word and work.

The Honorable Frank Pooler is a prominent politician and business man of Wisconsin. He has made a brilliant record and as he is only 40 years of age has still a wide future.

#### CHICAGO TRACK ELEVATION.

All of the steam railroads are being compelled by the City of Chicago to elevate their tracks within the city limits, in order to avoid grade crossings. The principal advantage to the railroads will be an increase of speed.

Where there are streets to be crossed they are depressed, and a subway built, as shown in our illustration. The new system will be of considerable advantage to the car lines, as many of them cross railroad tracks, and they can make better time, while the danger from crossing accidents will be entirely avoided.

A DIVIDEND of 3 per cent has been earned by the Columbus, O., Street Railroad Company for the nine months ending October 1. The gross earnings and rents aggregated \$421,166.96, of which \$197,781.56 was absorbed by operating expenses and \$132,307.65 by interest and taxes, leaving \$91,077.75 for the stockholders. The Columbus Street Railroad Company operates the Crosstown Street Railway Company, which, for the same nine months, made gross earnings of \$59,013.71 with operating expenses of \$23,474.38 and interest and taxes amounting to \$14,700.85, leaving \$20,838.48, net.

#### MADE THE FIRE FLY.

Some electric railway men were exchanging prevarications the other evening, when one of the party broke over the rule by telling a true story. As it was a good one, it was allowed to pass. The trolley wire broke one day, and a clerk in the offices of the company was instructed to go out and wrap the hanging down end around a pole. Now the clerk was innocent of all knowledge of electricity. He also had a refined taste, and as he went out to pick up the live trolley wire he saw an iron lamp post available, which was ever so much better to wrap the wire around than the vulgar wooden poles. A kind fortune kept him from getting a shock while he carried the live end across the street, and the first intimation he had of anything being wrong was when the wire first touched the iron lamp post. Electric railway men do not need to be told of the brilliant display of fireworks which immediately took place. The clerk started up the street on the run. He was probably as much surprised as a dog which came along where the boys were repairing the line one day and smelled of the end of a live trolley wire. The boys at first claimed there was a streak of fire a block long, but after cogitation concluded that it was simply the yellow dog under full speed.

#### CHARLES SCOTT SPRING COMPANY.

The Charles Scott Spring Company, of Philadelphia, has recently bought the lot adjoining its present factory and thereby secured frontage of 130 feet on Germantown avenue, 120 feet on Canal street and 43 feet on New Market street. A siding from the Philadelphia & Reading Railroad, running on Germantown avenue, will run into the works and greatly increase the shipping facilities. The new addition to the factory is now in process of erection and will be under roof by the middle of October. This new shop will be devoted entirely to the manufacture of elliptic springs. The old elliptic mill has a capacity of 100 tons of elliptic springs per month, but this was found inadequate to the growing business. With the new shop, the Charles Scott Spring Company will have a total capacity of nearly 3,000 tons of elliptic springs annually, while in the spiral spring department it has a capacity of 5,000 tons. This concern manufactures springs of every description, including springs for trucks, motors and trolley stands. Its brush-holder springs are acknowledged to be the best in the country. The company's business is increasing to such an extent that it is unable to look after it from the home office, and now has Arthur S. Partridge as the St. Louis agent and F. A. Lawson & Co., in San Francisco, Cal.

MENOMINEE, Mich., and Marinette, Wis., have been brought closer together by the extension of the tracks of the Menominee Street Railway Company across a bridge. Heretofore passengers have been compelled to walk a block to make the connection from one line to the other.

UNDER the supervision of Superintendent Fox, the Traction Company, Scranton, Pa., is building a mile and a half extension.

IN Philadelphia a motorman fainted at his post, the car ran away, there was a collision, and three passengers were slightly injured.

THE Haverhill, Merrimac & Amesbury, Haverhill, Mass., Electric Road, carried 1,346,043 passengers, between October 1, 1893 and October 1, 1894.

DURING the State G. A. R. encampment, the Citizens' Street Railway Company, Indianapolis, Ind., collected 75,000 fares one day from 6 A. M. to 12 P. M.

THE Baltimore City Passenger Railway Company paid \$24,964 park tax for the quarter ending September 30, which indicates gross receipts of \$278,488.

WORK has begun on the electric line from Asbury Park, N. J., to Branchport, which will make a new direct line to New York both for freight and passengers.

BETWEEN Elyria, O., and Lorain, an electric road has been constructed and put in operation by the Johnson Company, which is building a steel plant at Lorain.

IN this matter of street car accommodation, it may be said that the strap carries too much weight. It was never designed as a substitute for the seat.—Daily Fling.

THE City Railway Company, Wilmington, Del., has opened its new line to Gordon Heights. It is two miles long and runs to a summer resort on the Delaware river.

AN order of court requires Receiver J. C. O'Gorman of the Union Depot Street Railway & Transfer Company, Stillwater, Minn., to distribute \$25,000 among creditors.

ONE druggist in Owensboro, Ky., sold 9,300 street car tickets during a fair. The Owensboro City Railway Company carried 24,000 passengers Friday, and 30,000 Saturday.

WHILE uncoupling a trailer, a conductor in Terre Haute got his head tangled in a trolley rope and was almost unconscious when discovered, having been dragged several feet.

THE Milwaukee Street Railway Company has won its suit to have the assessment of its franchise declared illegal, and consequently the assessment will be reduced over one-half.

ARBITRATION has been adopted to fix the compensation of the Union Depot Railroad Company, of St. Louis, Mo., for the use of its track by the Southern Electric Railway Company.

A YOUNG man of Newark, N. J., has made a pleasure trip of eighty-five miles on the electric cars, running out of Newark, at an expense of \$1.50 in money, and thirteen hours of time.

THE newly elected officers of the Riverside & Arlington Street Car Company are: S. C. Evans, president; F. A. Miller, secretary; G. O. Newman, superintendent. The directors were re-elected.

PHILADELPHIA police made a raid by trolley. They captured the proprietor of a "speak-easy," whatever that may be, who had long boasted of his security, and had eluded the police for a long time.

THE consolidation of the Rochester Railway Company and the Rochester Electric Railway Company, Rochester, N. Y., has caused the abandonment of the latter company's power house and car barns.

THE Allegheny, Etna & Sharpsburg Electric Railway, of Allegheny, Pa., has opened a new line. The fare is five cents for the same distance for which two competing railroads exact ten and fourteen cents.

NEW officers of the Boise Rapid Transit Company, Boise, Ida., are: George Ainslie, president; Dwight Arnold, vice-president; George D. Ellis, treasurer; J. Spofford, secretary; George D. Ellis, general manager.

THE receiver of the street railway of Schenectady, N. Y., has filed his report with the state railroad commissioners. It shows gross earnings from operation, \$5,466.55; operating expenses, \$6,300; net deficit from operation, \$834.29.

THE Pawtuxet Valley Electric Street Railway Company, Providence, R. I., has re-elected its officers with the exception of reducing the board of directors from 11 to 5, who are: Gorham P. Pomroy; Charles H. Perkins; Marsden J. Perry; Arthur H. Watson; William G. Rolker.

THE stockholders of the Newburyport & Amesbury Street Railroad Company recently elected the following directors: Charles Odell, Thomas H. Johnson, John M. Anderson, C. H. Odell, C. C. G. Thornton and George H. Stevens. The new directors elected Charles Odell president and Ralph Calef, treasurer.

QUITE a record has been made by the two companies comprising the New England Street Railway Company, which earned the year's dividend in the eight and one-half months, ending September 15. The New Haven & West Haven earned \$152,830, an increase of \$9,230, and the Plymouth & Kingston, \$22,396, an increase of \$845.

ONE New Jersey editor has fears that the overhead trolley wires will interfere with the circulation of the air, as there are several companies after franchises in the vicinity. The poor man doesn't seem to realize that if there was such a net work, the atmosphere would be purer, for the impurities would be caught, and electricity itself is a great purifier of the atmosphere.

CONDUCTORS of the Lynn and Boston Street Railway Company have been defrauding the company. The janitor secured used tickets, which were given to passengers when conductors were changed, and sold them to the conductors for \$3 a hundred. They agreed to accept the cancelled checks, but the falling off in receipts led to exposure.

AT Chester, Pa., a car front was smashed by running into a 50-foot iron stack loaded on a wagon. The driver of the team attempted to get off the track, but the hind wheels, which were forty feet away from the horses, could not leave the tracks. The motorman saw the horses and slowed down, striking the load, which he did not see because of darkness.

THERE was a great jollification in Philadelphia September 27, when the Girard avenue line of the Philadelphia Traction Company was completed. When the car reached the Girard college, a young lady signalled the car, pressing on General Manager McIntyre a large bouquet of roses, and a card inscribed, "Welcome Rapid Transit."

THE Detroit Citizens Street Railway Company has won a decisive victory against the city of Detroit, Mich., in its appeal to the United States Court of Appeals, Judges Jackson, Lurton and Sage, having lately handed down a decision, conceding all of the points claimed by the company. The company will now construct electric lines in place of the horse cars, as the city can no longer obstruct the improvement of its lines.

THE licensing of motormen has been proposed to the city council of Providence, R. I. Advocates of licenses argue that since hack drivers and expressmen are licensed motormen ought to be, forgetting that the railway company is responsible for its employees.

A NOVEL damage suit has been brought against the Kansas City, Mo., Railway Company by Mrs. Jennie Rhoads. Her household furniture was damaged by flood one night during a heavy rainstorm. A portion of the water came from a lake at Troost Park, where the flood gates had been opened; and this park is controlled by the Kansas City Railway Company.

THE Riverside & Arlington Street Railway Company, of Riverside, Cal., permitted all persons attending school to ride free during September, and since October 1, has been selling tickets at forty-six for \$1.00. Many who rode only because it cost nothing, were loath to give up riding, and have become paying patrons.

IT is related of a conductor in a Missouri town, that when his car was crowded would say, "all you with passes stay on the back platform, those with cash please pass inside." When asked the reason for the order he replied. "The motorman gets all the money on the front platform, I get all in the inside of the car, while the company gets what is taken in on the back platform. I don't want any passes in mine, neither does my partner."

THE Syndicat de Traction par le Gaz (Syndicate of Gas Traction) has been organized in London, with a capital of £20,000, in £40 shares, to acquire certain inventions for France and the French colonies, and dependencies relating in any way to the traction or propulsion of vehicles by means of gas, and to carry on the business of mechanical engineers, machinists, gas engine makers, supplies of electricity, manufacturers of machinery and apparatus connected with the generation, storage and distribution of gas and electricity, etc. The first directors are Thomas H. Pearson, W. Clarkson and Henry P. Holt.

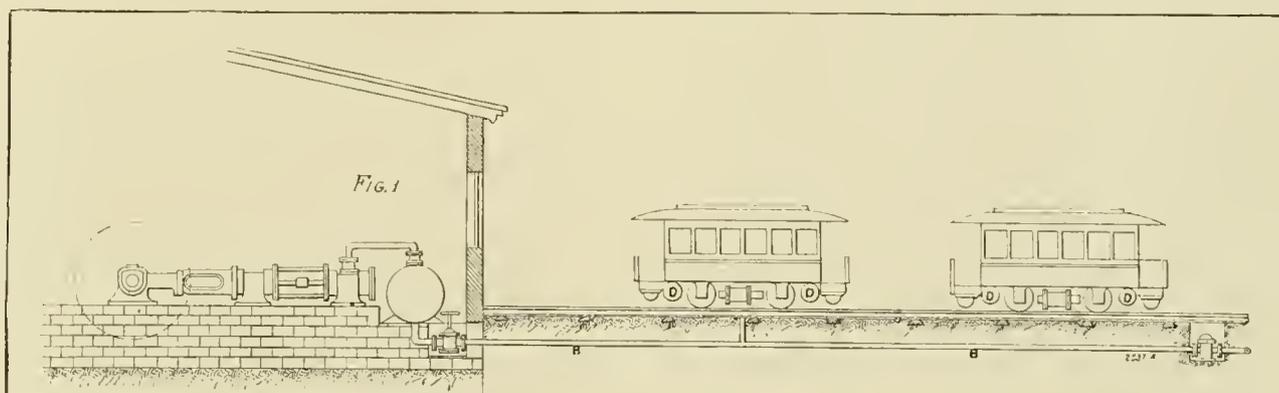

GERMAN electric railway business is booming. The municipal authorities of Leipsic have granted a forty years' concession for electric tramways in the town to the Allgemeine Elektrizitäts-Gesellschaft, of Berlin. It is proposed to construct at first lines to the extent of about fifteen miles, to which about six and a half miles will be subsequently added. The new lines will run alongside of the existing horse tramways, but will only use the latter's tracks at certain points. There will be seventy-five motor cars, each to carry thirty-four passengers, and about fifty trailers of the same capacity. The total estimated cost is £258,400. After considerable delays, at last it appears that the local authorities of Düsseldorf have come to an arrangement with Mr. von Tippelskirch, for the construction of an electric tramway to Grafenberg.

### THE CONTI COMPRESSED AIR SYSTEM.

Experiments are being made on the Conti system of compressed air as a motive power for street cars, by the Compagnie Generale des Omnibus, Paris, France, at Nantes and at Nugent. If the preliminary trials show the system is a success, the company will build three new lines in Paris, which will be opened for traffic during the present year. The Conti system is also in experimental use in Vienna.

"In this system the air is compressed at a relatively high pressure at a central station," says Engineering, of London, from which we have reproduced the illustrations. It is then admitted into the mains B placed beneath the

Nugent tramways, which have 8 $\frac{3}{4}$  miles of tracks. Nine fields are at the present time being developed in the application of compressed air: distribution of power in quantities varying from the minute time pulses to motors of 150 horse power, ventilation and other sanitary purposes; refrigerators especially for the preservation of meat; manufacture of ice as a by-product of compressed air used as a motive power; elevating water and other liquids; emptying cesspools; passenger and luggage elevators; pneumatic clocks. There are 798 industrial establishments that are using compressed air for power; many workshops operating their old steam engines, the boilers being utilized as reservoirs in which the air is heated before passing to the cylinders.

THE CONTI COMPRESSED AIR SYSTEM.—FIG. 1.

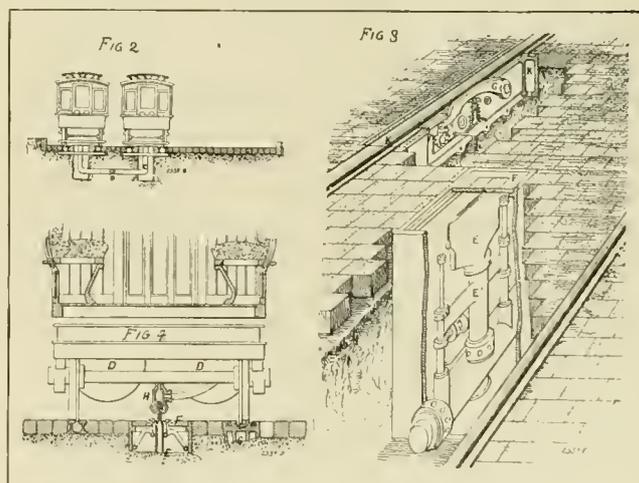

rails (Figs. 1 and 2). Branches C lead the air nearly to the surface into automatic devices by which the car reservoirs can be charged. The distance between the charging stations varies according to circumstances, but for convenience stations should be located at recognized stopping places.

An iron box is sunk into the roadway to enclose the mechanism. It is covered by a plate containing two hinged flaps, F, placed immediately over the air nozzle, E. This nozzle is the continuation of a plunger working in the cylinder E, which can be placed in connection with the air main. As the front truck of the car passes over the rails it strikes the lever G, and, depressing it, opens a valve that admits air beneath the plunger E, raises it and causes the air nozzle to push open the flaps F and rise above the level of the road. By the time it has reached its full height, the nozzle makes connection at C, communicating with reservoir D in the car. A valve is opened, which permits the compressed air to fill the reservoirs in a few seconds. The valve is then automatically closed, and as the car proceeds, the lever G is released, the air beneath the plungers in the cylinder E escapes and the nozzle falls, the flaps F closing over it, restoring the street surface. Stand pipes are provided for use in case the system should be out of order.

There are three stations in Paris intended for street railroad traction. They produce compressed air at high pressure, representing about 13,000 horse-power. An application of the McKarski system is made on the

### COMPRESSED AIR AT WESTFIELD.

On the street railway tracks at Westfield, Mass., there has been operating, for the past ten weeks, a car propelled by compressed air. The demonstration has been

THE CONTI COMPRESSED AIR SYSTEM.—FIGS. 2, 3 AND 4.

conducted by J. F. Lewis, of the Rand Drill Company, New York, and we are advised the experiment has met with strong approval of the riding public, and has proved economical in fuel and repairs. The car has been in regular, full term daily service and has recently completed 18,000 miles of service, carrying 63,000 passengers at a cost per car mile of less than 12 $\frac{1}{2}$  cents.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Injuries Inflicted by Fellow Passengers.*

The failure of a street car company to expel an intoxicated man from its car does not render it liable for an injury inflicted by him upon a fellow passenger, where the intoxicated man has not been demeaning himself in such a manner as to forfeit his legal right to ride.

This suit was for the recovery of damages for injury to plaintiff's foot. The injury was by being trodden upon by a passenger who was standing in the same car where the plaintiff was seated. The plaintiff entered the car at the City Hall Station, and after it started she noticed a man in a state of intoxication standing in the aisle holding on to a strap, nearly in front of her. After the man had been in that position some time he lurched and stepped on the plaintiff's foot. He was holding on to the strap and lurching at every turn. Some ladies appeared to be frightened, but neither they nor the plaintiff made any special manifestations of their fear. A passenger called the attention of the guard to the intoxicated man, and suggested that he be put off or found a seat; and made some other suggestions, but he was not removed.

At the trial, when the plaintiff rested her case, the trial judge dismissed the complaint. The question is whether the testimony introduced on the part of the plaintiff was sufficient to carry the cause to the jury. There is no legal principle which imposes liability upon a carrier of passengers for the wrongful acts of the passenger; but because such carriers have the right to refuse passage to one who is drunk or disorderly, and to expel him after he has been received, if he so conducts himself as to be dangerous to other passengers, or interfere with their comfort, and it is their duty to expel persons who imperil the safety or annoy their fellow passengers, they may become responsible for injuries inflicted or resulting as a consequence of such negligence. Yet, it must be borne in mind that all passengers have the same legal rights, of which they cannot be deprived until they are forfeited by their misconduct. A man in a state of inebriety has a legal right to ride in a public conveyance. So long as he remains quiet and molests no one he cannot be legally expelled. It is only when he becomes dangerous or annoying to other passengers that he becomes liable to expulsion.

There is no claim that the injury to the plaintiff was intentional, and we detect no misconduct on his part that would have justified his expulsion from the car. We also find the evidence entirely insufficient to charge the guard with any neglect of duty which the law imposed upon him. It is true that his attention was called to the man, but he neither saw nor received information of any impropriety, nor anything to indicate a disturbance.

It follows that we find no cause of action.

(Supreme Court of New York. *Thompson vs. Man-*

*hattan Railway Company.* 27 New York Supplement 608.)

*Injury to Passenger—Proximate Cause—Passenger Jumping from Moving Car.*

Two acts of negligence are charged in the declaration, viz: That defendant's driver failed to stop its car, as requested, at the intersection of Addison street and Evanston avenue; and that the deceased, while with due care and diligence endeavoring to alight from the car, was thrown to the ground and injured by reason of the negligence of appellant in failing to properly equip its cars with safety guards and appliances.

As to the alleged negligence in failing to stop its car when requested the Court is unitedly of the opinion that no recovery can be had in this case. For whatever damage a passenger may sustain from the failure to stop a street car at a proper place when properly requested, such failure being the proximate cause of the injury, a recovery might be had.

In the present case, between the negligence of the driver, and the injury to the plaintiff's intestate, there intervened another cause without which the accident would not have happened; that intervening cause was the act of the deceased in jumping from the car while it was in motion.

The train of events, from the failure to stop the car to the accident, was not a natural or necessary sequence from the act of the driver in not stopping his car; nor was the jumping from the car, so far as is shown by the evidence, a thing which the defendant can be presumed to have known would follow the failure to stop.

(Appellate Court of Illinois. *North Chicago Street Railway Company vs. Wrixon.* 51 Illinois Appellate, 307.)

*Injury to Person Crossing Street—Rate of Speed—Negligence.*

Street cars propelled by electricity and running along land burdened only with the easement of a public highway, cannot be run at a rate of speed incompatible with the lawful and customary use of the highway by others with reasonable safety.

The rule requiring one exercising his lawful rights in a place where the exercise of lawful rights by others may put him in peril, to use such precaution and care for his safety as a reasonably prudent man would use under the circumstances, is the measure of duty for one who crosses a public highway on foot. He must use his powers of observation to discover approaching vehicles, and his judgment how and when to cross without collision: but his observation need not extend beyond the distance within which vehicles moving at lawful speed would endanger him. If obstacles temporarily intervene to prevent observation, he should wait until the required observation can be made.

(New Jersey Court of Errors and Appeals. *Newark Passenger Railway Company vs. Block.* 27 Atlantic Reporter 1067.)

*Rights of Street Railway in Street—Consent of Abutting Property Owners—Agreement Contrary to Public Policy.*

When the property of an abutting owner is damaged by the construction of a horse railroad in front of his premises, he is, under the provisions of the Constitution, entitled to compensation. Thinking that such construction would be a damage to him, he has a right, before and as a condition of giving his consent to the laying of such tracks, to bargain and sell the right to damage his property, for the largest sum he can obtain.

Where an obligation provided that if the obligor would "violate the conditions of this obligation the sum of one hundred thousand dollars shall thereupon become due and payable to the said obligee, \* \* \* as liquidated damages therein," etc., it was held that the sum nominated was not in law liquidated damages, but merely a penalty.

A street railroad company cannot, by a contract with an individual, limit the sphere of its action and contract that it will not in the future do that which the public interests may demand.

The Chicago City Railway entered into an obligation "that it will not hereafter build, construct or lay, any other or more than a single track railway without switch or switches, turnout or turnouts, along any part of Wabash avenue, between Lake street and the north line of Madison street." *Held*, that the obligation was without binding force, as it was in effect a contract not to do that which, in the future, the public interests might demand.

(Appellate Court of Illinois. *Doane v. Chicago City Railway Company*. 51 Illinois Appellate 353.)

*Obstruction Near Track—Elevated Railroad Pillar—Injury to Person on Step of Street Car.*

The plaintiff, with some friends, boarded an open summer car of the defendant, having steps running along upon the outside. The plaintiff stood for a time on the rear platform smoking. As the car neared Forty-Second street some people got out and the plaintiff undertook to proceed along the side step to occupy one of the seats vacated. The change was voluntary on his part, and while he was attempting to consummate it his head was brought in contact with an elevated railroad column and badly injured. At the trial the complaint was dismissed, and we think the dismissal was right. The defendant was guilty of no act of negligence, and did nothing by means of which the plaintiff was injured. The defendant was not responsible for the presence of the elevated railroad columns, nor for any injuries caused by them.

(City Court of New York. *Vroman vs. Houston W. St. & P. F. R. Co.* 27 New York Supplement, 257.)

*Injury to Person in Street—Wagon Beside Track—Care of Motorman.*

So long as a common user of streets exists in the public it is the duty of street railway companies to exercise such watchful care as will prevent accidents or injuries to persons who, without negligence on their own part may not at the moment be able to get out of the way of a passing car. The degree of care to be exercised must necessarily vary with the circumstances of each case.

In an action against a street railroad company for personal injuries, plaintiff, the driver of a delivery wagon, testified that he drove his wagon close to the curb because he knew the street was so narrow as to render it difficult for cars to pass teams; that after making the delivery he noticed an approaching car, and went to the

rear of the wagon to shut up the tail board; that he signalled the motorneer to stop, and started to unhitch the horse to get him out of the way of the car, and that, while unhitching, the car struck the end of the wagon, frightening the horse, which turned around and injured plaintiff. *Held*, sufficient evidence of negligence on defendant's part to warrant the submission of the case to the jury.

(Supreme Court of Pennsylvania. *Kestner v. Pittsburg & B. Traction Co.* 27 Atlantic Reporter 1,048.)

*Street Railway—Paving Streets—Raising Track to Grade.*

A borough, in 1886, granted a street railway company a franchise of certain streets, the company to keep them in repair between and a foot outside its rails, to construct its road in accordance with the grades, and, in case of change of grade or improvement, to change said railway to conform thereto, as per notice from the borough engineer, at the company's expense. The company accepted, and built on the borough's principal street, which had been macadamized some eight or ten years before. The street being about worn out, and the borough and its traffic having largely increased, in 1890 the council determined to pave the street with Belgian blocks. *Held*, a reasonable and proper repair, to which the company was bound to conform its part of the street.

When a street railway company contracts, in case of a change of grade or improvement, to change its "railway" to conform thereto, it does not conform to a change of grade by digging trenches for its rails to the new grade, leaving the space between unexcavated.

(Supreme Court of Pennsylvania. *Borough of McKeesport v. McKeesport Passenger Ry. Co.* 27 Atlantic Reporter, 1,006.)

*Unguarded Excavation—Injury to Person Traveling in Street—Liability of Street Car Company.*

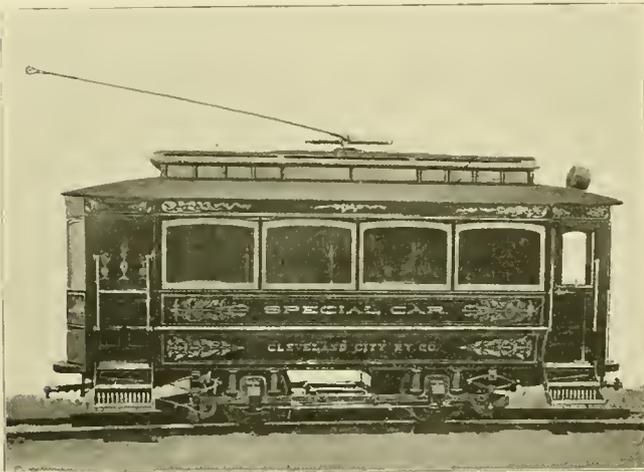

Plaintiff was injured by the wheels of her wagon getting into an excavation made by the removal of the cobblestones on a turnpike road, between the rails of defendant street railroad company. The excavation was near a bridge which the turnpike company was raising, and, at the time of the accident, was unguarded and unlighted. It is no doubt true that it was competent for defendant company to show that the injury complained of was due to the negligence of others; but, unfortunately for it, there was evidence that the repairs out of which the injury grew were under the immediate charge of its officers, while the railway was in actual operation by the company. The public had a right, and, it appears, was accustomed to use the tracks in common with defendant; and if the track was put in such a condition as to render dangerous public travel it was the duty of those having charge to give adequate warning. The judgment is affirmed.

(Supreme Court of Pennsylvania. *Wagner v. Pittsburg & W. E. Pass Ry. Co.* 27 Atlantic Reporter, 1,008.)

### THE CLEVELAND CITY RAILWAY PALACE CAR.

The new palace car of the Cleveland City Railway is shown in the accompanying engravings, by courtesy of Secretary J. B. Hanna, of that line.

The car is of 16-foot body, with a width of 7 feet 6 inches to swell of panel. It has four windows on the side and two narrow ones in front, with a beveled looking glass between. There is no access from the front

PALACE STREET CAR.

end. All the window glass is beveled plate and the ventilators of green chipped glass. The ventilators, which are along either side and at each end, are attached to a metal rod and move ensemble.

The entire interior of the car, including the ceiling, is laid with white mahogany, rubbed off in oil and decorated by a Cleveland artist of national reputation. The carpet on the floor is green wilton and the sofas and cushions of green corduroy, matching the glass and carpet. The sofa, which extends across the front end, and twelve rattan chairs, make the guests comfortable. All of the metal work, including the grab handles, light-pendants, brake wheels and controller top, are of nickel plate. Ten lights are aboard the car, the forward and rear four being enclosed in two large greenish tinted bowls, and the headlight forward is of the electric style. Electric call bells are used throughout, for signaling both the motorman and conductor.

One-half of the rear platform is thrown into the car, making an alcove, a pretty and useful idea. This alcove is furnished with a pendant lamp. Two steps instead of one are furnished the guests of the road to mount this beautiful car.

The truck in use is furnished with patent cushioned wheels, made by the company. It is an ordinary wheel with a steel tire on the outside, with springs in between to relieve the jar, as well as to deaden the sound of the running gear. One single reduction Westinghouse motor drives this beautiful effort of the car builders' art.

Mr. Hanna was the designer of the interior decoration

and furnishings of the car, while Superintendent G. C. Mulhern arranged the running gear. So rich is the car in its decoration and equipment that many newspapers have refused to believe it. If our engravings, from photographs, do not prove the story, Mr. Hanna invites all doubters to go down to Cleveland and take a ride.

### ANOTHER FALSE REPORT FROM THE DEADLY TROLLEY.

Some time ago a report came from Butte, Montana, that a boy had died from the effects of a shock received from the trolley of the Butte Consolidated Railway. On investigation the affair proves to be another of those unfortunate cases in which death resulted from the effects of a fall caused by the shock and not by the shock itself. Injuries from this cause are far more frequent than those the result of the shock alone. The circumstances of the case in question were most peculiar and it almost amounted to suicide. At the place it occurred the street railway passes under a steam railroad trestle. Alongside of and at the same height as the trestle, was a flume with several inches of water in it. The trolley wire was suspended from the trestle and flume. The boy was wading in the water in the flume and threw a wire which he held in his hand over the trolley wire. He was warned by his companions to look out, but took no heed. The shock knocked him down, and he fell 15 feet on to the street railway tracks below, striking on his head. He was undoubtedly killed by the fall rather than by the shock, as the resistance of the water in the flume must have been considerable. This business of small boys playing with electric wires is getting entirely too common. It is impossible to get wires beyond the reach of those who are determined to get at them, and the only remedy seems to be an application of the parental slipper. The Consolidated was exonerated of all blame in this case.

INTERIOR—PALACE STREET CAR.

NEW PLANT OF THE CHICAGO GENERAL RAILWAY.

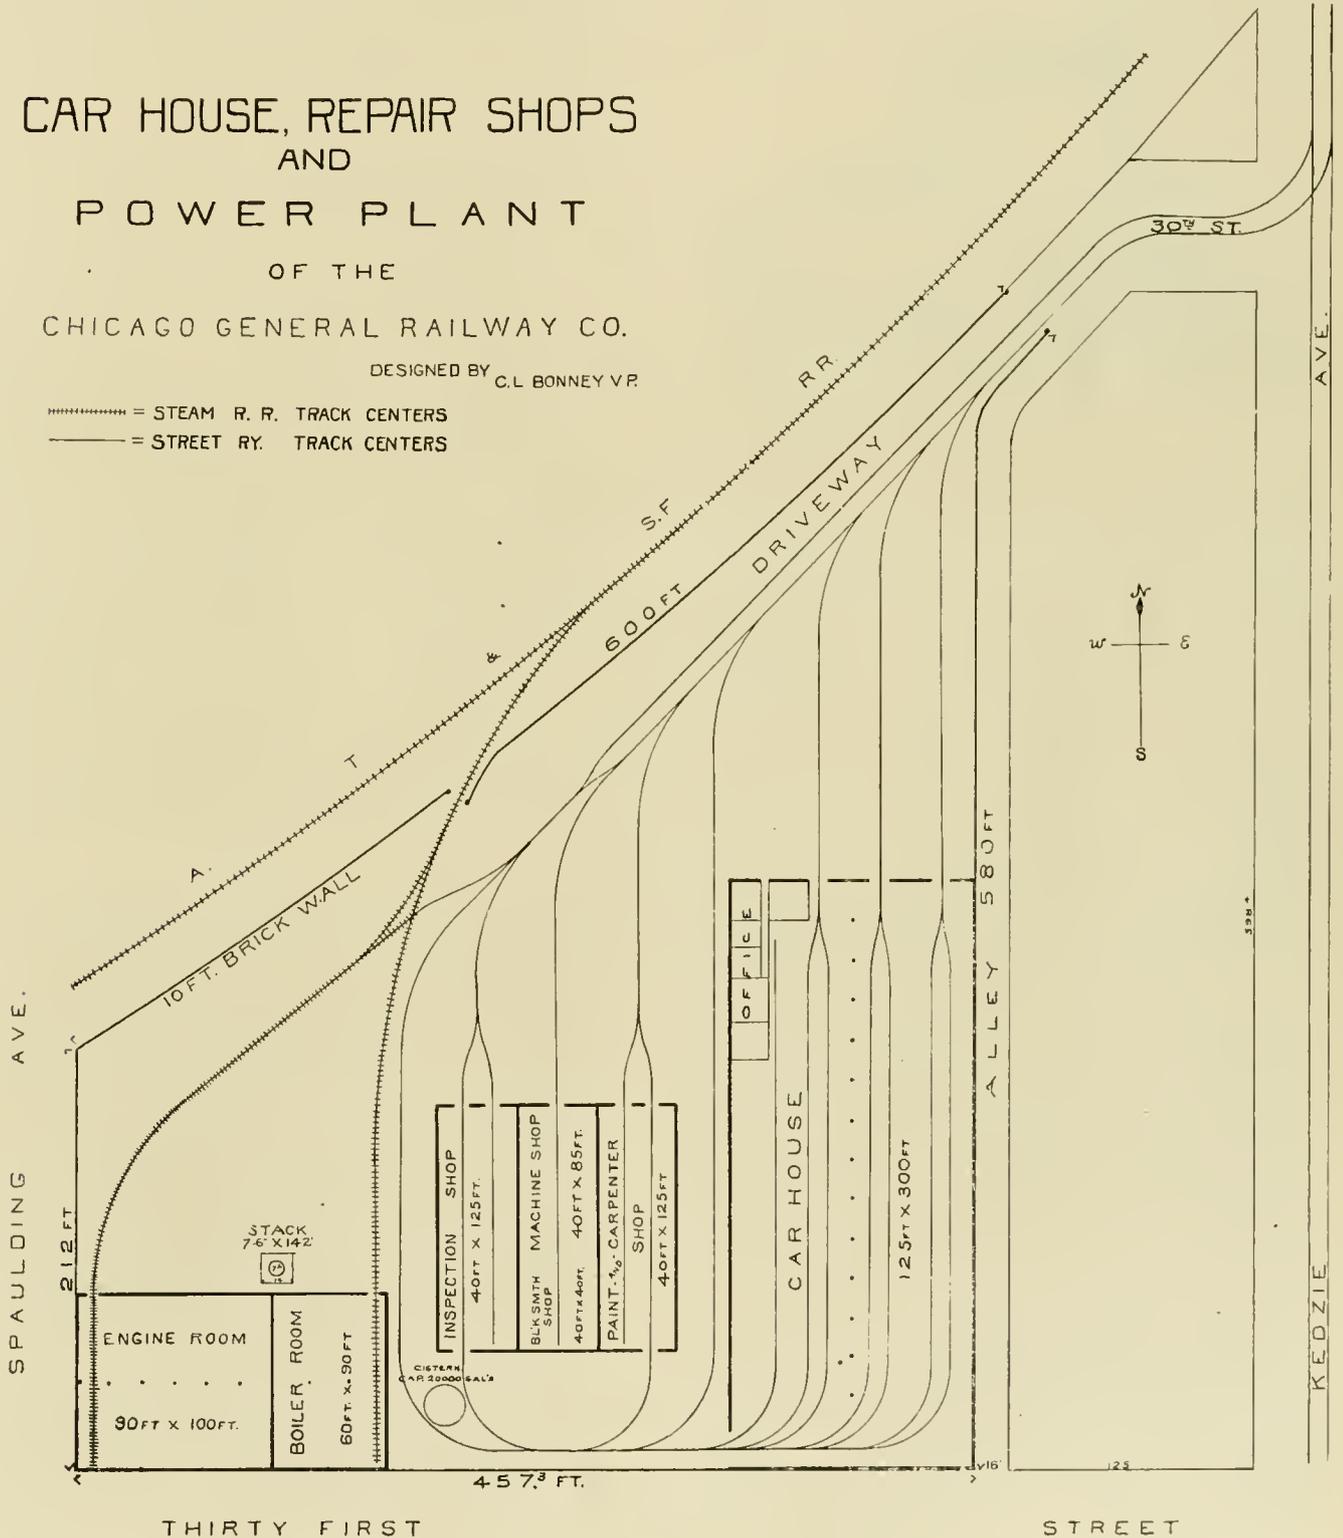

The most important electric railway work being done in Chicago this fall, exclusive of the changing over from horses to electricity of the three great systems which have held sway on the north, west and south sides for many years, is the new plant of the Chicago General Railway, a company that has extensive franchises in the

southwest part of the city and which has been operating four miles of line on west Twenty-second street for over a year. The line now running has proved to be a remarkably paying one as was noted in a previous issue of the REVIEW. It is simply a crosstown line and has no downtown connection as yet. The traffic is at present restricted by the limited output of a temporary power plant. With the erection of the power house and car barns here described and the building of several more

CAR HOUSE, REPAIR SHOPS AND POWER PLANT OF THE CHICAGO GENERAL RAILWAY CO.

DESIGNED BY C.L. BONNEY V.P.

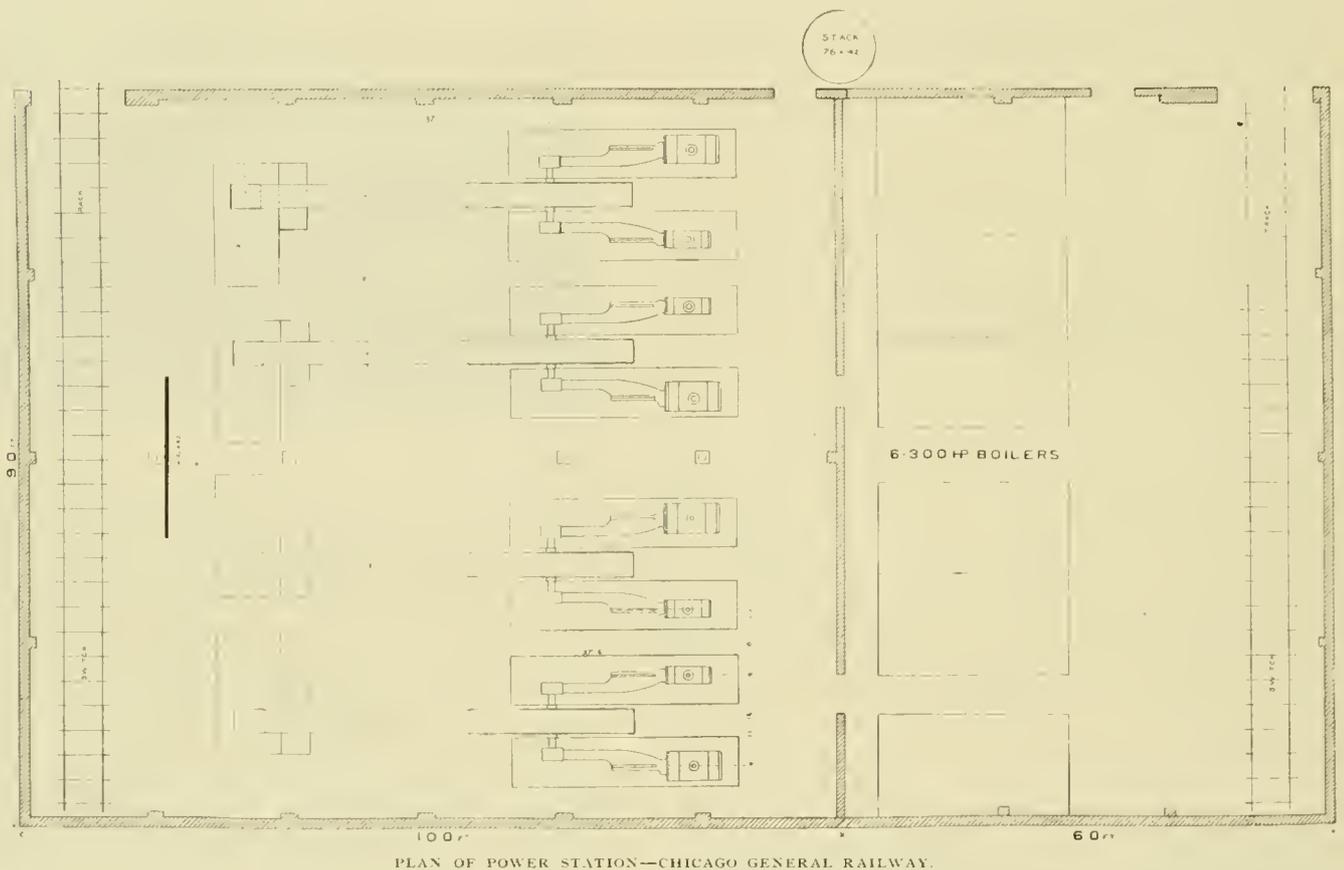

----- = STEAM R. R. TRACK CENTERS  
 ————— = STREET RY. TRACK CENTERS

miles of line for which franchises have been granted, the road will at once take a place as one of the important systems of Chicago. The buildings are now almost completed.

The site chosen was on the corner of Thirty-first street and Kedzie avenue a location nearly central to the territory to be served and at the same time one which did not necessitate any expensive crowding of power station or car barns. The lot is bounded on the east by Kedzie avenue, on the south by Thirty-first street, and on the north diagonally by a branch of the Santa Fe Railroad. The Chicago river is but a short distance to the

The plans are so drawn that enlargements can be made to utilize every foot of ground to good advantage without tearing down work already put in. The power house, located in the southwest corner of the lot, can be extended north toward the railroad tracks, so as to more than double its present planned maximum capacity with a uniform arrangement throughout. The car barn can be extended east 125 feet to the boundary of the lot, and the inspection, machine, carpenter and paint shops can be extended north. As the road demands it, more tracks will be put in the barn. This provision for extensions is the only sound policy for a growing road to pursue.

PLAN OF POWER STATION—CHICAGO GENERAL RAILWAY.

south so that water is at hand for condensing. Thus the location is about all that could be desired. The lot having been secured, C. L. Bonney, the vice-president of the company, who has planned the installation and has charge of the construction work, announced a prize contest for a set of plans to cover a complete street railway plant to be located on this lot, the idea being to get a stock of ideas from which to choose. The contest was decided about August 1, and the results as announced in the August REVIEW are known to our readers. The plant as finally arranged by Mr. Bonney, and as now being installed, contains a number of valuable ideas obtained from the various contestants and combined in a rather unique way. The plans will be found worth study, as some radical departures from common practice have been made, not however without due deliberation and good reasons for such action,

The size of the lot is much in excess of present needs, but as the street railway business goes in this country it will be outgrown much before the owners of the road expect.

The plant is surrounded by a brick wall 10 feet high. While this is not expected to keep out people who are determined to climb over, it is calculated to prevent petty annoyances, especially in times of strikes. There are only two entrances to the grounds, one at the steam railroad switch track and the other where the street railway tracks come in from Kedzie avenue, at the northeast corner of the lot. A peculiar feature of the arrangement is that there is no switching done in the street, all the special work being inside the yard. This arrangement would not be practicable in some places, but it must be remembered that the location is in a thinly settled district where land is plenty and the streets are not

yet brought to grade. Aside from this, the advantage of having the special work above the surface, where so much of it is necessary, as in this case, is considerable. It cannot be denied that the arrangement of tracks is convenient and conducive to economical operation. The steam road tracks run into the boiler room and also into the engine room. When the station is completed, a traveling crane will be supplied for each half of the engine room, one rail being supported by the center line of pillars and the other by the outer wall. There is a connection between the steam and street railway tracks near the yard entrance which has proved a great convenience in construction, and will no doubt be the same in future years.

A car on entering the yard may go directly into the barn or be run into the inspection shop. From the inspection shop it can either be taken into the rear of the barn or run up alongside of the barn and back to the street. There are two distinct and complete loops for cars to go around inside the yard and buildings. A little study will show how convenient the arrangement is.

The power station is arranged for four engine and dynamo units, of 450-horse-power each, one of which is now being installed. The generator chosen is a 300-kilowatt General Electric, and the engine the 450-horse power tandem compound condensing corliss, made by the Bates Machine Company. Root boilers will be used, and coal will be unloaded from the cars directly in front of them, so that fuel will not have to be handled twice. The brick stack, 142 feet high, is slightly separated from the building.

The idea has been to centralize everything into one yard, and provide the centralized plant with every convenience for economical operation. The arrangement is one that certainly ought to give good results, and one in which Mr. Bonney may justly take much pride.

#### CAR FENDER HUMOR.

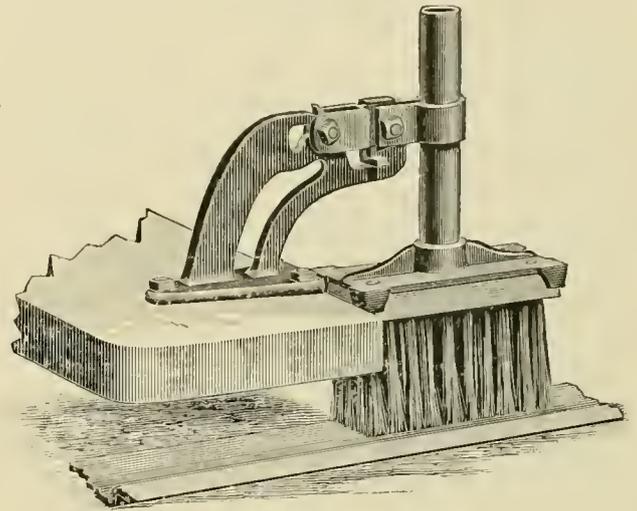

"But your car fender is entirely too light and fragile," said the president of the street car railway to the inventor, "I don't believe the fender could stand the slightest resistance without breaking—"

"That's its chief merit," interrupted the inventor, "it breaks easily. If a person is struck by the fender it is sure to break, and then the company can have the person struck arrested for malicious mischief, prosecuted for trespassing and bring suit for damages. This will worry the injured person so that he will be glad to compromise matters, and the company will be saved a great many heavy damage suits."

H. C. BRUNER, the extensive brickmaker of Pontiac, Ills., has sold to the Chicago City Railway, 350,000 brick liners, or fillers, which he will make to their special order. The fillers can be used in paving to any section of T or girder rail, and this is the largest order of the kind ever placed.

#### TWO NEW SPECIALTIES.

The Ohio Brass Company, Mansfield, O., has brought out two new specialties, which have been added to its line of material. One is the Jewell trolley sling and the other an adjustable and reversible track brush holder.

ADJUSTABLE TRACK BRUSH HOLDER.

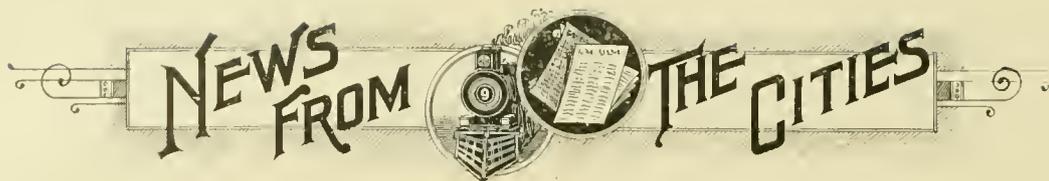

Both of these devices were shown at the Atlanta convention, attracting considerable attention. They have been thoroughly tested and large sales are reported. The Ohio Brass Company reports a satisfactory trade with a constantly increasing number of orders.

#### WAGES OF CONDUCTORS AND DRIVERS IN EUROPE.

A traveler returning from Europe gives some statistics regarding wages, which he had gathered merely to gratify his own curiosity. He found that in Constantinople street car drivers were paid forty cents a day, conductors, seventy-five cents a day. In Florence, Italy, street car drivers received fifty cents and conductors seventy-five cents a day. In Naples the drivers and conductors were on an equal footing, receiving fifty cents a day. In Athens, Greece, the daily stipend of both drivers and conductors is also fifty cents. In Algiers, Africa, the men receive a trifle more, drivers getting sixty cents and conductors eighty cents per day. The omnibus driver in London is paid \$1.50 for twelve hours' work. Many of the omnibus drivers labor fourteen to sixteen hours daily.

#### HAS A REAL GRIEVANCE.

Eben Rathbone of Westerly, R. I., has a grievance against the electric road there. For many years past he has salted a barrel of skunks every fall, for winter use. During the past few weeks the electric cars have wrought such destruction among those animals that he fears he will have to resort to other means of sustenance.

### Alabama.

ANNISTON, ALA.—It is reported that the Anniston Street Railway has suspended operation.

### Arizona.

PHOENIX, ARIZ.—Messrs. Kittridge, Hedges and Dobson, real estate men, are projecting an electric road to Montgomery's addition.

### Arkansas.

TEXARKANA, ARK.—The Texarkana Car & Foundry Company has assigned to P. A. Turner.

### California.

SAN FRANCISCO, CAL.—The Market Street Railway Company will make several extensions.

SAN FRANCISCO, CAL.—The Phelps Manufacturing Company, makers of cable road iron work, has failed.

BERKLEY, CAL.—The street car line to West Berkley will be equipped with electricity. It will be a \$60,000 job.

PASADENA, CAL.—The Los Angeles & Pasadena Electric Railway has purchased the Highland Electric Railway of Pasadena for \$18,000.

PASADENA, CAL.—The Los Angeles & Pasadena Electric Railway Company has been granted a franchise for 50 years, which will be sold to the highest bidder.

PASADENA, CAL.—Prof. C. C. Lowe has returned from Chicago, where he closed a deal to build an electric extension of the mountain road, seven miles from Echo mountain to Mt. Lowe.

BERKLEY, CAL.—The town trustees have ordered a street railway franchise advertised, at the request of the West Berkeley & Perlata Park street car line, which will be equipped with electricity.

OAKLAND, CAL.—The receiver of the Piedmont Consolidated Cable Company has filed a petition in court asking permission to change the cable road over the hills into an electric road. He also wants to borrow \$32,000 to pay debts and make improvements.

### Canada

PORT HOPE, ONT.—P. R. Randall says work will be begun on the electric railway in the spring.

TORONTO, CAN.—The Toronto Railway Company will build a brick car shed costing \$20,000, and will place vestibules on all cars.

MONTREAL, CAN.—The Montreal Park & Island Railway Company will extend its electric line to Notre Dame de Grace and Lachine, and will resume work on other extensions.

TORONTO, ONT.—York township has voted a bonus of \$5,000 to the City & Suburban Street Railway Company, for the purpose of extending its line from Toronto Junction to Weston.

PRESTON, ONT.—The Preston & Berlin Street Railway Company has decided to construct an electric road to Berlin. John Fennell and T. M. Burt, of Berlin, are the principal promoters.

OTTAWA, ONT.—The town council of Aylmer has made a bargain with Theophile Viau, Hull, to operate an electric railway system. At least \$10,000 worth of work must be done the first year.

HAMILTON, ONT.—The Hamilton Electric Radial Railway Company has bought the Niagara Central Railway, a steam road from Niagara Falls to St. Catharines. The consideration is reported \$400,000. The new road will be extended to Hamilton to connect with the radial road.

QUEBEC, CANADA.—The Quebec City & District Railway Company will be incorporated by L. P. Peletier, of Quebec, Philippe Landry, of Ville Mastai, J. J. T. Fremont, P. B. Dumoulin, Bernard Leonard, John U. Gregory and Ernest Pacaud, all of Quebec, to build lines in Quebec and adjoining counties.

HULL, ONT.—The men interested in the road here are: Theophile Viau, contractor, Hull; J. P. Demartigny, manager, Banque; Jacques Cartier, Hull; Stanislaus Aubry, father of Dr. Aubry, who is mayor of Hull; J. M. McDougall, Q. C., of Hull, and W. J. Poupore, contractor, of Morrisburgh. The capital of the company will be \$25,000.

### Chicago.

CHICAGO.—Fernwood property owners are securing consents for an extension of the Calumet Electric.

CHICAGO.—The Metropolitan "L" has taken out a permit for a two-story and basement brick repair shops, to cost \$30,000.

CHICAGO.—The North Chicago Street Railway Company has secured control of the Chicago & North Shore Railway Company.

CHICAGO.—The Chicago City Railway is securing the consent of the property owners along Lake avenue for a trolley line along that street.

CHICAGO.—The Calumet Electric Street Railway Company has an ordinance before the city council for an extension of about three miles in South Chicago.

CHICAGO.—The Carter Brake Company has been incorporated with \$2,000,000 capital by Samuel C. Carter, Robert E. Lindgerwood and Clarence W. Carter.

CHICAGO.—B. J. Jones, formerly of Sioux City, Iowa, has been elected superintendent of the South Chicago City Railway, to fill the resignation of R. D. Rowe.

CHICAGO.—Ald. Kleinecke introduced an ordinance for the Chicago Electric Transit Company to operate in the northwestern portion of the city, with the right to connect with other lines.

CHICAGO.—O. W. Bruner, president of the Chicago Inter-Urban Street Railroad Company, has given notice by publication that the company will ask the Cicero town board for a franchise.

CHICAGO.—The Ogden Street Railway Company, E. A. Cummings, president, is asking for an electric railway franchise in the town of Cicero. Charles T. Yerkes is supposed to be back of the company.

CHICAGO.—Contract has been awarded for erecting the new electric power house of the West Chicago Street Railroad Company to L. L. Leach & Sons. The building will be 126x250 feet and cost \$150,000.

CHICAGO.—The Columbia Construction Company, which has the contract for building the Northwestern Elevated Railroad, has called for a third installment of 25 per cent of its capital stock.

CHICAGO.—The Cook County Electric Railway Light & Power Company has been incorporated with \$500,000 capital by Clarence N. Durand, 813 Chamber of Commerce, Abner T. Young and Charles Greenwood.

**CHICAGO.**—The Chicago Suburban Rapid Transit Company has asked the board of county commissioners for an electric road franchise, beginning at Fullerton avenue and Seventy-second street, to Desplaines, with a branch to the town of Maine.

**CHICAGO.**—It is reported in stock exchange circles that the North Chicago Street Railway Company will issue \$1,000,000 additional capital stock January 1, to be divided among the stockholders at par. The proceeds will be used for electrical construction.

**CHICAGO.**—Edward Koch has been elected president of the North Chicago Electric Railroad Company in place of D. H. Loudebach. It is said that right of way is being secured for an electric line twenty miles long with a loop in South Water, River, Rush streets and Michigan avenue, with a terminus at Norwood Park.

**CHICAGO.**—It is said that R. B. Campbell, general manager, Baltimore & Ohio Railroad; President Baker, of the Trust & Savings Company, and Mr. Selden, Baltimore; J. W. Fortune, assistant general manager, Grand Trunk Railway, and A. J. Green, Windsor, Ont., are negotiating for the purchase of the Joliet Street Railway Company, Economy Light & Power Company and Joliet Gas Works, and extend the line to Chicago.

## Colorado.

**COLORADO SPRINGS, COL.**—The officials of the Denver & Rio Grande Railroad Company are considering a proposition to equip the Manitou branch with an overhead electric system.

## Connecticut.

**NEW LONDON, CONN.**—The New London Street Railway Company will make improvements.

**FAIRFIELD, CONN.**—The Bridgeport Traction Company has been granted a franchise for a single track.

**ROCKVILLE, CONN.**—The Rockville & Ellington Electric Tramway Company wants to build its line beyond Talcottville.

**NORWALK, CONN.**—The Norwalk Tramway Company has been given permission to extend its electric lines to Dorlon's Point. The cost is estimated at \$30,000.

**HARTFORD, CONN.**—Judge Robinson has decided that an electric line to South Windsor is a public necessity, and the Hartford Street Railway Company will build. The case has been in the courts for some time.

**SOUTHINGTON, CONN.**—L. V. Walkley, New York, who has bought the controlling interest in the Southington & Plantsville Electric road, is negotiating with the New Britain folks and with the Meriden Electric Company, to extend their lines to Southington.

## District of Columbia.

**WASHINGTON, D. C.**—The stockholders of the Metropolitan Railway have voted to issue bonds to the amount of \$1,700,000, for equipping with an underground conduit system.

## Florida.

**JACKSONVILLE, FLA.**—E. M. Holmes says that financial matters are fixed all right for the electric railway.

**TAMPA, FLA.**—R. W. Easley and W. H. Kendrick propose to build an electric street railway to Palmetto Beach.

**DELAND, FLA.**—J. B. Stetson contemplates building an electric rail way from DeLand Junction to Orange Park, via DeLand.

**JACKSONVILLE, FLA.**—George W. Haines, superintendent of the Jacksonville Street Railroad Company, says that an extension is being arranged out to West Campbelltown, West Louisville and West Brooklyn.

## Georgia.

**SAVANNAH, GA.**—As a result of the war of competition between the street railways, it is rumored that the Electric Railway Company and the Savannah Street Railway Company will be reorganized.

## Illinois.

**LASALLE, ILL.**—The City electric line will extend its upper and lower lines.

**PERU, ILL.**—An ordinance has been passed giving franchises to the City Electric Railway Company.

**DIXON, ILL.**—The Rock River Electric Railroad has accepted the Dixon, Oregon, and Byron franchises.

**MT. CLEMONS.**—The council has granted a franchise to B. B. Cousins and others, to build a road here within a year.

**CINCINNATI, O.**—The Cincinnati Street Railway Company will build a power house 150 by 180 feet, designed by Bert Baldwin.

**BLOOMINGTON, ILL.**—W. H. Patterson, who has bought the Lincoln, Ill., line, will lay a mile of new track and make a belt line.

**PEORIA, ILL.**—The stockholders of the Peoria Heights Street Car Line Company decided to complete the line early in the spring.

**PEORIA, ILL.**—The Pekin & Peoria Electric Railway Company is selecting its route between the two cities. Edward Darst has the matter in charge.

**SPRINGFIELD, ILL.**—The Capital Electric Company has been incorporated, with \$60,000 capital, by John McCreery, Peter W. Harts, Fred D. Buck, George Pasfield, and Edwin A. Wilson, all of this city.

**JOLIET, ILL.**—R. B. Campbell, general manager of the Baltimore & Ohio, J. W. Fortune, assistant general manager of the Grand Trunk, and A. J. Green, are here, and it is reported will buy the Joliet Street Railway, the Economy Light & Power Company, and the gas works. There is talk of extending the electric road from Lockport to Chicago. The Joliet system will be overhauled.

## Indiana.

**LAPORTE, IND.**—An electric street railway is to be built with an extension to Michigan City, by P. J. Henson, of Chicago.

**INDIANAPOLIS, IND.**—The Indianapolis & Broad Ripple Rapid Transit Company has bought a lot and will build a two-story office building and car barn, and in time, a power station.

**SOUTH BEND, IND.**—Franchise has been granted the General Power & Quick Transit Company, J. Mc M. Smith, president, for a line to Mishawaka. Mr. Smith says he will get to work in the spring.

**HAMMOND, IND.**—The Hammond, Whiting & East Chicago Electric Railway Company will build a four mile extension to Robey, making a direct connection. A summer resort will be created at Lake George.

**TERRE HAUTE, IND.**—Stockholders of the recently organized Terre Haute & Brazil Electric Railway Company have elected the following directors: Major Collins, of Brazil; S. N. Hickman, W. H. White, C. F. Miller, R. J. Smith, Max Joseph and J. G. Elder.

## Iowa.

**DES MOINES, IA.**—The Des Moines City Railway Company will build an extension.

**BURLINGTON, IA.**—The Burlington Electric Railway Company will extend its lines to West Burlington.

**COUNCIL BLUFFS, IA.**—S. P. McConnell has sold his interest in the Lake Manawa Railway Company to J. C. Shaffer.

INDEPENDENCE, IA.—A. C. Rowe, late of Minneapolis, has been appointed superintendent of the Independence Electric Street Railroad Company, in place of A. D. Guernsey.

FT. MADISON, IA.—It is reported that interested parties have been looking over the field for an electric line to Nauvoo, the Mormon settlement, which is said to be exceptionally good.

### Kansas.

LEAVENWORTH, KAN.—The Leavenworth electric railway has surveyed a route to Lansing, and will extend to that place at once.

ATCHISON, KAS.—Topeka and St. Joseph parties are figuring on an electric line to St. Joseph, touching Wathena, Troy, Doniphan and Brenner.

INDEPENDENCE, KANS.—The Farmers' & Merchants' Suburban Railroad Company & Fair Association has been incorporated to build and operate a line of street railway from Independence to Petroleum Park, with branches to Cherryvale, Coffeyville, Liberty and Neodesha. Capital stock, \$200,000; incorporators, M. J. Paul, M. F. Wood, Edwin Foster, J. H. Brewster, Joseph Chandler, O. P. Ergenbright and J. W. Wright, of Independence.

### Kentucky.

GEORGETOWN, KY.—The street car stable was burned on the night of October 19. One car was destroyed. Loss, \$1,500.

HENDERSON, KY.—Benjamin Allsop, Owensboro is negotiating for the purchase of the Henderson Street Railway Company by the Owensboro City Railway Company. If the deal is consummated, the line will be equipped with electricity.

### Louisiana.

NEW ORLEANS, LA.—It is reported that enough stockholders have been won over to assure the substitution of electricity on the Orleans Street Railway Company.

### Maryland.

BALTIMORE, MD.—The Baltimore Traction Company will change its Gilmore street line from cable to electric power. President Brown expects a saving of \$20,000 annually by the change. A 500 horse-power generator will be purchased.

BALTIMORE, MD.—President Nelson Perin has sold 5,000 shares of the City & Suburban Railway Company to John A. Whitridge, John W. Hall, Alexander Shaw and Jenkins Brothers. The price paid was \$42.50, par value being \$50. Mr. Perin still retains a controlling interest.

BALTIMORE, MD.—The Clifton Park Passenger Railway Company has been incorporated, with a capital of \$50,000, by W. J. Taylor receiver of the Baltimore & Lehigh Railroad, Alfred J. Ulman, Jas. H. Smith, Davies Murdoch, Frank N. Hoen, Roberts S. Carswell, and Eben B. Hunting, all well known men.

### Massachusetts.

PLYMOUTH, MASS.—Albert L. Gordon has been elected president of the Plymouth & Kingston Street Railway.

MEDFORD, MASS.—Property owners made no objection to the proposed franchise of the West End Street Railway Company.

BOSTON, MASS.—The West End Street Railway Company has bought property at Dorchester, on which a large car house will be built.

NORTHAMPTON, MASS.—An extension of the Northampton Street Railway Company to Eastampton will probably soon be made.

WESTFIELD, MASS.—The selectmen have given the Highland Street Railway Company permission to use the tracks and turnouts of the Woronoco Street Railway Company.

LOWELL, MASS.—The Lowell, Lawrence & Haverhill Electric Railroad Company has asked for a location for its entrance into the city. The road must be built by April 29, 1895.

BOSTON.—The Fall River & Providence Street Railway Company, backed by F. S. Stevens, R. T. Davis, Frank Brightman, and Benjamin Cook, will ask the legislature for a franchise.

BOSTON, MASS.—The Board of Railroad Commissioners has given permission to the Natick & Cochituate Street Railway Company to issue \$28,000 additional capital stock to pay for extensions.

BRAINTREE, MASS.—The Weymouth & Braintree Street Railway Company has been formed to build an electric line between the two towns, each of them having granted the necessary franchise.

NEW BEDFORD, MASS.—The Union Street Railway Company has been sold to a syndicate represented by J. A. Beauvis. Electricity will be used. Edward N. Gibbs, N. Beckley, Frank W. Brightman, Frank S. Stevens, George H. Hawes and Charles F. Shaw.

MARLBORO, MASS.—A company has been organized by J. O. Burdett A. M. Bridgman, L. V. Price, E. B. Harvey, E. C. Bates, W. C. Blake and W. D. Burdett, to build a street railway to Westboro via Southboro, a distance of seven miles. Capital stock, \$100,000. The heaviest subscriber is G. M. Jewett, trustee, New York.

### Michigan.

DETROIT, MICH.—The Citizens' Street Railway Company is considering the extension of its tracks on Russell street.

SAGINAW, MICH.—The line between here and Bay City will be built next spring by the Saginaw Union and the Bay Cities Consolidated.

PORT HURON, MICH.—The Port Huron Street Railway Company has been granted a six months' extension to build its Lapeer avenue line.

BATTLE CREEK, MICH.—The Citizens Street Railway wants bids for equipping six motor cars and other work at once; also bids on two 150-horse-power engines.

SAGINAW, MICH.—The Saginaw Consolidated Street Railway Company has been incorporated with \$150,000 capital, by John M. Nicol, Frank E. Snow, William A. Jackson.

DETROIT.—General Manager Hawks, of the reorganized Citizens' Street Railway Company, says his company is considering the question of equipping the Grand River avenue line with electricity this fall.

DETROIT, MICH.—Major Edwards has been elected president of the Suburban Street Railway Company; A. Z. Johnson, vice-president; J. R. Stirling, secretary; directors, J. D. Hawks, G. H. Russell, D. M. Ferry, R. M. Wilson, and the officers.

DETROIT, MICH.—Attorney General Ellis has denied the application for quo warranto proceedings, and has declined to allow the state to be made a party to any litigation on the part of the city of Detroit against the Citizens' Street Railway Company. The only redress the city has is by mandamus to compel the attorney general to file the information in the quo warranto proceedings.

SAGINAW, MICH.—Walter S. Eddy, Warren Y. Soper and Thomas Ahearn have asked the city council for a franchise, permitting the Saginaw & Bay City Street Railway Company to build an electric street railway between the two cities. The new company is not identified with the Union Street Railway Company, which has been making preparations to build between the two cities. General Manager W. J. Hart, of the latter company, declares he will go ahead and build, regardless of the new company.

## Missouri.

**KANSAS CITY, MO.**—The Kansas City Traction Company has been granted franchises for its proposed extensions.

**ST. LOUIS, MO.**—Plans are completed for changing the Fourth Street & Arsenal Railway Company to an electric line and extending it.

**HANNIBAL, MO.**—The Hannibal Street Railway Company has been granted the right to extend its lines to Quincy, Ill., the road to be completed by June 1, 1895.

**MARSHALL, MO.**—California capitalists have been over the ground and are likely to soon begin an electric coal line from Miami to Sedalia via Marshall and Blue Lick.

**SPRINGFIELD, MO.**—Dr. E. C. Davis, representing Chicago capitalists, is directing the survey for an electric line, forty-five miles long, from Eureka Springs to Green Forest.

**ST. LOUIS, MO.**—It is said the Broadway cable line will be extended two miles from Baden to Prospect Hill, and that the Bellefontaine line is also seeking a franchise to reach Prospect Hill.

**KANSAS CITY, MO.**—General Manager R. J. McCarty, of the Metropolitan Street Railway Company, has prepared plans and estimates of cost for the proposed change from mule to electric power on the Broadway line.

**ST. LOUIS, MO.**—The purchase of large tracts of suburban property by Ex-Governor Francis, J. T. Donovan, John V. Hogan and John Scullin, is taken as an indication that there will be some new electric lines, or an extension of existing lines.

**KANSAS CITY, MO.**—A construction company has been organized to build a connecting line between the Kansas City Cable and the West Side Railway, of Kansas City, Kan. B. S. Coler, of the latter road, is at the head. It is called the Kansas City Traction Company, and has a capital of \$1,000,000. The directors are B. S. Coler, Brooklyn, N. Y.; W. J. Smith, and W. H. Lucas, of Kansas City, Mo.; and C. W. Trickett and F. D. Hutchings of Kansas City, Kan. The officers are B. S. Coler, president; W. H. Lucas, secretary, and F. D. Hutchings, treasurer.

## Montana.

**HELENA, MONT.**—The property of the Helena Rapid Transit Company has been formally transferred to the Helena Power & Light Company. The latter company is the consolidation of the Helena Electric and Rapid Transit companies.

## New Hampshire.

**MANCHESTER, N. H.**—J. H. Beckford, Salem, Mass., with Gen. Bartlett, of the board of directors of the proposed electric line, have said that all the contracts will be made before January 1.

## New Jersey.

**CAMDEN, N. J.**—The West Jersey Traction Company has secured the passage of all its ordinances.

**PATERSON, N. J.**—Surveyors are staking out a new electric railroad between this city and New Brunswick.

**HOBOKEN, N. J.**—The Jersey City, Hoboken & Rutherford Electric Railway Company has asked for a franchise.

**BURLINGTON, N. J.**—The West Jersey Trolley Company is getting right of way signatures here for a line to connect Camden and Florence.

**SOUTH ORANGE, N. J.**—Franchise has been granted to the Maplewood & South Orange Railway Company. A franchise has also been asked for by the Newark & South Orange Railway Company.

**NEWARK, N. J.**—The New Jersey Consolidated Traction Company has secured from the Essex County Board of Freeholders, franchises to build electric lines to Elizabeth, Orange, Bloomfield, Montclair and Caldwell.

**CLARKSBORO, N. J.**—A company has been formed to build an 18-mile electric railway from Clarksboro to Swedesboro, and from Mullica Hill to the Delaware river. John S. Somers of Clarkshoro, is president, and James J. Davidson, secretary.

**NEWARK, N. J.**—The North Jersey Street Railway Company, the Central Jersey Traction Company and the New York & Philadelphia Traction Company have filed applications for franchises between Irvington and Hilton, in South Orange township.

## New York.

**SYRACUSE, N. Y.**—The Syracuse Street Railway Company has asked for ordinances.

**GOSHEN, N. Y.**—The Middletown-Goshen Traction Company will be permitted to build

**PLATTSBURG, N. Y.**—The town trustees have been petitioned for an electric road franchise.

**PEEKSKILL, N. Y.**—Willgot Klingberg will be constructing engineer of the new electric line.

**NEW YORK CITY.**—The Union Railroad Company will extend its lines in Westchester county.

**BLOOMSBURG, N. Y.**—The town authorities have granted a franchise for an electric street railway.

**MATAMORAS, N. Y.**—Franchise has been granted the Delaware Valley Electric Railroad Company.

**PORT JERVIS, N. Y.**—The council has granted a franchise to the Port Jervis & Suburban Electric Railway.

**COHOES, N. Y.**—The Cohoes City Electric Railroad Company will accept the franchise recently granted.

**PORT BYRON, N. Y.**—Eastern capitalists are reported to be reviving the project for an electric line to Auburn.

**SYRACUSE, N. Y.**—The Syracuse & East Side Railroad Company has bought a site for a power house and will build.

**SYRACUSE, N. Y.**—The Syracuse & East Side Street Railway Company will extend its lines and use electric power.

**FLUSHING, L. I.**—Franchises have been given the Brooklyn City Railroad Company and the Newtown Railway Company.

**BATAVIA, N. Y.**—James H. Ahern, New York, has been trying to induce local capitalists to build an electric line to Le Roy.

**BROOKLYN, N. Y.**—The Nassau Electric Railroad Company is taking bids for a tunnel under Ocean Parkway at Church avenue.

**WATERTOWN, N. Y.**—The Watertown Street Railway proposes to extend from Brownville to Dexter, a distance of three miles.

**LOCKPORT, N. Y.**—The city council will forfeit the franchise recently granted the Lockport City & Olcott Electric Railroad Company.

**NIAGARA FALLS, N. Y.**—John J. McIntire is working for 20 miles of electric road around Grand Island, touching all the summer resorts.

NEW YORK CITY.—It is believed that Howard Carroll and others will build an electric line on Staten Island, to run in opposition to the steam road.

LAKESIDE, N. Y.—The Empire Construction Company has taken up the work on the abandoned Beecher single rail electric railway to Batavia.

ITHACA, N. Y.—Property owners on South Hill are talking of building a road and turning it over for a term of years to the Ithaca Street Railway.

MILTON, N. Y.—Frederick R. Barnes, representing the Boston Electrical Construction & Supply Company, has been given a franchise for an electric road.

SYRACUSE, N. Y.—The Syracuse Street Railroad Company has filed with the secretary of state a certificate of proposed extensions on ten different routes.

SYRACUSE, N. Y.—The highway committee of the city council has reported favorably on all the routes of the various street railway companies seeking franchises.

OGDENSBURG, N. Y.—The Ogdensburg Street Railway Company will relay its tracks with 56-pound rails, and will equip its line with electricity and buy new cars.

NEW YORK CITY.—The Metropolitan Street Railway Company will build the "largest car house in the world," at Seventh avenue, Fiftieth and Fifty-first streets, to cost \$1,000,000.

SYRACUSE, N. Y.—The Twelfth Ward Street Railroad Company, recently organized by Maurice A. Graves, Frank M. Bonta, Dwight H. Murray, and others, has applied for an electric railway franchise.

COWLESVILLE, N. Y.—A. H. Haskins, Charles Hart, W. T. Martin, T. Austin, Grove Barnum, Cowlesville; Loren Kittsley, Folsomdale; V. D. Osgood, Borough, are working on a proposed trolley line to Marilla.

BROOKLYN, N. Y.—The Brooklyn & Brighton Beach Railroad Company is contemplating substituting electricity for steam on its line to Coney Island.

BUFFALO, N. Y.—Capt. John M. Brinker, Buffalo, president; H. Sellers McKee, Pittsburg, vice-president; R. W. Jones, Buffalo, secretary and treasurer, are officers of a proposed electric line to Lewiston, which will be built in the spring. The fare from the Falls to Lewiston will be 50 cents.

PEEKSKILL, N. Y.—Petitions for franchises have been presented to the village board by the Peekskill, State Camp & Mohegan Railroad Company, and the Peekskill & Cortlandt Electric Railroad Company, which were recently organized. Each company has presented a certified check for \$10,000.

NEWBURG, N. Y.—The Orange Lake & Walden Electric Railroad, to be a continuation of the Newburg & Orange Lake Railway, has been incorporated. The incorporators were Benjamin Norton, Brooklyn; H. C. Norton, H. R. Newkirk, formerly of Brooklyn; B. B. Odell, Jr., Colonel William D. Dickey, Captain Joseph M. Dickey and Major W. H. Weston, Newburg.

BINGHAMTON, N. Y.—The Binghamton, Lestershire & Union Railway Company has been incorporated to construct a road six miles in length, from Lestershire to Union. Capital stock, \$100,000. Directors: Jerome B. Landfield, John Evans, John P. E. Clark, George Whitney, John B. Rogers, Frederick E. Ross, Charles J. Krapp and Theodore S. Rogers, of Binghamton, and Arthur S. Beves, of New York.

BROOKLYN, N. Y.—The Brooklyn, Newton & Bowery Bay Railroad Company has been incorporated, with \$100,000 capital, to build six and one-half miles of road. The directors are S. Fisk Washington, Alexander Hance and Alexander D. Hance, Winfield; Abbott C. Combes, Clarence E. Mundy and Peter V. P. Mundy, Newtown; Frank M. Meinikhelm and Bernard G. Meinikhelm, Maspeth; Adam Wiener, New York City.

OGDENSBURG, N. Y.—The Ogdensburg Street Railway Company will reconstruct its lines, changing from horse to electric power. Extensions will be made. The cost is estimated at \$125,000.

PEEKSKILL, N. Y.—Incorporated: The Peekskill, State Camp & Mohegan Railroad Company, with a capital of \$175,000, to operate a street railroad from Peekskill to Lake Mohegan, a distance of four miles, with branch roads in Peekskill and the towns of Courtlandt and Yorktown. The principal directors are Frederick C. Beach, Edward B. Gallagher and Charles E. Hammond, of New York City.

PEEKSKILL, N. Y.—The Peekskill & Cortlandt Electric Railway has been incorporated here, with a capital of \$150,000. The road is to be four miles long, running through Peekskill, Cortlandt and Yorktown, in Westchester county. The directors are: Edgar Peckham, New York; Benjamin Norton, H. C. Soop, W. H. Wilkinson, W. Klingberg, J. H. Burton, all of Kingston; E. De M. Lyon, W. D. Southard and E. F. Hill, of Peekskill.

### North Carolina.

RALEIGH, N. C.—The new car wheel works have started. Capital stock, \$100,000.

### Ohio.

CLEVELAND, O.—N. F. Wood is securing right of way for an electric line to Bedford.

FREMONT, O.—The council has granted extension franchises to the Fremont Street Railway.

ELYRIA, O.—The council has passed the Cleveland & Berea Electric Railway Company ordinance.

CINCINNATI, O.—The Mt. Auburn cable road has been ordered sold by the receiver within thirty days.

CLEVELAND, O.—The Cleveland & Berea Street Railway Company is back of a plan for a road to Elyria.

TOLEDO, O.—The Toledo Electric Street Railway Company will change from a single to double track system.

FREMONT, O.—The Fremont Street Railway Company will accept the recently granted franchise and extend its lines.

CLEVELAND, O.—The Cleveland Electric Railway Company contemplates an extension of its lines to Brooklyn, O.

MARION, O.—H. J. Hill and H. S. Jones, of Marion, will build an electric railway in Marion, Monon and Knox counties.

AKRON, O.—The Akron, Bedford & Cleveland Railroad Company has been granted a franchise through Summit county.

CINCINNATI, O.—The Cincinnati Street Railway Company has secured a franchise through the village of Winton Place.

BEREA, O.—L. M. Coe, of this place, has been granted a franchise to build an electric road. The Cleveland & Berea road is behind him.

CLEVELAND, O.—The Cuyahoga Suburban Railway Company has secured right of way to Chagrin Falls by way of Randall, and work will soon begin.

GALION, O.—Toledo parties asked for a franchise for an electric line, which it is proposed to build from Bucyrus. They also want an old franchise rescinded.

MT. VERNON, O.—Frederick T. Botzum, superintendent of the Cleveland & Berea road, is promoting a road from here to Walhonding, and has applied for franchises.

CLEVELAND, O.—R. S. Hubbard, treasurer of Cuyahoga county; W. B. Blake and T. S. Maxwell, Cleveland, are expecting to build an electric line to Chagrin Falls.

**BOWLING GREEN, O.**—E. H. McKnight is promoting an electric road from here to Perrysburg and Portage. Mr. McKnight is manager of the electric light plant here.

**SPRINGFIELD, O.**—Stockholders of the Springfield Street Railway Company will meet in Philadelphia next month, to vote for extensions of line and enlarging power house.

**CLEVELAND, O.**—L. A. Winch, C. N. Mix and H. P. Rose are promoting an independent electric line from Nottingham to Glenville, connecting with the Little Consolidated.

**ELYRIA, O.**—A. H. Pomeroy, president of the Berea National Bank, and Frank Carpenter, have secured the consent of the property owners to build an electric road in Lorain county.

**NORWALK, O.**—There is a project to build an electric road from Sandusky through Norwalk, Ashland and other places to Loudonville, to connect with the Mahoning Railroad, making a new outlet from the coal mines.

**TIFFIN, O.**—George B. Kerper, of Cincinnati; M. McCarthy, of New York, and M. Frost, of Fostoria, have applied for a franchise for an electric railway, connecting Tiffin, Scyamore, Melmore and Upper Sandusky.

**IRONTON, O.**—The Ironton Street Railroad, Electric Light & Power Company has been incorporated with \$100,000 capital stock, by Joseph Fisher, Lev. Ebert, H. A. Marting, R. Mather, T. J. Mulligan, A. R. Johnson, D. C. Davies, A. Winters and Mat. Anderson.

**CLEVELAND, O.**—C. C. Thompson and John Mitchell, active spirits in the Cuyahoga Suburban Railway Company, have obtained right of way to Randall, and will begin work within thirty days from the terminus of the Broadway electric line.

**COLUMBUS, O.**—The Worthington, Clintonville & Columbus Street Railway Company has had its charter amended, changing its southern terminus from Clintonville to Columbus.

**HARTWELL, O.**—Mayor Charles C. Richardson, Glendale, and secretary of the Haldeman Paper Company, Lockland, has asked the city council for an electric road franchise. It is the intention to build a line connecting Lockland, Wyoming and Hartwell.

**MT. VERNON, O.**—A franchise has been granted to the Central Ohio Electric Railway Company for electric lines connecting Mt. Vernon, Mt. Gilead and Marion. F. W. Jones is at the head of the enterprise.

**FINDLAY, O.**—An electric railway will be built between Findlay and Bowling Green via Stuartsville, Van Buren, Welker, Cygnet, with a loop at Welker to North Baltimore. George B. Kerper is the moving spirit.

**COLUMBUS, O.**—Work is progressing on the electric line between Worthington, Westerville and Flint. A traffic agreement has been made with the Delaware City Street Railway Company for a line that will be built next spring from Flint to Delaware.

**CLEVELAND, O.**—Articles of incorporation have been filed for the Akron, Bedford & Cleveland Electric Railroad Company, with a capital stock of \$300,000. The incorporators are J. F. Seiberling, F. A. Seiberling, Will Christy, James Christy, Jr., and C. H. Howland. Representatives of the Akron Street Railroad Company, the originators of the scheme, have appeared before the court commissioners to secure a franchise through Summit county.

## Oregon.

**PORTLAND, ORE.**—Sidney Dell reports that citizens of North Tualatin and the Upper Nehalem valley are organized to grant land subsidies for an electric line, taking in the valleys of the Pebble, Beaver, Upper Nehalem and Rock Creek, in which are coal fields.

## Pennsylvania.

**LATROBE, PA.**—An electric railway will be built to Pittsburg.

**SCRANTON, PA.**—The street car line will be extended from Hyde Park to Providence.

**BANGOR, PA.**—The Pen-Argyl, Bangor & Water Gap road has been sold by sheriff.

**MCKEESPORT, PA.**—A route is being selected for an electric railway from McKeesport to Elizabeth.

**MCKEESPORT, PA.**—The McKeesport & Wilmerding Electric Railway Company ordinance was passed.

**PITTSBURG, PA.**—The Traction Company's surveyors are at work on the line to Mill Creek and Miner's Mills.

**CARLISLE, PA.**—The Cumberland Valley Traction Company has adopted plans for a branch to Boiling Springs.

**TARENTUM, PA.**—The Tarentum Traction Passenger Railway Company will build four miles of road in the spring.

**HAMBURG, PA.**—Permission to pass through the town was given the Pottsville & Reading Electric Railway Company.

**HOMESTEAD, PA.**—A branch will be built to Whittaker by the Homestead & Highland Avenue Street Railway Company.

**HOMESTEAD, PA.**—Franchise has been granted the Homestead Traction Company. It will straddle the lines of the other roads.

**SHAMOKIN, PA.**—The Shamokin & Mt. Carmel Street Railway Company will begin work on its Locust Gap branch in the spring.

**CHESTER, PA.**—The Chester, Media, Middletown & Aston Traction Company will use the tracks of the Chester Traction Company.

**MAHANOEY CITY, PA.**—The Lake Side Railway Company is surveying for an extension of eight miles, and other extensions are contemplated.

**AVOCA, PA.**—Legal disability preventing the building of the Pittston, Jenkins & Avoca Street Railway Company in Avoca has been removed.

**DOYLESTOWN, PA.**—The Buck's County Railway Company has filed its bond, which has been approved by the city council. Work will be begun at once.

**HATBORO, PA.**—Senator Markley has been chosen president of the Willow Grove & Hatboro Electric Railway Company, which will build fourteen miles.

**BRAOFCO, PA.**—A 10 per cent assessment has been levied on subscribers to stock in the Bradford Electric Street Railway Company which was organized in June.

**NEW CASTLE, PA.**—J. C. Whitla and others are figuring on buying the New Castle and Brinton Park street car lines. If the deal goes through extensions will be built.

**ALLENTOWN, PA.**—The Allentown & Lehigh Valley Traction Company stockholders will meet December 29 to vote to increase the capital stock from \$1,500,000 to \$4,000,000.

**MCKEESPORT, PA.**—Eight miles of electric road are to be constructed from McKeesport via Glenwood and Dravasburg to Pittsburg. The steam railroad route is sixteen miles.

## PERSONAL.

RUSSELL B. HARRISON, president of the Terre Haute system, made the REVIEW a pleasant visit.

A. H. DOLLARD has resigned his position as president of the Lewis & Fowler Manufacturing Company, of Brooklyn, N. Y.

B. J. JONES, of Sioux City, has been appointed superintendent of the South Chicago City Railway and has begun his duties.

A. W. GILBERT, of St. Louis, a successful promoter of water works, electric light and railway enterprises, called on the REVIEW.

COL. W. H. SINCLAIR, president of the Galveston Street Railway Company, went home from the Atlanta Convention by way of Chicago.

F. H. KILLINGER, superintendent of the Canton-Mason Electric Railway Company, gave a reception recently at Canton, O., to his railway friends.

W. D. RAY, formerly an electrical engineer of Chicago, has gone to take charge of the Everett Railway & Electric Company as superintendent.

WALTER SMITH has been promoted to be mechanical engineer and assistant to Superintendent Lynn, of the Milwaukee Street Railway Company.

E. K. STONE, JR., secretary and superintendent of the Quincy Horse Railway and Carrying Company, at Quincy, Ill., made the REVIEW a call lately.

A. B. CLARK, treasurer of the Baltimore, Md., City Passenger Railway Company, has been granted a leave of absence. Henry P. Smith is treasurer pro tem.

J. A. KERN, for several years auditor of the Des Moines, Ia., City Railway Company, has made an extended tour of the west, accompanied by his wife.

A. DERR has resigned the superintendency of the Rochester, N. Y., Electric Railway Company, to accept a similar position with the Rochester Railway Company.

L. N. DOWNS, of the new Citizens' Street Railway, of Battle Creek, Mich., made the REVIEW office a call recently. He is pushing the construction of the system rapidly.

A. K. STONE, formerly superintendent of the Omaha & Council Bluffs electric line, has been made a division superintendent of the Great Northern Railroad, with headquarters at Glasgow, Minn.

W. W. HATCH, superintendent of the new Elkhart, Ind., system, was a recent caller, and reports good pro-

gress making with construction work. As soon as the lines in the city are completed, work will be pushed on the interurban which promises to be one of the largest in the world.

PRESIDENT WILLIAM M. HAYES, of the West Chester, Pa., Street Railway Company, recently gave a wedding reception to his son Carroll and his bride, to which all employes of the company were invited.

HARRY ULLERY, superintendent of the electric street railway at Hartford City, Ind., was married recently to Miss Fanny A. Fox. The happy couple spent their honeymoon in a tour of Ohio on bicycles.

CHARLES R. HOLMES, superintendent of the Anaconda, Montana, street railway, light and water companies, and one of the youngest men in the country holding such position, was a REVIEW caller on his recent trip east.

E. W. GOSS has resigned his position as superintendent of the Amesbury, Mass., Electric Light, Heat & Power Company, and is now superintending the reconstruction and equipment with electricity of the Middletown, Conn., Horse Railroad.

W. S. DIMMOCK, general superintendent of the Omaha & Council Bluffs Railway & Bridge Company, Council Bluffs, Ia., called on the REVIEW on his way home from the convention. With Mrs. Dimmock he inspected the systems in Cincinnati, Louisville and Indianapolis.

FRANK STRANGE and Morton Dawson, two large land owners, recently ran a trip as conductors and motormen on the Broad Ripple Rapid Transit Company, Indianapolis, Ind. They are both stockholders of the company, and it is said Mr. Dawson will be general manager.

CHARLES HATHAWAY, accompanied by his son, A. L. Hathaway, were REVIEW callers when en route home from a successful hunting trip in northern Dakota. They went back 50 miles from the railroad and slept in tents during weather in which ice formed every night.

STANLEY GREEN, western representative of the Fuel Economizer Company, 574 Rookery, who has been confined to his bed for several months with muscular rheumatism, has recovered sufficiently to attend to business. His customers are very much pleased that he is with them again.

JOHN J. STANLEY, superintendent, of the Cleveland Electric Railway was arrested on three charges of violating an ordinance, which provided for an extra conductor, or motorman for trailers. When the case came up a nolle pros was entered by the director of law of the city, who said the city had no right to pass such an ordinance. It is only when attempts are made to enforce similar legislative acts adopted for political reasons, that the foolishness of the politicians is made apparent.

W. A. ARMSTRONG, superintendent of the Pennsylvania Traction Company, of Lancaster, Pa., was recently presented with an elegant watchchain and charm by the employes of the company. The thirty-first anniversary of Mr. Armstrong's birth was made the occasion of the presentation.

A. E. BAKER, assistant secretary of the Baltimore Car Wheel Company, sailed from London for Philadelphia, on October 3. Mr. Baker returns from a three months' combined business and pleasure trip, and has visited all the principal cities both on the Continent and in England, where he found rapid strides were being made in the building of electric railways, but nowhere found as rapid service as in America, which may possibly be accounted for by the fact of their being practically in their infancy.

W. F. RUDOLPH, of the Central Avenue Railway Company, Oakland, Cal., banqueted a number of Oakland and San Francisco street railway men, October 16. His guests were George Y. Loring, Oakland Railroad Company; Frank Leland, Oakland, San Leandro & Haywards Electric Railway Company; A. K. Grim, Oakland Consolidated Street Railway Company; J. E. Morris, Highland Park & Fruit Vale Railway Company; S. B. Lenegan, Central Avenue Railway Company; A. G. Briggs, Geary street road.

PROPOSED CHICAGO LINES.

It is given out on good authority that an electric line will be built from the corner of Michigan avenue and River street, Chicago, north across the river on Rush street bridge to Kinzie street, west on Kinzie street to the Chicago, Evanston & Lake Superior Railroad, a suburban steam road owned and operated by the Chicago, Milwaukee & St. Paul Railroad, and running to Evanston. When connection is made with the road the equipment will be changed to electricity. The steam road is 13.69 miles long. E. S. Dreyer and W. M. Hoyt are said to be interested. Mr. Dreyer, however, says there is nothing in the story, and President Miller, of the Chicago, Milwaukee & St. Paul Railroad, says the same. The information comes from such a source that though the plan may not have developed sufficiently for a proposition to have been made to the railroad company, it is likely to be done. The possession of this line of steam road would be of advantage to the proposed Chicago-Milwaukee interurban.

Notice has been given that on November 17 the North Chicago Street Railroad Company and the West Chicago Street Railroad Company will ask for ordinances for several new lines.

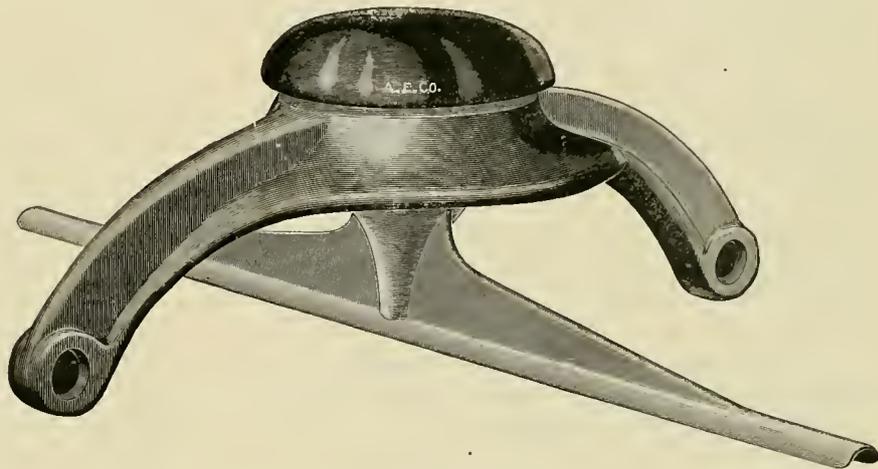

METROPOLITAN ELECTRIC COMPANY.

The Metropolitan Electric Company, 186 and 188 Fifth Avenue, Chicago, has recently added a street rail-

INSULATED ADJUSTABLE CROSS OVER.

way department. The company has been in existence for a long time, but has not entered the street railway field until lately. A full line of materials is carried in

DOUBLE PULL OVER.

stock. William H. McKinlock, is president, and Walter C. McKinlock, is secretary of the company.

Among the specialties handled by the company are a double pull over and an insulated adjustable cross over. The pull over is made with light or heavy 15-inch ear. It is made for No. O. 2, B. & S., and No. 4, B. W. G., wire. The company has just issued a handsome special street railway catalog of 204 pages. It is full of illustrations and descriptive matter concerning almost every variety of electric devices. There are many valuable tables, which are convenient for ready reference. A cipher code is also appended, and each item in the catalog has a trade name, so that telegraphic orders can be sent at slight expense. The code is quite a feature of the book, and is very complete. There is also a large index, which will enable purchasing agents to find quickly whatever they may need.

A WIRE cable 21,800 feet long and weighing forty-five tons was recently furnished the Broadway cable road in New York City, by the John A. Roebling's Sons Company of Trenton, N. J.

Playing Cards.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to P. S. Eustis, Gen'l Pass. Agent, C. B. & Q. R. R., Chicago, Ill.

THE Consolidated Traction Company, of Newark, has adopted the Darrach fender.

THE New Castle Car Company is at work on a combination baggage and passenger car for the Goshen-Elkhart, Ind., interurban.

THE Scarritt Car Seat Company, St. Louis, has orders on hand for more than 3,000 of its celebrated reversible car seats for street railroads.

H. A. HOAGLAND, superintendent of the Marinette Street Railway, has accepted a position at the factory of the Mather Electric Company.

WAREHAM & HUGHES, Beaver Falls, Pa., have the contract for eight miles of electric road between Benwood and Moundsville, W. Va., for \$300,000.

THE New England office of Westinghouse, Church, Kerr & Co., has been moved from 620 Atlantic avenue to the Exchange building, 53 State street, Boston.

THE foundry of the Maryland Steel Company, Baltimore, is busy on an order for about 3,000 cable railway yokes, for the Columbian Traction Company, of Washington, D. C.

TAYLOR, DEE & MACK, dealers in electrical supplies at Chicago, have dissolved partnership, as a result of business complications, and placed their business in the hands of Franklin S. Terry, as assignee, who will close out the stock.

THE Scarritt Car Seat Company, St. Louis, sold the Big Four road 720 of its popular high back car seats, which will be placed in the new vestibule limited trains now being built.

THE Penney-Meyers Construction Company has a contract to build seven miles of electric line in St. Louis. The line will eventually run to Kirkwood, fourteen miles from the court house.

THE Card Electric Company, of Mansfield, O., is making a specialty of multipolar motors, iron-clad, for bridges, turntables, and all places where the motors must be exposed to weather and dirt.

CARDWELL BROS., New Haven, Conn., have the contract for constructing the Danbury & Bethel electric road, which is to be eleven miles long. The road will be parallel with the Consolidated road.

THE Berlin Iron Bridge Company, East Berlin, Conn., has secured the contract to build an iron car house with capacity for 25 cars, for the New Haven & Centerville Street Railway. The Laclede Car Company, St. Louis, will build the cars.

THE Elwell-Parker Electric Company of America is sending out from its Cleveland office a large and fully illustrated catalogue of its apparatus, which corresponds with that of its parent, the Electric Construction Company, Limited, of England.

DANIEL HIGGINS, 1719 West Lombard street, Baltimore, has furnished 1,400 badges for the Market Street Railway Company, San Francisco. He has also made the badges used by all the street railway companies in Baltimore and a number of other cities.

THE Michigan overhead material, manufactured by the Michigan Electric Company, Detroit, Michigan, and exhibited at the Atlanta convention, is meeting with great favor among street railway and construction men. The company reports encouraging sales, and an improvement in business.

THE Mather Electric Company has taken a third order for a 180 kilowatt multipolar railway generator from the Hartford & West Hartford Street Railway Company. It has sold a 100-horse-power multipolar to the Bloomington City Railway Company, Bloomington, Ill.; also a 100 kilowatt for Scranton, Pa.

THE White Manufacturing Company, 556 West Thirty-fourth street, New York City, has bought the patents and patents pending on the steel snow plow, as used by the West End Street Railway Company, of Boston, and the Brooklyn Heights Railway, Brooklyn. This plow has done excellent work on these lines.

THE Pittsburg Bridge Company, Pittsburg, Pa., has received a contract for 800 feet of steel trestle work on the line of the Akron & Cuyahoga Falls Rapid Transit Company. The Pittsburg Bridge Company is noted for the high grade of work turned out by its plant, and this work will be found to be up to the highest standard.

FRANK DE RONDE, general and genial sales agent for the Standard Paint Company, of New York, was in the city on business. He also introduces to the trade J. C. Shainwald, who will represent the company in Chicago at 871 Rookery. Mr. Shainwald is a most affable gentleman, and will be eminently successful in this new connection.

THE Consolidated Car Heating Company, of Albany, N. Y., has recently received orders to equip with its electric heaters and temperature regulating switches 100 cars of the Nassau Railway, Brooklyn; the Allentown & Lehigh Valley Traction Company and the Yonkers, N. Y., Street Railway Company, all of which are operated by the Johnson syndicate.

THE Southwark Foundry & Machine Company, of Philadelphia, is furnishing two 500-horse-power compound Porter-Allen engines to the People's Electric Light & Motor Company, of Chicago. The excellent record of the Porter-Allen simple and compound engines formerly installed has led to this second order. The company also furnishes the boilers.

THE Berlin Iron Bridge Company has erected for the Mather Electric Company, a new building 300 feet by 50 feet, equipped with the latest improved machinery and a 40-ton traveling crane, especially for the building of large direct connected generators for railway work. The unfinished castings are brought in at one end of the shop and go out at the other end as finished machines.

THE Wallace Electric Company is general sales agent for the manufacturers of the Brilliak railway incandescent lamp. It is made with an anchored filament, to withstand the severe conditions which lamps are sometimes subjected to in railway work. The railway specialties manufactured by the Wallace Company are all well illustrated in its railway catalogue, which is complete throughout, and which should be in the hands of every superintendent.

J. H. ROSE, patentee of the Lima register, has formed a combination with D. L. Bates & Bro., Dayton, O., to manufacture his new and improved register. Mr. Rose has had years of experience as a street railroad man, and has patented a number of street railway appliances. He thinks he has in his improved register, known as the Rose, one that will command the attention of street railway managers. It is handsomely finished in nickel, and in polished and oxidized bronze.

THE Mather Electric Company, of Manchester, Conn., reports, as a sign of the revival in the electrical business, the closing in three consecutive days of contracts for more than 1,500 horse-power of its standard apparatus, consisting of direct connected and belted generators, and its Manchester type slow speed motors. This, with the other work the Mather Company now has on hand, will compel it to at once increase its working force, although part of the works is now being operated at night.

THE Griffin Wheel Company, of Chicago, reports a most satisfactory month's business in October. Orders from steam railroads numbered more than any previous month this year; some important time contracts were closed and new customers secured among the larger electric roads. Reports of excellent service resulting from the use of its special chilled iron wheel under electric cars are constantly coming in, and state that they find the managers of these roads are fast learning that it is often false economy to buy the lowest priced wheels and are now looking more to quality than to price.

THE Lane & Bodley Company, Cincinnati, O., the well known engine builders, is receiving bids for limestone foundations, brick, carpenter and mill work, roofing and structural steel work, for a new addition to the machine shop, 40 feet by 147 feet, six stories in height, and also for building materials separately therefrom, and has specifications prepared for electric power generating and distributing plant, including motors, wiring, arc and incandescent lamps and several direct motor driven machine tools. Specifications may be had on application.

THE Philadelphia Electrical Equipment Company is a new concern, the organization of which it gives us great pleasure to announce, as it has as general manager the well-known street railway man, C. P. Young, formerly superintendent of the Chattanooga Electric Railway and recently in construction work around Philadelphia. The new company will do all kinds of electric railway contracting, and besides this has an elegantly equipped shop for doing all kinds of repair work at 816 to 822 Cherry street. Those who are acquainted with Mr. Young's thoroughness, as well as his large practical experience in the operation of electrical apparatus, will know that whatever work is done will be as near perfect as it is possible to make it.

THE Siemens & Halske Electric Company's factory was destroyed by the great lumber fire, August 1, in Chicago. The company made a lease with the Grant Locomotive Works, August 11, and commenced moving into the new works August 15. The company on October 15 finished and shipped the first generator, built entirely at the new factory. Every available tool in the new works is now in operation, and many of the tools which were destroyed in the fire have been duplicated so that from now on the company is in the position to finish one direct-coupled generator each day. These few simple facts indicate the dauntless spirit of the company, which is to-day in a better condition for competition in the electrical field than before the fire.

THE New Process Rawhide Company, Syracuse, N. Y., is happy over a very pleasant testimonial letter from H. S. Cooper, general manager of the lines at Schenectady, N. Y., who writes as follows:

"We enclose our order for two more No. 16 Edison pinions, same as before. The pinions have done excellently well. On May 10 we equipped an open car with steel pinions; on May 28 we equipped an identical car with rawhide of your make. To-day the steel pinions are worn out, and have also worn out the axle gears in which they mesh, while the rawhide pinions are not nearly worn out, and the axle gears in which they mesh are not worn at all perceptibly. Both these cars have run steadily over identically the same route, and have carried very closely the same number of passengers, and averaged the same mileage, 100 miles per day. As you know, our road is a very hard one on gears, as it is all curves and grades, with the curves all on grades 6, 7½, 10 and 12 per cent, and some of them pretty long ones. We are well pleased with the results, the more especially as the writer was somewhat dubious at first as to the using of rawhide on single reduction machines, although his experience with them on double reduction had been very satisfactory."

CHARLES A. SHELDON has been put in charge of the compressed gas lighting department of the Consolidated Car Heating Company, Albany, N. Y., which is introducing the Pope system, interchangeable with the "Pintsch." Mr. Sheldon graduated from Yale in 1890, and was employed by the Lake Shore & Michigan Southern Railroad, rising to the position of assistant division superintendent of the Michigan division. The Consolidated Car Heating Company has secured an order from the West End Railway, Boston, to equip 149 cars with electric car heaters, after a competitive test with five companies. An addition to the factory is being built, which will double the capacity of its departments of electric heating appliances and compressed gas.

THE Scarritt Furniture Company, St. Louis, has a most attractive display of street car seats at the St. Louis Exposition. The different styles of seat are arranged within a palace street car, which is open at the side and very brilliantly lighted by the Pintsch light. The Scarritt Company street car seat has been adopted by many railways and has found favor everywhere, especially in St. Louis, where it is in use on the Lindell Railway, Compton Heights, Union Depot & Merchants' Terminal Railway, Taylor Avenue Railway, Union Depot Railroad, Baden & St. Louis Railway, Citizens' Railway, South Seventh Street Railway and the Laclede & Fourth Street Railway. Scarritt seats have been shipped to almost every part of the United States and to a dozen foreign countries. Fully 200 steam roads in America use them

H. O. NOURSE, of 941 Rookery, agent for the Scarritt Car Seat Company of St. Louis, was born in Bardstown, Ky., in 1852, and acquired his education in Kentucky public schools and at the Mechanical and Agricultural College at Lexington. In 1874 he entered railroad work with the Elizabethtown & Paducah R. R., later going with the Louisville, Cincinnati & Lexington. With this company he remained seven years, when he was appointed purchasing agent and later auditor of the Monon. In 1884 he removed to Chicago, and in 1886 went into the supply business as agent for the Dickson Manufacturing Company, of Scranton, with headquarters at Chicago. After a successful term in this line Mr. Nourse took up general supplies until August last, when he became minister plenipotentiary and envoy extraordinary for the Scarritt Car Seat Company. He reports business flourishing and street railway car seats of the Scarritt type in active demand.

H. O. NOURSE.

THE McGuire Manufacturing Company, of Chicago, has orders for November delivery which show a large improvement in street railway business throughout the

entire country. Orders were from the following parties: Consolidated Traction Company, Jersey City, 22 Columbian trucks and 117 of the Columbian A 1 suspension trucks; Norwalk Street Railway Company, Norwalk, Conn., 13 Columbian trucks; American Car Company, St. Louis, 12 adjustable traction trucks; Augusta Street Railway Company, Augusta, Ga., 10 A 1 suspension trucks; Allegheny Traction Company, Pittsburg, Pa., 10 A 1 suspension trucks (being a duplicate order); 40 A 1 suspension bicycle trucks from the Consolidated Electric Railway Company, Los Angeles, Cal., and 60 Columbian trucks for the Chicago City Railway Company. The Toledo Consolidated Street Railway Company, Toledo, ordered two combination track sweepers and snow plows; the Citizens Street Railway Company, Indianapolis, 2 combination snow plows, and the LaCrosse City Railway Company, LaCrosse, 1 combination snow plow. The company also reports orders for nearly 700 car heaters for the month of October, which is certainly a good evidence of reviving business.

#### CONVENTION MEMORIES.

Just before the convention party left Chattanooga on the Saturday of convention week, a meeting was held in the railroad depot. A committee was appointed to prepare resolutions expressing the grateful feeling of the party towards its hosts for the manner in which it was entertained. The committee met in Chicago, November 2, and prepared the following:

Before memory stores a treasure in its crystal vaults, it seeks expression in some word or sign.

Consequently the members of the American Street Railway Association and their friends desire, through the undersigned committee, to extend to the people of the City of Atlanta, Ga., a vote of sincere thanks for their hospitable treatment of the association during its convention held in their city, October 17th, 18th and 19th, 1894.

Particularly do they desire to thank the officers and employees of the Atlanta street railway lines for many favors received at their hands.

Also, would we recognize the very hospitable manner in which we were received by the Capital City Club, and thank its eloquent president for the very graceful tribute paid to the genius that has worked out the problem of rapid transit for municipalities, and the beautiful compliment rendered to the ladies in attendance. Nor can we soon forget the barbecue.

Appreciating that our indebtedness to the Southern hospitality which prompted the preparation for this long-to-be-remembered occasion, can never be liquidated, at the same time, if our expression of gratitude will in any way be acceptable, we trust that those to whom we are under so many obligation will accept this recognition.

On behalf of the Boston, New York, Philadelphia, Chicago and other parties who, on October 20th, spent such a delightful day at Chattanooga, Tenn., the committee desires to thank the officers of the Lookout Mountain Railroad, and, also the officers of the street railways of Chattanooga for courtesies extended to them in excursions to various points of interest about the "City of the Bird's Nest."

(Signed)

THE Grand Island (Neb.) Street Railway has been sold to A. W. Ockabock, Portland Ore., for \$10,000.

## PROGRESS OF CONSTRUCTION WORK IN CHICAGO.

Work on electrical construction is now being pushed rapidly by all three of Chicago's great street railway systems and there is also much activity among the suburban roads.

### THE CHICAGO CITY RAILWAY

had the advantage of the other systems in having its power station already erected and three crosstown lines in operation when its additional franchises were granted last summer. Its electrical and mechanical department was already in shape for pushing the electrical construction and many plans and drawings had been prepared when the first lines were opened last year. About a month after work began a 5-mile route on Thirty-ninth and Halsted streets was opened for traffic. In the power station the foundations are ready for the three new 1,400-horse-power units to be put in. The capacity of this plant will be 7,000-horse-power. The State street cable line below Thirty-ninth street is being relaid with the beveled rail illustrated in our September issue. The Wheeler joint is being used on the new work. This it will be remembered, is a wedge joint having no bolts. The wedge is driven up with a twelve pound sledge. The rail ends are butted together closely. The results obtained with these joints will be watched with interest. The 600-horse-power Westinghouse motor for running the Fifty-second street cable plant has arrived but will not be put in place until the new work in the electric station is finished which will be well along into the winter. The plan of keeping all the trolley line sections insulated from each other is to be rigidly adhered to in the new work as it has been in the past. Each section will have its own feeder and each feeder its own circuit breaker and ammeter on the switchboard. This plan is not usually followed out on large roads because of the great amount of copper required, but reliability and the confining of interruptions to one section were more important than cost of copper in this case.

### THE NORTH CHICAGO STREET RAILROAD

has its power station at Roscoe street and the north branch of the Chicago river nearly finished. It is a one-story structure with basement. Condensing engines will of course be used. The present contract calls for four 620-horse-power direct connected Siemens & Halske generators and Fraser & Chalmers vertical engines. The engine room will have iron floors and the boiler room concrete. The ultimate capacity is to be 6,000-horse-power.

In addition to this station the same company will build a 4,000-horse-power station near Division street on the canal opposite Goose Island. There are to be four units of 1,000-horse-power, direct connected. This plant is to supply the southern part of the company's territory. It is located on the line of the C. M. & St. P. Railroad.

### THE WEST CHICAGO STREET RAILROAD

is laying the foundations for the largest railway power plant in Chicago, at the corner of Western avenue and Washington boulevard. It is central to the west side territory and is on a lot which has been owned by the company for many years. The ultimate capacity is to be 11,000-horse-power, consisting of five 2,000-horse-power, and one 1,000-horse-power units. Present contracts call for three 2,000-horse-power Siemens & Halske generators and Fraser & Chalmers engines and one 1,000-horse-power unit from the same firms. Twenty Stirling water tube boilers of 400-horse-power each will furnish steam. The stack is to be 240 feet high with an inside diameter of 16 feet. There is a not unreasonable rumor that if the Lake Street Elevated (which is also controlled by the Yerkes syndicate) is changed to electricity it will be supplied by this power station. Underground feeders will be laid for a mile south from this station. J. R. Chapman has charge of the electrical work on both the north and west sides.

### THE METROPOLITAN WEST SIDE ELEVATED

road with the electrical department under the charge of W. E. Baker is beginning to get above the city grade line with its power station at Throop street near Van Buren. It is located between the four tracks of the elevated structure. Vertical Allis cross compound condensing corliss engines and General Electric direct connected generators will be installed. Two units of 2,000-horse-power and two of 1,000-horse-power are to be put in at present. The station can be enlarged to more than double this capacity by building an extension. It is now 300 feet long by 90 feet wide. It will not be finished before spring. That part of the road east of the river or the down town terminus is not yet built. One half of the jack-knife bridge across the river is completed.

### THE CHICAGO GENERAL RAILWAY

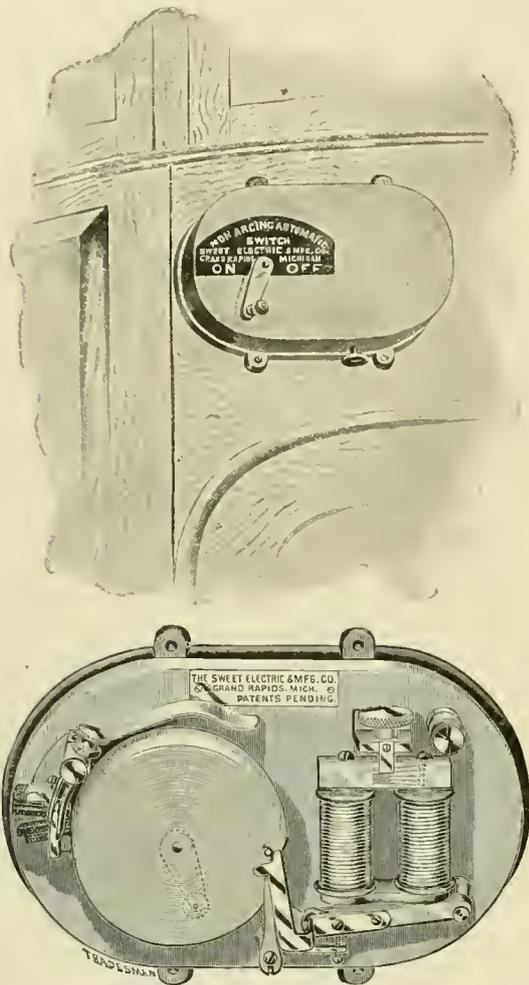

has the walls up for its 1,600-horse-power plant and 100-car barn at Kedzie avenue and Thirty-first street. The work is described in detail elsewhere in this issue.

## THE GIRL IN BLUE TIGHTS.

Visitors to Chattanooga, Tenn., on their way home from the convention, no doubt remember the pictures of the girl in blue that ornamented the walls and bill boards. Originally she was dressed in blue tights, but the day before the visitors arrived, the chief of police compelled the theatre manager to put skirts on the figure. On Saturday the street railway people gazed on a girl with blue decollete waist, and short skirts of red and white bunting, speckled with stars. The curious inspected the garments, discovering that the bunting was tacked on. The courts have since passed on the case, and decided that the picture was not indecent, arriving at the decision after hearing expert evidence from leading citizens of Chattanooga.

## THE SWEET LIMIT SWITCH FOR CARS.

Some time ago we illustrated the switch made by the Sweet Electric & Manufacturing Company, of Grand Rapids, Michigan, for use on station switchboards. It has been recently adapted for use on electric cars. It is intended to take the place of both fuse box and canopy switch, as with it the motors can be cut out by hand as well as automatically. It is much quicker in its action

than a fuse in case of short circuits. It is only 11 inches long, 8 inches wide and 3 inches deep. The final break of the circuit is made between carbons so that there is no serious arcing. It is quick enough in action to be some protection against lightning, and is so sensitive that it quickly detects overloads on the car and makes motormen careful, whereas a fuse will stand considerable overload for several seconds without blowing. The principle of the switch is the same as for the station switch.

Will make proposals for the Construction of all Classes of Street Railway Tracks, Power Houses, Etc.

## NEW YORK VOTES FOR RAPID TRANSIT.

New York City, by a majority of 68,790 votes, decided in favor of the city constructing a rapid transit road. Under the law, construction must begin within 30 days after the Rapid Transit Commission has received official notice of the result of the election. The road will be underground from the Battery to the northern limits of the city, and operated by electricity. The cost will be met by an issue of \$50,000,000 of bonds, bearing 3 per cent interest.

Concerning the details of construction little is known, except that a meeting of the Rapid Transit Commission was called for November 13, to consider plans. This meeting was held too late for an account in this issue of the REVIEW. The city will own the road, and it is estimated that it will cost \$30,000,000 to complete the road, in addition to the \$50,000,000. The city will lease the road to the contractor, who shall deposit \$1,000,000 in cash, and an approved bond of \$5,000,000 before beginning work. When the road is running he shall pay as rent a sum equal to the interest on the bonds, and one per cent on \$50,000,000 additional. The contractor's lease will be for 35 years, and he must provide cars, motive power and other appliances for its operation, the city having a first lien on the property. The city has a right, in case of any breach of contract, to take possession of the equipment of the road, and operate it at the expense of the contractor.

The commissioners will carefully consider all the plans that have been heretofore presented to them, and it may be some time before a definite plan is decided. At any time the plans can be changed. The tunnel will be constructed under Broadway, beneath the cable line to the Boulevard, and thence to the upper end of Manhattan Island. It is proposed to build a branch from Union square up Fourth avenue to Forty-third street, with extensions later.

THE STREET RAILWAY REVIEW  
269 Dearborn Street, Chicago

Eastern Office, Room 14, No. 126 Liberty Street, New York

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4. DECEMBER 15, 1894. NO. 12.

THE Elektrotechnischer Anzeiger is authority for the statement that of six Luhrig gas motor cars put on the Dresden Tramway last July, four have from various causes been withdrawn. 'Twas ever thus.

AN interesting case is reported in our law digest this month, in which the supreme court of the state of Washington rules that a passenger who attempts to board a moving car, even though its speed had been reduced on signal of the passenger, does so at his own peril.

MAYOR PINGREE, of Detroit, he who has been so considerate of the rights and property of the street railway in this city, recently caused his carriage horses to be shot as a matter of economy, stating he could buy more in the spring for less money than their feed would cost for the winter. His humane ideas, which, however, are not largely shared, may also be seen in his recommendation to his board of public works to dispose in the same way of the idle horses belonging to the city.

THE New York state law very justly makes it hot for those who tamper with electric wires. Considering the loss of life and property involved this is as it should be. Those who have a knowledge of electricity can cause serious damage by interfering with power circuits. Offences of this nature are becoming more frequent as the use of electricity increases and laws on the subject

would be in order in all states, although it is usually possible to secure the punishment of the guilty parties, even if there is no special law to cover the case, of tampering with electric wires.

It has recently been shown that with a trolley road costing about \$6,000 per mile the cost to the country lying one mile on each side of an electric road would be only \$4.60 per acre. This is not a very high figure, and it seems as if in most cases the electric road would be worth more than that to the country it passes through. The figure of \$6,000 a mile is perhaps rather low and could hardly be made to cover the entire cost of a road, but on figuring on country feeders to trunk interurban lines it would be fair to count simply the cost of track and line, so that \$6,000 a mile ought to cover it.

IF the New York "rapid transit" scheme continues to move with the same alacrity which has characterized its motions thus far, there are some grounds of expectancy that the great-grandchildren of the present promoters may live to witness its completion. The Brooklyn Standard-Union says: "Rapid transit down Park Row, traveling under the foundations of the 'World,' 'Tribune,' 'Times' and Potter buildings and the postoffice, and then taking a slant down Broadway, will be a daisy of an enterprise. Fifty millions can be spent between the City hall and the Battery, and then the elevators that go down would be extra."

REPORTS have come to us from small roads in different parts of the country that they are compelled to cease operating during the winter months. A few are electric lines, while others are horse lines. The reason given in every case is that there is not enough traffic to pay expenses. A certain line will continue to operate one car as long as the driver can collect enough money to buy feed for the horses. It is a difficult but strictly local question as to what extent a company can go in operating at a prolonged loss, and would seem to raise grave doubts as to the judgment of those who first conceived the enterprise. It is to be hoped that revival of business the coming year will again place all such roads in position to maintain constant service and at a profit.

THE Philadelphia Press very sensibly comments on the evil of granting franchises good for 10, 20 or 30 years, which permit the recipient to postpone construction of the lines so granted for a long term of years. A reasonable time in which to build should always be granted, and there are also cases where companies through no fault of their own are prevented from installing for two or even three years. But such are exceptional cases and are entitled to favorable consideration and temporary extension of time. But the granting of a franchise of any kind which ties up a street for a long term of years is bad policy, and while in some ways a good thing for the grantee, eventually works evil through the change of public sentiment from friendship to hostility.

THE Pennsylvania State Association has a much needed work before it at the coming session next month of the legislature. As the law now stands and passed at the instigation of the steam roads, notably the Pennsylvania railroad, interurban electric roads are debarred from a freight service, which is almost a necessity to the existence of such lines. There is neither justice nor reason in the law, and the sooner it is repealed the better for everybody. Even the steam roads which are now alarmed at the prospective competition, will find that the electric interurbans will create a large volume of business for steam roads, and in the long run prove an advantage rather than otherwise. Improvement of country roads might be objected to on equal grounds and with quite as much sense.

WATTMETER tests taken on the individual cars of one of the largest electric railway systems of the west, show the consumption of 25 per cent less energy with series-parallel control than with the plain rheostat. It has been claimed as a further advantage of the series-parallel controller that it evens up the sudden short variations due to the starting and stopping of cars, so that no more power is required when a majority of the cars are started at once than when the majority are running at usual speed. By inquiries among railway power plants we have been unable to learn that this is strictly true although there is some difference in favor of the new method. The greatest advantage of the series-parallel method is in the power saved when running at less than maximum speed and in pulling heavy loads on grades.

NEWS seems to move slowly eastward, judging from an editorial in the *City Leader*, of London, England, which says: "The Glasgow corporation, since they are considering the question of mechanical traction for their tramway system, may be influenced by the fact that even Chicago has now come to the decision that the tramway companies there cannot be authorized to use overhead wires in connection with the electric traction, and they have therefore had to adopt the accumulator system." If anything Chicago "has come to" is any guidance to our Glasgow friends, we would state that there are now in this city 200 miles of horse car lines being changed to the overhead trolley system, just as rapidly as men and money can accomplish the transformation. As for the "accumulator system," the term has a very familiar sound, but belongs to so remote a past we had almost forgotten all about its great promises and greater failure.

A DECISION in the Exchequer court will have important bearing on street railway construction in Canada, until the higher courts, to which the case has been appealed, renders the final ruling. Under the act of 1887, passed for the purpose of promoting railroad construction, steel rails were admitted free, for railroad use. The customs department, however, held that the exception does not apply to the same weight and quality of rail when imported for street railway purposes. The Toronto

Street Railway sued to recover \$56,000 duties paid on its iron. The case went against the street railway and will now go to the supreme court, and from there to the Privy council. The ruling is obviously unfair and illogical. The duty, or an exemption of duty, should apply the same to steam and street railways. It is inconsistent to impose taxation in one case and remit it in the other upon identically the same article, and an article used to promote the same ends in both cases.

A CINCINNATI clergyman recently asked for warrants for the arrest of a gang of trackmen who were repairing the car tracks on Sunday. The company insists the work could be done at no other time. If arrests are to be made along such lines, why not be consistent and extend the good work. How about the church sexton who dusts, and fires and turns on the lights, and puts in a long day's work on Sunday? And the hired organist, who plays for money and would not do so from his own individual desire to worship; and the high-priced choir, who warble for so much a warble per Sunday; and even the parson himself, no one expects him to preach for glory alone—but enough. We certainly are not out in favor of one stroke of unnecessary work on Sunday. There is too much of it at best, and the physical and mental man cannot attain his best without that stated time for rest, but where, in such a case as the one mentioned, the mayor had issued a permit to allow the work, the arrest of these men can subserve no desirable good end.

SOME doubt was recently expressed in the columns of a street railway publication as to whether the additional power required by a dirty track is sufficient to warrant running sprinklers or sweepers. On clean streets the small amount of dirt that gets on the rails does not require much extra power, but when the rail is dirty enough to be called "bad" it is hard to figure anything but a saving by keeping the rails sprinkled or swept. An 8-mile road running 16 cars on a  $3\frac{3}{4}$  minute headway will have a daily car mileage of 2,304, running 18 hours a day. With coal at the very low figure of  $\frac{1}{2}$  cent a car mile and a clean rail the daily coal bill would be \$11.52 cents. The additional power required with a bad rail is from 10 to 50 per cent, so that the extra coal bill will be from \$2.30 to \$5.76 per day for the road under consideration. As coal usually costs more than  $\frac{1}{2}$  cent a car mile the extra expense would generally be more. If a clean rail can not be maintained for less than this by sprinkling or sweeping, there must surely be a screw loose in the management.

Two decisions have recently been delivered by United States courts, which establish two important principles of law. The first was the Detroit case, which establishes the fact that a city does not grant a street railway franchise, but simply consents to its exercise. In the Indianapolis case, Judge Woods has given an opinion that the charter granted by a legislature is in effect perpetual,

subject only to amendments of the creative body, so that if consent of city council is only for a term of years, the charter of the company will enable it to continue in possession of the rights conferred by the city until the end of time, notwithstanding a limit has been placed by the city. This is important for street railway companies to know, especially those which see the end of the life of their ordinances approaching. Every company will endorse this statement of Judge Woods: "In the nature of things a street railway once established, where needed, will be of perpetual and increasing utility, and there seems to be good reason why the franchise should cease while the utility lasts."

NOTHING better illustrates the perfection of modern electric railway work as compared with that of a few years ago than the difference between the average trial trip of to-day and that of the earlier days. The time is not long past when a trial trip was justly the cause of much apprehension on the part of the electrical engineer in charge. Trouble was to be expected at "every turn" in both a literal and a figurative sense. If the engineer was unwise enough to make the trial trip coincident with the opening ceremonies an ironical fate was sure to bring the car carrying the official party to a halt somewhere along the line. The wise engineer would operate cars in the night for a week or two before the opening ceremonies took place. It is now a very usual occurrence on well built roads to open a road for traffic within 48 hours of the time the first car is run over the line. This simply goes to show that there is less of the cut and try method than formerly, and that electric railroading has been reduced to the same well understood basis as the other commercial arts.

It is greatly to be hoped that Governor Flower will see his way clear to grant the necessary order permitting the experiment of resuscitation to be made on the body of the next victim of electrocution. There has been a very grave question of well founded doubt all along, in the minds of many of the foremost electricians, that the post mortem (?) surgeons and not the electrical current have been the real executioners. Now, let the truth be known. The condemned stands a chance of being restored to life and liberty, and certainly can make no objection, for he has everything to gain and nothing to lose, and should he be restored to consciousness and animation might well be set free as a reward. If on the other hand all known methods of restoration fail, the condemned will still furnish just as interesting a subject for articulation and the public mind will be freed from gruesome doubts. If the current is found not to have caused death, and only effected a temporary suspension of vital functions the knowledge will be invaluable in stimulating renewed and persevering work on such patients as may hereafter suffer accidental shock, and who heretofore have been given up for dead when possibly prompt and intelligent effort might have saved their lives.

THOSE who are financially interested in street railways can afford to spend some time and thought in stamping out the pernicious custom of some supply companies of "influencing" employes that are entrusted with the selection of supplies. Such influence does not always come in the way of a cash "rake off" to the man who recommends certain supplies to his trusting employers, who know nothing about the technical details of the business, but in whatever form it comes, it does not require a very deep thinker to see that the result is not the best either to the street railway or to the supply trade. Honest supply companies that make goods to sell on their merits, will be glad to see this reform, because it will put them on an equal basis with the wire pullers. The owners of roads can not afford to have goods bought on any basis except that of actual merit, nor can they afford to have in their employ, in any position, men who will recommend goods on any other basis. The supply men's influence is not always confined to low places, and for that reason it is not always a pleasant or easy task to inquire into the reasons for the awarding of contracts, but we are sure that both railway owners and supply men will agree with us that the practice is bad for all concerned, and that it will benefit both sides to have it stopped.

WHILE the dear public is humanely crying for vestibules for the motorman, it doesn't take into consideration the fact that vestibules are likely to make the running of cars in the winter more risky than if there were none. In November, a motor car of an Ohio road crashed into a freight train standing on a crossing and seven men were injured, two of them seriously. The motorman was unable to see the train on account of the steam which had collected on the windows of the vestibule. In fact, he said he could not see objects ten feet in front of the car, and it was early morning, the car being on its way to the barns. Everybody who rides, knows that windows of all kinds of vehicles become coated with steam or become frosted in cold weather. Unless the glass can be kept clear, there is constant danger of accidents. This defect in vestibules suggests that some device must be adopted to keep the windows clear. Moderate heat only aggravates the difficulty, and enough heat to prevent frosting the windows would compel the motorman to keep them open, thereby causing the very conditions that have brought about the agitation for vestibules. If the body of the motorman is protected from the wind by a partition or extension of the dash, stopping even with his shoulders, so that his view is unobstructed, he will be amply protected, and the risk to passengers will be much less than if glass is used.

A PHILADELPHIA kicker writes a daily paper there, urging the public to adopt his plan of making a pencil memorandum of all shortcomings noted on the part of conductors and drivers. While every manager is glad to be advised of the violation of well known rules, on the part of his men, when such actually exist, his long experi-

ence has taught him that in probably four cases out of five a careful investigation will reveal the fact that the report was prompted by personal resentment, or if made in good faith, was subject to mitigating circumstances of which the complainant was ignorant. The great trouble is, that passengers look upon the operation of a street car system as one of the simplest things in the world to manage, which, if satisfactory to everybody, reflects no special credit on the executive, and furthermore, every individual who pays his five cents is proudly conscious of his ability to run the road a great deal better than it is being run. These conditions combine to make the hundreds of "reports" sent in by well meaning people unreliable and unfair, and there are roads where, if the manager acted on all the complaints sent in and blindly accepted such as true, an entire new set of employees would be needed every three months. It is one of the easiest things in the world for a person to be absolutely sure and yet be radically mistaken, and reporting car and conductor numbers is no exception to the rule.

In another column will be found an unusually practical and suggestive article from the pen of a successful superintendent, that deserves editorial mention here. The name of the road, and that of the writer, for obvious reasons, cannot be stated, but the very unusual record of 5,000,000 passengers carried the past twelve months, without incurring the loss of a penny for personal accident claims, cannot but appeal to all our readers. In the same period the property damage charge was only \$89.10, and of this amount \$35 went for attorney's fees. As stated in the article, local conditions must always bear an important influence in the working out and adaptation of any successful plan, but what has produced such marked results in one instance cannot fail to be valuable elsewhere. As mentioned in the article, too many managers accept as inevitable the proposition that cars cannot be operated without incurring personal injury, and unquestionably the larger the city the greater this liability, and the more difficult to utilize, to its fullest extent, the plan described. But there are very many roads working under practically the same conditions, where the item of damages each year runs into four figures. Money saved is money earned, and when that saving is accomplished in the claim department, it may almost be said to be doubly earned. We commend the article to the careful study of managers who have been trying, with disappointing success to reduce the losses in this direction. We shall be glad to hear from others.

THE public and the complaining daily papers have no idea of the systematic and thorough effort that is being made by the large systems in eastern cities to find a good fender. Hundreds have been tried and found wanting, and yet the public is of the opinion that it is pure obstinacy that keeps companies from adopting a perfect fender at once. While on the subject of fenders it may not be amiss to quote a master mechanic of a large sys-

tem who was showing some visitors the various fenders that had been tried by him. After exhibiting device after device and telling of the results obtained by each in actual practice, he finished the exposition as follows: "This is the fender that we have adopted as our standard. It is the best thing that we have found, and in my opinion it isn't worth a d—. It extends so far in front of the car that at dusk and after dark, people who are crossing in front of the car are continually falling over it, so that it knocks down a great many people that would otherwise be untouched. Another trouble is that wagons often drive over it and wreck it—necessitating of course a new fender." From this master mechanic's remarks it will be seen that a railway company is between two fires as regards projecting fenders. If it does not adopt them there will be a certain number of fatal accidents. If it does adopt them some accidents will be prevented, but there will also be a number caused by the fender alone, and there will also be a regular repair account for smashed fenders. The fact that several large companies use the projecting fender in spite of the objections to it looks as if the latter course had been found to be the best and cheapest, although the projecting fender is by no means an unqualified success.

THE electric conduit road now building on Lenox avenue, New York, can but strengthen the belief that the trolley is here to stay and that the conduit or any other underground system will never revolutionize our electric railways. The Lenox avenue conduit which is the design of a corps of the most able electrical engineers of the country, and is evidently the cheapest form of construction that those gentlemen think has any prospect of success, is still much more expensive than the cable to build and so is suited only to the heaviest traffic, such as exists on but a few lines in this country and in places where the cable is now doing the work satisfactorily. If 500 volts could be used with success on an underground system there would be some prospect that an electric conduit system might some day take the place of the cable on certain roads where a large number of trolley lines act as feeders to the cable lines and where the operation of the entire system by electricity would simplify matters enough to make a saving on the whole road which would counteract the low operating expenses of the cable part of the system. Operating a system that is all electric ought to be cheaper than operating one that is half cable and half electric. The Chicago roads are soon to be confronted with the inconvenience of having two kinds of mechanical motive power. This is discussed somewhat at length elsewhere in this issue, in connection with a device for throwing the motors out of gear so that they can be hauled as trailers on cable trains. The use of electricity all through, instead of electricity on one part and cable on another, presents some economical advantages in the way of centralizing power stations and simplifying matters in the repair shops. However, the possibility of such a change taking place is largely dependent on the practicability of using 500 volts on the

underground part of the system. If the voltage must be lower than this on the underground part, nearly all of the advantages of having the whole system electric would disappear, because, the underground trolley would require a different set of motor cars and a different set of generators to drive them. The same cars should be able to run over both overhead and underground lines and the same set of generators supply both sections of road. As the Lenox avenue conduit is to use only 250 to 300 volts it looks as if the able engineers who designed it did not consider 500 volts a reliable pressure for conduit work, and if their decision proves correct there seems to be little hope that the conduit system will occupy the field mentioned above.

---

#### ADVERTISING IN STREET CARS.

Advertising in street cars has now become one of the best known, and, to the advertiser, popular and profitable mediums, sought by discriminating business men. There was a time when both the public and the big advertiser did not look with favor on a scheme which has been tried and found valuable in England long ago. This fact, and a lack, or imagined lack, of the proper knowledge of how the business could be profitably conducted, made easy work for the many street car advertising companies, who took advantage of this want of experience to belittle the possibilities of the business and magnify its expense. Naturally many contracts were made at prices which brought the street car companies a very small share of the profits of the business. Many roads now see, too late, their mistake in contracting at so low figures, or even where what seemed a fair price was obtained, that they did not insist on more, which they would have secured. That the scheme has been a fat one for the promoters is evidenced by the big salaries paid those in charge; the frequent and prolonged trips to Europe and the fat dividends paid even after all these expenses. That the owners of the cars which alone make possible such sure and profitable a return should ever see so little of the earnings is a matter of regret.

A glance at the line of ads taken by these advertising companies shows the great majority to be patent medicines, baking powders, and similar household articles, while the local advertiser, the home merchant, is rarely seen outside the big cities. That the local advertising which can be changed as often as desired, commands a higher price is well known; but a company several hundred miles away cannot handle this local business as cheaply as the railroad company itself, which can do so at practically no expense at all.

We have in mind a large road which decided it was not receiving its due share, and when the contract expired declined to renew, and has ever since been conducting its own advertising department, and with marked success.

Another, one of the largest systems in the country, will do so as soon as present contract expires, which will not be long.

Now that the time is approaching when many roads will be asked to renew is a good time to inquire what others are being paid, with a view to receiving a fairer proportion of these earnings, or even of conducting the business themselves and keeping the whole. There are several large firms which make a business of supplying reputable advertising to country newspapers, attending to all collection of bills therefor, and even guaranteeing their payment, which handle this work at a small commission, who would be equally willing to do the same for street car companies.

Your road may have a contract which cannot be improved, and again, yours may be one of those which think they have but for lack of proper study of the question have never realized their own value.

---

#### KNOCKED OUT THE PREACHERS.

In Peekskill, N. Y., the preachers banded together to oppose the granting of a franchise for an electric street railway. They were very much in earnest, for the road was intended to reach a summer resort. Looking into the future, the clergymen thought they beheld crowds of summer resorters riding on the cars on Sundays. At the meeting of the board of trustees the ministers with one voice proclaimed that God did not allow men to harness the electric fluid for such purposes, in order that they might add another to the many forms in which the sanctity of His day was violated. It was shown to the preachers that there was no church at the summer resort, and, as heretofore, there had been no way of reaching Peekskill except walking, the cause of small summer congregations was apparent. With means of transportation, the resorters would come to church, which would result in increasing the revenue and assuring ministers' salaries and other expenses. The force of the argument was so apparent that opposition was withdrawn, and a franchise granted to the Beach Railway Company.

---

#### JOHN WORTHY DEAD.

John Worthy, president of the Metropolitan Elevated Railway Company, Chicago, died, December 12, at the Murray Hill hotel, New York. Mr. Worthy had been in New York ten days. About a week before, a small pimple broke out between his shoulders, which developed into a carbuncle. A surgical operation was necessary, from which he did not rally. Mrs. Worthy and their son were with him. Mr. Worthy was also president of the Commercial Loan and Trust Company Bank. He was born in the county of Durham, England, August 12, 1841, coming to this country when he was 11 years old. His commercial life began with the coal business, but after the war, he entered the stone trade, in which he became wealthy and was interested at the time of his death. Mr. Worthy was a man who made no enemies, and was prominent in the affairs of Chicago.

J. W. Wheeler has been appointed receiver for the J. W. Fowler Car Company, Elizabeth, N. J.

# STREET RAILWAY PROGRESS 1894

While the progress of the street railway industry during 1894, has not been as remarkable as during some previous years, it has been of a substantial character. In common with other lines of trade the street railway business has been held back by the recent financial condition of the country. In spite of this there has been a progress that was made possible only by the fact that the electric railway business is probably growing more rapidly than any other great American industry. Not only is its growth in mileage remarkable but improvements in numerous mechanical and electrical details are being made daily. The panic has had the useful effect of preventing the building of many non-paying roads, and of checking the tendency that has existed for several years of placing fictitious values on electric railway properties. The industry will now go ahead on a firmer basis than ever before. That it received so slight a check during the financial stringency is one of the best proofs we have that electric road building will not be retarded until all the meshes of the steam road network over the United States are further divided by the finer network of the suburban and interurban electric road. In round numbers there are about 10,000 miles of electric road and 20,000 electric motor cars at present.

Electrically and mechanically the electric road has reached that state of perfection which puts it on a par with steam roads. The progress of 1894 along these lines has been principally in the improvement of details. The days of experiment have passed and the electric railway apparatus in use to-day is the result of an evolution in which the survival of the fittest is the rule just as truly as in biological evolution. A few years ago there was a great variety of apparatus in the market but the hard knocks of every day use have sifted out the good from the bad until certain types have been developed to which the majority of manufacturers conform. The general design of apparatus having been settled, an opportunity is afforded to perfect the details and it is to the perfection of details as much as to the general principles that the electric railway owes its success. Hand in hand with the perfection of details which has taken place during the last year has come a more substantial construction of everything used in street railway work, especially track and overhead lines.

Previous to this year the manufacture of electric railway apparatus occupied a peculiar position among the other industries of the country. The profits relative to the factory cost of apparatus were enormous and the ordinary laws of competition in trade did not seem to apply here. At the same time it may be said in explanation that the amounts spent in experimenting and in making sales were also enormous.

Why this condition of affairs existed for so long a time

under competition is difficult to explain. However, it was not until the latter part of 1893 that this state of the business began to change, and 1894 has seen a grand crash of prices that has entirely removed the basis upon which the manufacture of electrical appliances formerly rested. Electric railway appliances are now made and sold in very much the same way that other standard articles of manufacture are sold. That is, there is the closest competition and everything is figured on a small margin of profit. In fact it is said that many contracts are now being taken at a loss. During 1894, prices on railway motors have been cut in two, and while other apparatus has not taken so serious a drop the reduction is below what would have been thought possible last year. How long prices will continue at their present low ebb it is impossible to say but it is certain that they will never go back to where they were before the cut throat competition of the panic forced them down.

The most revolutionizing change in the electric railway field this year has been the increasing use of generators directly connected to engines. They were introduced to the public at the World's Fair and the number installed this year has exceeded the expectations of the most enthusiastic advocate of that type of apparatus. They are growing so in popularity that it looks at present as if it would not be many years before they are used on all new work. Not only are they being built in the large sizes, but in the smaller units. The largest railway power plants in Brooklyn, Philadelphia and Chicago are being supplied with them. One company has this year built and installed 36,900 horse-power of these generators and is building 20,000 horse-power more.

One important move made this year by railway motor makers was the lightening of the equipment by using cast steel or something closely allied to it, in place of cast iron. The movement was begun in 1893, by the appearance of the General Electric 800 motor. Early in this year the Westinghouse No. 12 appeared closely followed by the Walker motor. Both of these are light motors and have in addition to the improvement of decreased weight, devices for suspending the motor by springs and relieving the axle of its dead weight. About the middle of the year the Card and Steel motors were announced as on the market.

The electric welding of the joints on many miles of street railroad track has been a prominent feature of the year's work. The Johnson Company opened up the season by welding  $3\frac{1}{2}$  miles of straight double track at St. Louis. Some track was welded at Boston in '93 but about ten per cent of the joints broke near the weld. The method of welding was then radically changed and the work done in 1894 may be said to stand by itself as

an important experiment, the results of which we will know ere many days of '95 have passed. On the Nassau Railroad of Brooklyn, 32 miles of track have been welded. The Cleveland Electric Railway and the West End Street Railway of Boston, have also been favored with visits by the Johnson welding cars this year.

Another method of making continuous track was discovered by A. Hoffman, now of the Falk Manufacturing Company, Milwaukee. His process is one of casting iron around the rail joints and it seems to have good prospects of being a success. Three miles of track have been supplied with these cast joints at St. Louis and the coming winter will test this track as well as that electrically welded last spring. The casting process was first publicly shown at the Atlanta street railway convention in October.

A notable addition to the list of practical railway appliances is the Sperry electric brake. The inventor has been working on this brake for many years, but it has not been put forward for commercial use until this year. This brake has probably attracted more attention than any other single electric railway device brought out this year because it is such a radical departure from any previous commercial braking apparatus. The interest was not lessened by the fact that Mr. Sperry waited until the brake was an assured commercial success before announcing his work to the technical world.

About October 15 work was begun on a section of conduit electric road for the Metropolitan Traction Company of New York, by the General Electric Company. This is notable as being the first electric conduit road to be built for commercial operation by any large American electrical manufacturing concern. The principal manufacturing companies have in times past been too careful of their reputations to get tangled up in any underground conduit roads except in their own experimental yards. Although the New York conduit has the best prospects of success of any system yet laid there is no probability that such a success will create the revolution in electric railway practice that some expect, as its cost is enormous, being greater per mile of track than that of the cable system. This being the case, its use will be limited by commercial considerations to very heavy traffic, such as is served by the cable and hence it will never come into very extensive use, though it may serve a limited field.

The first application of the "booster" to electric railway feeder lines has been made on the Poughkeepsie City & Wappingers Falls Electric Railway. It is used to raise the voltage on a ten mile feed line.

The use of T rail in paved streets has been more prominently brought to public notice this year than ever before and it is now recognized as a reliable and established form of track construction.

The three wire system has been operating for several years on two or three roads of the country. The results were first publicly announced this year through the columns of the REVIEW and considerable interest aroused.

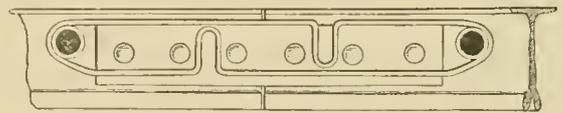

The year has been one of great activity in electric railway construction in Brooklyn, Philadelphia, and Chicago. Brooklyn has been putting the finishing touches on its extensive systems. Philadelphia has undergone a great transformation which was begun last year and is yet to be finished. The general upheaval of Chicago horse lines did not begin until half of '94 was gone, but taken altogether it is probably safe to say that the work of changing over is now about one-half accomplished. However, this does not mean that half the electric lines are opened for traffic.

In May, the Metropolitan West Side Elevated Railroad of Chicago announced its intention to use electricity. The result created quite a jubilee in electrical circles, especially in Chicago, as this project together with the changing over of the horse surface lines will combine to make Chicago as prominent an electric railway center as it now is a commercial center. The contracts for the electrical machinery for this road were let about July 1. Within the last month the formal announcement has been made that the Lake Street Elevated Railroad of Chicago will soon adopt electricity. The change is to take place early next year. This road was recently bought by the Yerkes syndicate which controls the north and west side surface lines, so that the announcement is no great surprise. The Northwestern Elevated soon to be built on the north side will also be an electric road.

Taken as a whole, in view of the unfavorable conditions, the record of the year is a very creditable one, and as compared with new work in the steam railroad field is specially gratifying. With restored confidence, and the accumulated demands for extensions and new lines which have been gathering for nearly two years, and the conditions of a steadily improving money market the outlook for 1895 is certainly a bright one.

#### ROBINSON'S RAIL BOND.

F. Foley Robinson, an English electrical engineer, has invented a bond which has terminals of tubes, which are expanded to fit the holes in the rails in the same way that

NEW RAIL BOND.

boiler flues are expanded. The principle of the terminals is the same as that of the Chicago rail bonds, now so well known in this country, but instead of being one piece the tubes are connected with some sort of conductor, so that four joints are involved in each bond.

DURING the fiscal year ending October 1, the Springfield (Mass.) Street Railway Company has built forty-six miles of new track, laid T rail, made 179,061 round trips, run 1,490,451 miles, and carried 7,225,197 passengers. Sixteen new cars were added.

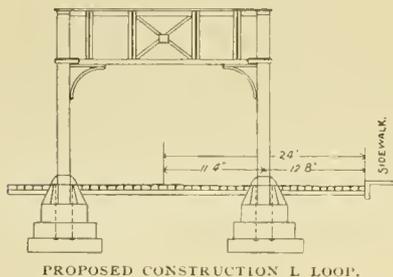

### LOOP FOR CHICAGO L ROADS.

After much talk, incorporation of several companies, considerable rivalry and many refusals to go into such a scheme, the four elevated railways of Chicago have decided to use a union loop. The terminals of the companies for geographical reasons have been necessarily placed at points several blocks from the business center of the city. All of them have greatly desired to come down town, but have found many obstacles to overcome, the principal one being the objection of property owners to a separate loop for each company. Ordinances have been passed by the city council granting franchises for loops, but the only company that has taken steps to construct one is the Lake street, which put down foundations and columns in May, or June, but has done nothing since.

As the Metropolitan road was drawing near completion, steps were taken to secure a loop. A combination was made with the Alley L Company, which resulted in the incorporation of the Chicago Central Railroad Company with \$3,000,000 capital. The incorporators were John Worthy, president of the Metropolitan; Marcellus Hopkins, president of the Alley L; Herman Benze, right of way agent, Joseph Keffer, cashier and Addison L. Gardner, local attorney for the Metropolitan; and Eugene Klapp, chief engineer, and Edward A. Nichols, attorney for the Alley L.

The same day was incorporated the Union Elevated Railroad Company with \$5,000,000 capital, by those interested with Mr. Yerkes, viz., D. H. Louderback, Egbert Jamieson, John B. Parsons, John A. Rose J. William Helm, Le Grand Perce, Edmund Furthman, Edward Koch and L. D. Condee. This company will build the loop. An agreement has been reached between the officers of the Metropolitan and Alley L companies on one hand and Mr. Yerkes, by which the

latter will build and control the loop, while the other companies have the privilege of running over it. The route as projected, will be on Lake street from the terminus of the Lake Street L line to Wabash avenue,

PROPOSED CONSTRUCTION L LOOP.

south on Wabash to Harrison, west, crossing the Alley L, to Pacific avenue, north to Van Buren, west to Market, north to Madison connecting with the Lake Street L terminal at that point. Plans have been prepared, which seem to meet with favor from the property owners, who are apparently willing to give consent to only one loop.

The structure will be very light and will, it is said, interfere with the light in the stores little, if at all. The supporting posts will be placed twelve feet eight inches from the curb line in the street, coming just outside the double street car track. It has not been definitely decided

where stations will be placed, but it is expected there will be three on Lake street, and six on Wabash avenue, no plans have been made for stations on other streets, but they will be placed about every two blocks. The illustration is a sectional view showing location of columns with reference to curb lines and sidewalks.

### GEORGE W. MYERS.

George W. Myers, secretary of the Lewis & Fowler Manufacturing Company, Brooklyn, N. Y., is a young man to hold such a responsible position with a concern of such magnitude. Mr.

Myers has earned his present position by hard work, which has been appreciated and rewarded by his employers. He was born in Brooklyn, in 1862, his early life being the same as most boys. The public schools furnished him with the foundation of his education, which was completed, as far as institutions of learning go, in the Adelpia academy, and one year at the scientific school of Yale University. Seven years ago he entered the employ of the Lewis & Fowler Manufacturing Company, as auditor and cashier. In this position Mr. Myers soon developed the faculty of mastering details, which made him a valuable man in the service of the company. In January, 1893, he was elected secretary of the company, which was a well deserved promotion, showing the appreciation of his employers in his hard work and his integrity.

GEORGE W. MYERS.

### COMPRESSED AIR AT WESTFIELD.

The Compressed Air Car Company has leased the Woronoco Street Railway Company, Westfield, Mass. The street car line will be extended, and will be used for testing cars before shipment. A large plant will probably be built. The company is to pay an annual rental of \$2,000 for the street railway line, which is practically five per cent of the capital stock of \$25,000 and its \$16,000 debt. The capital of the compressed air company will be increased to \$100,000. Westfield will secure the plant, if the citizens take half the capital stock.

Edward Ash, superintendent of the Schuylkill Traction Company, Shenandoah, Pa., has become a benedict. Miss Anneta Buckwalter was the happy bride.

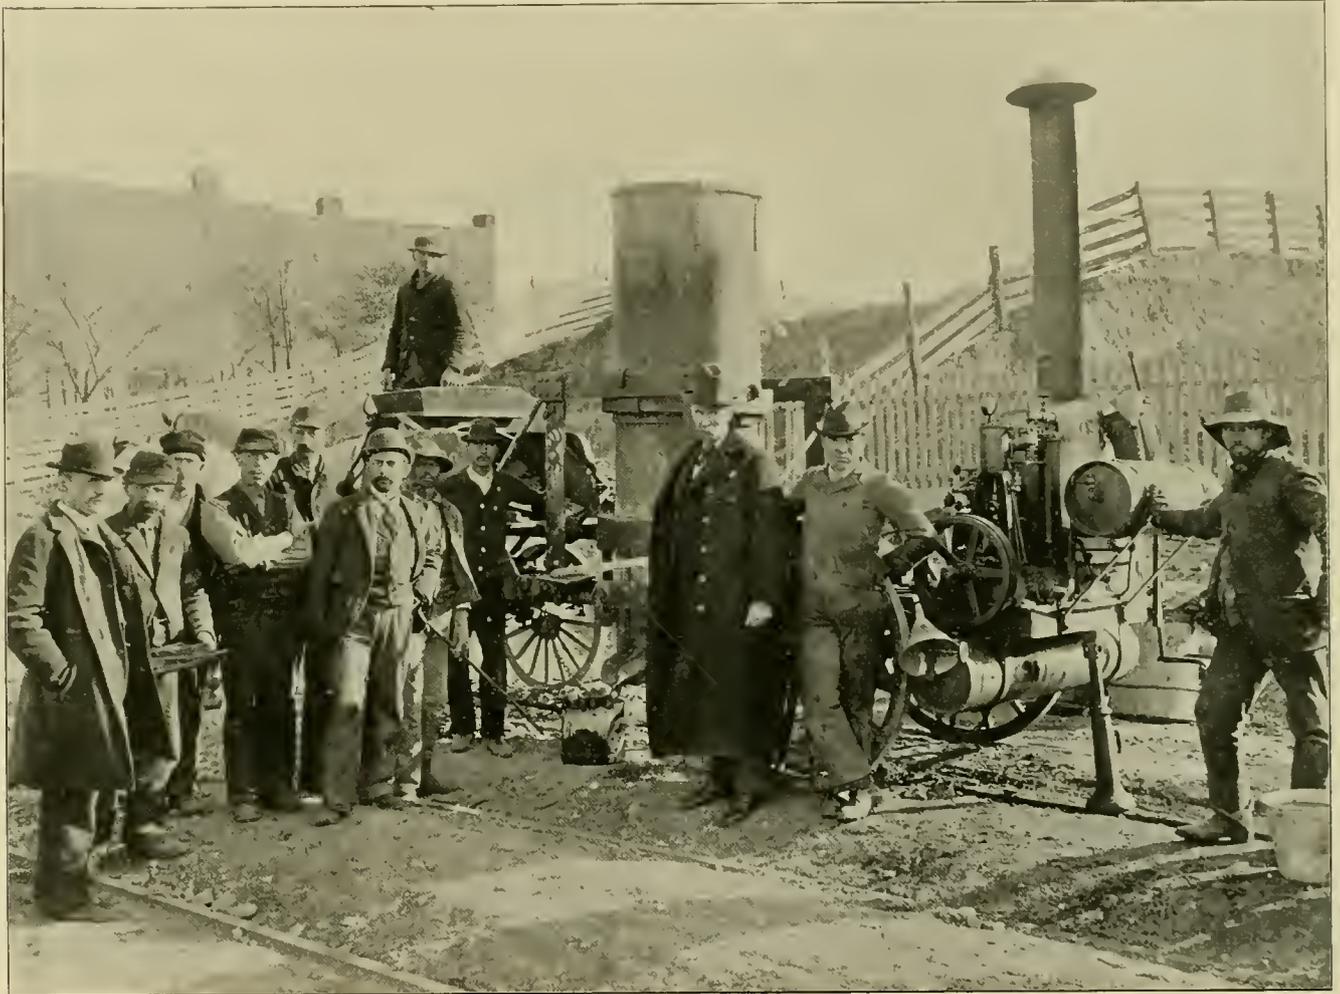

## CAST-WELDING RAIL JOINTS.

The New Process of Making Continuous Track—A Promising Rival of Electric Welding—Three Miles Laid at St. Louis.

Like a thunderbolt out of a clear sky came the announcement, several months ago, that the Falk Manufacturing Company, of Milwaukee, would soon come forward with a process of welding cast iron around rail joints which would make a continuous track and seri-

and how anxious street railway men are to find something that will do away with those everlasting nuisances, the rail joints.

Immediately after convention, work began at St. Louis, and the joints have been cast on about three miles of track there. This track was laid some time ago, with common angle bar joints but no traffic has passed over the road except that of teams so that the track is practically new and on an equal basis with the electric welded track laid last spring. Besides that mentioned, 37 joints which

READY FOR WORK.

ously compete with electric welding. It was the suddenness with which this process came forward that startled the electric railway world. It is not often that any industrial method comes so absolutely without warning and apparently without any evolution. The usual course is a long series of experiments and investigations before even an attempt is made in a commercial way. Then after the commercial application begins there is a still further evolution.

The process was shown at the Atlanta convention, and the constant throng of visitors which crowded around the place where the work was going on, and prevented many from seeing as much as they wished, showed how vitally important the work was considered to be

have broken on the six miles of electrically welded track have been repaired by the cast-welding process. The latter work was done in two evenings' work of three hours each. The accompanying engravings show the work in progress.

The outfit used is nothing more than a small foundry cupola for melting the iron, mounted on wheels. This cupola wagon weighs 7,000 pounds complete and is easily drawn by two horses. The one used at St. Louis and shown in the engraving made 60 joints a day. The Falk Manufacturing Company is now completing several which will have a capacity of from 140 to 200 joints a day. The coal and coke box is located just behind the driver's seat. The cupola is hung on pivots similar to a

mariner's compass so that it is always kept level even though the wagon may be standing on a grade. Behind the cupola is a small steam engine with a water tube boiler. The engine takes care of itself to a large extent as the water feed is automatic being regulated by the height of the water in the boiler. The oil fuel flow is regulated by the pressure of steam. The engine drives a blower for furnishing an air blast to the cupola. The air pipe between the blower and cupola has a flexible

a pair. Before the molds are applied the rails near the ends are cleaned and if the ends do not butt together closely a thin section of rail is driven in to fill the crack. The molds are then put around the joints. The iron is then poured in the molds from a ladle as in an ordinary foundry. The union between the iron and steel of the rail is similar to that which takes place in a good weld and hence the term cast-welding is applied to the process by the Falk company. Sections through joints and

METAL RUNNING.

joint to allow for the movement of the cupola on its pivots. Under the engine can be seen the tank for water supply.

In operation the first thing, of course, is to dig up the paving and expose the joints. Meanwhile the molds which are of common cast iron are thrown in a heap somewhere near by and a fire built around them so that by the time they are to be put around the joints they are a dull red. The molds are lined with a composition of graphite and another substance the nature of which is not given out. This composition is applied with an ordinary paint brush. The molds are relined in this way for about every 20 joints cast in them. They can be lined while hot and it takes about half a minute to reline

pieces of casting broken off show that the same state of union exists as with a good weld.

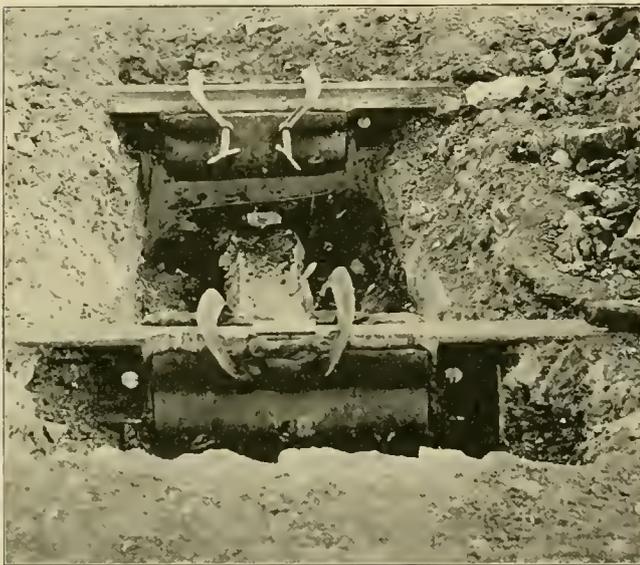

As shown in the engravings the molds have eyebolts so that they can be handled with iron hooks. They are held in place with ordinary clamps and are of such shape as to fit up snugly against the rails and hold them firmly in line until the joint has cooled. As shown in the engravings the cracks on top between molds and rails are filled with clay and sand. A plate of iron is laid over the crack between the ends of the rails so that when the iron attempts to rise there it is suddenly chilled and prevented from flowing out on top of the rail. Underneath the molds the crack between the halves is closed by holding a pan of sand up against it. The

molds can be put on a joint in about two minutes. As said before the molds are hot when put on and they are allowed to stay on long enough to heat the rail ends. After the iron has been poured in about ten minutes is allowed to elapse before the molds are taken off and put on another joint. About a dozen sets of molds are kept in use at once. Every other joint of a section of track is cast in the morning and in the afternoon the remaining joints are cast. This is to prevent, as far as possible, the severe strain of contraction and expansion. When the the joint is hot it heats the rail for some distance on each side and consequently there is considerable expansion. There is a corresponding contraction when the joint cools. The effects of this were feared enough so that the above

FILLING MOLDS.

also requires from 250 to 300-horse-power from the power station. While on a large system this is easily provided for, it is a seriously large item for a small road. When construction work is being rapidly pushed the fact that the trolley wire does not have to be strung before the track is completed will prove an advantage as well as the rapidity of the cast-welding process. With the casting method there is no heavy welding machine to run over and bend the track out of shape before the joints are set. There are not many roads that can afford to keep on hand a welding machine for mending broken joints and doing odd jobs around a system, but a cupola large enough to do such work can be supplied at a cost of less than \$1,000, so that there need be no angle bar joints on an entire road. No special skill is required on the part of the men employed except the man who runs the cupola. Electric welding, especially of steel, is as is well known, a process in which the skill and experience of the operators plays a vitally important part. The facility with which broken and defective joints are repaired by the cast-welding process is an important point. Defective joints will appear with both systems. The question is how best to handle them. With electric welding it is necessary to saw out the joint (if the break is such that it can not be repaired by re-welding) and insert a new section of rail which requires two joints

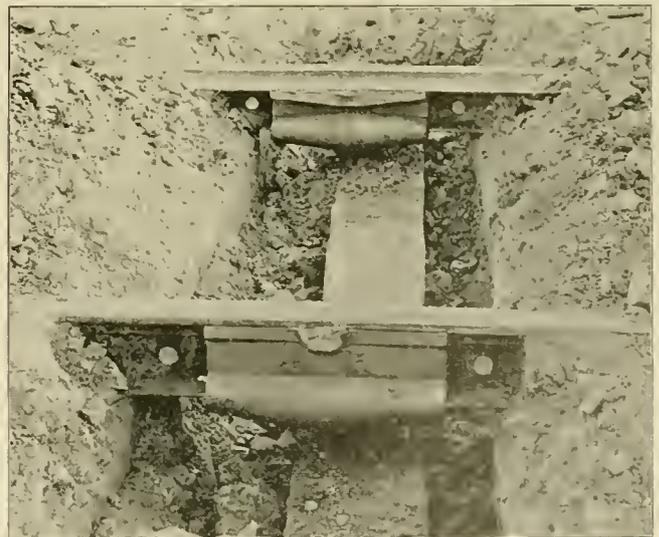

MOLDS ON JOINTS.

method has been used to prevent the strain to some extent.

The joint made at St. Louis weighed 120 pounds. The joints can, of course, be made of any weight. Those made by the company at first weighed 54 pounds. The 54-pound joint placed on blocks two feet apart has when tested stood a downward pressure of 100,000 pounds. The 120-pound joint covers four bolt-holes. The material used is common cast iron with a secret composition mixed therewith. The cast iron is selected with a view to great tensile strength. The cost of a joint is about \$3.

In the engraving showing the wagon and force of men employed on the work there are about eight who are employed in the actual operation of running the cupola and casting the joints. The rest are for digging up the pavement. Iron is unloaded along the street at the places where it will be needed.

If it is found to stand the test of time this process will have some marked advantages over electric welding. In the first place the initial cost of apparatus is nowhere near that of an electric welder, and it is also much less delicate and costly to maintain. The electric welder

JOINTS FINISHED.

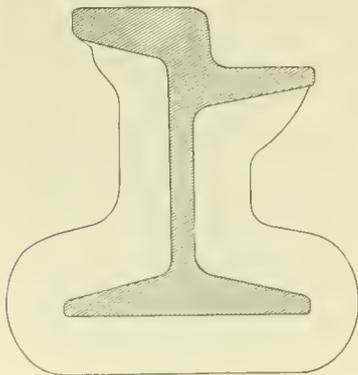

CUPOLA AND CREWS.

where one was before. With the cast-iron joint it is only necessary that the top or ball of the rail be continuous. If it is not continuous a short piece can be put in and the mass of metal cast around the break will make a good joint.

A peculiar feature of the cast joints as now made is that the welding action between the rail and casting takes place around the base and about two-thirds of the way up the web of the rail but not around the head and upper part of the web. This is as it is intended to be because if the joint is defective and breaks, the head of the rail remains intact. The manner in which the non-welding of the upper part is accomplished is interesting. When the iron is poured the quantity of melted metal around the base is so great that it heats that part of the rail nearly to its own temperature and a union takes place between the metals. In the upper part of the joint the small mass of hot metal is not sufficient to heat the head and upper web hot enough to make a weld.

The Falk company is confident that the continuous rail will prove a success, but in case it does not they have another plan to fall back on which would still make a very superior joint. By painting the rail with a secret liquid before the metal is run in, the welding action is prevented and a solid mechanical joint is made, which allows for contraction and expansion. It should be said here that the failure of the few joints mentioned on the electrically welded track of the Baden Railway at St. Louis is not to be taken as pointing against the use of continuous track, as the joints which broke were defective and not fair specimens of the electric welding process.

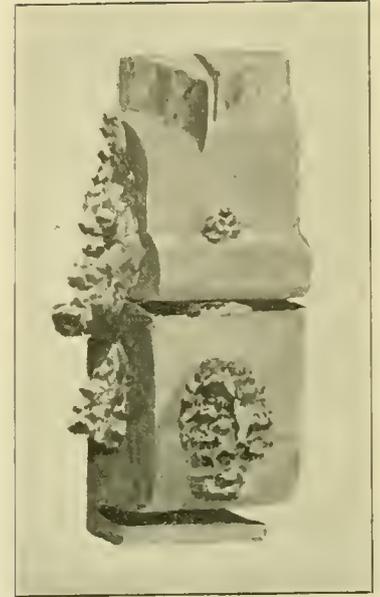

54 POUND JOINT.

The accompanying engraving, which is of one of the lugs knocked off of a broken electrically welded joint, shows that welding took place only at two or three places of small area. The lugs on the defective joints were knocked off with a light sledge.

The results at St. Louis will be awaited with intense interest and the outcome of the winter's trial means much to the street railway business.

To Captain Robt. McCulloch, general manager of the National Railway Company's lines, of Louis, is due the thanks of the entire fraternity, for his zeal in experimenting and sifting the continuous rail problem to the bottom. He has shown the same progressive spirit in this as in many other matters relating to street railway welfare, and the fraternity is to be congratulated on having him as a member.

LUG KNOCKED OFF DEFECTIVE ELECTRIC WELD.

#### NEW COMPANY IN DETROIT.

The Detroit Railway Company, recently organized by H. A. Everett, of Cleveland; Albert Pack, of Detroit; Green Pack, of Oscoda, Mich., and George W. Pack, of Ashville, N. C., was granted a franchise November 28, by the Detroit city council, to build forty miles of electric railway on twenty-seven miles of street. The vote in favor of the ordinance was twenty-nine to one. Fares will be three cents. Track-laying will begin April 15, it is said. A deposit of \$50,000 has been made to guarantee construction, completion and operation of all lines within the coming year. The cost is estimated at \$1,500,000. An agreement has been made with the Fort Wayne & Belle Isle Street Railway Company permitting the new company to transfer its cars over that company's lines to the union depot.

FRANCIS J. CALLANAN, treasurer of the Union Traction Company, of New Jersey, a new road recently incorporated, was killed while attempting to board a moving train at Rutherford, N. J. He started as a boy in the Midland line, Utica, built the Peoples' line, Syracuse, bought the Oswego Street Railway Company, and organized the Peoples' Railway Company, Brooklyn, and the Union Traction Company, of New Jersey, which will build from Newark through Rutherford to Hackensack.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Injury to Passenger Riding on Step of Car.*

A Passenger on a street car, who, on the invitation of a person in charge, or without objection from him, stands on the step of the car, outside of the gate, is not negligent per se, as the danger of such a position is not so obvious that it could be said that a reasonable man would disobey the invitation or direction.

At the time of the accident, the defendant was converting its horse railroad into a cable road. The plaintiff had been engaged in finishing up the new track by putting gravel between the paving stones at a point near Taylor avenue, which was about three-fourths of a mile west of the place of the accident. The plaintiff was in the employ of contractors, and not of the defendant. At 5 o'clock in the evening he took a car going east. According to his evidence, he got on the car when it stopped at Taylor avenue. It seems the car was full of passengers, so that there was neither sitting nor standing room on the inside. He first went to the rear platform, but found so many persons standing on it that he could not get on. He then went to the forward platform, and found that crowded with passengers. There was an iron gate at the front platform, extending from the outer side of the car, across the platform to the dashboard, and the gate extended down to within a few inches of a step leading up to the platform, which step extended out six or seven inches beyond the outer line of the car. He and another person, by the name of Kelly, stood on this step. When they reached Sarah street, the plaintiff was struck by a projecting timber of a derrick standing on the street, and was knocked off.

The defendant company had nothing to do with this derrick. It was a large contrivance used by contractors in constructing a sewer, and was moved along as the work of the sewer progressed. It consisted of timbers, pulleys, a track, and a dumping apparatus. The end next the car was about four feet high, and the other end much higher. At the lower end a timber projected out within ten inches of the passing car, and it was this projecting timber that struck the plaintiff.

It is conceded on all hands that the plaintiff was a passenger on this car, and the question is whether, as a matter of law, he was guilty of contributory negligence in riding on the step on the outside of the gate. The law is now well settled that it is not negligence per se on the part of a passenger on a horse car to ride on the platform, and this is true whether there is or is not room in the car. There can be no doubt but riding on the step or platform of such a car is attended with more danger than riding in the car; and if a passenger will take a position upon such a place in violation of the rules of the company and the warning of its servants in charge of the car, he is guilty of negligence. Here the closed gate was itself a warning that this front platform was not a proper place to stand. Nothing more appearing than this, that the plaintiff took his position on the step,

with the closed gate between him and the platform, and that he was knocked off by coming in contact with the derrick, and we should have no hesitancy in upholding the ruling of the trial court. But what are the additional facts? Though this car was crowded with passengers, it stopped at Taylor avenue, and this was an invitation to the plaintiff and others to get on, no contrary announcement being made. Indeed, there is certain evidence tending to show that some ladies got on at that place. The plaintiff and Kelly took a position on this step of the front platform, for want of room elsewhere, and this, too, with the knowledge of the driver. Having gone one or two blocks, they, by the driver's direction, took out the gate, but could find no standing room on the platform. The driver then directed them to put the gate in place, and stand on the outside, and this order they obeyed, and were thus carried for a half mile before the accident. In short, the plaintiff was received as a passenger, and was by the driver permitted and even directed to take this position on the step outside of the gate, and it cannot be said that the plaintiff was, as a matter of law, guilty of contributory negligence. A passenger has no right to take a position, even at the direction of the servant, which is obviously dangerous; and in such case the direction of the servant will be no excuse. Standing on the step of the car cannot be said to fall within this principle. The danger of such a position is not so obvious that it can be said a reasonable man will disobey the invitation or direction.

The evidence of the plaintiff shows that he knew parties were constructing a sewer at Sarah street, and that he had seen this derrick in the street when passing to and from his work. The defendant's track had been moved over towards the derrick on the morning of the day of this accident. There is nothing in these circumstances from which the court can say the plaintiff was, as a matter of law, guilty of contributory negligence in failing to see the derrick.

There is also evidence tending to show negligence on the part of defendant. The track was placed in this position near the derrick on the morning of the day of the accident, and the defendant must have known of its proximity to the cars. With such knowledge it became the duty of the defendant to use all reasonable care to avoid exposing passengers to danger, and especially is this so in view of the fact that passengers were allowed to stand on the side steps of the car.

The defendant pleads as a defence an act which provides: "Said railroad companies shall not be liable for injuries occasioned to persons by their getting on or off the cars, at the front of or forward end of the car." Surely the statute cannot and does not apply to a case like the one in hand, where the passenger, at the time of the injury, was not getting on or off, but was riding on

the steps of the platform, with the knowledge and by the direction of the driver.

(Supreme Court of Missouri. *Seymour v. Citizens' Railway Company*. 58 American and English Railroad Cases, 395.)

*Sleigh Standing near Track—Care Required of Car Driver.*

Plaintiff was driving his milk sleigh; he stopped and took a can of milk from it into a sleigh standing alongside. Plaintiff's sleigh stood very near the track. As he was lifting the can out, with his horse headed towards the west, a two-horse car came from the west, and before he could put the can into the other sleigh, the car struck his sleigh, overturned it, and injured him. As he saw the car nearing his sleigh, he threw the can into the other sleigh and reached for his lines. He knew that the car was coming, and that it overhung the track, and that his sleigh was so close that it might be struck. The driver of the car saw plaintiff's sleigh, but drove on without making any stop.

It was a question of fact for the jury to determine whether the plaintiff, under the circumstances, should have been out of the way when the car reached that point, or whether the accident occurred wholly by reason of the negligence of the driver of the car. He could have stopped his car and avoided the injury. If he saw the plaintiff could not get out of the way in time to avoid a collision, it was his duty to stop. It is contended by defendant's counsel that, by the ordinance by which the road is operated, the car is at all times entitled to the track. It is true that under this ordinance parties driving upon the street car track, or so close to it as to impede the progress of the car, are bound to turn out and give the car the right of way, but this ordinance does not give railway companies the right, by their drivers, to run any vehicle down and injure the person or property of another, under the circumstances stated in this case. The plaintiff's claim was that when he did see the car coming, he made every effort possible to get out of the way. His sleigh was in full view of the driver, and if the driver saw that he could not get out in time, he should have stopped. Whether the plaintiff was guilty of negligence in remaining there the length of time he did, or in not having seen the car sooner, was a question for the jury.

(Supreme Court of Michigan. *Laethem v. Ft. Wayne & B. I. Ry. Co.* 58 Northwestern Reporter, 996.)

*Duty to Signal Cars to Stop.—Boarding Front Platform.*

It is the duty of a person seeking to take passage on a street car to signal the person in charge, and if, without signalling, he attempts to board a moving car, he cannot recover for the injuries thereby sustained.

An attempt to board the front platform of a street car running at the rate of seven or eight miles an hour, is such negligence as will preclude recovery, and an instruction to that effect is not prejudicial to a plaintiff who contends that the car slowed down in response to his signal, and that when he was about to jump on the rate

of speed was suddenly increased, since if its rate was not reduced and the car was proceeding at its ordinary speed, there was no negligence on the part of the company, and the injuries must have been sustained by the attempt to board a car moving so rapidly.

(Washington Supreme Court. *Woo Dan v. Seattle Electric Railway & Power Company*. 58 American and English Railroad Cases, 195.)

*Boy Boarding Car—Damages for Wrongful Expulsion—Wilful Injury.*

A complaint for personal injuries to the plaintiff, a boy 13 years old, which set forth that, desiring to ride as a passenger on one of defendant's cars, he stepped upon the platform thereof, intending to enter and pay his fare, when the conductor, without cause or warning, wilfully and with great force threw him upon the street, while the car was running at great speed, does not state a cause of action for a breach of the contract of carriage, but sets forth facts constituting a cause of action for wilful injuries inflicted by a servant acting within the scope of his employment.

In such an action the plaintiff cannot recover upon proof of mere negligence, however gross, and he is not obliged to prove his freedom from negligence, as his right of recovery is solely for the wilful injury.

In determining whether or not the injury was wilful, the jury may consider the other circumstances of the case, the manner of the conductor, the force, if any, used by him, and the effects of his acts, together with the presumption that every person intends the probable and natural consequences of his acts, and the unlawful intent may be inferred from conduct which shows a reckless disregard of consequences and a willingness to inflict injury by purposely and voluntarily doing the act with knowledge that some one is in a situation to be unavoidably injured thereby.

If the company's servant, in expelling the plaintiff, inflicted injuries complained of, in a fit of oppressive malice, or acted in such a manner as to indicate a heedless disregard of consequences, plaintiff may recover exemplary damages.

(Indiana Supreme Court. *Citizens' Street Railway Company, of Indianapolis v Willoebey*. 58 American and English Railroad Cases, 485.)

*Excessive Speed of Electric Car—Inattention of Motorman—Horse Going on Track.*

An instruction that if the motorman in charge of a street car could, in the exercise of reasonable care, have seen the plaintiff in time to have checked his car, after plaintiff's horse sprang upon the track and before the car collided with plaintiff's horse, and if plaintiff was not guilty of negligence which contributed to his injury, then the defendant would be liable, held properly given, qualified as it was by an immediately preceding instruction that if the injury resulted from the sudden fright of plaintiff's horse by reason of which said horse sprang in front of the moving car, and if the motorman, in the exercise of reasonable care, could not have checked the car in time to have prevented the collision, the defendant would not be liable, these alternatives presenting, as they did, the only disputed propositions of fact involved.

Street railway companies have no such proprietary interest in that portion of the streets upon which their tracks are laid as limits the right of the general public also to use the same territory as a part of the public highway. Whether an injury resulting from such joint use is attributable solely to the negligence of the railroad

company, or is wholly or in part imputable to contributory negligence of the person by whom injury has been sustained, is a question of fact to be determined by the jury.

(Supreme Court of Nebraska. Omaha Street Ry. Co. v. Duvall, 58 Northwestern Reporter, 531.)

*Injury to Section Man—Riding on Car Step.*

Where a section man of a street car company whose trains were drawn by a steam motor was ordered by the foreman to take passage on one of its trains and not to get on "so as to bother the passengers," the question of his contributory negligence in riding on the front platform with his feet on the step is for the jury.

A conversation between the plaintiff and the engineer of the motor concerning the situation the plaintiff took on the front platform of the motor, was admissible to show that the engineer knew of plaintiff's position.

Plaintiff may recover for the injury to which his

**BLAKISTONE'S COMBINATION CAR FENDERS.**

George Blakistone, president of the Central Railway Company, of Baltimore, Md., has invented a fender attachment for his cars, which has received the approval of the Baltimore Car Fender Commission as complying with all requirements of the city ordinance. The practical value of this fender has been demonstrated in a year's service on the cars of the Central Railway Company, during which time many lives have been saved and not a few damage suits avoided.

The appearance of the front fender is well shown in the illustrations given herewith. A netting of stout rope is stretched upon an iron framework, which is hinged to the car and held up by two chains hooked on the upper edge of the dashboard. The front edge of the fender is flexible. In addition to the front fender the car is provided with two wheel guards. These guards can be

BLAKISTONE'S FENDER—CENTRAL RAILWAY COMPANY, BALTIMORE, MD.

negligence contributed, if defendant, knowing his position, could have averted it by using ordinary care.

Where plaintiff was injured by having his feet caught between the step of the car and an embankment, the fact that he might have saved himself by stepping on the platform, does not show contributory negligence, when he had very little time in which to act.

(Supreme Court of Colorado. Denver, etc., Rapid Transit Co. v. Dwyer, 36 Pacific Reporter 1106.)

THE receiver of the Orange Mountain Cable Company, Trenton, N. J., has filed his report, showing liabilities \$767,734.69; assets \$180,782.26. The daily loss during October was \$5.89. The receiver has asked the court for permission to issue bonds and operate the road.

THE City Electric Company, Decatur, Ill., has a special policeman to arrest boys who jump on and off cars. Recently while the motorman was inside collecting fares, boys locked the front door, and turned on the current, and jumped off. The motorman rushed to the rear platform and pulled down the trolley before damage was done.

lowered and raised by the motorman without leaving the platform. It is dropped by the motorman touching a pin in the floor of the platform, or by an automatic trip which is connected to a light board or frame hanging down within a few inches of the track.

In Fig. 2 the fender and guard are shown in the positions they occupy while the car is running upon an unobstructed track. In this position both the fender and the guard are carried eight inches above the track.

In Fig. 3 the wheel guard is lying on the track, a position which follows when the front fender has passed over an object, or when the hanging trip board strikes an object, or when the motorman has pressed with his foot the pin in the platform floor. The guard is pressed down by strong springs, thus incidentally acting as a track brake of considerable power.

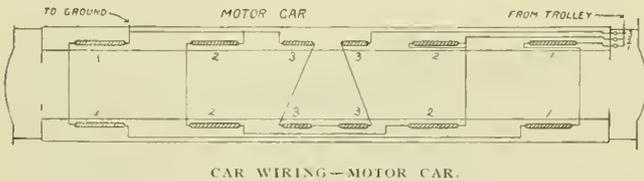

In Fig. 1 the front fender is shown drawn up out of the way preparatory to entering the car barn.

A man standing on the track is first struck on the ankles and thrown into the front fender, where he rides safely until the car is stopped. In case the person is lying down on the track, the front fender passes over

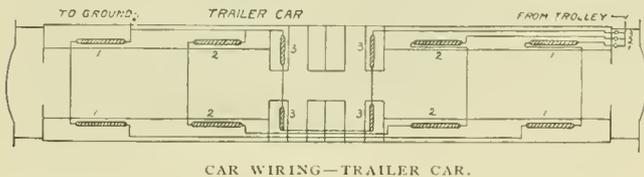

him, rising as it does so, and trips the wheel guard. The victim is then gathered up into the net of the wheel guard and not pushed along the pavement to be bruised and lacerated. When the projecting front fender is not in use the wheel guard is tripped by the hanging board. The provision is valuable, as there are serious objections to the use of projecting fenders. In Blakistone's fender these objections are minimized, it being light in weight, easily and readily movable from end to end, easily folded up, and, best of all, it passes over a man lying on the track, and does not crush him in a vain effort to pick him up.

**ELECTRIC HEATERS FOR THE METROPOLITAN ELEVATED, CHICAGO.**

The most notable victory that electric heating has made since its beginning is the contract for the heating of all the cars of the Metropolitan West Side Elevated

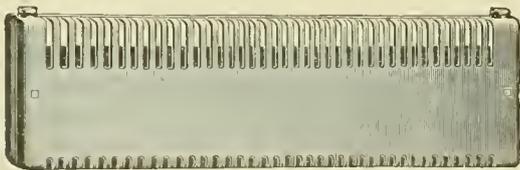

Railroad of Chicago, which was recently awarded to the Central Electric Heating Company of New York, the maker of the "American" heater. There are still a

few people that believe electric heaters to be nothing more than expensive toys, but when it comes to the heating of elevated railway trains it looks as if the toys were getting to be rather practical affairs.

The first lot of cars to be equipped will be 55 motor

STYLE C HEATER UNDER CROSS SEATS—METROPOLITAN ELEVATED.

cars and 100 trailers. These cars are all 38 feet 8½ inches long; 7 feet 10 inches wide; center height, 8 feet 6¾ inches; side height, 6 feet 7¾ inches. The capacity is 2,233 cubic feet, and the total glass surface is 208 square feet. As shown by the accompanying diagrams of car wiring, each car will have twelve heaters. These are connected four in series, and each of the three series is on an independent switch. With all the circuits in so as to get the maximum heat, the car heating will take

7,000 watts or 14 amperes at 500 volts. Eight heaters will be placed under the side seats, which are to be 34 inches long, 7 inches high, and 2½ inches wide. The other four are smaller, being 21 by 7 by 2½ inches. Each series of the larger heaters takes 2,600 watts and the four smaller 1,800 watts. It is estimated that with all the heaters in, the car temperature will be kept between 55 and 60 degrees Fahrenheit, when that outside is from 0 to 10 degrees. This will be the largest application of the electric heater yet made, and will, no doubt, be a great help toward their general introduction.

**ODEN BOWIE DEAD.**

Ex-Gov. Oden Bowie, president of the Baltimore City Passenger Railway Company, died at his home, December 4, of paralysis. Mr. Bowie, who was 68 years old, had an active life, which was spent in Maryland, his native state. He served in the Mexican war, being promoted from private to captain on account of his bravery and ability. Before he was 21 he was a candidate for the legislature, but was defeated. Coming before the people the next year he had better luck, and continued active in politics until 1867, when he was elected governor. In 1860 Mr. Bowie was elected president of the Baltimore & Potomac Railroad Company.

ODEN BOWIE.

Governor Bowie's street railway connection began in 1873, when he was elected president of the Baltimore City Passenger Railway Company. During the summer, while the line was being operated with horses, he stationed men at short intervals with buckets of water, whose duty it was to sponge the horses. This was the result of his fondness for that animal, which caused him to keep a great many, and for twenty years he was one of the most successful breeders of racing horses in the world.

**WESTERN ENGINEERS' EXCURSION.**

The November excursion of the Western Society of Engineers occurred November 17 and was full of pleasure and profit for those who found time to participate. The excursion occupied a day, as is customary, and the industrial works of South Chicago were visited. The Illinois Steel Company, Iroquois Furnace Company, Chicago Shipbuilding Company, and Morden Frog and Crossing Company were on the list. It is safe to say that nowhere in the west can the iron industry be studied better than at South Chicago. The trip was one of unusual interest to railway men, because it gave them an insight into the production of a class of supplies of which they are large consumers.

PAID HIS TURKEY'S FARE.

TALL, solidly built, well dressed man, with a good natured face, who had been drinking just enough to make him feel jolly, got on an Eighth street cross-town car near Sixth avenue, New York, carrying in his arms an immense turkey. He sat the turkey down in a corner seat and then said:

"Conductor, see that turk ?

He's mine."

"Yes, sir," answered the conductor.

"Well, I'm going on the front platform to smoke, and I want you to take care of the turk till I come back. See?"

"Certainly, sir."

"The turk will not disturb any one, and no one must disturb him; and to avoid all trouble I will pay his fare," and he did so, while the conductor laughed.

"Great Hivvins!" said a man with red whiskers, who was seated next the bird; "I nivver heard on the loikes av that—paying carfare for a turkey."

The owner of the turkey then went out on the front platform, while the bird sat in a dignified manner in the corner. Passengers continued to come in, and the man with whiskers was crowded nearer the turkey. "Don't crush him, gintlemin," he said. "His fare has been paid and he is entitled to a sate."

The conductor evidently thought the man with red whiskers had too much affection for the turkey, for he looked into the car every now and then to see if his charge was safe and unmolested.

"Hully gee!" exclaimed a tough young man opposite the bird. "Think of a bloke blowin' in de price of a skillet of beer on a dead turk! Some blokes must have more money dan de Astors ter pay car fare for er gobbler. Hully gee!"

When the car reached Second avenue the owner of the turkey came in, picked it up in his arms, said "much 'bliged" to the conductor and got off.

"It wur a foine burd," said the red whiskered man, with a sigh, "an' I was a-hopin' he'd forget it. If he had there would have been a raffle at O'Brien's Thanksgiving eve as would have done yer heart glad to see."

TOUCHED A LIVE WIRE.

H. Herbert Hutchins has secured a verdict of \$1,000 against the Denver Tramway Company, having sued for \$10,000. He alleged that some time ago he was riding on the back platform of a car, when he felt himself being suddenly jerked backward, as it was rounding a curve. In order to prevent himself from falling, he reached out his hand, and grabbed what he thought was a piece of cord. He happened to catch hold of a piece of live wire, which he testified, "knocked him silly," from which he has never recovered.

AN INGENIOUS SNOW PLOW.

On the Richmond City Railway Company, Richmond, Ind., is an ingenious snow plow, the invention of E. Kessler, electrical superintendent. On a Bemis truck is mounted two W. P. 50 motors. A frame of 8-inch by 10-inch timbers, on which are laid sills of 8-inch by 10-inch by 24 feet, is bolted to the truck frame. Upon the sills is a floor with two traps for access to the motors. The body is vestibuled at both ends, so that the operator is inside. The plow blade is 2 inches by 18 inches by 10 feet long, standing 45 degrees to the track, with a hoist of 10 inches. It can be set at any distance from the rail by the tightening of four chains.

The rail scrapers are four T. H. trolley bases, one at each corner of the car, inverted in order to get the tension on the rails. Round iron plugs welded on spring steel 1/2-inch by 3 inches wide, are inserted in the trolley bases. The steel is bent to right angles on a gentle

INGENIOUS HOME MADE SNOW PLOW.

curve at a point 2 feet 6 inches from the trolley base. At the lower end of the steel shanks are applied steel shovels 6 inches by 8 inches by 1/2-inch, the face being formed to fit the top and sides of rails. In the shovels are mold boards 14 inches by 30 inches, which throw snow or any other obstruction caught by the scraper, to the outside of the track. The mold boards do not appear in the illustration, as they were removed. It was intended to add a salt spreader, but a separate car was built and is used as a trailer.

The rail scrapers, invented by Henry E. French, assistant electrician, who has patents pending, were used last winter on a flat car with great success, snow and sleet having stopped the road only twelve hours during the entire winter. Sleet stayed on wires and trees for ten days, the trolley wire being 3/4-inch in diameter, and in some places the ice being two inches thick on the rail. In seven hours the rail-scrapers cleaned up the entire road. It is possible to put 100 pounds tension on each of the scrapers. All parts of the car are adjusted and managed from the inside, so that only one man is required to

run it. With left hand on the controller, right on the brake, and foot on the lever, he controls everything. The scrapers require no attention, as they take all switches without attention from the operator. The gentleman standing at front of car is E. A. Gormon, cashier, the other is E. Kessler.

### THE PHILADELPHIA ELECTRICAL EQUIPMENT COMPANY.

In the November REVIEW was a notice that the Philadelphia Electrical Equipment Company had gone into business at 816, 818, 820 and 822 Cherry street, Philadelphia. The offices, warehouse and shops are all in one building, which is well equipped for the three branches of the business, construction, repairs and supplies. The active men in the company are Carl P. Young, general manager, and James R. Rettew, secretary and treasurer. They have

C. P. YOUNG.

gathered around them as assistants the best electrical and mechanical talent they could secure.

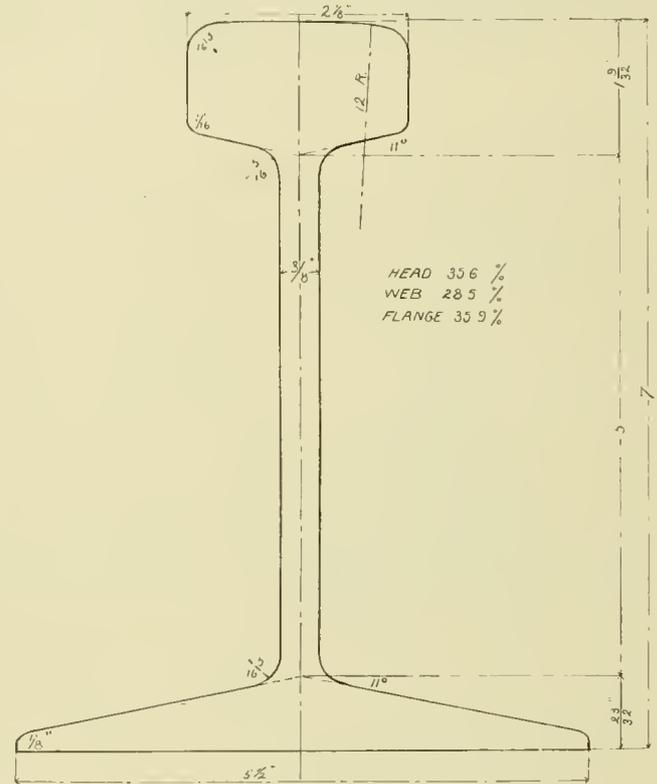

Carl P. Young has had a long experience in many different lines of electrical construction, and is an electrical and mechanical engineer. He says he has suffered agony in the past from the ignorance and mistakes of others, but hopes to never cause the same troubles and have his customers encounter the same obstacles at his hands, for every piece of work will be known to be perfect before it leaves the plant. Mr. Young served an apprenticeship for six years on marine engines and locomotives in Sweden, was engineer at sea for two years, worked at brass finishing for the Southern Pacific Railroad and was engaged with Crane Bros., Chicago, and the Edward P. Allis Company, Milwaukee. His electrical experience consists of work in the experimental room of Leo Daft, New York; Frank Sprague, New York; Gold & Stock Telegraph Company; James J. Wood, of the Ft. Wayne, who was then with the American Electric Company, making Wood's arc machines; and with the Julien Electric Traction Company on its storage battery experiments. In street railway work Mr. Young has also had a long service. For three years he was electrical and mechanical engineer for the Chatanooga, Tenn., Electric Railroad Company, and since that time he has been with the Hestonville, Mantua & Fairmount Passenger Railroad Company, Philadelphia, giving up his position for his present business. Mr. Young has charge of the electrical and mechanical work at the factory and the construction work out of town.

James R. Rettew, who has charge of the financial part of the business, though a young man, has had 17 years' experience in commercial life in Philadelphia.

Mrs. ANNIE HURLEY has sued the Brooklyn Heights Railroad Company for \$5,000 for killing a dog.

### SEVEN-INCH SHANGHAI T RAIL.

The accompanying engraving represents the new section of shanghai T rail which has just been designed by the Illinois Steel Company for street railway use. The shanghai T is now so well known among electric railways that little explanation is needed, save to say that the new section is seven inches high, which is an inch higher

7-INCH SHANGHAI T RAIL.

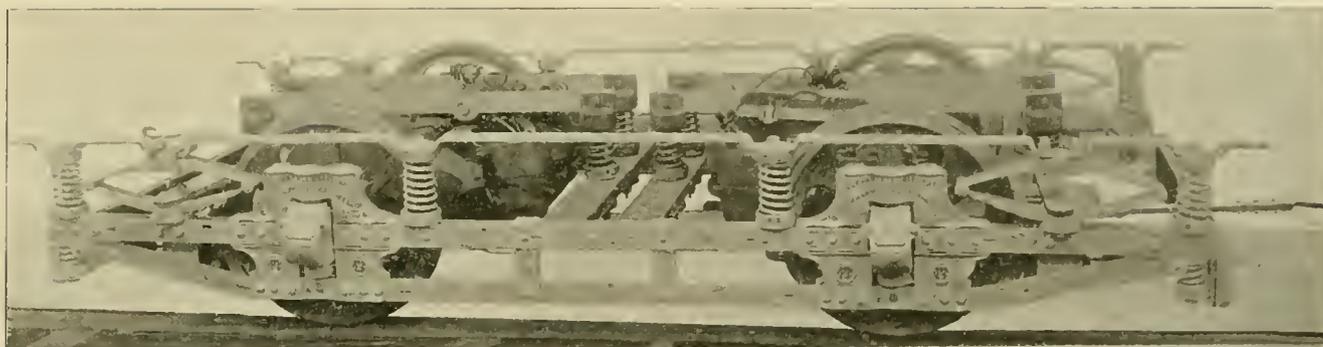

than sections previously rolled. The weight is seventy pounds to the yard. Being seven inches high, it will accommodate any form of paving that a street railway may wish to use with it. While the 72-pound, 6-inch shanghai now in common use is high enough for the majority of places, there are some companies that wish to use very high paving blocks. This new section puts the T rail on an equality with the higher girder rails as far as convenience in paving is concerned.

### STRUCK BY LIGHTNING.

Our bright English contemporary, "Lightning," comments on the September REVIEW as follows:—

"The STREET RAILWAY REVIEW for September devotes some twenty-seven pages to an account of the city where the convention is to meet, its history, its buildings, and, above all, its street railways, power stations, etc. To those who can read the American tongue with facility, and who have time for technical literature on this scale, these pages will be inviting. Everything has been done that could be done in the way of print and illustration to make them attractive.

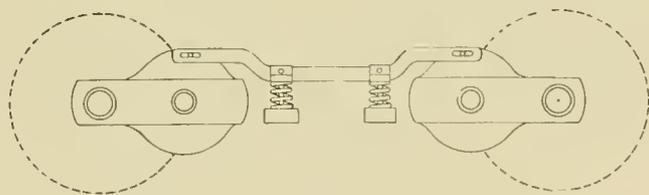

"In accordance with a custom almost universal in American journalism, this serious article is interspersed with short stories and rhymes, some humorous, some supposed to be so, and others mere news paragraphs."

PECKHAM TRUCK EQUIPPED WITH WESTINGHOUSE MOTORS.

### SPRING SUSPENSION OF WESTINGHOUSE MOTORS.

The new No. 12 Westinghouse motors are so designed that nothing but spring suspension can be used. By this arrangement the motors are literally "hung up" from bars attached to the top of the motor case, and the greater part of the dead weight is taken off the car axle. Figure 1 shows the suspension on a Peckham truck as it originally appeared to the street railway public. A peculiar modification of this is used by the Terre Haute Electric Railway. Figure 2 is a rough outline giving a general idea of the Terre Haute method. Instead of having four bars (two to each motor) and suspending the motors from the middle of each pair of bars, there

WESTINGHOUSE SUSPENSION—TERRE HAUTE.

are two bars and the motors are hung on each end. It is a very peculiar method, but seems to be giving excellent results in every day operation. The suspension bars were at first made straight, but they hit the beams of the car body, so that the body had to be raised on six inch sills. This made the steps high, and now the suspension bars used are bent down in the middle. The Westinghouse motors now being delivered to the Chicago City Railway have lugs or ears cast on the motor case which overhang the suspension bars and do away with the round pins or lugs which are seen extending through the suspension bars in Figure 1. This makes a much neater arrangement, as it allows the motor to be entirely closed and also lowers the suspension bars so that they do not come so near to the beams of the car body.

WHILE the franchise of the West Jersey Traction Company was before the city council of Camden, N. J., a crowd of men entered the council chamber wearing badges with the inscription, "Vote for the Traction Company. We need work."

### T RAILS PREVENT ACCIDENTS.

Robert E. Daniels, inventor of the Daniels' steel tie, has been giving his views to a newspaper man on track construction. He said, "Under conditions of rapid transit, why do we need girder rail? It is unnecessary for wagons to use railway tracks for wheeling. If a vehicle is in the tracks and endeavors to get out of the way of a rapidly approaching car, great care has to be used, for if there is not room to turn at the right angle a wheel is likely to come off, causing a delay to traffic. The time is past when street car lines should necessarily be compelled to put down such rails, not that the companies should have all the privileges and the vehicles none, but that the people should have the preference. With T rails the wagons can use the space between tracks, and when a car comes along can move out of the way without trouble, for if the pavement is correctly laid any wagon or buggy can cross and recross at will, as it is impossible to get tangled up with the rail, for there is only room for the flange of the car wheel between the pavement and the rail. The preventing of accidents will do away with all delays, thereby securing rapid transit. People who have had experience with rapid travel are never satisfied to go back to the old methods."

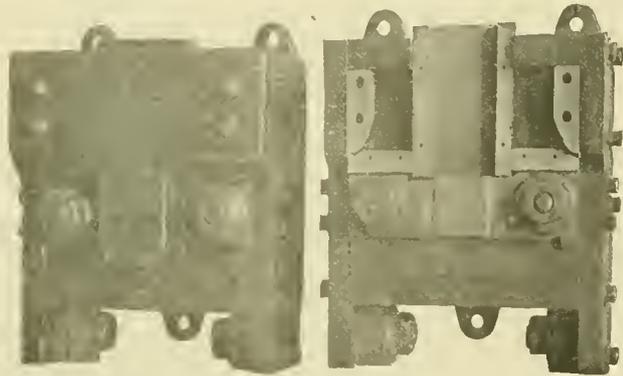

### IMPROVEMENTS AT SPRINGFIELD.

General Manager S. L. Nelson, of the Springfield Railway Company, Springfield, O., reports that the stockholders have voted to spend \$75,000 in improvements. The appropriation is apportioned as follows: Tracks, \$35,000 to \$40,000; power-house, additional power, \$10,000; cars, \$10,000; remainder extensions and general improvements. Work will be begun as soon as possible, so that the road and extensions will be ready for summer travel. Stockholders met December 15 to adopt a plan for raising the money.

A SATISFACTORY test has been made of some apparatus put in one of the cars running on the York road extension of the City & Suburban Company, Baltimore. President Perin said the apparatus was designed to heat all the cars beyond the city limits, but not those upon the the city end of the road.

### THE VALUE OF THE MAGNETIC BLOW-OUT.

The principle of the magnetic blow-out for preventing destructive arcing when electric circuits are broken, is used on all the cut-out and switching devices of the General Electric Company in places where live circuits are to be opened. It is this device that is the secret of the great success of the type K series-parallel controller. A test, showing its remarkable effect on fuses, was recently made in the station of the Brooklyn City Railroad. The regular General Electric generator fuse block was used.

MAGNETIC BLOW-OUT—FIG. 1.

This block has the fuse strip placed between the poles of an electro magnet. It is shown in Figure 1, complete, and with the magnet removed. The test spoken of consisted of throwing a water resistance between the terminals of two 1,500 kilowatt generators, and increasing the current until the fuse melted. The fuse blew at 4,400 amperes and 500 volts. The result can be seen in Figure 2, which shows the fuse before and after melting. It is a beautiful illustration of the efficacy of a magnetic field in blowing out an arc. The magnetic blow-out is probably one of the most valuable of the General Electric Company's patents.

### LAKE STREET ELEVATED TO ELECTRIFY.

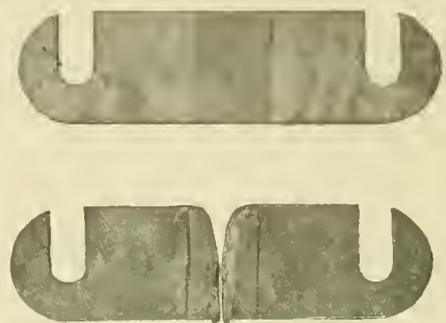

The management of the Lake Street Elevated Railway of Chicago has recently made public its intention to soon adopt electricity as a motive power. This has been expected for some time, and that electricity would soon be adopted seemed an assured fact when the control of this road was secured last summer by persons friendly to the Yerkes interests. As the Yerkes lines were at the time beginning on electrical construction work, and as the Northwestern elevated, a road projected by the same parties, is to be electric, it was but natural to suppose that the Lake street road would soon make the change. President D. H. Louderback says that trains will be operated by electricity next summer. Power will be obtained from the 11,000 horse-power station of the West Chicago Street Railroad at Western avenue and Washington boulevard, which is now in process of erection. This is about the middle of the line, and is only two blocks from Lake street.

### CHICAGO CITY RAILWAY MUTUAL AID SOCIETY.

The employes of the Chicago City Railway have recently formed a mutual aid society which is meeting with great success, as it now has 1,000 members out of the 2,500 persons employed by the company. Its object is to act as a mutual life insurance society. It is expected, however, before long to extend the field of usefulness, so as to help sick and disabled members. The present membership includes men in all departments, and the company officers are all on the roll. Each member pays up two 50-cent assessments when he joins, and in case of a death the heirs receive the amount of the second previous association assessment. This leaves a comfortable margin always in the treasury. The annual dues are 50 cents per year in addition to the assessments. The treasurer of the company shall, it is agreed, deduct from the salaries of members enough to make up the amount of the current assessment, and remit to the treasurer of the aid society. The company is not liable for the assessments so collected, as the treasurer is acting as an individual, and not as an officer of the company. Although the membership is not compulsory it is hoped by its officers that it can be made so soon, as it would then be on an absolutely solid basis. A medical examination is required of applicants. None of the officers receive a salary except the secretary and medical examiner. The officers are: George O. Nagle, president; H. M. Sills, vice-president; T. C. Penington, treasurer; F. P. Morehouse, secretary, and E. E. Babcock, medical examiner. Mr. Nagle will be glad to give any information about the organization to those who are contemplating similar associations.

### CAR BARN FIRE, PITTSBURG.

On the morning of November 3, a frame car barn of the Allegheny Traction Company, Pittsburg, Pa., was burned. In the building were twenty-seven horses and

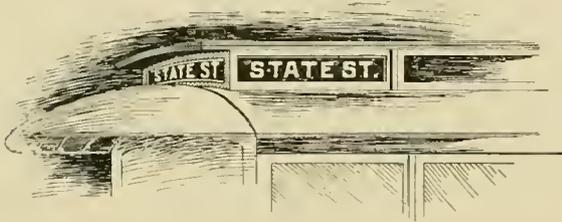

MAGNETIC BLOW-OUT—FIG. 2.

mules, thirteen horse cars, and twelve and one-half equipments of motors. The loss is about \$25,000, fully insured. The company will soon build an iron frame building, covered with corrugated iron, of about 180 feet by 70 feet, for a car shed.

AN ILLUMINATED CAR SIGN.

Superintendent T. M. Jenkins of the South Covington & Cincinnati Street Railway writes us that his company has for some time known of an almost general feeling on the part of the public for the necessity of an adequate route signal for cars, especially at night. A sign which is readable night or day, and which is changeable and inexpensive, best answers the requirements of the case. The one which is being used on the South Covington & Cincinnati cars is the invention of Bradford McGregor,

ILLUMINATED CAR SIGN.

a Covington man, and is proving very satisfactory. A dark stencil properly lettered is placed over translucent glass before the front and rear dome lights of the car or any other convenient place. In the day time the reflected rays of light give a white letter in a dark background. At night the light inside the dome gives the same effect except that the sign can be read from a greater distance. The important advantage of this plan over others, involving lettering in the car dome, is that the stencils can be easily changed when the car is put on a new route. It is also much more distinct than ordinary methods of lettering on the dome glass. The cost is merely nominal with the simple stencil fastenings used.

TO PRESERVE A BATTLEFIELD.

Recently the U. S. government secured a decision in a condemnation suit against the Gettysburg Electric Railway Company, awarding the latter \$30,000 compensation for a strip of land 6,000 feet long. The object of the government is to preserve the famous Gettysburg battlefield. While the railway company approves of this action from a sentimental standpoint, it has serious objection to giving up the strip, because this mile and a fifth is an integral part of the right of way of one of the branches of the road. The effect of the condemnation would be to cut the branch in two, destroy its contiguity, and prevent its further operation. An appeal has been taken.

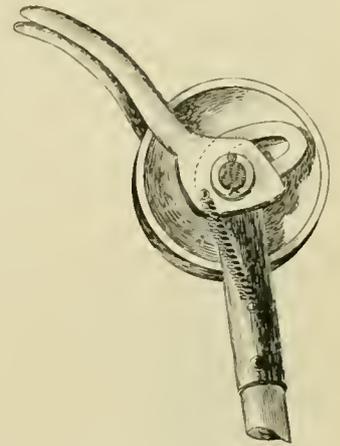

Map of the United States.

A large handsome map of the United States, mounted and suitable for home use, is issued by the Burlington Route. Copies will be mailed to any address on receipt of 15 cents in postage by P. S. Eustis, Gen'l Pass. Agent, C., B. & Q. R. R., Chicago, Ill.

NEW TROLLEY GUIDE.

Something new in a trolley guide has been patented by William Dickerhoff and George W. Pollock, Cincinnati.

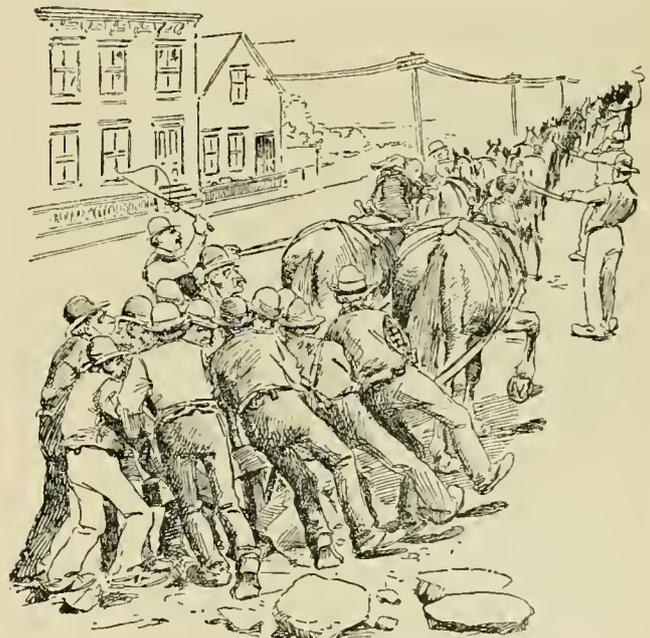

Two light brass prongs are placed on each side of any trolley wheel, which are held in position by two steel springs, each of 2 1/2 pounds tension. The object of the prongs is to hold the wheel to the wire, and when it jumps from its place to automatically guide it back again. When a cross-wire is reached the prongs are folded back automatically, being pressed under, so there is no interruption. When the cross-wire is passed the springs throw the prongs in place. The illustration shows the mechanism of the guide. The device has been praised by electric street railway men.

NEW TROLLEY GUIDE.

HOW THEY PLOW IN CITIES.

This illustration shows some of the difficulties of construction that have to be overcome by the street railway companies in the large cities. The view shows an actual

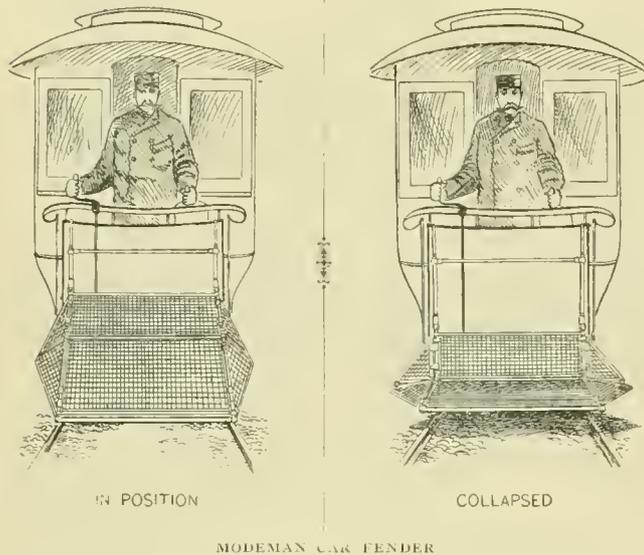

occurrence in San Francisco, where the Market Street Railroad Company was building a line on Devisadero street. The task was not an easy one, yet the road was completed in a very short time after it was begun.

THE Camden, (N. J.), Horse Railroad Company, has opened Wood Lynne Park as a pleasure resort.

## MODEMANN CAR FENDER.

The Modemann car fender was successfully tested on the Atlantic Avenue Railroad Company's line, Brooklyn, N. Y. A man stood in front of a trolley car, coming at a high rate of speed. The fender struck him above the right ankle, and carried him along without apparent inconvenience. A woman stood between the rails, when the car came along again, and was picked up as gracefully as an accomplished woman seats herself in a parlor. In neither case was the "victim" injured.

As will be seen from the illustration, the Modemann

MODEMANN CAR FENDER

fender consists of half-inch mesh of flexible steel similar to that used for wire beds, which is fastened to the dash by means of iron tubing. The mesh, called an apron, has wings which hang down on each side of the car, and are extended 22 inches beyond the rails when an object 40 pounds or heavier is struck. At the bottom of the apron is a hard rubber roller, which does not touch the surface of the road unless the car rocks, and when a stone, or similar object is struck, the fender slides on the iron rods. When folded against the dashboard, the fender it is said, does not extend beyond the bumper. Only one fender is required for each car, as it can be transferred with little work, if desired.

## NEW SAN FRANCISCO MANAGER.

E. P. Vining is general manager of the Market Street Railroad Company, San Francisco, in place of M. D. Stein. This is the first appointment which has been made to this position since the consolidation of the road, Mr. Stein having held the position of acting manager of the transportation department, which office has been abolished. Though practically new to the street railway field, Mr. Vining is well and favorably known in traffic circles of steam roads, through his long connection with the Union Pacific Railroad, and later with the Western Trunk Line Association. The newspapers report his salary to be \$15,000 a year.

## THE LOST WAS FOUND.

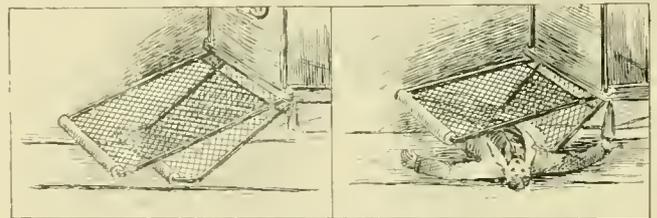

A very crowded street car was going up Powell street, San Francisco, when it stopped to take aboard a stout, showily dressed woman. For a few minutes no one arose to offer her a seat, and as her fashionably tight attire prevented her reaching the steadying strap it was with difficulty that she kept her footing. Soon a young man, not over eighteen or twenty, arose and kindly offered her his place. She took it with the enquiring remark: "Well, you have found your manners, have you?" The quiet young man made no reply, but began searching on the floor of the car as if he had lost something. The lady asked: "Have you lost anything?" He replied that he had. She arose to allow him to search further, when he slipped into the vacated seat with the remark: "I've found it now and I mean to keep it." A very audible smile went around that crowded car, and the discomfited lady left it at the next crossing.

## NEW AUSTRALIAN CABLE LINE.

At Sydney, New South Wales, has recently been completed the Ocean Street Cable Line, which was begun in October, 1892. The line is two and one-half miles long, with many curves, and cost about \$777,600. The cables weigh 150 tons, requiring 250-horse-power to run them without cars. There are two horizontal compound surface-condensing Spencer-Inglis Corliss engines, built by Hudson Bros., Granville. The main shaft carries a twenty-five ton fly wheel, and a rope drum seven feet in diameter, with thirty-six grooves for 2-inch cotton ropes. There are three multipolar under-fire boilers of 250-horse-power each, and working at a pressure of 150 pounds to the square inch.

## THE PITTSBURG MCGUIRE FENDER.

Robert McGuire, Pittsburg, Pa., has patented a car fender, which consists really of a double fender. It is made of wire netting and has rollers at the end which comes over the tracks. The upper fender projects over

NEW DOUBLE FENDERS.

the lower one. The inventor says if the upper fender misses an object or rises above it, the lower one will be almost sure to catch it. The illustration shows the fender at rest and in action.

W. C. DIBRELL and R. W. Turner have petitioned for a receiver for the Nashville (Tenn.) Street Railway Company and the foreclosure of mortgages.

## FOREIGN FACTS.

BERLIN is to have an electric elevated railway. The vote of the municipality in its favor was almost unanimous.

THE Hull, Eng., tramways have been offered for sale by order of court at the upset price of \$75,000. The horse car system will probably be replaced by electric lines.

THE Committee of the Paris, France, municipal council, appointed to study foreign tramway systems, has returned after visiting Zurich, Vienna, Budapest, Milan and Geneva, and will soon present a report.

THE City Railway Company, Berlin, has a device for selling tickets during rush hours. It is a nickel-in-the-slot machine which rejects everything except coins of the right denominations. They might be of use on bob tail cars.

THE Buenos Ayres Tramway Corporation of Buenos Ayres, Argentine Republic, has declared a dividend for the half year ending June 30, of sixty cents per share upon full paid shares and forty-eight cents on other shares, amounting to over \$72,000. The car miles were 2,006,299, passengers, 13,200,719, and gross receipts, \$347,500 for the half year.

AN electric tram line is projected from the Furness district to Bowness, England, which is to derive its motive power from the falls at the southern end of lake Windermere, the finest water power in England. The available power aggregates 40,000 horse. It is to be distributed over a wide area, by electric currents of high voltage, for railways, light and power purposes.

BASEL, Switzerland, is soon to have an overhead trolley electric railway two miles in length. Double track will be laid for most of the distance. The line will include grades of five per cent. A three minute service will be maintained with twelve motor cars. The work of construction is to be carried on by Siemens & Halske, of Berlin, and R. Alioth, of Basel Moenchenstein, at the expense of the town.

RUBBER stud blocks are being tried on the footboards of some cars operated by the Glasgow & Southwestern Railway Company, of Scotland, to prevent the slipping of the feet when entering or leaving the cars. These blocks consist of inch-square iron plates having a covering of india-rubber on top and projecting nail points on the under side. A tap of the hammer fixes the block firmly in the wooden floor.

LONDON's tramways will all pass into the possession of the city government within four years, under the operation of the purchase clause in their franchise. This clause provides that the London county council may, at any time within six months of the expiration of a lease, purchase, take possession of and operate the railway. A portion

of the London Tramway Company's line has been bought, and another line in South London is purchasable.

AN electric trolley railway is now being constructed for the Dublin Southern District Tramway Company, from Dublin to Dalkey, Ireland, by the British Thomson-Houston Company. The route extends for eight miles through the beautiful scenery of Wicklow. Two 300-horse-power Babcock water tube boilers will be installed. The three engines of 150-horse-power each will be direct belted to the dynamos. The line is to be completed by the summer of 1895.

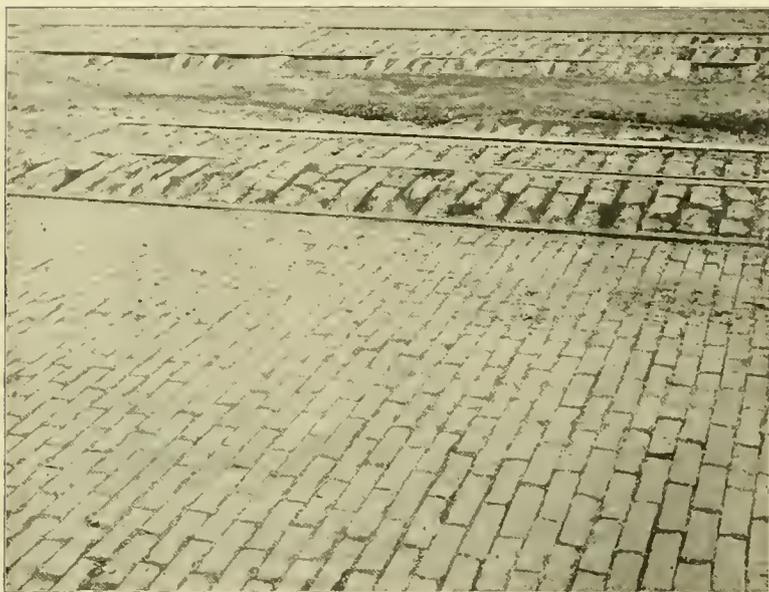

THE adverse report of the city engineer of Newcastle, Eng., to the Town Improvement Commission, upon the conduit electric tramway system at Budapest, has called forth a protest from Siemens Brothers & Company, in which they assert that the cost is not \$58,398 per mile of single track, as stated in the report, but \$19,466, and that the rails of the tramway do not rest upon loose brickwork, as alleged, but upon cast iron frames, to which they are firmly bolted, and which are set in the concrete conduit at the distance of four feet apart. The protest admitted that the width of the slot at Pest is one and one-fourth inches, but claims that there is no need for so great width, and that there will be no difficulty in contracting the slot to one-half inch. The objections as to interruptions of the service from climatic causes are explained away, there being no great difference between the climate at Pest and at Newcastle. The speed at Pest is given at eight miles per hour. Grades of 2 per cent at Pest are easily climbed.

THE Glasgow, Scotland, Tramways Committee has received a very favorable report from the deputation sent to Budapest to examine the conduit electric railways. The report states that the cars are run at a speed of eleven and one-half miles outside the town, nine miles inside, and four miles in narrow streets and at crossings. The total cost of constructing fifteen miles of single line, including power stations, car houses, rolling stock and general expenses has been \$926,000 or \$61,730 per mile. The receipts per car mile for 1893 were 22.5 cents, ranging from 16 cents to 31.6 cents, according to location of line. The traffic per car mile was  $8\frac{1}{4}$  persons, exclusive of season ticket holders. The operating expense per car mile, including cost of removing snow from track, repairs and maintenance of equipment, was 10.35 cents, of which 5.5 cents was expended for power and running of cars, including drivers. The margin of receipts over expenses is thus about 12 cents per car mile, to be applied on general charges and dividends to stockholders.

THE St. Louis & Southwestern Street Railway Company will build an electric line to various points in South St. Louis and to Forest Park. The officers are George C. Fox, president; A. E. Weiss, secretary; J. M. Wiener, treasurer.

## BRICK, GRANITE AND CEDAR PAVEMENT.

An interesting object lesson is presented by the illustration shown in this connection, which is a section of La Salle street near the corner of Washington street, giving two cable tracks operated by the North and West Chicago Street Railroad Companies. The pavement nearest the observer is end-cut brick  $7\frac{3}{4}$  by  $3\frac{3}{4}$  by  $2\frac{3}{8}$  inches; between the rails is granite block, and between

SHOWS ADVANTAGES OF BRICK PAVEMENT.

the tracks is cedar block. The brick pavement shows for itself its superior merit, as compared with the other two varieties so far as the laying and surface is considered, but its other advantages, such as cheapness, durability and ease on horses have been demonstrated in other ways. The section of brick shown was laid in August, 1894, by the Purington Brick Company, Galesburg, Ill., and the photograph was taken October, 22. Had the brick been of larger size, there would have been less chipping of corners and less breakage across, under the heavy traffic. In both cases the percentage is small, and it is noticeable that having reached a certain stage, the breakage becomes no worse.

W. M. Jeffrys has been appointed electrician of the Warren, N. Y., Street Railway Company, in place of J. A. Seamons.

THE Ann Arbor & Ypsilanti Street Railway Company, Ann Arbor, Mich., carried 80,000 passengers last year, and its receipts paid all operating expenses, including maintenance of track and rolling stock. For eight months there was no connection at the Ann Arbor end. The express business is increasing. The old officers were re-elected: J. E. Beal, president; H. P. Glover, vice-president; J. T. Jacobs, secretary; D. L. Quirk, treasurer.

## A SHORT CIRCUIT AND RUNAWAY CAR AT WALTHAM, MASS.

One of the most peculiar electric railway accidents it has ever been our lot to chronicle, occurred last month at Waltham, Mass., on the Newtonville & Watertown Street Railway. The car was standing near a steam railroad crossing waiting for a freight train to pass, when a short circuit occurred in the car wiring. The car floor took fire and the car started ahead rapidly, breaking through the crossing gate and running on the track just in time so that the front end was struck by the locomotive. There were no fatal injuries. There was a storm at the time, which fact accounts for the short circuit. It was a most unusual accident, and one not likely to occur in a long time in the operation of all the electric cars of the country, but it brings forcibly to mind the point editorially commented on by us last month in regard to the necessity of better car wiring. The car to which the accident happened was probably wired as well as the majority of cars running in this country to-day. The accident was not so much a reflection on the way that particular car was wired, as it was a strong criticism on common practice in car wiring. As stated last month, there are four or five cases a month of cars taking fire from wires, as reported in the newspapers, and there are probably as many again that are not so reported. It is not an

easy matter to wire a car so that the moisture from hard rain and snow storms will not affect it, but there is room for improvement on many present methods.

## ELECTRIC LIGHT ON THE BROOKLYN BRIDGE CABLE ROAD

Bids were recently received by the trustees of the Brooklyn bridge cable line for the installation and equipment of a system of gas or electric light to supplant the oil lamp. The Safety Car Heating & Lighting Company submitted a bid to equip 60 cars and install the necessary gas plant at a price which would make the cost of lighting 4.4 cents per hour per car. The General Electric Company made a bid which would make the cost 5.3 cents per hour per car. The Electrical & Mechanical Engineering & Trading Company bid a somewhat higher figure than the General Electric Company for the equipment but guaranteed that the cost would not be over 2.78 cents per hour per car, and was awarded the contract.

THE Highland & Dravosburg Electric Railway Company, which is constructing a line between Pittsburg and McKeesport, has leased the system of the McKeesport & Reynoldston Company. The trip between the two cities will be made in 35 minutes, over a double track line, the fare being 30 cents round trip.

## RESULT OF CHEAP RIDING.

Street Railway men all over the country have been interested in the fight that has been going on between the two street railway companies of Savannah, Georgia, which have been selling tickets for a cent each, and on some lines round trip tickets limited to one day, for 1 cent, or one-half a cent a ride. Both roads seemed to agree, however, that a basket of washing was worth 5 cents for a ride, so there was no cutting of fares in that respect. Such a bitter warfare as has been waged was certainly expected to outgrow its weapons, and the next move has been awaited with interest.

The courts have been appealed to, but not in the usual way. J. S. Collins, president of the Electric Street Railway Company, writes: "About six months ago our rival railway company started a rate war for the purpose forcing us to buy it out at its own price, and finding that the cut in fares did not result as had been hoped, J. H. Harriman, representing the owner of the company began selling our bonds short, and after having sold a large amount for August delivery, found that he could not get the bonds. He then set to work to try to get the creditors of our company to apply for a receiver. After several weeks he secured three creditors to make application to the court. The case came up for trial and was dismissed, the judge saying it was his duty to protect, not to wreck property. The evidence showed that our rival and one other party, who held a disputed claim against our company, had entered into a conspiracy to wreck our property, and we now sue these people for damages to credit, etc. The suit is for \$25,000 damages, in attachment against the Sloss Iron & Steel Company and J. N. Harriman."

James H. Johnston, president of the City & Suburban Railway, says the only way his company's name has been associated with the suit is that an attachment was laid against Mr. Harriman's stock in the company. This is the only expression from the City & Suburban Railway. Mr. Harriman says he doesn't think the suit will amount to much, and that the electric railway people are trying to amuse themselves.

In regard to the reduction of fares Mr. Harriman is reported to have said:

"The City & Suburban in this fight is simply taking care of itself, and doing what anybody else would do under the same circumstance. We did not begin the fight, and we do not propose, now we are in it, to let it drop. The electric railway people commenced this game of cutting rates sometime last spring, or the latter part of the winter, and we have simply met them by the same or further reductions, which we propose to keep up. The rate cutting was begun by them and we followed. If they do not like it, they have nobody to thank but themselves. I am glad at any rate that the public in Savannah is getting the benefit. The City and Suburban is more of a home institution than the other crowd, anyhow. The entire issue of the City & Suburban bonds is owned here in Savannah by citizens and charitable

institutions. But a large proportion of the bonds of our opponents is owned in Nashville and other places at a distance. Our lines were laid down first, and we are the best located for the convenience of the public. The Electric railway people in many instances came along and paralleled our lines, and then commenced the rate cutting as I have already stated.

"We did not want war and were ready from the start to agree with the Electric railway people. We did agree with them last November. An agreement was entered into in writing, signed by Mr. Parsons and myself, representing the City & Suburban's interests, and by Mr. Wrenne and Mr. Collins representing the Electric railway interest. It was a fair and liberal agreement and settlement of all differences. When Mr. Collins and Mr. Wrenne got back to Savannah they reported that their board of directors had repudiated it. We were surprised, because Mr. Collins and Mr. Wrenne had represented themselves to us as being authorized to act."

## WHO PAID THE FARE?

The little by-play between two women in the street car to see who shall (not) pay the fares, while both are begging to be allowed to do it, is always interesting, although it has been noticed ever since horse railroads were discovered. A conductor on a Broad street trolley car says that he actually saw an exception to the usual proceeding last week. Two girls got on at Taylor street and both opened their purses and began pretending to look for dimes in the ruck of cents, quarters, buttons and scraps of paper.

"Let me pay it, Anna. I know I have a 10-cent piece right here," said the young woman nearest the door.

"No, let me this time, Emily. You know you paid last time we went down town together, and I am sure I have just got the change."

They seemed to have difficulty in fishing out the money, and meanwhile the conductor entered the car and stood in front of them. Both got out their dimes at the same instant, and they looked into each other's eyes.

"I'll tell you what I'll do," said Anna. "Let's match to see who pays? You match me," and she laid the dime on the back of one of her gloved hands and covered it with the other.

"No, I'll match you," said Emily, thinking she was changing the order of arrangement most shrewdly, and consequently there must be some advantages in so doing.

Both coins came out head and Emily remarked with a sigh, "There, you have lost, and I'll have to pay," and taking up the two coins she gave one to the conductor and put the other in her purse.

The conductor said it was all right in the end, but he could not understand the mental process by which the conclusion was arrived at. As she was leaving he heard Emily say, "Oh, isn't it exciting. We'll have to do that every time, but let's do it before we get on the car."

## CENTER POLES ON RESIDENCE STREETS.

When a trolley road first tries to get a franchise along the residence streets of a district where property owners are not acquainted with the system, there is frequently a general uplifting of hands in horror at the thought. People who do not come in daily contact with electric railways have little idea of what they really are, and their opinions are formed very largely by the newspapers. It is a notable fact that all the objection to the trolley system in any place comes before it is installed. After it is once put in there is not one man in a thousand that would vote for going back to horse cars. One of the most difficult things is to assure a property owner that a neat center pole line will not disfigure his street. The best way to convince such people would of course be to take them to some of the beautiful residence streets of some of our principal cities and let them see for themselves that a center pole line is more of an ornament than a disfigurement to a street. As this is not practicable, the next best thing is to show them some street scenes which will give them an idea of how the center pole system looks. The Chicago City Railway has used this plan to advantage. The accompanying page of engravings is from photographs taken along Indiana avenue, Chicago, on which the Chicago City Railway now operates a horse line. On one set of engravings the street is shown as it

actually is at present, and in the corresponding ones in the other set the center pole line and trolley line has been drawn in to represent the street exactly as it would appear equipped with the trolley. The comparison is certainly not unfavorable to the trolley. The ornamental poles set regularly give a symmetrical appearance to the street and make a very pleasing effect. This, with the fact that there will be no more horse cars dragging their weary way down the thoroughfare, ought to be a sufficient argument to any of the property holders, to say nothing of the benefits of rapid transit to the city. The other engraving is from a street in Evansville, Ind., where the Electric Railway Equipment Company of Cincinnati recently did some neat center pole construction work. These poles originally had ornamental bases, but the city council thought they were an obstruction, so that the bases were cut off.

D. J. HAUSS secured a verdict for \$500 against the Maysville Electric Railway Company in the U. S. Circuit court, Covington. He sued for \$2,500 for extra work done as a sub-contractor.

## NEWSBOYS ON STREET CARS.

In all large cities the abating of the newsboy nuisance has caused more thought and worry than many an important question involving the operation of the vast systems of street railways. These obstreperous, omnipresent, dirty little youngsters, are continually jumping on and off cars, endangering their own lives and annoying passengers and conductors. Many ways have been tried to keep them off. Some cities have ordinances directed against them, and in other places the conductors have instructions to keep them off. The little rascals, however, shrewdly watch their chances, jumping on the cars at a point remote from the employes.

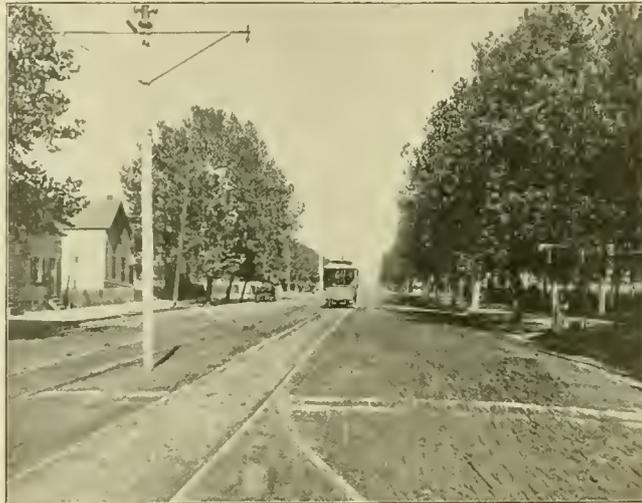

Quite a number of serious accidents have resulted from this apparently irrepressible habit. The West End Street Railway Company, Boston, has tried many plans, none of which has worked as well as was desired. Now the

company has a contract with the Hotel and Railroad News Company, by which newsboys wearing its badges are the only ones allowed on the cars. The limit of age in this contract provides that no boy less than eighteen years old shall be employed, the object being to have only large, well grown boys employed, who can look after themselves. C. S. Sergeant, general manager of the company, writes: "While this does not rid us of the newsboy nuisance, it has proved more satisfac-

tory than any other method which we have tried."

The Southern News Company has made a proposition to the Orleans Traction Company, New Orleans, for placing a uniformed newsboy on the rear platform. Those who sell morning papers, to be on the cars from 4 to 11 a. m., while those selling afternoon papers are to ply their trade from 2 until 7 p. m. The boys are not to be permitted to jump on and off cars in motion. Occasionally they will walk through the cars for the accommodation of passengers, being instructed to be polite and courteous, and to keep out of the way of the conductor, so they will not interfere with him in the discharge of his duties.

If the larger companies make arrangements with news companies on similar lines, they will always have some one on hand to repel the common newsboy from the car, for it will be part of the duty of the uniformed lad to see that no one encroaches on his preserves. It will also relieve passengers from the annoyance of boys coming through the car at every street crossing, shouting their wares into sensitive, tired, and unresponsive ears, and in the winter time creating death dealing drafts by the opening and shutting of doors, when the car is in motion.

CENTER POLES—EVANSVILLE, IND.

CENTER POLE CONSTRUCTION IN RESIDENCE STREETS—SHOWING SAME STREETS WITH AND WITHOUT POLES.

Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.

WORK has been begun on the Sutro line, San Francisco.

IN Syracuse it is called the "punch your face" transfer.

BUFFALO has no horse car lines. Electricity is now used on all the lines.

THE new Niagara Falls, Whirlpool & Northern Street Railway Company is in operation.

THE trolley mail cars, of Brooklyn, now run into the postoffice yard over a special track.

STANDARD gage will be adopted by the Market Street Railway Company, San Francisco.

THE York City Railway Company, York, Pa., carried 80,000 passengers during five days of the fair.

THE Akron, O., Street Railway Company has been giving a prize to the conductor selling the most tickets.

LARGE railroad crossing signs have been placed at crossings by the Redlands, Cal., Street Railway Company.

A KNIGHTS OF LABOR assembly, composed wholly of street railway employes, is being organized at Pittsburg, Penn.

THE Cumberland Valley Traction Company, Harrisburg, Pa., has completed its new road in Cumberland County.

THE 21 street railways of St. Louis made 1,487,441 trips and carried 24,745,396 passengers the third quarter of the year.

THE new line of the Millvale, Etna & Sharpsburg Company, Pittsburg, is completed, and opens up a large territory.

J. M. MOORE, has finished tracklaying for the Piedmont Construction & Improvement Company, Charlottesville, Va.

THE tilting of a manhole in the middle of the track, wrecked a car of the Missouri Street Railway Company, St. Louis.

THE Homestead & Highland Street Railway Company, of Homestead, Pa., will soon have its new road completed.

THE People's and Electric Traction Companies, Philadelphia, have decided to exchange transfers between the two systems.

THE Dallas & Oak Cliff Street Railway Company, of Dallas, Tex., has completed the equipment of its road for electric service.

THE contract for the Manchester & Winchester, O., Electric Railroad Company has been awarded to Chicago parties for \$200,000.

ERBECK BROS., are building the Homestead & Highland street railway, which will connect with the Duquesne traction system, Pittsburg.

THE Watertown, N. Y. Street Railway Company, has done away with conductors. Three men meet cars at certain points and collect fares.

THE Brockton, Mass., Street Railway Company carried 184,752 passengers during fair week, as against 170,052 during the fair week of 1893.

THE Philadelphia Times notes the need of a phrase as applied to electric cars that will answer the same purpose as the old expression "one-horse."

JAMES ROBINSON, superintendent of the Third Avenue Railroad, of New York, is the designer of a wheel guard fender, that is doing good work on that line.

THE West End Street Railway of Boston has begun the operation of putting its feed wires underground; \$360,000 worth of work is to be done at once.

SANFORD & BROOKS, Baltimore, Md., bid \$175,000 and secured the contract for building the Dravostburg & Glenwood Electric Railroad Company's line.

JOHN MAHAN, superintendent of repairs of the board of education of Newark, N. J., was injured by a trolley car, and had the manliness to say that it was his own fault.

J. W. HARTSELL, who built the first street railway in Topeka, Kans., has failed in San Francisco, having lost \$300,000 in an irrigation scheme and \$50,000 in other ventures.

THE recent opening of the new electric line by the Allegheny Traction Company has abolished the last horse power lines on the down town streets of Pittsburg and Allegheny, Pa.

ONLY two killed and eight injured is the casualty record of the Citizens' Traction Company, of Pittsburg, Pa., for the past two years, although 28,000,000 persons have been carried.

THE annual report of the Electric Traction Company, Philadelphia, shows 41,040,346 passengers carried; receipts, \$1,916,936.77; expenditures, \$1,823,562.82; balance, \$84,363.95.

THE Shamokin & Mount Carmel Electric Railway Company, of Shamokin, Pa., is selling miners' tickets at

the rate of thirty for one dollar, but these are good only on cars bearing the sign, "Miners' Car."

THE conduit electric system will actually be given a trial in New York by the Metropolitan Crosstown Railway Company, of which H. H. Vreeland, is president. The work of construction has already begun.

THE bondholders of the Piedmont Consolidated Cable Company, Oakland, Cal., petitioned the court to postpone the sale, as the receiver is making alterations and improvements that will greatly increase its value.

ONE of the ex-motormen got judgment against the Oakland, San Leandro & Haywards Electric Railway Company for \$25, the amount of his deposit, which had been retained on account of damages in a collision.

AT a recent annual meeting of the Moline, Ill., Central Street Railway Company the following directors were elected: S. H. Velie, W. L. Velie, L. S. McCabe, W. E. Reck, E. H. Guyer, J. R. Kimball and J. B. Cornwall.

THE Metropolitan Traction Company, New York, statement shows that it is earning 5 per cent. on \$27,301,650. When the Lexington and Columbus avenue surface lines are completed the company will own 143 miles of surface road.

A commodious waiting room has been opened at an important transfer station by the City Railway Company, of Louisville, Ky. The room is steam-heated and contains a lunch counter, coffee stand and other conveniences.

THE Cumberland Valley Traction Company has finished a new electric railway across the Susquehanna river at Harrisburg, Pa., permitting cars of the East Harrisburg Passenger Railway Company to run over into Cumberland County.

THE city of Detroit, not only was badly whipped in its alleged case against the Citizens' Railway, but is now confronted with an attorney's fee of \$40,000, for all of which the deluded public can thank that officious and misguided Mayor Pingree.

SOME Baltimore clergymen set aside a Sunday to ranting on the car fender question, most of them showing a lamentable ignorance of current events in their own city. If doing were as easy as talking, what a change there would be in this world,—and in car fenders.

WHEN the people celebrated the opening of the Pawtuxet Valley Electric Railway, they borrowed a cannon. So great was the enthusiasm, that the cannon burst. Demand was made for cannon or money by the owner of the engine of war, and a popular subscription was taken.

QUICK work was done in laying the Eleventh street track of the Oakland, Alameda & Piedmont Electric Company from Washington street to Broadway. The macadam was taken up, dirt removed, the rails laid, and the street placed in first-class condition in ten hours one Sunday.

THE management of the St. Thomas, Ont., Street Railroad Company has been changed by the election of D. N. Cameron as president and John Break as secretary and treasurer, in place of Cameron Currie and Strathearn Hendrie, who resigned. The new management contemplates a change in motive power from horses to electricity.

THE annual statement of the receiver of Helena, (Mont.), Rapid Transit Company, shows a paid in capital of \$500,000; debts, \$24,684.45, of which \$21,431.45 is due the Minneapolis Trust Company; \$1,777.27 for wages, and \$1,475.75 for supplies; outstanding claims not counted as debts, \$5,908.81; \$3,743 due on notes and a mortgage for \$24,000.

DURING the six days from September 26 to September 28 there was a fair in Ottawa, Can. The Ottawa Electric Railway Company took in \$1,001, the first day; \$860, the second; \$1,625, the third; \$2,007, the fourth; \$2,114, the fifth; \$1,314, the sixth; total, \$8,921, an average of \$1,486 a day. The road earned \$85,000 since June, an average of \$816 per working day.

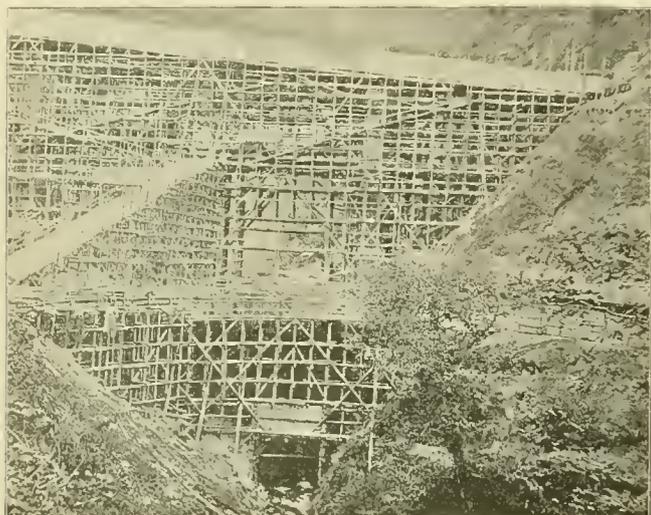

SMOKING cars have been put on the lines of the People's Traction Company, Philadelphia, for use during the rush hours. In other cities where the plan has been tried, it has been abandoned, because it has been impossible to keep the women out, as they seemed to prefer riding in the smoker and complaining to the conductor that the "horrid men smoke all the time," rather than go in the car provided for them.

AT the annual meeting of the stockholders of the Pittsburg Traction Company, the annual report for the fiscal year, ending July 1, was read. Receipts from all sources, except inclines, were \$297,407.06; from inclines, \$60,401.67; total receipts, \$357,989.63; expenses and taxes, \$183,420.35; incline expenses, \$75,653.43; less dividend received from Mt. Olive incline, \$3,714; total expenses, \$365,800.78; loss for year, \$7,820.15.

SMOKING is not permitted on cars of the Rochester, N. Y., Railway Company, and recently when a prominent attorney boarded a car he was requested by the conductor to stop smoking or leave the car. Thereupon the passenger committed a vicious assault upon the conductor, blacking his eye and injuring his jaw. The company will now bring suit against the pugnacious attorney as a warning to others who disregard rules and threaten the conductors.

## JAPANESE RACK RAILWAY.

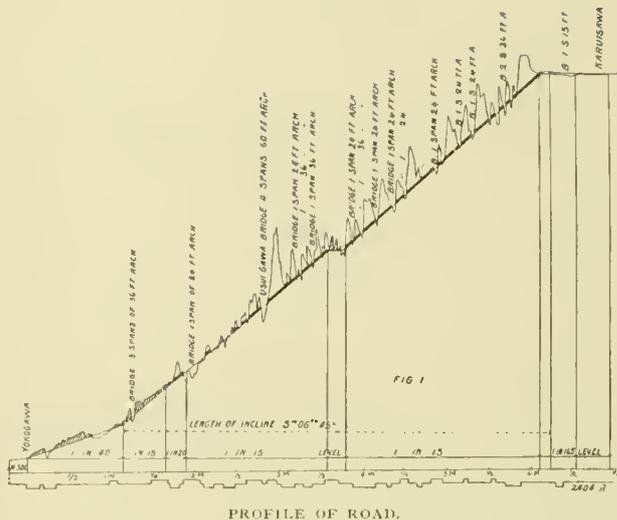

Anything about Japan is of interest to the general reader on account of the war between that country and China. On April 1, 1893, was opened for business the Usui Toge Rack Railway, which fills up a seven-mile gap in the main line connecting Tokio with Naoyetsu, a seaport town. Work was begun in August, 1891, many difficult engineering problems having to be solved and overcome. There are 26 tunnels and 18 viaducts, the largest of the latter being the bridge shown in the illustration, which consists of four spans of 60-foot arches, and in its highest point, being 106 feet from the river

BAMBOO SCAFFOLDING FOR VIADUCT.

bed to the formation level. There were 2,300,000 bricks used in the bridge, which cost 300 yen, or about \$300 a running foot, the total span being 267 feet between abutments.

Fig 1 shows a profile of the road. Besides the tunnels, viaducts and culverts shown in these views, there were 438,000 cubic yards of cutting and 173,400 cubic yards of embankments. The tunnels cost about 65 yen, or about \$65 a running foot. Rack rails with cross steel sleepers were used, rails of special lengths having been required for the outside and inside of each curve, the sleepers at curves having been placed radially. Except on inclines ordinary T rails were used on wooden

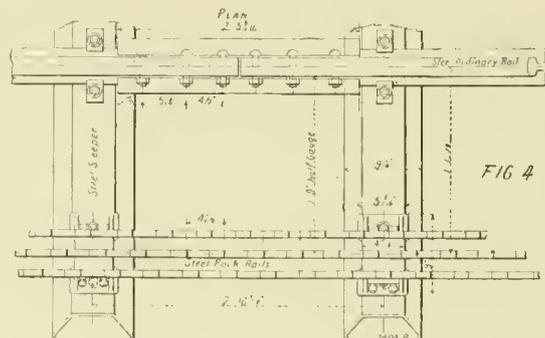

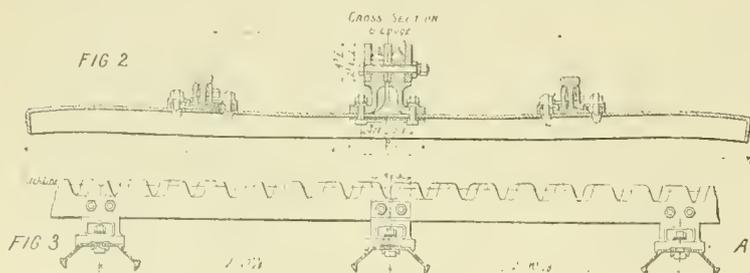

cross ties. The general finish of the curves is said to be excellent, the rails being laid in a true curve, giving smooth running to the wheels of the rolling stock. Mr. Hongma and Messrs. Kikkawa and Watanate were the engineers in charge. Figs. 2 to 4 show the methods of laying rails. For the description and views we are indebted to the courtesy of Engineering of London.

### DIDN'T WEAR HOOPS.

He was a near-sighted German who entered a crowded car, and sat down in the lap of a colored man, who gave him such a push that he landed in the lap of an Irish woman across the car. There was an amusing dialectic war of words. When all was silence, the German turned to the colored man and said: "Vell, vat vas der madder mit you? Does you vear hoops?" After a while the colored man got out, so the German prepared to take the vacant seat. He was so slow about it, however, that a young lady slipped in ahead of him, and he landed in her lap. She gave a scream and a push, and as he was hanging on the strap, the German remarked, "Vell, vat vas der madder mit you? Does you vear hoops?"

J. C. Hutchins has been elected vice president and assistant treasurer of the Citizens Street Railway Company, Detroit, in place of Major J. V. Johnston.

FIGS. 2, 3 AND 4.—SHOWING METHODS OF LAYING RAILS.

**NOVEL METHOD OF CREATING TRAVEL.**

The REVIEW is always pleased to learn of new methods of creating travel, and never loses an opportunity to give its readers the benefit of any suggestion it may discover along this line. That more managers do not give attention to the possibilities of creating good business out of practically nothing is by no means to their credit. The smaller roads are the ones which usually can work such enterprises to best advantage, and are also the very ones which most need the business.

W. W. Bean, president of the St. Joe-Benton Harbor, Mich., road, has a line leading three and a half miles out to a pretty park, which while all right as a park was not calculated to attract a great rush of people to see green grass and trees which flourish right in town, so he bethought himself early last spring of supplying attractions which would draw. The first available feature was a traveling medicine company which was giving free performances. The park was put at their disposal, and a miscellaneous assortment of groceries purchased, sacks of flour, boxes of soap, packages of oatmeal, hams, candy, stew pans, and enough other domestic miscellany to fairly stock a small store. These were turned over to the medicine company. The next step was to freely advertise the scheme, in which announcement was made that a ten cent round trip ticket would be sold on a certain date, good only that day, and which included also admission to the park and one guess on the presents. People who preferred to walk out or go in any other than the approved street car method paid ten cents to get inside the grounds, and had no guess either. The ticket used for this scheme is shown herewith, and is in coupon form.

Good only Sunday, May 27, '94  
Between 1 p. m. and 6 p. m.

**To Pavilion**

Each passenger wrote his or her name in the guess coupon, and when all were in they were shuffled in a big box, and then a medicine man would set up a sack of flour, and blindfolded, draw out one of the guess coupons,

the prize going to the person named on the coupon. In this way a great deal of sport was had, among the big crowd which was thus attracted. When the grocery scheme had been worked for all it would stand, a variety of entertainments was given, including free band concerts, a cake walk, picnics, comedy companies, and a big dance every Saturday night. The attendance kept up all summer, and was only checked when cold weather no longer made outdoor entertainments possible.

There are many other roads which can now lay their plans for next summer's business, and which can easily study up other schemes to suit the special requirements of each individual community.

**USE OF HORSES ON AN ELECTRIC GRADE CROSSING.**

At one of the very bad steam railroad crossings on the West End street railway system of Boston a very sensible precaution is taken to prevent the possibility of a car getting stalled on the crossing. The crossing is at a very obtuse angle, and, as all railway men know, is for that reason a very dangerous one, because of the time that it takes to get a car across. Fast trains are also very frequent on the steam road. The precaution is to have a team of horses, which is hitched to each car as it goes over the crossing. In case the fuse blows or the trolley comes off the car is not stopped. It is a rather expensive safeguard, and it would probably not be warranted except at such exceptionally dangerous crossings. The Chicago City Railway and some other roads use a fork extending on each side of the trolley wheel, so that in case the trolley wheel comes off the circuit is not broken. This reduces the danger of stoppage by a very large per cent, as the only other thing that would be likely to occur to the motive power is the blowing of a fuse. While the blowing of a fuse is a possibility it is not a common accident in such places, as the track at a crossing is necessarily nearly level and there is not a large demand for current. Consequently the danger from this source is very small, although when a fuse does blow it is a matter of several minutes to replace it. Experience has shown that the majority of grade-crossing accidents to street cars are the result of carelessness on the part of the conductor and gateman, or inability to see trains on account of fog and smoke. For such there is absolutely no preventative except more care on the part of conductors. It makes little difference whether the car has any motive power or not at such times. If anything, electric motors without any horses are the best at such times, because there is a possibility of turning on enough current to get out of the way. After all, as was said before, the best preventative for these accidents is care in ascertaining that there is no train approaching that will be on the crossing until the electric car can get across, even should there be an accident to its motive power. There should be a rigid discipline maintained among conductors and motormen in regard to this.

## WHAT STREET RAILWAYS CAN LEARN FROM STEAM RAILROADS.

1.

Many are the lessons that street railways have yet to learn from steam roads. Even former steam railroad men who join the street railway ranks seem to forget some things that their previous experience has taught them. The system of terminal switching put in operation on the Chicago City Railway cable lines recently, is

to D, stops, hitches on with a rope to the trailer or trailers at E and pulls them over to its own track by means of the cross over which is made for trailers only and is not provided with a slot. Before the grip car has stopped, but while both grip and trailer are running by momentum, the grip car is slackened in speed enough to loosen the rope which is unhitched from the trailer and dropped. As the grip is still moving the rope is stretched out straight alongside the track so that it can not be tangled or run over. When the next train comes along

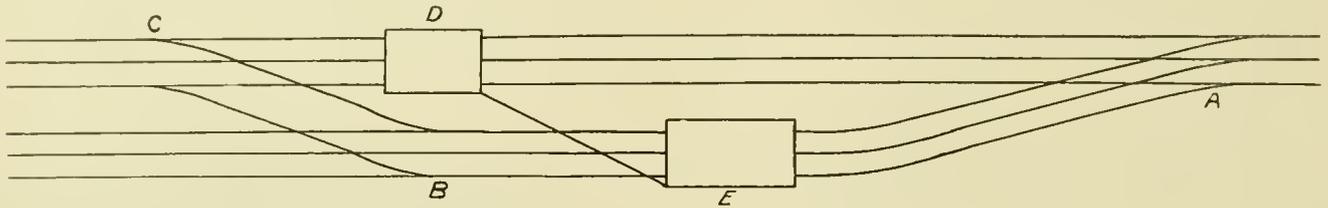

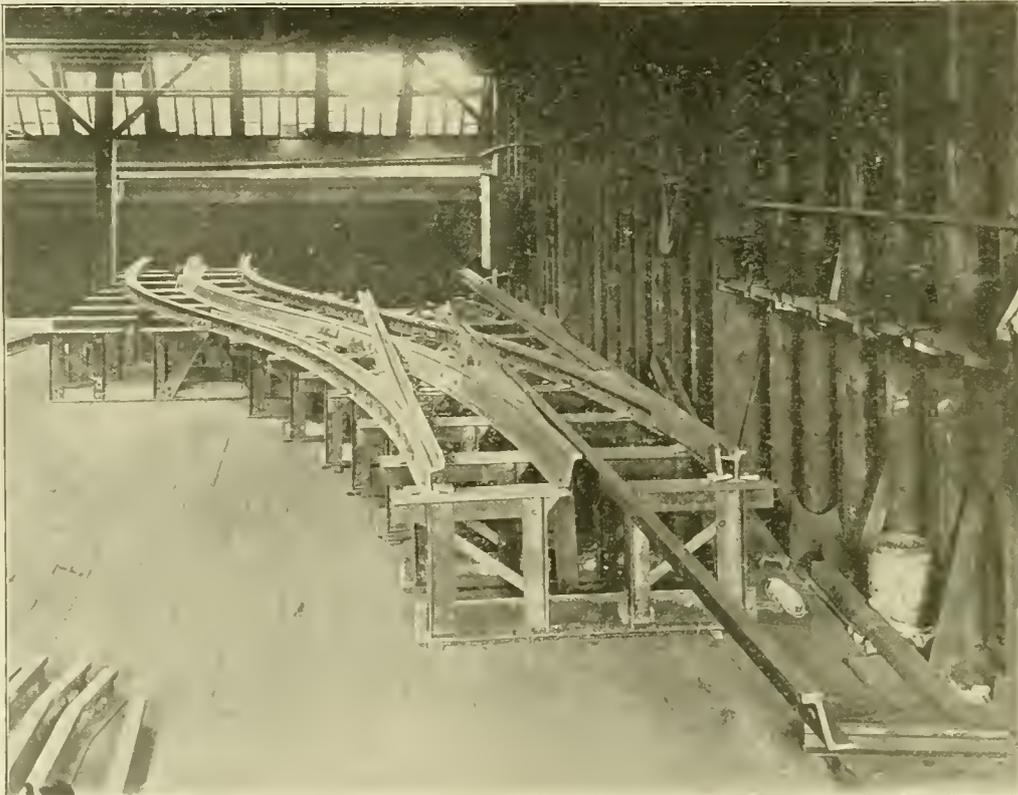

FIGURE 1— SWITCHES AT SEVENTY-FIRST STREET AND COTTAGE GROVE AVENUE, CHICAGO.

simply a method used for many years on steam roads. Figure 1 is the plan of the switches at the terminus of the Cottage Grove avenue cable line at Seventy-first street, which is the last one installed. The operation is as follows:

A train arrives at E and the grip car is uncoupled. The grip car is then run across to a point beyond the run off at A. Its momentum is sufficient to carry it over the switch after it has dropped the cable on one track, and when it has passed the run off A on the other rack it can again pick up the cable. It then runs back

the conductor drops off, picks up the rope and gets it ready to hitch across between the cars while the grip car is switching. On this road the saving is great as the switching was formerly done by horses. It also has some very marked advantages over common methods on electric roads.

An old steam road, man who is now superintendent of an electric road, was shown the plan recently and felt like kicking himself over several counties for not having used it before in switching trailers on his road. He had been using the method for twenty years on steam roads but

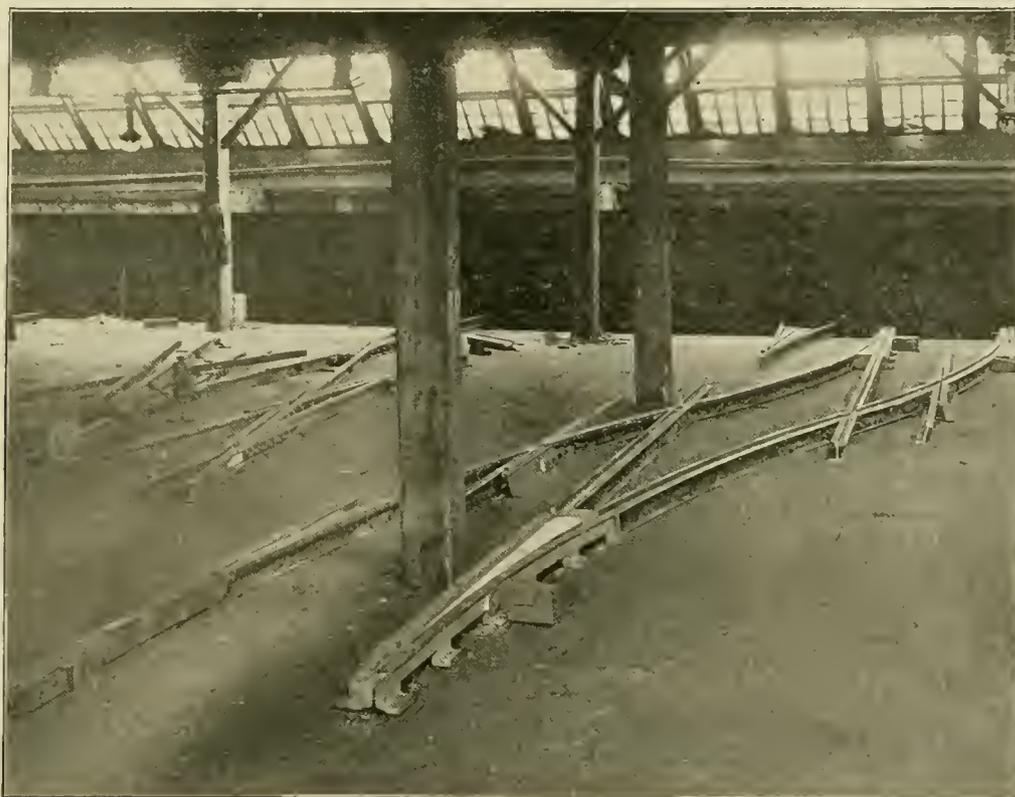

GRIP SWITCH.

had fallen into the old street railroad rut when he took charge of an electric road. Not only does the method save time but it saves a great deal of wear and tear on switches, men and overhead work. By the common method of backing up the motor car to hitch to a trailer the trolley has to be turned three times where once suffices with the plan under discussion. Then again, three overhead switches are necessary with the common method and only one with this. In fact that single overhead switch is not a necessity, as the motor car is alone and will run through by momentum. The fact that the rope method eliminates the running over with current on of

weight on it while it is being thrown and consequently there is little wear.

For an electric road the most advantageous arrangement would probably be to put a run-off at A, a spring tongue switch, held normally for the cross-over at B and a run-off at C. The switch point at B should be on the outer rail to insure minimum wear.

THE Knoxville Electric Railway Company, Knoxville, Tenn., has turned a 14-foot car out of its shops. It does not intend to build its own cars, but was just seeing what could be done.

TRAILER SWITCH.

four overhead switches (twice for each one) is enough to recommend it without any further consideration.

We show herewith two engravings of the special work spoken of, as it appeared when being laid out on the floors at the Paige Iron Works. The yokes are made entirely of steel angle bars. The switch tongues are steel in castings faced with steel. At A is a run off but the slot at A is provided with a switch which springs itself so that it is always set for the main line. The spring of the slot rail accomplishes this so that it is perfectly automatic. The trailer switch at B is set by a spring for the crossover, so that the trainmen never have to bother with throwing switches. At C is a spring point switch which is held normally in position for the main line. As the trailers come onto the main line from the cross-over they open this switch against the spring but as the point is on the inside of the curve there is no

#### JAPANESE ELECTRICAL PAPER.

Electricians in Japan have a technical paper called "The Electrical Friend," which also circulates in China. It looks interesting, so our electrical editor says, but he has a short circuit on his Japanese, and cannot read the articles. The title page occupies what with us is the outside back cover, and the matter begins at the north-east corner and reads down and to the left. We are indebted to our friend, S. Katogi, Tokio, Japan, for a copy of this publication.

THE Union Street Railway Company, New Bedford, Mass., has passed into new hands. The officers are: Henry Crapo, president; Frank S. Stevens, vice-president; Charles F. Shaw, clerk and treasurer; E. E. Potter, general superintendent.

PERSONAL INJURY ACCIDENTS—THE MANAGEMENT OF EMPLOYEES, WITH REFERENCE THERETO.

BY A SUPERINTENDENT.

With the increase in street car traffic during the past few years the number of personal injury accidents has increased so largely, and the amount paid annually to settle the same assumed such enormous proportions that street car companies feel no little uneasiness in regard to this uncertain quantity. This naturally leads managers to seek the cause of the trouble, to obviate it if possible, or, at least, find some remedy by which it may be reduced to a minimum. In seeking this remedy we can come to but one point for consideration which offers any hope for relief, viz: the management of employes with reference to preventing personal injury accidents.

The writer of this article is the manager of the street car system in a town of some 50,000 inhabitants, which during the year ending September 1, 1894, carried nearly 5,000,000 passengers without either incurring one cent liability for any personal injury nor paying one cent for the same purpose. The policy pursued to attain this result is given below.

In looking over the record of various roads we find the per cent of accidents to the number of passengers carried, varies so largely that we are obliged to look beyond the natural and geographical conditions of the road for the cause of this difference. These may and will cause some variance, but we are firmly convinced that the main reason lies in the difference in training and discipline which different roads give their employes with reference to this branch of the business. It has been the writer's observation that on many roads it is a branch to which no attention whatever is paid until the accident occurs, managers simply taking their "accidental" pill as something that must be swallowed, and sit down resignedly to take it, consoling themselves as far as possible with the thought that it could not have been averted.

Too often the manager thinks it a useless task to spend his time teaching his employes the importance of being careful in this respect, because he can see no immediate financial return, except in an abstract way. Yet if he pause to consider the matter, how can he bring greater returns to his company than by eliminating these ghostly shadows, "damage suits," which hover over us by day and by night, threatening our very existence. If a motorman is hired he is put through a course of training in the shop to learn the various parts of a motor, etc., or a conductor is put on the road to learn the streets, but is one word said to him to show how a serious damage case may result from some trivial mismove on his part? He is "green" and does not understand the importance of this matter unless it is impressed upon his mind.

In many instances the entire control of employes is left to some foreman, a well-meaning and hard-working individual, yet who has no power of perception and who

cannot read human nature. His one object is to keep his cars running, and beyond this he cannot see. Though he tries to have discipline, and goes after his men sledge-hammer fashion, yet they soon learn his true caliber; and watch them as he may, they take advantage of him at every turn. The writer knows of cases where this state of affairs does exist—where accidents and breakdowns continually take place—and still the manager, seeking the cause, cannot see that it lies in the fact that there is something radically wrong with his system, and no one cares to tell him. If anyone did he would probably receive no thanks.

On another road, where the accident expense is something enormous, the writer has seen employes visit saloons while on duty; also a motorman and a conductor sparring on the front platform of their car while it was in motion. Is it any wonder this road's accident bill is large?

I hold that an employe should be studied, like a piece of machinery, in all its different phases; his weak places discovered, and quietly corrected. It is the only way to discover whatever merit he may possess, and to do this he must be watched while on duty and off.

The writer passes on all persons who are applicants for positions on his road, devoting a certain amount of time each day to this purpose. A glance, by experience, tells whether the applicant is a desirable quantity. If not, he is informed that there is no use for his services. On the contrary, if he seems likely he is given a blank to fill out, stating name, age, etc. His record is looked up, and nothing derogatory being found, when an opening occurs he is sent for and put to work.

His name is then entered, together with other data, in a book kept for that purpose, and all further breaches of discipline are duly recorded here also.

Politics and "influence" are allowed to cut no figure in appointments if the applicant does not give promise of being a success. Above all things, relatives and friends are shunned (especially the former) in making appointments. Nothing does more to make a set of men dissatisfied than to have appointments and promotions given to some friend or relative of the manager, and nothing is more conducive to their contentment than to make promotions from the ranks.

Again, one should know how his subordinates conduct themselves while off duty, as well as on—in short, to be successful in the matter in question, it is absolutely essential. A man cannot be out all night and do his work in the day satisfactorily. The writer has a system of espionage so complete in its details that it brings reports from all questionable resorts and many saloons as to the actions of employes while off duty. When a man visits these places a report is received, showing the amount of time, money, etc., spent there. If he goes to a certain limit he is called to the office and questioned in regard to his conduct. If he denies his conduct he is led on with his denials till he has entangled himself, when he is shown a record of his actions so complete in its details that it bewilders him.

The chances are that in the future he will never do anything but tell the truth. By pursuing this method the "bumming" element will be soon gotten rid of.

Ordinarily, the making of an absolute rule is unadvisable, as circumstances may arise under which it is best to make an exception to most any rule; whereas, if an inflexible rule has been given it is impossible to do this. Again, a rule should not be accompanied by a threat of dismissal. A statement of the simple order should be effective. Attaching the threat of dismissal for disobedience is not only superfluous, but it causes a feeling of animosity in the subordinate, which is undesirable.

The writer has in his possession a book of rules issued by a certain road, to conductors, which contains thirty rules, in which the word "must" (frequently with the words "under penalty of dismissal") occurs thirty-six times.

A man sometimes becomes embroiled in an affair which would seem to warrant dismissal, but which may be overlooked, especially if he gives promise of becoming a valuable man with proper training. A case is called to mind when three young employes became intoxicated. Two of them were dismissed, while the third was retained, although all were guilty of the same offense. But the third was considered capable of becoming a skilful operative, and time has proved that no mistake was made. He was shown the mistake he was making and laid off for a time, when he was allowed to resume his position on two conditions:

1st. He was to drink no more.

2d. He was to put a certain amount of money in the bank each pay day. This amount was enough to take nearly all his wages outside of his expenses.

This happened some time ago, but the conditions have been faithfully carried out, and to-day there is no more faithful and attentive man to be found than this man.

The object of this was not so much a humanitarian one as it was this:

1st. If a man once gets started to saving money it is human nature for him to be anxious to get more. This makes him extremely careful to do well, that he may hold his position.

2d. If you have not misjudged your man he will prove a man on whom you can depend in every emergency.

The too frequent changing of men is the cause of many accidents. Unless some serious fault has happened it is not policy to displace a man. A proper course of discipline will have the desired effect. If you discharge him you must take a green man in his place, and you have no assurance the new man will be any improvement on the old, and you have simply got to go through a course of education with him to make him proficient. In writing the above I do not mean to say that discipline should be relaxed—on the contrary, it cannot be too strict—yet discipline can be enforced without brutality, and is far more effective than if enforced with it.

Men should be made to feel that a rule is a rule, and

as such is not to be violated, but at the same time he should feel the justice of any penalty inflicted for its violation. I have no patience with men of that ilk, which is constantly stirring up dissension, and the sooner it is gotten rid of the better. Fortunately there are comparatively few of them. Ordinarily men are men; to command their respect and sympathy is essential to success; their enmity is fatal. The service requires men of a higher degree of intelligence than in the days of "horse power," and it requires a higher degree of skill and tact to handle them. The model road is like a well balanced piece of machinery, where each part does its work well and without friction; but the best engine requires constant attention.

The writer devotes a certain portion of each day to riding over the different lines, always having in mind to caution operatives about accidents, showing them how some careless act on their part may lead to serious and costly results; how serious and how costly only those interested know. A notice is posted the first of each month and allowed to remain one week, calling attention to the liability of accidents and cautioning all employes to be careful.

Men are taught to be careful in small things. For instance, a supply of blacking is kept in their room that they may keep their shoes shined, and a box of metal polish is always there to keep buttons and badges bright. If they are required to be careful in small things they will be in greater ones. Any dissatisfaction and dissension is always reported by certain trusted ones. A reading room is furnished for the use of all employes, in which some leading papers and magazines are kept on file, all of which tends to attract a better class of men and make the position more desirable.

This in the main embodies the writer's system for avoiding accidents. To develop a system of espionage which has its ramifications throughout the city, including systematic reports from so many sources, involves a large amount of study and deeply laid plans. How it is to be done each manager must decide for himself.

Does the end justify the means? I know that many managers disagree with me on this point, holding that if a man does his work fairly well his time while off duty is his own. I grant it. But when a man transgresses the limit to such an extent that he cannot give you his best efforts, then it is time for the employer to assert himself. It is useless to think there is no dissipation among our employes. There is bound to be some in any body of men, although the extent to which it exists differs largely on different roads. Many managers, I imagine, would be surprised if they but knew the extent to which it existed on their roads. Many a serious trouble could have been averted had it been known in its incipency. To know these things requires continued vigilance. That I am right I am firmly convinced, and to substantiate what I say I mention the record of the above road: also the fact that with the accident insurance company which carried the same road (probably the strongest accident insurance company in the United States) it had the best

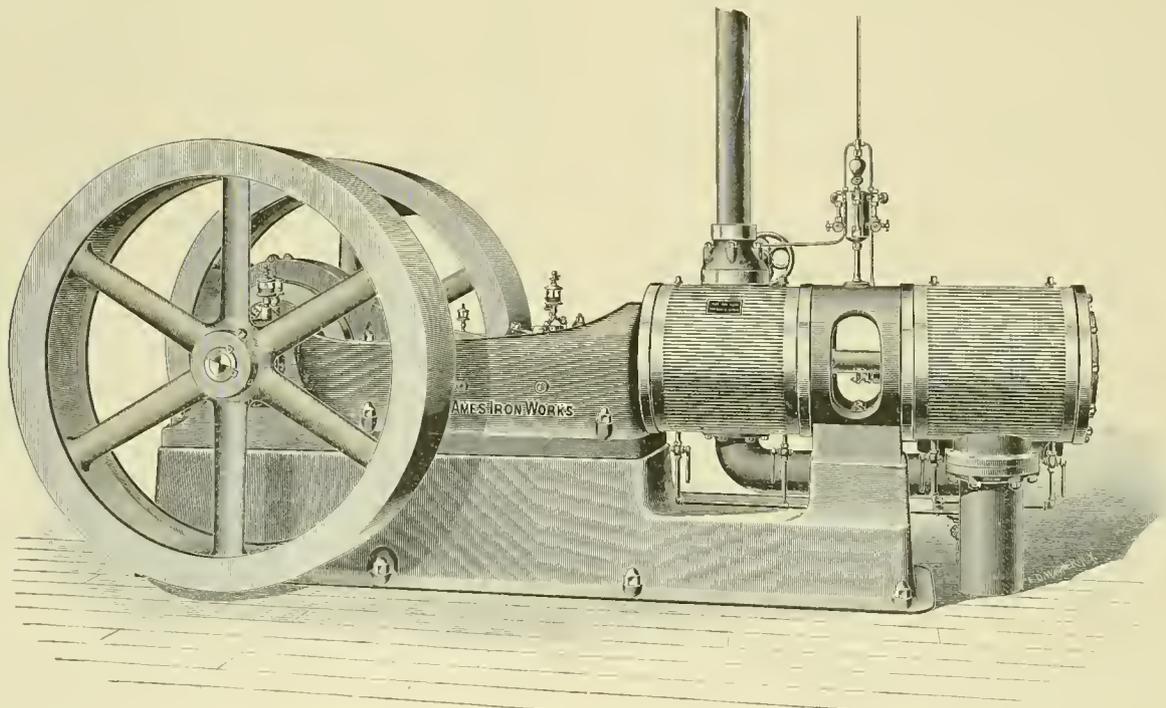

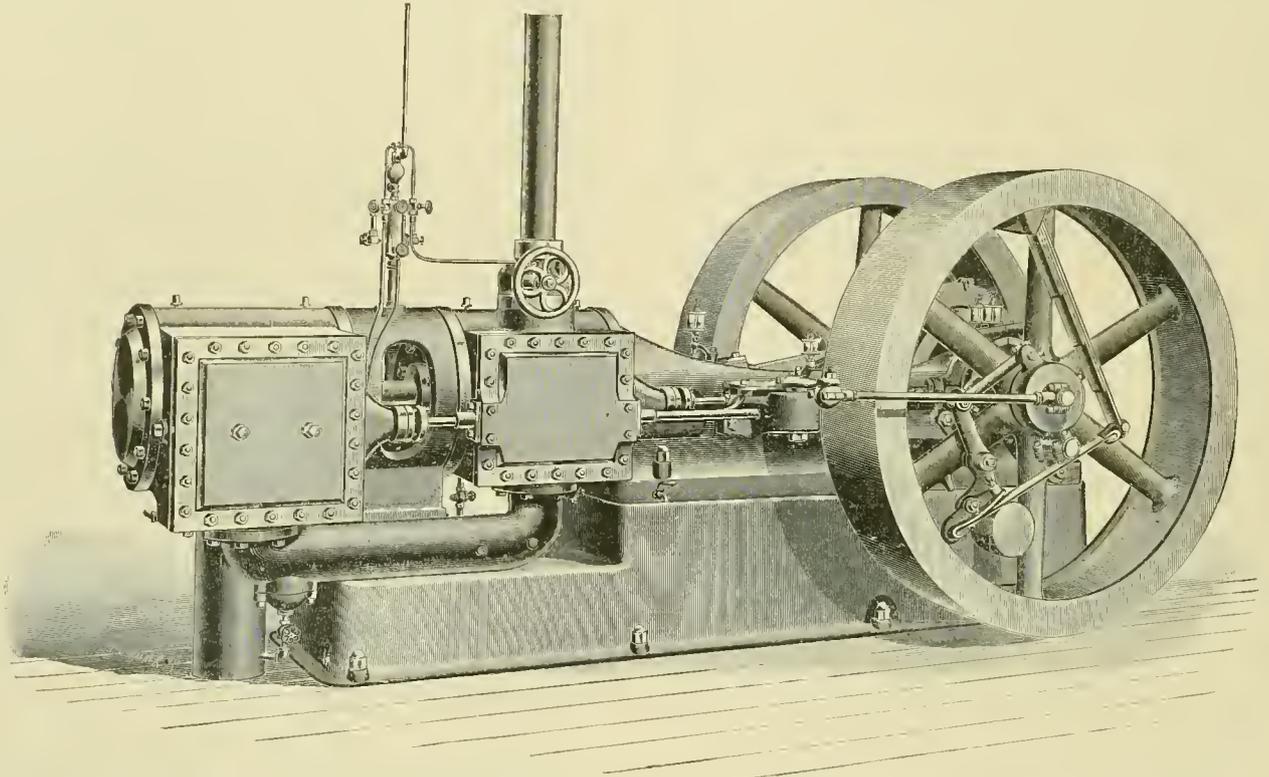

record of any road on its list for not having accidents, and the list is a long one.

NOTE—The amount paid for property damages by the above road, for the year ending September 1, 1894, was \$89.10, of which \$35 was attorneys' fees.

### NEW TANDEM COMPOUND ENGINE.

Among the latest engines is the new tandem compound, of the Ames Iron Works, Oswego, N. Y., which

was designed by E. J. Armstrong, superintendent of the company. It is a high speed engine, in which the high pressure cylinder is placed next to the frame in such a manner that the piston and rod can be removed in the same way and nearly as easily as in a simple engine. The two intermediate cylinder heads pass out through the low cylinder. It is said that the advantage of this construction, is that the exhaust pipe is brought out of the way so that the sub-base extends way back, thereby giving sub-

NEW TANDEM COMPOUND ENGINE.

stantial support to the low pressure cylinder. A novel feature in this engine is that cut-offs are on both cylinders, each driven by a separate eccentric, but controlled by one governor. The eccentric which drives the low pressure valve is shifted to a less degree than the one that drives the high pressure valve, so that while the latter is shifted through a range of from 0 to  $\frac{3}{4}$  cut-off, the low pressure changes from  $\frac{3}{8}$  to  $\frac{1}{2}$  cut-off. The link connecting the low pressure eccentric with the governor, has several adjustments, by which the low pressure cut-off may be made to vary, thereby securing best results under any conditions.

The engine is well constructed in all its parts. The packing is all metallic, and the packing of piston rods is such that leaks can only be from one cylinder to the other. One side of the engine is so arranged that it can be direct coupled to dynamos. All valve motions are on the other side, which is made in four different ratios of cylinder areas, and in sizes from 75 to 500-horsepower.

The pronounced success of the former products of the Ames Iron Works is ample guarantee that this, their latest and best, cannot fail to meet with a wide demand. Good materials; good workmen; and good ideas, the result of long experience and careful study, all combine to make the Ames engines serviceable, durable, and satisfactory.

---

#### FAR OR NEAR STOPS.

---

To stop on the far side, or near side of street crossings is a problem that has been solved for some companies by municipal authorities. There are arguments in favor of both methods, but some companies, which have been stopping on near crossings, have changed to the old style of stopping on the far side of streets. The chief objection to the near stop is, that passengers are compelled to alight in the mud when the streets are wet, while when the stop is on the far side, a clean crossing is secured on which they can stand.

A. W. Dingman, secretary and manager of the Toronto & Scarboro Electric Railway, Light and Power Company (Limited), Toronto, Canada, writes: "The Toronto Railway Company has adopted the plan of stopping at the nearest side of the street crossing. While in theory it appeared to be a great advantage over the previous arrangement, yet in practice it is developing an unthought of disadvantage, the result of which is, we may all die of pneumonia. The result has been to transform the front end of the car into the rear end, so far as the ingress and egress of the passengers is concerned. The front end of car, being the nearest to the passengers in waiting at the crossing, is almost invariably utilized for entrance and exit. In warm climates, this would not matter, but in these Northern cities in winter time, the result of such a practice cannot be otherwise than disastrous to the health of many of the patrons of the street car. This is the only objection so far developed, but it is a very serious one, and unless the street car companies are compelled to stop

all access to the cars by way of the front door, more harm than good will result from the change."

The Toronto Street Railway Company has had the system of near stops in practice for two months, and there have been no reasons for rescinding the order. It has proved decidedly that it lessens the number of accidents. The change was advertised thoroughly for a week before it went into effect, and there was little trouble after the first day. When the car stops on the first crossing, it gives teams time and warning to clear the way.

Philadelphia uses both systems of stopping. Where cars cross the tracks of other companies, stops are made at the near side of the street, but in other places some companies use one, and others the other style.

Charles O. Kruger, secretary of the People's Traction Company, says his company would prefer to stop cars on the far side of the street, but in order to harmonize with the desire of the Philadelphia Traction Company, decided to stop on the near side.

D. W. Dickson, treasurer of the Philadelphia Traction Company, says that the stopping of the cars of all the electric lines on the near side of crossings, lessens the liability of collisions.

Isaac Blum, vice-president and general manager of the Hestonville, Mantua & Fairmount Passenger Railroad Company, writes that the plan of stopping at the near side of street crossings seems to be appreciated by the public, which is in favor of the plan.

Frank Brown, president of the Baltimore Traction Company, Baltimore, Md., writes that the street railways of Baltimore are required by city ordinance to stop at the near side of the crossings. He also says that the system seems to work well with his company.

J. F. Heyward, general manager of the City & Suburban Railway Company, Baltimore, says: "The arrangement, in our opinion, has many arguments pro and con. I am rather inclined to think, however, that it is a fairly good arrangement. Of course at times it is disagreeable for the traveling public, say in cases where the streets are in a slushy, or muddy condition. I might add, that when we are stopping at the intersecting streets, on which the travel is not very great, we frequently throw the platforms of car to crossing, but, of course, this cannot be done on the main thoroughfares."

---

#### SKATING RINK AT DUBUQUE, IOWA.

---

President J. H. Rhomberg of the Dubuque Street Railway, writes us of a plan to turn the street railway ball park into a skating rink this winter. The ground is of the right shape and when cold weather sets in the surface of the ground will be saturated with water from the water company's mains. This will freeze so that it will make a good reservoir for the water that will subsequently be let in. When finished the rink will be 300 feet across.

---

F. S. Falling has been made manager of the Oswego Street Railway Company.

## A QUERY AS TO OPERATING EXPENSES.

EDITOR REVIEW:—In your issue of October 15, you give figures from the superintendent of an electric road, which show that he has reduced his operating expenses to the extremely low figure of seven cents per car mile. I know I shall be pardoned if I ask a few questions relative to this statement, as I am particularly interested in the cost of operating electric roads.

First. Cannot the cost per car mile be reduced to a still lower point by the addition to the service of more cars?

Second. Does a low expense per car mile always show that a road is being economically managed?

Third. If this particular road can economically operate for seven cents per car mile, why should its operating expenses be about 70 per cent of the gross earnings for the year ending June 30, 1893. (Verification may be had of this in "American Street Railway Investments.")

As 70 per cent of the gross earnings is about the average operating expense of a large number of roads which have come under my notice, we have the following paradox in the case of the road we are considering: An exceptionally low cost of operation per car mile has produced no beneficial results.

Therefore: It occurs to me that the expense per car mile may be reduced by the simple introduction of additional cars to the service; but that the introduction of these cars will be an economical proceeding is an entirely different matter. I do not write this as a criticism on the road in question, but simply to place this matter before the minds of thinking railroad men, that I may know if I am correct.

G. E. T.

In answer to the first question, it may be laid down as a general rule that the larger a road's business the less its expenses per car mile. For example, we can conceive of conditions under which a road might be able to double the number of cars in service without increasing its office or power house force. There might also be several other items that would remain the same if the number of cars in service were doubled, and hence there would be a decrease in the expense per car mile. If a road is working up to its full capacity in all departments, any increase in the number of cars will result in a very nearly proportional increase in the total operating expense, and consequently the car mile expense will remain the same. It very often happens that a road is operating a power station much below its maximum capacity, and in such case the cost of power per car mile is decreased by adding cars. It is also true that it would decrease the car mile expense to run the same number of cars from the time of starting in the morning until shutting down at night, but such a procedure would, evidently, not be a paying one on any but small roads.

This brings us to the second question. A low car mile expense shows that the road is being economically managed, as far as the simple movement of cars over the road is concerned, but it gives no clue as to whether a

manager is giving a more frequent service than the traffic warrants. The operating expenses are entirely separate and independent of the earnings. A road could be operated very economically without carrying any passengers whatever. The frequency of the service that a road should give its patrons is a perplexing question, and one on which the manager has no other guide than his judgment. The more people that can be carried with a given number of cars, the greater will be the earnings of a road relative to its expenses. But right here comes in the consideration of inducing traffic. A road might make money for a short time by crowding its passengers into as few cars as possible but there are very few that could afford to do so long. A frequent service induces travel, and it is for this reason that it is an almost universal custom for street railways to give a somewhat better service than the traffic calls for. This policy is not the most economical one for the time being, but it builds up a business, and pays in the long run. As to how much better the service should be than is demanded by the traffic, is a local matter, left entirely to the judgment of the manager, as was said before. We do not think any manager would be guilty of running a lot of extra cars, just for the sake of cutting down car mile expense!

In answer to the third question, it is necessary to ask another. What condition would the road be in if the operating expenses were not as low as they are? It is not fair to apply data obtained from other roads to a particular road without making sure that the conditions are the same. If the low operating expenses have produced no beneficial results on the road in question, let it be considered for a minute what would be the effect if they were higher. It is not within our province to inquire into the frequency of the service given on this road, because that is a matter dependent on local conditions, with which we are not acquainted; but with the same service that is given now, an increase of four cents a car mile would turn the road into a money loser, and its expenses would still be less than many other roads of its size. A decrease in the number of cars might increase the expense per car mile slightly, but it will not do to jump at the conclusion that the operating expenses per car mile depend entirely on the number of cars run, or that low operating expenses per car mile are not a benefit worth striving for.

To sum up, we may say that the car mile expense may in some cases be slightly reduced by adding more cars to the service. This is not necessarily so in all cases. Whether this move is good economy depends entirely on outside circumstances, which have nothing to do with the operating expenses, just as the cost of manufacturing goods is independent of the demand for them.

EDITORS STREET RAILWAY REVIEW.

P. H. Carey, western agent of the Phoenix Iron Works, Meadville, Pa., was called east on account of the serious illness of his sister. His many friends in the street railway field will be grieved to know that death occurred before his arrival.

## EXPLOSION IN ELWOOD, IND.

On the night of November 16 the boiler of the Elwood Electric Street Railway Company, Elwood, Ind., exploded, wrecking the plant, together with car house and all the cars of the company. The loss is about \$20,000. The electric light plant will be duplicated, but nothing will be done with the street railway system until spring.

The exact cause of the explosion is not known, perhaps it never will be known, for the engineer is dead. A man who was in the boiler house a few minutes before the explosion occurred is positive that the gages showed plenty of water in the boilers. The force of the explosion was so great that a large section of the boiler was blown quite a distance. Although only one explosion was heard, the other boiler was twisted out of shape.

It was soon after midnight when Frank McDonald left Norman Clark, the engineer, to go to the car house. He

## SURELY OUGHT TO BE ABLE TO CONTROL HIS HALF.

R. D. Rowe, late superintendent of the South Chicago City Railway Company, had a caller recently who introduced to him a novel proposition. In connection with the Calumet road a target tender is employed. For some reason or other the visitor, who was under the influence of liquor, had a grievance against the target man, and asked for his discharge.

"Shay," said he, "are you shupertenant?"

"Yes, sir," replied Mr. Rowe.

"I wantsh that target man bounced."

"He is a joint man employed by both companies, and I have no power to discharge him," said Mr. Rowe.

"Cantsh you reprimand him?"

"No, he's a joint man and I can't even reprimand him."

"I sh'd think you could reprimand your half," said the kicker as he left the office.

"ALL TWISTED OUT OF SHAPE."

had got down into the pit, under a car, when the explosion came, and the roof of the car house fell on the four cars beneath it. McDonald climbed hurriedly from in under the car, which was crushed by the falling bricks and beams, receiving some slight injuries. The ruins caught fire, which was soon extinguished by the firemen who were early on the scene. A rescuing party discovered the engineer near a dynamo with an oil can in his hand. He was unconscious, and his body was frightfully burned and scalded. He survived only a short time. The illustrations give some idea of the destruction that was caused.

## HAS COME AT LAST.

Even the inoffensive trolley car has not been spared by the playwrights. "The Trolley System" has been on the Pennsylvania circuit. It is said to be a new farcical comedy in four acts, in which "there is more dialogue than is usual with entertainments of this class. Each act is staged with special scenery, which fills an entire car."

Mr. Rowe is still undecided which half to reprimand and wants advice.

## NEW ELECTRIC LINE IN DUBLIN.

Under the direction of J. Clifton Robinson, C. E., managing director of the South Dublin line, and electrical tramway expert to the Bristol and London United Companies, \$600,000 is being used in the construction of an electric railway, to take the place of the horse line. It will have eight miles of double track, 76-pound rails, laid in concrete. The contract requires the completion of the line by May 1, 1895, and it is being rapidly pushed. Trains will consist of two cars, the trailer being drawn by horses in the city, where no electrical provision has been made. It is said the rails will be double-tracked for the whole of the distance, thus largely avoiding something approaching the feeling of sea-sickness, which passengers traveling in trams over badly made lines not unfrequently experience. This is a strange comment to American ears. Cars will be run under headway of five minutes.

## OVERCROWDING CARS.

Every street railway manager and superintendent, probably, hears more complaints about overcrowded cars, than concerning any other branch of the service. In spite of the discomfort of standing it seems to be a trait of humanity to crowd into the first car that comes along, regardless of the fact that within a minute or two another car will arrive with empty seats. People rather enjoy standing and hanging on the straps, when they have become accustomed to it, for it does not take them long to get in that condition where they would just as leave stand as be seated. Still managers had rather see their patrons comfortable than discommoded.

Until human nature is changed there will probably be crowded cars in the large cities. The Broadway and Third avenue cable lines, New York, show this trait of human nature. During the rush hours cars follow each other so closely that in many cases there are two in each block.

"TAKE THE NEXT CAR."

Often the first car will be crowded, while the second will be practically empty, yet the conductor of the first car cannot keep people from hanging on.

Last month the Montreal Street Railway Company, Montreal, was fined \$1 and costs in each of two cases, for violating an ordinance fixing a penalty for receiving more passengers than cars would comfortably hold. The ordinance is a relic of horse car days, when the number of passengers each car could hold was posted. This was made necessary on account of the grades. Now that electricity has been adopted, there is no reason for such a law, and it should have been repealed. At any rate it is not being enforced, for a day or so after the fine was imposed, the official whose duty it was to prevent overcrowding was directed by his superiors to desist.

T. B. Warren, editor of the "Patriot," heard complaints of overcrowding, so he informed the officer whose duty it was to enforce the ordinance, that it was being disregarded. The latter did his duty. Mr. Warren would have a law passed under which a would be passenger who persists in pushing his way into a filled car, could be turned over to the first policeman and arrested for trespass. Mr. Warren would go farther and have the conductor arrested who permitted his car to become crowded.

Granville C. Cunningham, manager of the company and city engineer, writes, "The company does not wish

to have the cars overcrowded, but it seems to be impossible by ordinary means to prevent people from forcing their way in, whenever they can obtain a foothold, struggling and pushing often in a most discourteous fashion. What is the conductor to do? Is it to be expected that he should beat these men off with a club, or take them by the collar and jerk them off into the street? If he tells them to take the next car he is only "chaffed" in return. If on the company is to be thrown the onus of keeping the people off the cars, we will have to engage and train sluggers and bullies, who will fight on the smallest provocation and not hesitate to throw men into the street when they force their way on to a crowded car. Extra cars do not meet the requirements, as everyone wishes to get on the first car and will not wait for the next, which is only half filled. The Paris system, where every passenger has to wait at a street corner and get from the man in charge a number before he can enter a car, and the car has to wait until the passengers are counted like so many sheep before they get their places, will not suit the people of Montreal, who have to hurry sometimes, and the Paris plan does not contemplate such a state of affairs.

"The simplest means of all for preventing overcrowding is for the citizens themselves not to overcrowd the cars. There is not another city in Canada, nor in the United States where there is any regulation that punishes a street railway company because the citizens crowd its cars."

## GIVE ME A MATCH.

A horse car conductor was transferred on to an electric line in Chicago the other day, and as darkness approached walked proudly over to the lamp switch to turn on the electric light, congratulating himself, meanwhile, that "things were not as they once were" and that his days of lighting lamps with matches were over. The car floor was wet and he managed to get his fingers on a live spot of the lamp circuit in some way, so that when he tried to turn on the lights he got a good hard shock. After he had jumped half way across the car, and began to realize what had happened, he looked around in a confused way and exclaimed: "Give me a match." He had no further use for the modern way of doing things.

Another man on the same road, who was fortunate enough to get an electric run, was accosted by a fellow employe late one afternoon and asked where his lamps were. The car was several miles from the barn and darkness was fast coming on. "By George," said the dismayed conductor, "I've come off and forgot my lamps." A few minutes later the motorman turned on the light, and the conductor collapsed.

Sanford, Brooks & Bonsal have received the contract for constructing the double track electric road connecting Pittsburg with McKeesport, with a branch to Homestead.

## SIMPLE TICKET RECORDS.

For six months the Santa Cruz, Garfield Park & Capitola Electric Railway Company, Santa Cruz, Cal., has had in operation a coupon system. The coupons are similar to those in use on other roads, but Manager F. W. Ely has a simple and accurate system of keeping an account. Each person receiving a book is given a permanent number, and when another book is given him 100 is added to his individual number. It has been objected that in cases where a large number of free passes are issued, the hundreds might be so high as to require four or five figures, which would be likely to be

on the back over his own signature the man's name. For employes, books with a less number of coupons can be issued without numbers, thus keeping numbers for the 'free list.' The coupon books issued by our company for the 'free' are the same size and color as the commutation book tickets (25 rides for \$1), so that none except the conductor knows who is riding 'free,' and the conductor is compelled to account for every passenger in his car. We have found this system very satisfactory."

The conductor's daily report blank used by the company has a place for the number of motorman and conductor and for the conductor's punch. Each trip must be reported, showing time, number of trip, car number, miles, fares, transfers, passes. On the reverse must be placed a list of persons passed, or their numbers and the time. There is also a summary for car miles, passes, city employes, commutation, school, and transfer tickets collected. Cash fares, total passengers, and a blank for cashier's signature for cash fares received. The daily report of the cashier is shown herewith.

The Columbus, O., Street Railway Company has adopted a simple method of keeping track of ticket sales. Two styles of tickets are used, the conductor starting with \$5 worth of one kind and \$6 worth of the other, which are charged against him. Instead of turning in an account of sales at the end of the day, the money from the sale of tickets is used in purchasing other tickets, simplifying accounts and preventing errors.

## OBSTRUCTION NUISANCE SUPPRESSED AT TROY.

The Troy City Railway recently had a little trouble with some people who seemed bent on causing the public as much inconvenience as possible, but they were soon suppressed. A firm of boiler-makers, at Green Island, N. Y., had two boilers to move to the Troy waterworks pumping station at Lansingburg. Each boiler weighed about fourteen tons. The movers used the Troy City Railway tracks for about two miles. When about half-way with the first boiler one of the wheels of the heavy truck broke, and it was impossible to get a wheel that would take its place. While the wheel was being fixed there was a delay of about twenty-four hours. Moreover, the boiler, when on the truck, was dangerously near the trolley wire. When it came time to move the second boiler, Superintendent C. H. Smith of the City Railway notified the boiler people that they must not use the street railway tracks for that purpose, except between midnight and 5 o'clock in the morning. They replied that they would move it as they did the first one, whereat the railway obtained an injunction, which had the effect of keeping them off the track and compelling them to use other streets.

The Versailles Traction Company, which owns right of way from McKeesport, Pa., to Boston, four miles, has begun to run cars.

cumbersome. In regard to this point, Mr. Ely writes: "Assuming that a large company has 999 people entitled to a free ride, and issues books containing 50 or 100 rides. If A, who is number 3, receives a book of 100 rides, his second book will be No. 103, the third 203, and when he has received his No. 903, it will make ten books of 100 rides each. When he has received his book 1903, he will have had twenty books of 100 rides each. That is a good many rides and only four figures. Next year a letter can be added making the number 3a. The next person receiving a book would have No. 4, and the one who followed him would be No. 5. Should the manager or superintendent wish to send a man over the road for one trip, he can tear out coupons, endorse

MOTOR CAR AND TRAILER OF AN ELECTRIC CONDUIT ROAD—MADRAS, INDIA.

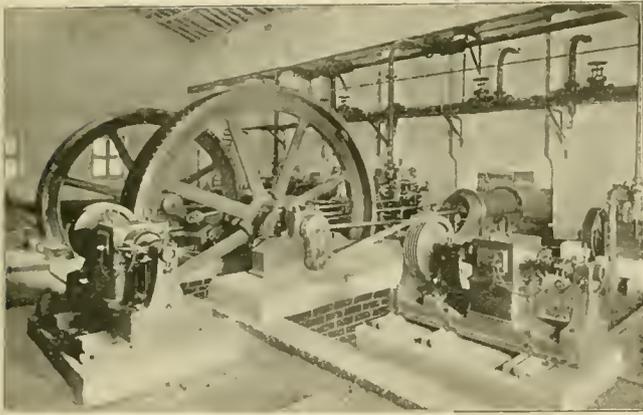

### THE MADRAS TRAMWAYS STARTED.

The slowness which usually marks the movements of affairs in tropical countries does not seem to characterize our street railway brethren of Madras, India. It was only last January that the inaugural ceremonies of the construction of the Madras tramways took place. Engravings from photographs taken at the time were pre-

sented to our readers in March. It was not to be expected that work would advance very fast in a country where no similar work had been done, but the progress has been truly remarkable, as can be seen from the views presented herewith. In fact, it puts to shame the street railway work done in some hustling cities in northern climates. It will be remembered that this is a conduit road somewhat similar to that at Budapest. It was

CHARACTERISTIC SCENE—MADRAS, INDIA.

POWER HOUSE—MADRAS, INDIA.

designed by Thomas Parker, the well-known English electrical engineer, who was so prominently connected with the electric elevated road of Liverpool, the first commercial electric elevated road in the world.

The Madras road is unique in more respects than one. Indeed, it has lost so many of the usual characteristics of the electric road—as we in America know it—as to be scarcely recognizable. The peculiar cars, their still more peculiar inmates, and the absence of overhead trolley all combine to give the outfit a strange appearance to the ordinary electric railway man.

We are able this month to present a likeness of the leading spirit and managing director of the enterprise, S. A. Chalk. Mr. Chalk received his education at the Middle School, Chester, England. At fifteen he began to qualify as an accountant, and after seven years at Liverpool he took charge of the counting-house of one of the largest Australian companies in London. After two years of that he became partner in the firm of William Hutchinson & Co., the East Indian merchants, who obtained the concession for the Madras electric tramways. Mr. Chalk took a most active part in the gaining of the franchise.

S. A. CHALK.

His extensive business relations with that country and his frequent visits in connection with the firm's business give him a knowledge of India which is of great value to the company of which he is managing director. The new road has created the most intense curiosity and interest throughout India, and can hardly fail to be speedily followed by others. It deserves success and has already entered on a good business. Its future operation and development will be followed with interest by electricians and railway men, both here and abroad. The mechanical conditions for operation would seem to be very favorable, and the public are already educated to riding, so that modern facilities should combine to make the enterprise a very desirable one.

THE Hartford (Conn.) Street Railway Company, sells its old cars for \$8 each.

## USE OF ELEVATED STRUCTURE FOR A RETURN.

A most remarkable decision was recently made in Brooklyn regarding the use of an elevated railway structure as a conductor for an electric railway return circuit. The Atlantic Avenue Railroad has a contract with the Brooklyn Elevated Railroad, whereby the former is allowed to hang its electrical conductors on the structure. The elevated road began to take down the conductors on the ground that the wires had not been attached in accordance with the contract, because none had been placed for the return current, and the telephone and telegraph circuits on the structure were disturbed. An injunction was applied for by the surface road to prevent the taking down of the wires, but Judge Gaynor of the Supreme court refused to grant the injunction and made the following memorandum:

“By written agreement between the parties to this action the plaintiff is given the right ‘to attach to and place on and along’ the elevated railroad structure of the defendant ‘such number of electric wires and electric cables’ as the plaintiff may require in the operation of its surface railroad by electricity. The plaintiff has placed wires and cables along such structure to carry or transmit electric currents from its power-house so as to propel its cars, but instead of so placing their wires for the transmission of the currents back to the power-house, as to complete the necessary circuit to get electric energy, it uses the structure of the defendant as an electric conductor for that purpose. The contract gives no such right. It only gives the right to string along the structure wires and cables necessary to transmit the electric current. The contract is in no way obscure or doubtful. A circuit of the current being essential, the contract plainly is that the wires to complete such circuit may be attached to the defendant's structure. The motion is denied, with ‘no costs.’”

The peculiar thing about the decision is the fact that the interference due to the ground return has nothing to

POWER HOUSE—MADRAS, INDIA.

do with the stringing of cables under the structure, and that even if the return is not connected to the structure the disturbance would be as bad or worse. If the return current could be prevented from seeking the elevated structure the case would be different, but as it is the refusal of the injunction simply means that the law upholds the elevated company in taking out its spite against the surface road for disturbing its telegraph service. Connection of the return to the elevated structure rather diminishes than increases difficulties.

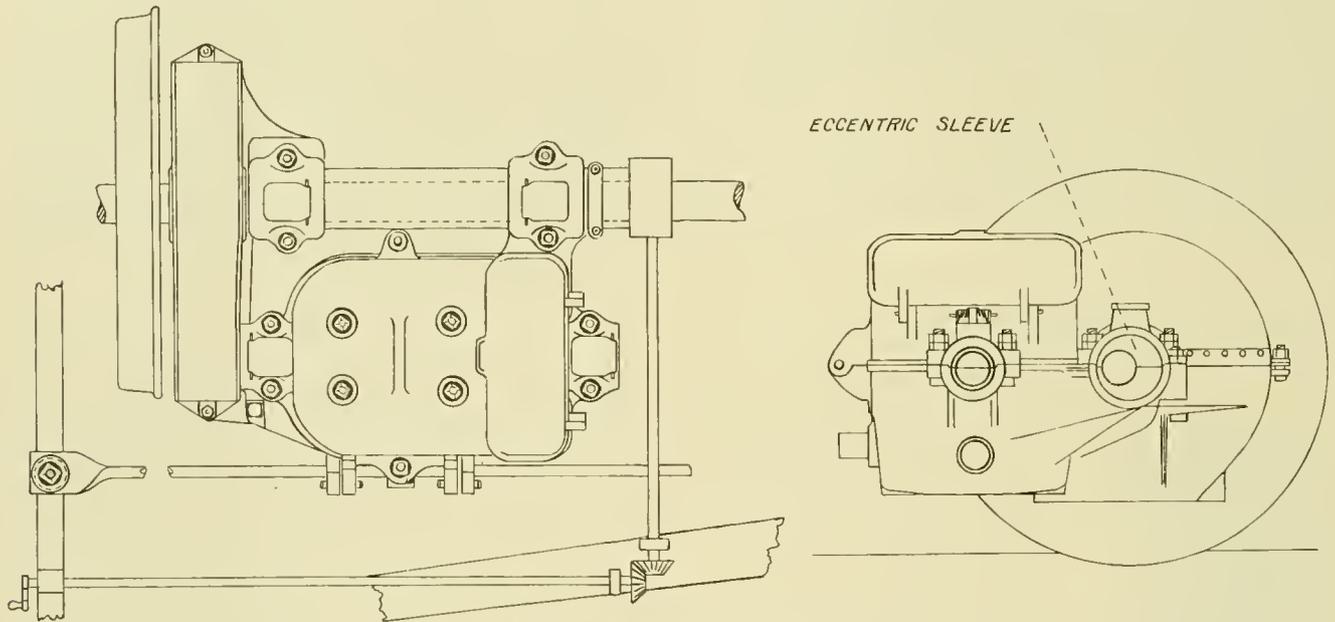

#### A DEVICE FOR MECHANICALLY DISCONNECTING MOTORS.

A problem of considerable importance has been confronting the three great street railway systems of Chicago ever since the reconstruction of the horse lines into

that considerably more power will be required than would be the case with an ordinary trailer, on account of the high speed motor armatures.

The problem of disconnecting the armature gearing so that the armatures will not revolve is apparently a very perplexing one, especially considering the fact that but a few seconds can be allowed in which to perform the operation. A very simple solution has however been found by J. R. Chapman, who has charge of the electrical department of the West and North Chicago Street Railroads. In fact, a man who has given the subject some unavailing thought and is shown Mr. Chapman's device, is reminded of Columbus and the egg: "It's easily done when you know how."

The car axle bearings of the motor are cast inside an eccentric brass sleeve, which extends the length of the axle. This sleeve is split and takes the place of the

CHAPMAN'S MOTOR DISCONNECTING DEVICE.

electric lines began. There are to be certain electric lines which run as feeders to the cable lines. That is they carry passengers to within a short distance of the heart of the city and then connect with the cable. It is customary at present with horse traction to unhitch the horses from each car as it arrives at the junction and haul it around the down town loop as a trailer on a cable train. When electricity is adopted, it will either be necessary to transfer the passengers and let the electric car go no further or hitch the motor car to the cable train and haul it around as a trailer. Either of these expedients seems at first thought to be very undesirable. It is not advisable to transfer at these points, because the incoming cars are crowded with passengers, nearly all of whom are going down town. If they are transferred, provision must be made for them on the cable trains. This means that a lot of empty cars must be hauled from the cable car barns, several miles out, simply to accommodate passengers around the down town loop. If the motor cars are hauled as trailers, there is the objection

ordinary journal box sleeves. The eccentric sleeve is made so that it can be turned around in the motor journal boxes. By turning this eccentric sleeve around one-half a revolution, the motor can be moved three quarters of an inch toward or away from the car axle, and the gears thus brought into or out of mesh. The rotation of the sleeve is effected by a worm gear. The worm gear shaft runs lengthwise of the truck until about midway between the axles where it connects by a bevel gear with a shaft running parallel with the axles and extending out to one side of the truck, where provision is made for attaching a controller handle as a crank. The shafts for both motors come out on the same side of the truck.

A car equipped in this way has been fitted up by the General Electric Company for Mr. Chapman, and has had several trials around Chicago. It takes about thirty seconds to disconnect both motors. Some inconvenience has been found on account of the gears not meshing when an attempt is made to throw the motors in gear. According to mathematical calculations this will probably

occur about one-third of the time before the pinion is worn, and less than this as gear and pinion are worn down. The results as to the comparative power consumed with the armatures running and at rest were disappointing in one sense and encouraging in another. As showing the small mechanical loss in the armature of a motor they are encouraging. The saving with the armatures thrown out was very much less than the majority of engineers would expect. Dynamometer tests on horizontal effort were, of course, dependent very much on the condition of track, but the pull averaged about 350 pounds with the armatures out, against 450 with the armatures in gear.

The device itself is certainly about as simple and effective as it is possible to make it. As to whether the power saved is worth the extra expense and trouble involved is still an open question.

### CABLE AND ELECTRICITY IN CALIFORNIA, COMPARED.

A western engineer has been looking into the relative cost of construction and operation of the two systems as working in San Francisco, and while the comparison is in some respects a local one, yet in the main it is fairly stated as to large cities generally, especially as to the great arteries of travel. The item of cost of cars it must be remembered is Pacific Coast prices.

The report states:

"The San Mateo electric road, as operated to-day, requires as much horse power to operate it as the whole original Market street system—that is, Market street, Valencia Haight, Hayes and McAllister streets combined.

"The comparative cost of the motive power of cable and electricity is very much in favor of the cable road, provided the number of cars are in excess of say from thirty to forty.

"No single electric car can be operated with less than from ten to fifteen horse-power, this ratio remaining the same no matter how great the number of cars operated from the one power plant, while the average horse-power expended for each cable car operated here (San Francisco) is less than five. The ratio of horse-power per car decreasing as the number of cars operated by the cable is increased; for example, it would require from 10 to 15 horse-power to operate an electric line of one car and from 500 to 750 horse-power to operate the same line with 50 cars.

"In the case of a cable line it would require 50 to 70 horse-power to operate a single car line and about 250 horse-power to operate 50 cars on the same line.

"On a steep grade where a single electric car would require at least 50 horse-power to propel the same, a cable car would require no more and perhaps less than on any other part of the road, as the cars returning down the same hill or a like hill would balance those going up, and the power expended to propel either would be nominal.

"Rails used on the electric road bed must necessarily be heavier than those used on a cable, as an electric car empty weighs more than a cable car of the same capacity and its load combined. With regard to the cost of the same, electric cars fully equipped with two motors cost from \$5,000 to \$6,000, whereas a cable car of the same capacity with grip and brakes complete, would not cost to exceed \$2,000. While the cable road is cheaper to operate, the cost of construction is in favor of the electric road.

"Each single track of the present Market street cable originally cost about \$100,000 per mile, but material—and rails especially—were expensive when the road was built; rails costing at that time \$70 per ton can be duplicated to-day for \$40.

"Electric roadbeds do not necessarily need steel and concrete construction, therefore electric lines similar to Mission street can be built for half the cost of cable lines, or about \$25,000 per mile, single track, while that on Kearney street, that is with concrete foundation, from \$30,000 to \$35,000 per mile. This is on the basis of single track, but electric roads seem to be the most popular to-day. The difference in the cost of building them, the speed obtainable and the electrically lighted cars are all inducements to the contemplating builders to use the same on streets with gradients not exceeding one in seven."

### HOW NOT TO PREVENT SAFE ROBBERIES.

An ingenious business man, of Utica, N. Y., hit upon a novel plan for preventing safeblowers from robbing his strong box. The expedient got him into trouble, for a coroner's jury was compelled to expose his secret. The man, whose name is Goldstein, set an iron plate in the floor in front of his safe and connected both it and the safe with an electric light circuit. A person standing on the plate and touching the safe made a connection. Customers of Goldstein knew of the device, but supposed the electricity was generated in small batteries, as it was customary to shock those unacquainted with the trick. One afternoon the current was on, when Stuart England stepped on the plate and touched the safe. The shock killed him. A coroner's jury decided that Goldstein had no excuse for maintaining a death trap in so public a place as his store, ready charged for the first person who came in contact with it.

The scheme has little to commend it, for the professional burglar could easily make the test with a piece of wire, and if the current was found to be on, protect himself by breaking the circuit or insulating himself. At the same time there is the constant danger that some one for whom it was not intended will get the medicine.

The North Chicago Street Railroad has awarded contracts for four 1,000-horse-power Allis engines and four General Electric generators for its station at Hawthorne street and the river. The station foundations are being put in.

## GREAT ELECTRIC RAILWAY SYSTEM.

Hamilton, Canada, is to be the center of a great electrical railway system which is being constructed by the Hamilton Radial Railway Company. The accompanying map shows the points which the system will embrace. There will be 227 miles of road, made up as follows: Hamilton to Toronto, 39 miles; Hamilton to Guelph, 29 (to Fergus, 21); Hamilton to Gault, 23 (to Waterloo, 35); Hamilton to Brantford, 22, (to Woodstock, 48, and to Port Dover, 49); Hamilton to St. Catharines, 33, (to Niagara Falls, 45, and to Buffalo, 67). The road will be up to steam road requirements, only the lines to Waterloo and Fergus being equipped with electricity.

This system of railways is designed to make the city of Hamilton the greatest commercial center of the Niagara peninsula, which includes a large fruit growing and farming region. To collect and bring the produce of this section to one point was the object which has engrossed the attention of John Patterson, who is about to see this plan perfected. Three of the branches will be built and equipped as steam roads, as a portion of the line from Niagara to Woodstock will be used as a link for a fast train service from New York to Chicago. The plans of the company contemplate the shortening of the distances between many of the towns, as compared with that of roads now in existence, in some cases from one-half to one and one-half miles, and in others one-third to one-half the distance is saved.

Another advantage over existing lines, will be the frequency of trains. In one place for instance, where, under present conditions, it is necessary for a man to rise a 5 a. m. to reach Hamilton and return the same day, the Hamilton Radial Railway Company will have cars running every hour, making the trip in thirty to forty-five minutes. The system will also reach one-half the coal consuming population of Ontario, and will supply transportation to a population of about 700,000 persons, or about one-third of the entire population of the province.

The territory is served by the Grand Trunk Railway and small branches of the Canadian Pacific and the Michigan Central Railroads, but as will be seen on the map, they do not cover the field, as the Radial Company proposes to do. The prospects for revenue are good.

Bonds are being issued with ten years' interest paid up, making the stock the only claim on the net earnings for that period. It has been estimated that it is only necessary to earn \$1,400 per mile to make 7 per cent, and this is such a small amount to be expected from a territory so rich in resources, that the most sanguine expectations of the people interested in the enterprise are likely to be exceeded.

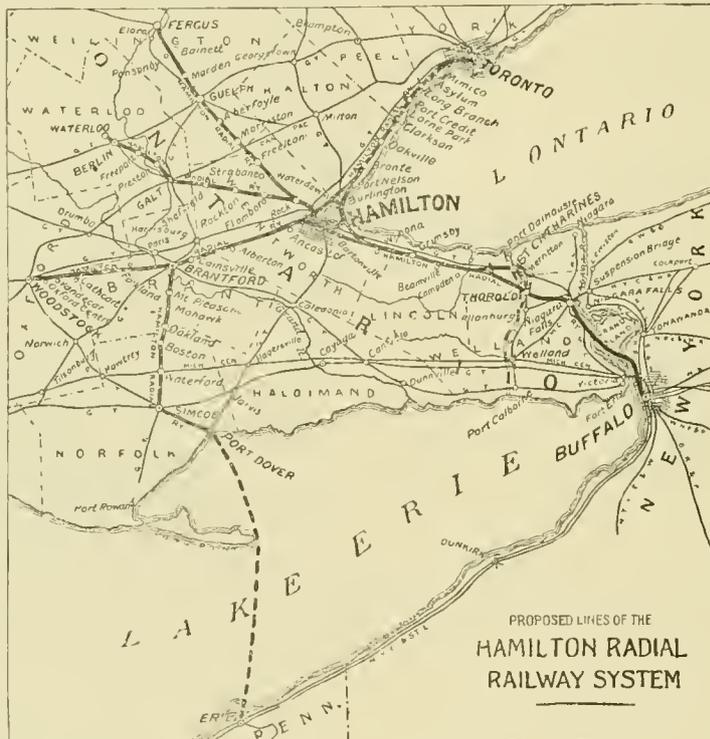

Work of construction has been delayed for some time on account of the large expense. But now the cheapness with which a first-class road can be constructed as compared with the cost a few years ago, has removed that obstacle. The eyes of all persons interested in electric railways, will be turned towards this road, as the work of construction progresses, for particular attention will be

paid to the development of high speed on its electric lines. Plans are being made and figures prepared with the expectation of handling 50-mile transmissions commercially, using the three-phase system at 20,000 volts pressure. At present the plans have not progressed sufficiently for details to be presented, but engineers are confident this prodigious feat can be accomplished.

The Hamilton Radial Railway Company is incorporated with \$2,000,000 capital, being owned largely by Boston and Eastern capitalists. It is reported that the Canadian Pacific Railway Company is also interested. The company

will probably use the charter of the Canadian Pacific for a line from Hamilton to Woodstock, with a promise of the usual Dominion subsidy of \$3,200 a mile, and the charter of the Niagara Central from Hamilton to Niagara Central with a bridge franchise. Recently was purchased the St. Catharines & Niagara Central Railway which runs twelve and one-half miles to Niagara Falls on the way of the system. It is expected that the city of Hamilton will give a bonus of \$400,000 on account of the benefit the road will be to the city.

H. B. VAN SICKLE, 321 Superior street, Toledo, Ohio, is making arrangements to construct the Delaware & Centerburg Electric Railway, and is in the market for six miles of second-hand 60-pound steel T rails, full length, to be shipped to Delaware, Ohio. Offers should name price delivered at Delaware. When completed the road will have twenty miles of track.

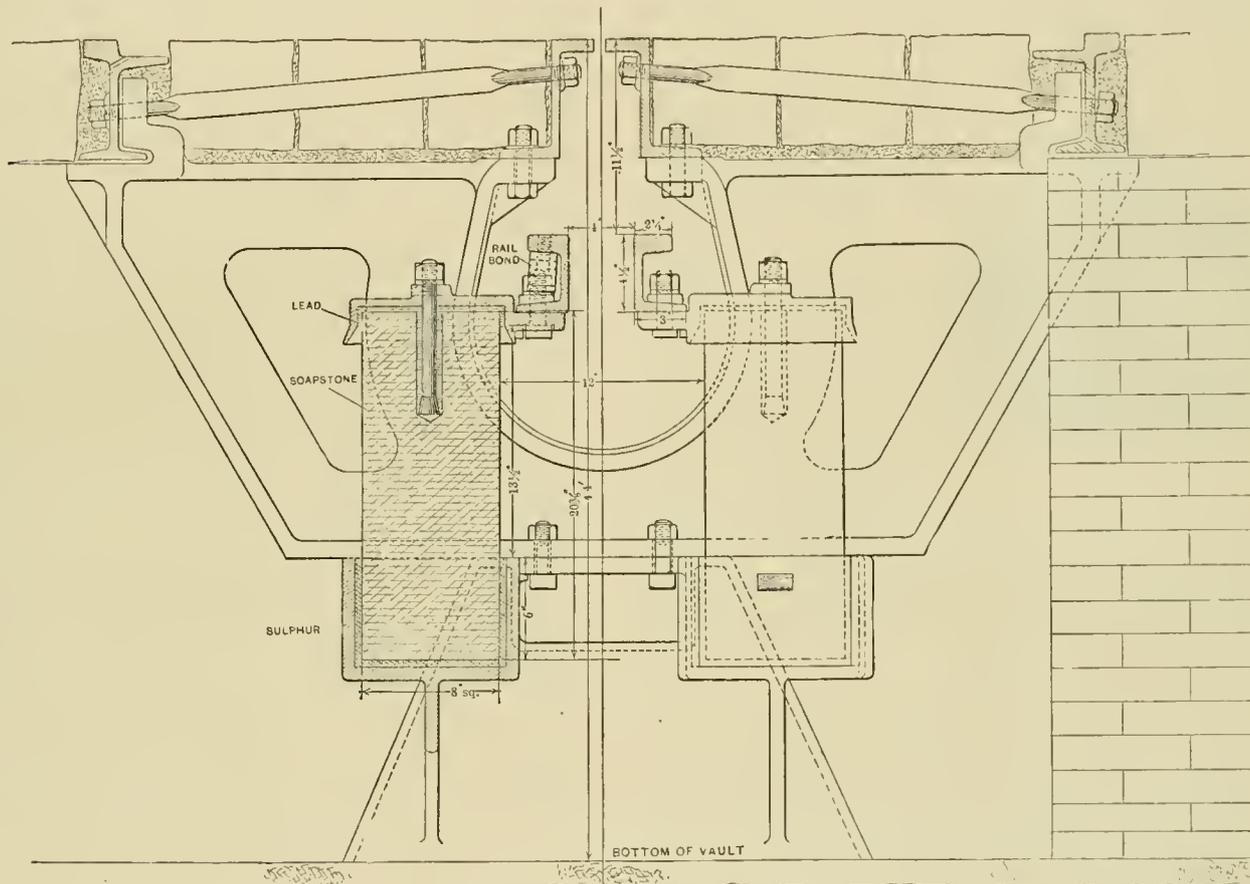

LENOX AVENUE CONDUIT ROAD, NEW YORK.

Metropolitan Traction Company's Experiment—General Electric Company's Solution of the Problem—A Miniature Pole Line Underground.

The electric conduit railway which is being built by the General Electric Company for the Metropolitan Traction Company of New York, on Lenox avenue, is of unusual interest because it will be the first conduit laid in this country with the endorsement of a large and long established electric manufacturing concern. This

to a cable conduit, except that every thirty feet are man-holes 4 feet 4 inches deep. The conductors are channel irons and are supported every thirty feet by soapstone pillars 13½ inches high. These soapstone pillars are set on iron pillars placed in the manholes. Between the iron pillars and the soapstone is a layer of sulphur. The accompanying engraving shows both the manhole and the yoke. The use of channel irons for conductors obviates many difficulties that have in the past beset conduits using wires. A conduit does not allow of much movement, and a good deal of trouble has been experienced on account of the stretch of the wires. This difficulty made frequent supports necessary, and frequent

NEW YORK CONDUIT—LENOX AVENUE.

does not mean that the large concerns have not done a great deal of private experimenting, but that those experiments and the experiments of others have had such unfavorable results that no concern of established reputation cared to lay a conduit for regular commercial use. Then, too, there were so many other electric railway problems to be solved which promised good results that the underground conduit business which gave so little promise of success had to take a back seat. The conduit being laid at New York bears marks of being planned by a corps of experienced electrical engineers who thoroughly understood the difficulties to be overcome, and in this respect is a marked contrast to some experimental lines that have been laid in this country.

The conduit laid on Lenox avenue is exactly similar

supports increase the chance of leakage and breaking of insulators, as well as causing more sparking at the clips. This conduit is certainly the most substantial thing in this line that has yet been built, and looks more as if it was intended for every day use than anything of the kind yet laid. It is, in fact, a pole line underground. The poles are short, but they are good insulators. The voltage used is to be only 250 to 300. This, of course, means that four times as much copper will be needed for feed wire as with the 500-volt trolley. The construction is more expensive than the ordinary cable conduit. The fact that the two conductors are directly under the slot and within reach of the small boy with a wire will not conduce to success. The two conductors make a grounded return unnecessary.

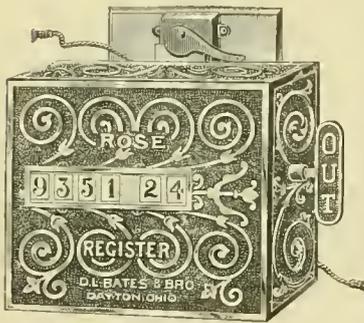

### THE ROSE REGISTER.

The very latest in street car fare registers is the "Rose," manufactured by D. L. Bates & Bro., Lima, O., successors to the Lima Register Company. The new register, which has several commendable features, is illustrated herewith, and is the invention of J. H. Rose, who has long been identified with the fare register business. He has patented several, including the Lima dial register, which is also made by the Bates Brothers.

The first feature that attracts the attention of the purchaser is the ease with which it can be changed from one car to another (when necessary). In changing the "out" and "in" signal at the end of the line, the mechanism is automatically locked, so the register can not be operated until the trip register is set to zero.

The totalizer shows a red figure  $\frac{7}{8}$  by  $\frac{3}{4}$  inches, and

is not molested in setting the trip register, which shows a black figure of the same size. The change in color obviating any error in taking the statement of the register. The manufacturers claim that it is utterly impossible to manipulate the register dishonestly. The mechanism is simple in construction and positive in action, and it is guaranteed not to get out of order. The case is of handsome design, of polished brass, nickel plate or oxidized copper. There is not a flat spring or gear in its construction, the entire mechanism being on one shaft.

THE ROSE REGISTER.

### NICKELS IN THEIR EARS.

A Chinaman boarded a Third avenue New York cable car, and, seating himself in a corner, lapsed into the condition of limp apathy characteristic of his race. His shoulders sloped forward and inward, his head drooped, and his hands rested open-palmed upon his knees. When the conductor came around with his usual salutation of "Fare, please," the Celestial didn't make a move.

"Fare, please," repeated the conductor. "Come, wake up, there."

Solemnly the passenger looked up at the official. Then he put his hand up and scratched his ear meditatively. When he brought it down his fingers clasped a nickel which he handed over to the conductor. The conductor smiled and returned to the platform, but an inquisitive passenger was much mystified as to where the nickel came from. Presently another Oriental boarded the car, and still another, for there are many Chinamen about Chatham Square. The inquisitive passenger watched them closely when the conductor entered, and saw both of them scratch their ears before

paying. He concluded that it must be a superstition and asked the conductor about it.

"Why, they carry their nickels in their ears," said the conductor. "When a Chink starts to go in a car he always sets a nickel in his ear. Perhaps it's for convenience. If it isn't, I don't know why they do it; but they always get the money with a quick movement. It used to puzzle me at first, but I soon got onto them. Now, when a Chink boards my car and falls asleep in the corner, quite a common performance with them, I simply get his fare from the right ear, for that's the one they carry it in."

At this point a Chinaman got on the car, and the inquisitive passenger looked at his right ear. Sure enough, snugly fitted in, was a nickel.

### WAS PERHAPS THE FIRST STREET CAR CONDUCTOR.

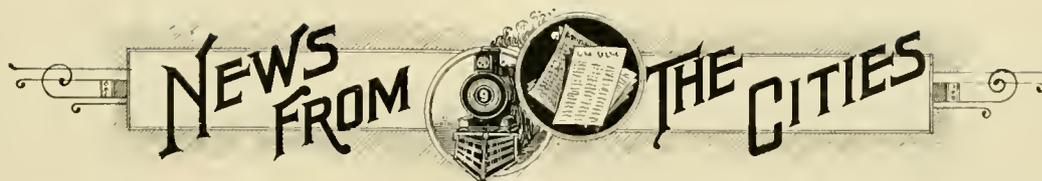

George D. Teller, who died recently in Buffalo, N. Y., at the age of 75 years, is believed to have been the first street car conductor in the United States. In 1835 Mr. Teller came from New York City to Buffalo, obtaining employment as conductor on a small road which ran along the terrace and beside the Erie canal to Black Rock. For three years he worked eleven hours every day, for the munificent sum of 75 cents.

Mr. Teller went into mercantile life, where he continued until 1853, when in an indirect way he entered the steam railroad realm by printing bulletin boards. In 1869 he began to publish "Teller's Shippers' and Express Guide." Mr. Teller became active in railroad-ing in 1871, when he was appointed eastern passenger agent of the St. Louis, Kansas City & Northern Railroad, which he held until 1882, leaving to join the Northern Pacific forces as traveling passenger and land agent. He held various responsible positions with this company, retiring from active service two or three years ago.

### NEST EGG FOR EMPLOYEES.

Employees of the New London Street Railway Company, New London, Conn., were agreeably surprised a short time ago by an announcement that the board of directors had deposited in the bank \$13,500 to the credit of each employe. The company had had a profitable and satisfactory year, with few accidents, due to the careful conduct of its employes. So to show its appreciation of good work, this plan was adopted. It is the intention of the company to act in a similar way next year.

A. S. HICKLEY, a superintendent of the Seashore Electric Railway Company, Asbury Park, N. J., received a verdict of \$6,000 against the Indianapolis Street Railway Company, of which he was formerly an official. While getting on the front platform of a car, he was struck in the head by the rebounding of a brake handle.

**Alabama.**

**BIRMINGHAM, ALA.**—The Birmingham Railway and Electric Company is converting its East Lake dummy into an electric line.

**Arkansas.**

**PARAGOULD, ARK.**—The Paragould Electric Light Company has been chartered with \$5,500 capital by T. H. Wyse and others.

**VAN BUREN, ARK.**—The Van Buren & Fort Smith Electric Railroad has been mortgaged to George C. Gronely for \$150,000 to provide funds for its construction.

**California.**

**SAN FRANCISCO, CAL.**—Adolph Sutro will use electricity instead of cable on his new line.

**SAN DIEGO, CAL.**—The San Diego Electric Street Railway Company will extend its line.

**PASADENA, CAL.**—The Pasadena & Los Angeles Electric Railway is receiving bids for a power house.

**PASADENA, CAL.**—L. P. Hansen was the only bidder for the electric railway franchise, and it was awarded to him.

**OAKLAND, CAL.**—The Haywards Electric Railway has asked for a franchise to change the equipment of the Twelfth street line to electricity.

**OAKLAND, CAL.**—The receiver of the Piedmont Consolidated Cable Company has been granted permission to equip that portion of the line over Piedmont Hills, with electricity.

**LOS ANGELES, CAL.**—Work is to be commenced on the Storrs electric crosstown railway, which has been promoted by the Jacksonville, Ill., Railway Company, of which William S. Hook is president.

**Canada**

**AYLMER, QUE.**—The Hull Electric Railway Company has been given a franchise for an electric line.

**ST. THOMAS, CAN.**—The St. Thomas Street Railway Company will build an electric line to Port Stanley.

**TORONTO, ONT.**—The Toronto & Suburban Railway Company has asked for a franchise for an extension.

**VANCOUVER, B. C.**—It is reported that the electric street railway has been sold to an English company for \$350,000.

**HAMILTON, ONT.**—The Hamilton & Dundas Railway Company proposes to convert the line into an electric road, if the town will give a bonus of \$25,000.

**NIAGARA FALLS, ONT.**—A. W. Wright, of Niagara and William Kyle, E. Hewitt and Robert Y. Sexworth contemplate building an electric road from Niagara Falls to Chippewa.

**BROCKVILLE, ONT.**—The special committee of the city council to consider the electric railway project made a favorable report, recommending that the company be relieved from taxation for ten years.

**MONTREAL, QUE.**—Frost loosened the iron girders of the new office building of the City Passenger Railway. The top floor fell through the building carrying everything with it. Two men were killed.

**OTTAWA, CAN.**—It is reported that the Canadian Pacific Railroad Company and the Ottawa Electric Railway Company have combined in a movement to build an electric line to Aylmer via Hintonburgh, Skead's Mills and Britannia.

**HAMILTON, ONT.**—Messrs. Biggs and Lewis, of Toronto, are endeavoring to organize the Toronto, Hamilton & Niagara Falls Electric Railway Company, to build an electric line from Toronto to Hamilton, and thence to a point on Niagara river, with a branch from Grimsby to Smithville and Dunnville.

**Chicago.**

**CHICAGO.**—The Wells & French Car Company's street car department was burned November 15.

**CHICAGO.**—The Chicago City Railway Company will issue \$1,000,000 additional stock July 1, 1895.

**CHICAGO.**—The South Chicago City Railway Company has applied for franchises on various streets.

**CHICAGO.** The North Side Electric Company has filed its certificate for a proposed increase of its capital stock to \$1,000,000.

**CHICAGO.**—The Chicago General Railway Company will issue \$10,000,000 in first mortgage 6 per cent bonds.

**CHICAGO, ILL.**—The Chicago General Street Railway Company has asked the city for franchises on many miles of streets.

**CHICAGO.**—The Nutting Electric Company, has been incorporated with \$50,000 capital, by James W. Hedenburg, Carl McFadden, Frank A. Smith.

**CHICAGO.**—The Metropolitan Elevated stockholders voted to construct twenty-five miles of additional roadway, estimated to cost about \$20,000,000.

**CHICAGO.**—The Interurban Railroad Company has been incorporated with \$50,000 capital by John W. Harrington, 134 Washington street; John Dymonde, 115 La Salle street; and Edgar H. Thorpe.

**CHICAGO.**—The Metropolitan West Side Elevated Railroad Company has filed articles with the secretary of state setting forth an enlargement of the objects of the corporation. This action enables it to make the extensions voted recently.

**CHICAGO.**—The Great Western Manufacturing Company, electrical supplies, with factory at Duluth, Minn., is in financial difficulty. The First National Bank, Chicago, is in possession of all the property on a claim of over \$100,000. It is too soon to know what the creditors will get.

**CHICAGO.**—The Union Elevated Railroad Company, \$5,000,000 capital, and the Central Chicago Elevated Railroad Company, with \$3,000,000 capital, have been incorporated to build down town loops for the elevated roads. The former is a part of the Yerkes' syndicate, and the latter is a union of the Metropolitan and Alley L interests, as John Worthy and Marcellus Hopkins both appear among the incorporators.

**Connecticut.**

**NORWICH, CONN.**—The Norwich Street Railway Company will make extensions.

**BRISTOL, CONN.**—The Bristol & Plainville Tramway Company will extend its line.

STAMFORD, CONN.—The Stamford Street Railway Company will be changed to an electric line. Some T rail will be used.

WESTPORT, CONN.—Local business men want to build a line to Southport to connect with the Bridgeport Traction Company.

BRIDGEPORT, CONN.—McMahon & Wrenn are surveying for five miles of electric road, in connection with their electric light plant at Pleasure Beach.

WESTPORT, CONN.—Francis W. Marsh, Bridgeport; Charles Fable, F. D. Ruland, M. D., W. E. Osborne, Charles Harris, Westport, will build an electric line from Weston to Westport.

NEW HAVEN, CONN.—Mayor Sargent is working on a plan for the extension of the New Haven Street Railway Company to East Rock Park. Application will be made to the legislature, so that work will begin in the spring.

### District of Columbia.

WASHINGTON, D. C.—The Glen Echo Railroad Company will extend its lines.

WASHINGTON, D. C.—The Columbia Street Railway Company will build a \$30,000 brick office building and car shed at Rosedale.

### Florida.

PALATKA, FLA.—The Palatka & Heights Street Railway Company will extend its line and use T rail.

PALATKA, FLA.—E. C. Haskell, William R. Powell and R. Packer have an ordinance for an electric line before the council.

ST. AUGUSTINE, FLA.—E. M. Holmes, president of the St. Augustine Electric Street Railway Company, has given notice to the city council that track laying will begin.

### Georgia.

COLUMBUS, GA.—Drake & Stratton, contractors, are reconstructing the Columbus Railroad Company's horse and dummy lines for electric power.

COLUMBUS, GA.—The Columbus Railroad Company and the North Highland Electric Railroad Company have consolidated. The officers are: John F. Flournoy, president; E. J. Rankin, vice president; Rhodes B. Bowne, secretary.

### Illinois.

ALTON, ILL.—The Alton Electric Street Railway Company will make improvements.

OTTAWA, ILL.—The Ottawa Electric Street Railway Company will make extensions in the spring.

DIXON, ILL.—The Rock River Electric Railway Company wants to extend its line to Grand Detour.

STERLING, ILL.—The Sterling Street Railway Company has been sold at sheriff's sale to satisfy a judgment of \$2,000.

EAST ST. LOUIS, ILL.—The car shed of the East St. Louis Electric Railway Company and seventeen cars were burned.

FREEPORT, ILL.—The Freeport Street Railway Company is now a full fledged electric line, having been opened for traffic Thanksgiving Day.

LINCOLN, ILL.—The Lincoln Electric Street Railway Company has had its franchise renewed and has been given additional grants of right of way.

LA SALLE, ILL.—A. G. Davids, superintendent of the City Electric Railway, wants figures on five equipments of canvas vestibule for front platform.

SAVANNAH, ILL.—J. B. Canterbury, La Crosse, Wis., is figuring on building an electric line. T rail will be used. A. D. Appleby is the local promoter.

WHITEHALL, ILL.—The Whitehall Electric Company has been incorporated with \$10,000 capital, by Golbert S. Vasseller, Orlando F. Guiswo'd and Henry W. Hand.

WAUKEGAN, ILL.—The Board of Trade at a recent meeting received favorable reports from the Bluff City Electric Street Railway Company, indicating that work may soon begin.

WAUKEGAN, ILL.—The Bluff City Electric Railway Company has completed its organization with these officers: Homer Cooke, president; T. H. Lindsay, treasurer; S. D. Talcott, secretary. The capital stock is \$200,000. The president's office is Room 50 Borden Block, Chicago.

### Indiana.

ANDERSON, IND.—The street railway will be extended to Collingwood and East Lynne.

ELKHART, IND.—The Indiana Electric Railway Company's line has been opened to traffic.

GREENFIELD, IND.—A petition has been filed for a receiver for the Greenfield Electric Light & Power Company.

ANDERSON, IND.—The Anderson Electric Street Railway Company has bought thirty-three acres of land for a park.

SEYMOUR, IND.—John S. Crump, Columbus, is reported to be negotiating for the purchase of the Seymour Street Railway.

MARION, IND.—The Marion City Railway Company is contemplating improvements, and may build a power house to accommodate additional machinery.

CRAWFORDSVILLE, IND.—C. E. Loss & Co., Chicago, have secured the contract for constructing and equipping the Indianapolis, Anderson, Alexandria & Marion Electric Railway for \$525,000.

TERRE HAUTE.—Voters of Harrison township will, on Dec. 17, vote on the proposition to donate \$20,000 to the Terre Haute & Brazil Electric Railway Company, which proposes to build to Brazil. Max Joseph is president of the company.

INDIANAPOLIS, IND.—The Indianapolis, Greenwood & Franklin Electric Railway Company, recently reorganized and incorporated, has asked for a franchise in Marion County. Grafton Johnson and J. K. Polk are the principal stockholders.

INDIANAPOLIS, IND.—H. Sellers McKee, president of the Citizens' Street Railroad has instructed the local management to complete improvements that have been waiting for the court decision. One new line will be built, and sixty new cars purchased.

### Iowa.

OTTUMWA, IA.—The Ottumwa Electric Railway Company will make extensions.

SIoux CITY, IA.—E. L. Kirk has been appointed receiver for the Riverside road.

FT. DODGE, IA.—S. T. Meservey and others who have bought the street railway will equip it with electricity.

SIoux CITY, IA.—The Manhattan Trust Company, New York, trustee for \$300,000 of bonds, has applied for a receiver for the Sioux City Cable Railway Company.

DUBUQUE, IA.—John Balch, Boston, has been appointed receiver of the Dubuque Light & Traction Company on application of the Old Colony Trust Company, Boston, trustee of a first mortgage to secure \$385,000 of bonds.

## Kansas.

LEAVENWORTH, KAS.—The Leavenworth Electric Railway Company will extend its lines.

SALINA, KAN.—L. M. Erb, Leavenworth, has been granted the street railway and electric light franchise. Five miles of the former must be completed within four months.

## Kentucky.

BOWLING GREEN, KY.—M. H. Crump, C. E., wants prices on electric street railway equipment.

ASHLAND, KY.—The Ashland & Catlettsburg Street Railway Company has secured its right of way and will build.

LEXINGTON, KY.—The Lexington Passenger & Belt Railway Company has been sold to the Chesapeake & Ohio Railroad Company for \$175,000.

NEWPORT, KY.—The South Covington & Cincinnati Street Railway Company will put in an electric system on Fifth street and a double track on Central avenue.

COVINGTON, KY.—The South Covington & Cincinnati Street Car Company, which purchased the franchise of Cincinnati & Rosedale Company, has been given an ordinance. The company intends to make other extensions during the spring.

HENDERSON, KY.—The Henderson Electric Street Railway Company has been reorganized with the following: W. E. Whitney, president; J. N. Alsop, secretary; David Banks, Reuben A. Miller and Elijah Sebree, directors. The company will spend \$50,000 in improvements. Eight motor cars and nine trailers are wanted.

## Louisiana.

NEW ORLEANS, LA.—The New Orleans Traction Company has decided to have an independent power plant.

NEW ORLEANS, LA.—President McClellan, of the St. Charles Street Railroad Company, has returned from an inspection trip, and plans are being made for converting the line into an electric road.

NEW ORLEANS, LA.—The New Orleans Traction Company has made financial arrangements which will enable it to equip all its lines with electricity, including twenty miles of new franchises.

NEW ORLEANS, LA.—It is reported that the Jefferson Avenue Railway Company will build its ten miles of double track as soon as right of way is secured. W. N. Louque, 835 Canal street, is in charge.

NEW ORLEANS, LA.—The Jefferson Avenue Railway Company has asked for a franchise for an electric line to Kennerville.

NEW ORLEANS, LA.—B. T. Woods has asked for a franchise for a double track horse railway from Carrollton to Southport, with privilege of changing to an electric line.

## Maine.

NORWAY, ME.—The directors of the proposed line to Paris are, J. Manchester Haynes, Orville D. Baker, John F. Hill, George Macomber, Augusta; George L. Beal, Freeiland Howe, Norway; Herbert L. Shepherd, Rockport.

LEWISTON, ME.—The Norway & Paris Street Railway Company has been incorporated with \$25,000 capital, to build two miles of electric road by George L. Beal and Freeiland Howe, Norway; John F. Hill, Augusta; Herbet L. Shepherd, Rockport; George E. Macomber, Augusta.

PORTLAND, ME.—The Portland & Yarmouth Electric Railway Company has been incorporated with \$200,000 capital; Edward S. Perry, New Haven, Conn., president; James O. Mayo, Naugatuck, Conn., vice-president; John S. Bradley, New Haven, Conn., treasurer. Work will be begun at once.

## Maryland.

BALTIMORE, MD.—The City and Suburban Railway Company will build an electric line to Clifton.

ANNAPOLIS, MD.—Surveying will begin for the line of the Annapolis & Bay Ridge Electric Railway Company.

KENSINGTON, MD.—The Chevy Chase & Kensington Electric Railway Company has been given a franchise.

BALTIMORE, MD.—The Mt. Washington Electric Railway Company has asked the county commissioners for a franchise for two miles of track.

CRISFIELD, MD.—T. S. Hodson is president, and O. P. Byrd, secretary, of a company formed to build two and a half miles of electric line to carry oysters.

BALTIMORE, MD.—Thomas S. Hodson, president of the Electric Light & Railway Company of Somerset county, says work will be begun in the spring.

### Wisconsin.

OSHKOSH, WIS.—J. K. Tillotson has begun work on the proposed interurban road.

MILWAUKEE, WIS.—City council has passed an ordinance requiring street cars to be heated.

APPLETON, WIS.—The Appleton Edison Electric Company is figuring on building an electric line to Neenah.

ASHLAND, WIS.—The Ashland Lighting & Street Railway Company will extend its lines to the county fair grounds.

WAUKESHA, WIS.—C. E. Loss & Co. have secured the contract for building the Waukesha Beach Electric Railway, six miles.

MILWAUKEE, WIS.—The North Greenfield Division of the Milwaukee & Wauwatosa Motor Railroad will probably be equipped as an electric line next summer and operated by the Milwaukee Street Railway Company.

### A NEW AND HIGHLY IMPORTANT LUBRICANT.

We have been watching with much interest for the past few months the progress in the tests of a new lubricant which, while equally adapted to a large variety of uses, commends itself with special force to street railways. The ingredients and manner of manufacture is a trade secret, although the elements composing the compound have long been known to chemists as the ideal lubricant. The trouble has always been, no one has until now succeeded in commercially combining these elements. This has now been accomplished by the Allerton Lubricant Company, of Chicago, at the head of which is the well-known millionaire, Samuel W. Allerton, and who has facetiously nicknamed one of the many brands of the lubricant "Farmer Allerton's Axle Grease." While it is without doubt the finest grease for all kinds of wagons, one application lasting an entire week on the heaviest kind of work, and this compound has already scored remarkable records on rock breakers, stamp mills, concentrators, and the roughest, heaviest machinery, we are more interested in its application to power house and car service. The nature of this lubricant is such that it cannot waste, but is every bit actually used. On July 6, last, Superintendent Bowen, of the Chicago City Railway, had it applied to the wheels of several electric motor cars running on a very dirty street over an old track and climbing a heavy grade at viaduct. The conditions were admittedly the most severe he could offer on his entire system of 150 miles. Not only have there been no hot boxes, but the one application has lasted until now, making a daily run of 150 miles per car, and to all appearances is as good as the day it was put on.

There has been a very small percentage of waste, and it will eventually have to be renewed, of course, but that date seems a long ways off even now, after steady use for five months. Mr. Bowen states that the journals of these cars have more pressure per square inch of journal than a loaded freight car. On steam roads surprising tests have also been made, using the new lubricant on one side of passenger and freight cars and the grease in use by the railroad company on the other side. While there have been frequent hot-boxes from fast running and heavy loads on one side, there failed to occur a single instance of over heating on "Farmer Allerton's" side.

The compound is of the consistency of a good hard grease, and therefore can be used most economically, as it does not spill or waste.

For a limited time to introduce the compound the Allerton Lubricant Company, whose general offices are in the Old Colony building, Chicago, will send free to any street railway superintendent a sufficient quantity with which to make a complete test. It can be used with equal success on bearings, axles, gas engines, motors, and in fact on anything but members of a city council.

### THE PARAGON INSULATING COMPANY.

The Paragon Insulating Company, Cleveland, O., has made rapid strides for a concern that has been in business but six months. Only the merit of its specialty, combined with the ability of those interested in the management of the business enabled it to attain its position. The object of the company was to supply a first-class insulating paint, which has been placed on the market as the "Acme insulating paint." It has the various qualities of other insulating paints, while the proprietors profess it has the additional quality of being an oil-proof paint, which is a boon to street railway men. The paint is the outcome of a long series of trials and experiments of the Meriam & Morgan Paraffine Company, which has for a quarter of a century been in the petroleum trade and conceived the idea of making an insulator out of petroleum products. The customers of the Paragon Insulating Company are of that class which is not accustomed to use an article in large quantities until it has been proven by many experiments to be all that is claimed.

E. B. Meriam, the general manager, has been with the Meriam & Morgan Paraffine Company for many years. He personally has charge of the manufacture of the insulating paint and of the asphaltuk.

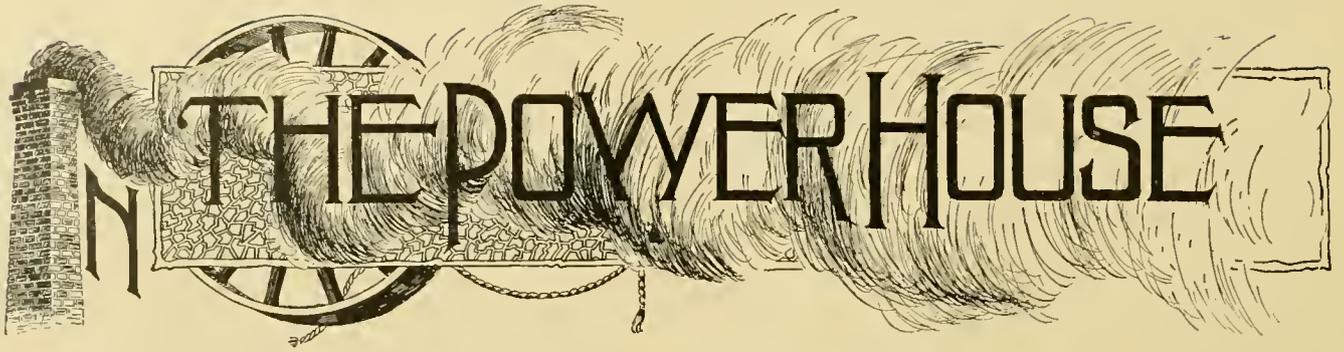

Asphaltuk is a new product that sells principally to wiremen and conduit manufacturers. It is delivered in a solid state, to be melted by the purchaser at the point desired. It is said to be an excellent penetrator and to leave a good black finish.

The officers of the Paragon Insulating Company are: J. B. Meriam, president; E. B. Meriam, treasurer and general manager; F. E. Abbott, secretary; Howard L. Browning, general manager sales department. The offices are at 1025 Society for Savings building.

### SELLS OAK STREET RAILWAY TIES.

W. B. Crane & Co., with a yard and office at Canalport avenue, Johnson and Twenty-second streets, Chicago, have enlarged their facilities for furnishing oak street car ties. Chicago street railroad companies have recently bought 275,000 oak cross-ties from the firm, as follows: West Chicago Street Railroad, 125,000; North Chicago Street Railroad, 100,000; Chicago General Railway Company, 30,000; Calumet Electric Street Railway Company, 20,000. The firm is one of the oldest engaged in the hardwood trade in Chicago, and, in addition to street railway ties, handles all kinds of hardwood lumber. A specialty is made of prompt deliveries of oak ties direct from the firm's own mills.

George Cradock, head of the extensive wire works at Wakefield, Eng., spent several days in Chicago the present month and favored the REVIEW with several calls. Mr. Cradock will reach home about January 1, having made an entire circuit of the globe, and visiting all the larger cities on his route.

*This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances, are expected to give their views and experiences on subjects within the range of the department.*

Always leave plenty of room behind a switchboard. It is a warm place to be in at times. Careless men will occasionally work behind them when they have no business to and again it is necessary to work behind them when the lines are alive, so that there is always a possibility for accident, and the more room allowed the better. If a man gets a shock in a narrow space he is liable to fall across the terminals and some of his tools with him. A case recently came under our notice where a man spent several weeks in a hospital and came out looking as if he had been run through a thrashing machine as a result of working behind a switchboard of a railway station when the lines were alive. He was found lying across the bus bars, a position he would not have been in had there been more room.

\* \* \*

Chief engineers should insist on care on the part of switchboard and generator attendants as to personal safety. It is usually thought that it is an employe's own business if he wants to take risks when he knows the danger he is running. This may be in a sense true but danger to an employe means danger to a station aside from any considerations of humanity. If the chief engineer is known by the employes to decidedly disapprove of any exhibitions of personal reckless it will have a good effect in making his assistants more careful not only of themselves but of the apparatus under their care.

\* \* \*

#### Direct Connected Units.

BY THOMAS ELLIOTT, CHIEF ENGINEER, ATLANTA CONSOLIDATED STREET RAILWAY.

I notice the wail of "One of the Old School" in the last REVIEW, and hasten to help to mitigate some of the misgivings he has about direct connected generators, because if he intends to stay in railway power houses, he will be obliged to operate the machines he now has doubts about. Of course there are direct connected machines running that were never properly designed, just as there

are lots of belted machines that ought to be in the scrap pile. The first direct connected plant that I visited was a revelation (no Indiana frog-pond about it).

The engine was a plain Corliss 32x60, running 95 per minute, and, with the exception of a little humming of the armature, was practically noiseless. The load varied from 1,500 to 2,500 amperes. The engine at that time was pulling about 75 cars and several of them had trailers. A few days after, I visited a belted station of about the same capacity, and the first impression was painful. However, a first impression will depend altogether on what station is visited. In regard to brushes running bad on direct connected generators, this is simply a matter of correct design and management. There are direct connected machines that run noiseless and sparkless and with no more trouble than the best belted machines. "Old School's" statement that belted machine commutators will last at least five years, is only good in some cases because we have had commutators wear out in two years and others that apparently will run ten years. "Old School" again ventilates the old saw about short circuits and shocks on the engine. Where is the direct connected plant that has suffered from this cause? My opinion is that direct coupling is the proper thing for the engine, and already some of the leading engine builders much prefer to build engines for direct connection. He says variations come quick as a flash, and there is nothing to cushion them. Well, what is the need, let them come. The direct connected unit can stand it a great deal better than a long stretch of cow hide which fits the back of an ox better than any thing in an electric plant. Once more, "Old School," there are direct connected machines built with the brush-holders, so that they move with every movement of the shaft. This is to overcome the imaginary trouble that "Old School" has in mind, but with any decent engine it is entirely groundless. Whatever may be the trouble with oil on the smaller sizes, we know nothing about it on the larger sizes. We operated our road for five years with machines belted from a counter-shaft; then we operated it direct-belted, and now the direct connected is carrying the load and the belted machines were consigned to the "Old School," where, between them and the scrap heap, I hope they will stay. The direct connected is better for several reasons. There is not near the liability for a burn out. There is no nuisance of a belt and accompanying noise, and the care and operation is precisely the same as a first

class belted machine. The advent of the direct coupled was the first evidence of good engineering in the generation of electricity. Let the good work continue.

\* \* \*

The Model Plant of the Fairhaven & Westville Railroad, New Haven, Conn.

The Fairhaven & Westville Railroad, of New Haven, Conn., recently started up a power plant that is an excellent example of thoroughly modern engineering. The work began early in 1894, when the company secured the services of Sheaff & Jaastad, engineers, of Boston, to supervise the work of construction. These gentlemen were eminently fitted for the task on account of previous experience in the actual construction and operation of power plants, and the station as completed

A. U. JAASTAD.

bears all the marks of good engineering. No small amount of credit is also due to President H. S. Parmelee, who has had personal control of the work.

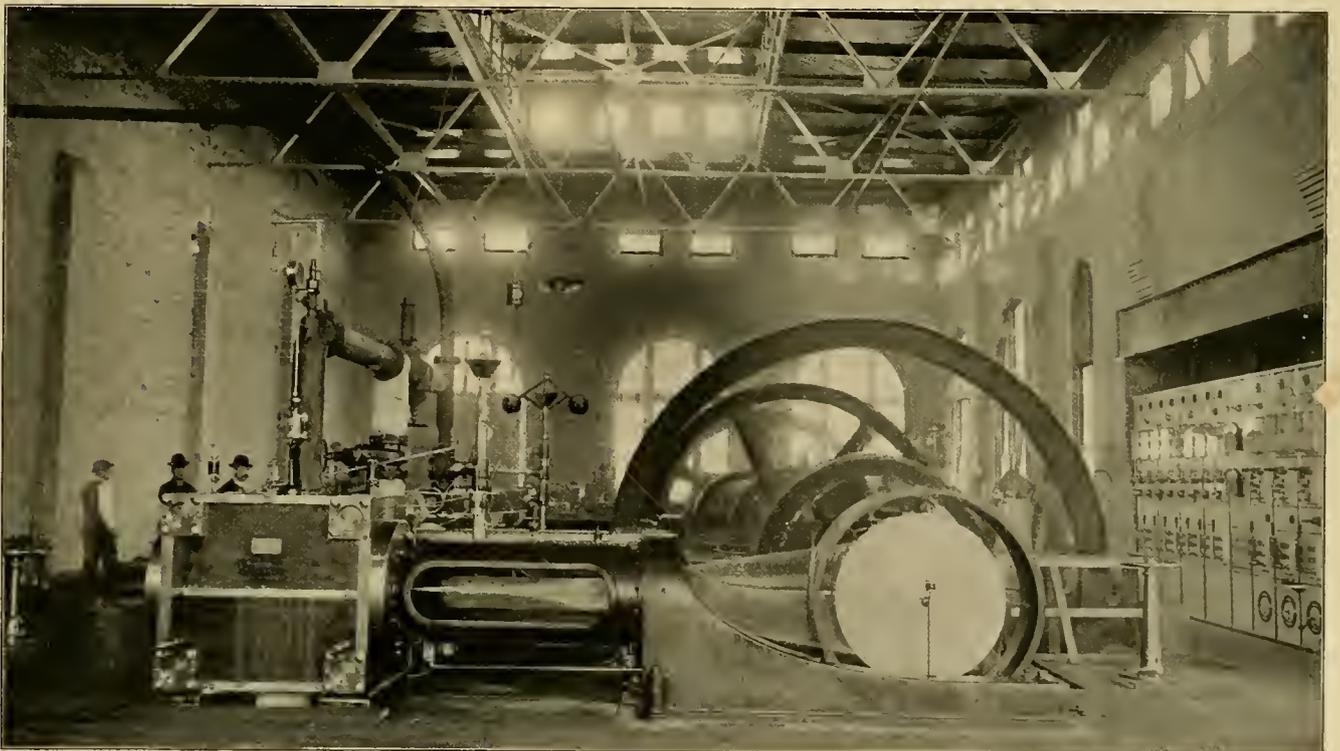

Work began early last spring and current was furnished from the station early last month. The location of the power-house is on Grand avenue at the Mill River, from which water is taken for condensing. The lot

being made land it was found necessary to drive piles as deep as 40 feet in some places before striking solid bottom. Over 900 spiles were used under the foundations. The spiles were cut off one foot below mean high water and concrete was filled in around them. They were then capped with stone. The outside dimensions of the power-house are 113 by 82 feet. The inside dimensions of the engine room are 109 by 49 feet. The boiler room is 97 by 28. The offices are 11 by 14. The chimney is 140 feet high, with a 6½-foot core. The building is laid out for a capacity of 2,000 horse-power, 1,000 of which is now installed. The engines are compound condensing corliss, made by the E. P. Allis Company, Milwaukee. The selection of an engine from so far distant a manufacturer is a striking testimonial of the high opinion in which these engines are held by railway managers. The engines have cylinders 16 and 30 inches by 36-inch stroke and run at 90 revolutions a minute. The bases are of the Allis 1890 patent. The condensers are independent, one being provided for each engine. They are known as the Allis fly-wheel vertical jet condensers.

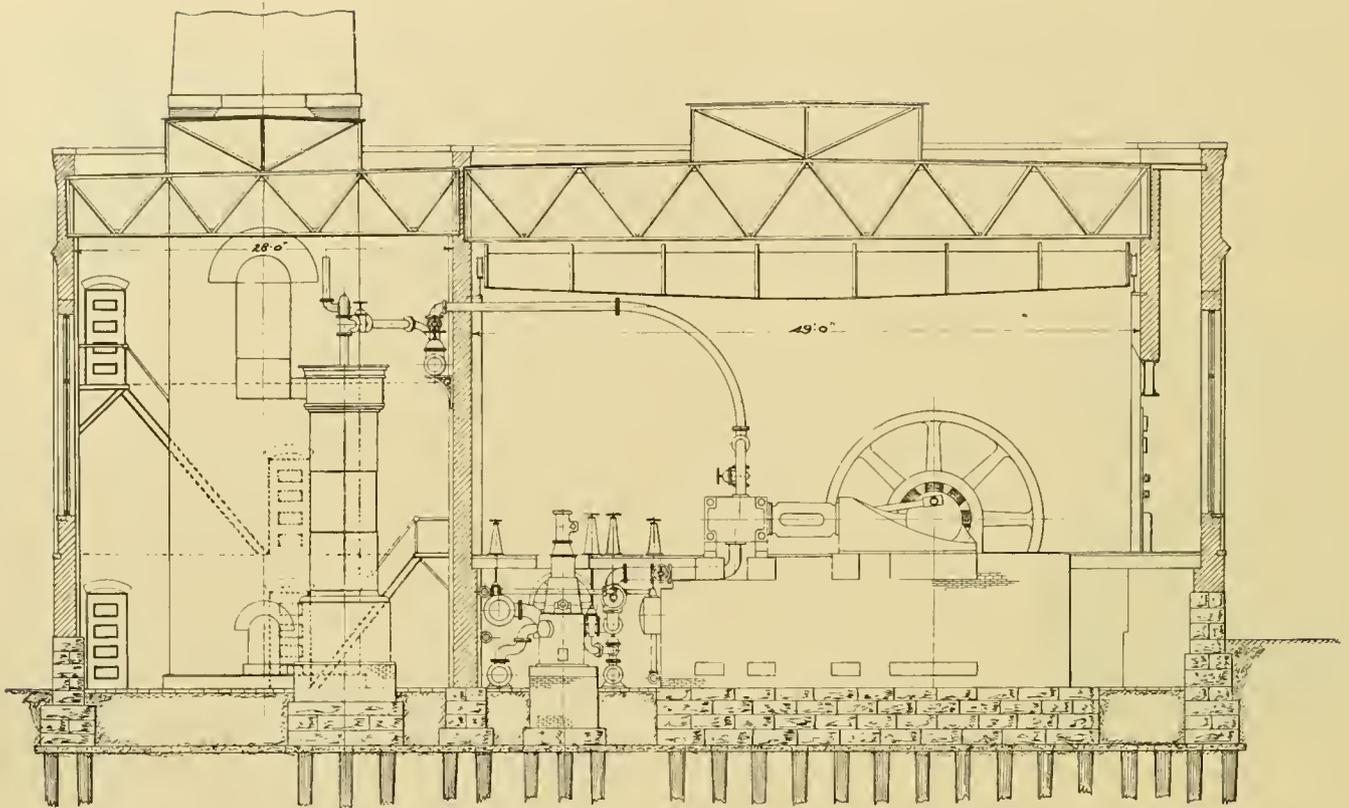

H. S. PARMELEE.

The boiler feed pumps are of the "Knowles" make and are in duplicate. These pumps are so piped that either one can be used for fire purposes. The heaters are of the Goubert make, one being placed in the exhaust

IN THE POWER HOUSE—FAIR HAVEN AND WESTVILLE RAILROAD, NEW HAVEN, CONN

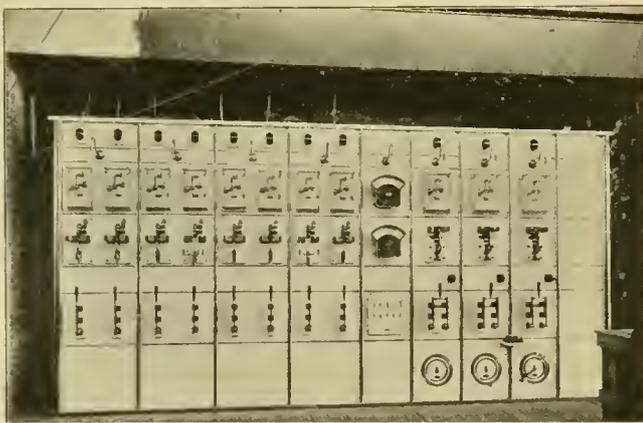

ELEVATION POWER HOUSE—FAIRHAVEN &amp; WESTVILLE RAILROAD—NEW HAVEN, CONN.

pipe, between each engine and its condenser, and an auxiliary heater located in the boiler room into which the exhaust steam from the condensers and pumps is piped.

The arrangement of the heaters is such that water is passed first through the heaters located in the exhausts of the engines, where it is heated to about 120 degrees,

and then through the auxiliary heater in the boiler room where it is heated to about 200 degrees, and from there into the boiler. piping was carefully laid out so as to secure the best possible results, the arrangements of the steam piping being such that should a break down occur in any part of the piping it would be impossible to cripple the plant. Short turns and right angle elbows have been discarded and long bends put in wherever practicable. The engines are provided with a main free exhaust pipe which can be used whenever it is found necessary to run high pressure.

In piping for the feed water for the boilers there were provided three different ways for feeding the boilers, making it almost impossible that any accident should render this important adjunct of the plant inoperative.

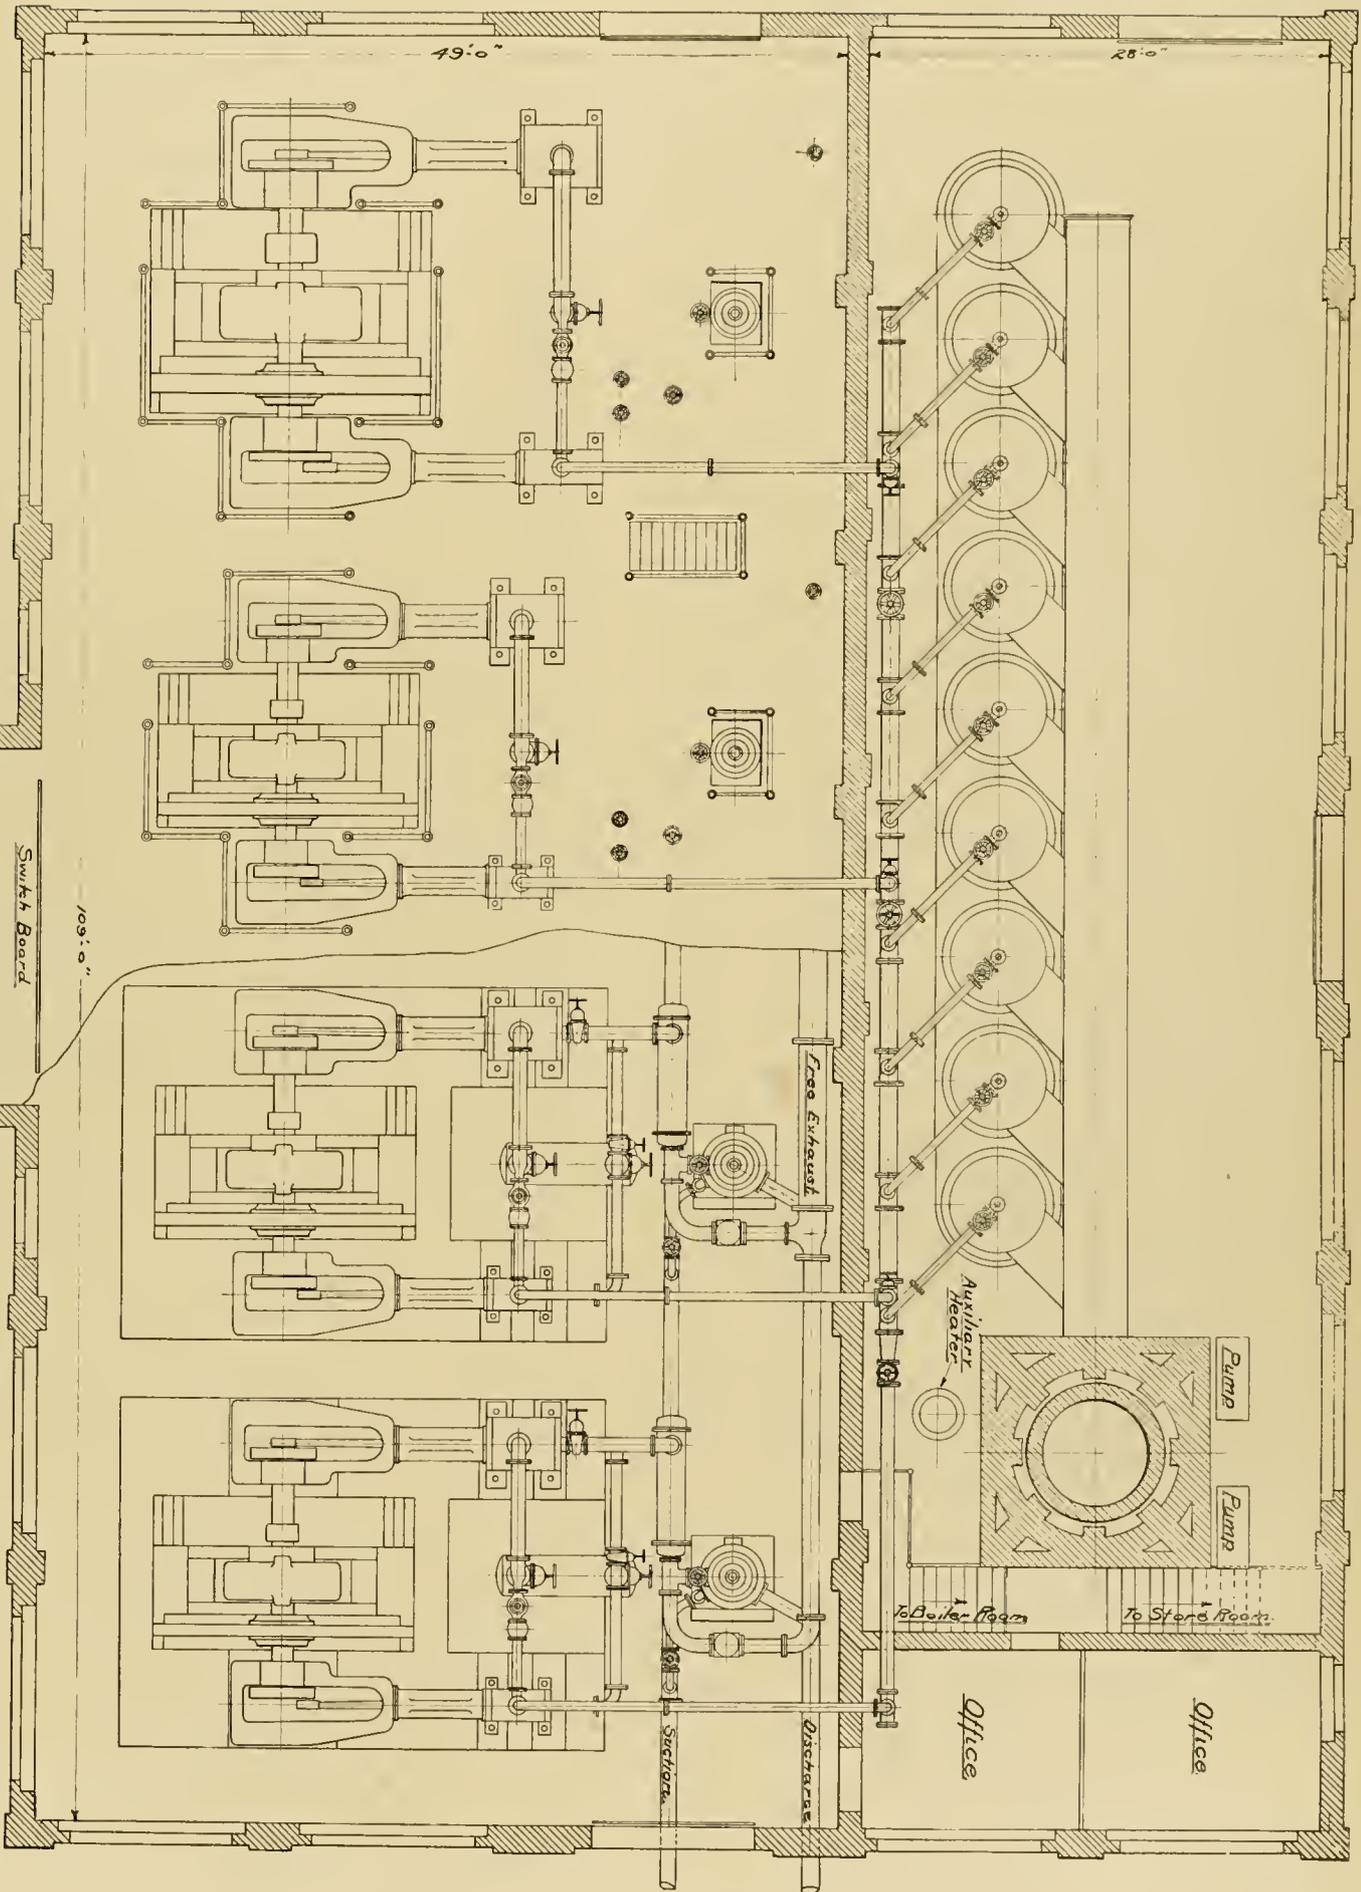

SWITCH BOARD.

and then through the auxiliary heater in the boiler room where it is heated to about 200 degrees, and from there into the boiler.

The boilers are of the "Manning" type and were furnished by the Bigelow Company of New Haven, Conn. The draft is controlled by a "Spencer" regulator attached to the main damper located in the extreme end of the smoke flue before it enters the chimney. The

EXTERIOR OF POWER HOUSE.

PLAN OF POWER HOUSE—FAIRHAVEN & WESTVILLE RAILROAD, NEW HAVEN, CONN.

The generators are furnished by the Westinghouse company and are direct connected of 300 kilowatt capacity.

The switch board is white marble trimmed with yellow brass and is provided with switches and instruments of the latest improved makes. The board and fixtures were furnished by the Westinghouse company. A feature in the arrangement of the switch board is that it is flush with the wall of the engine room, an off-set having been built onto the building into which the wires are run, from the outside, passing directly down through the flue to the back of the board, thereby concealing the wires, which are so frequently seen in the engine room.

The road is at the present time operating twenty cars, the electrical equipment of which was furnished by the Westinghouse company. More cars will be added as fast as possible until it is fully equipped, when it is expected it will operate about forty cars.

Throughout, the aim of the the constructing engineers has been to design and install in such way as to secure all the advantages of good and economical location and connection, with generous supply of room, steam and power, and yet to do so at a minimum expense consistent with good practice. They have succeeded to a degree highly complimentary to themselves, and satisfactory to the owners of the plant. Our illustrations and plans will give a very intelligent idea of the lay out, and are worthy of careful study.

THE ST. LOUIS ELECTRIC BRAKE.

An electric brake has been in use for five months on a car of the St. Louis & Suburban Railway, engravings of which are shown herewith. It acts simply on the principle of a solenoid, operated by the trolley current,—the

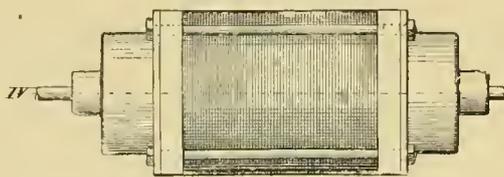

FIG. 1.

solenoid taking the place of the brake cylinder on an air brake. A form of solenoid has been devised which gives a powerful pull, with a small amount of energy and does not tighten the brakes with a jerk. Figure 1 shows the

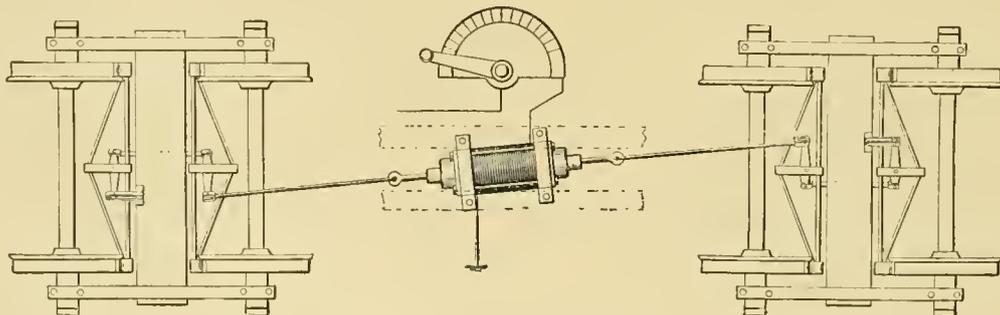

FIG. 4.

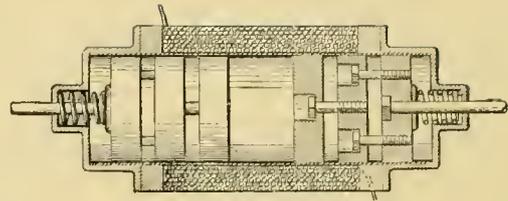

FIG. 2.

exterior of the solenoid, which, for a 16,000-pound double truck car, is 21 inches long, and has cores 5 inches in diameter. The wire coil is 18 inches long, and has ten layers of No. 10 wire. With an outside resistance of proper amount the brake will take 10 amperes and make an emergency stop. Figure 2 is a section through the solenoid as it appears when the brakes are released. Figure 3 is a section through the solenoid with the brakes applied. Figure 4 shows the equipment as applied to a double truck car. The peculiar divided magnet cores are employed to give a powerful application as the brakes become nearly set. This apparatus is being exploited by the St. Louis Electric Brake Company, on the directorate of which will be found J. L. Black, the inventor of the brake; P. M. Kling, vice-president and general manager of the St. Louis Car Company; W. V. Wolcott, president St. Louis Car Coupler Company; Samuel Resh, in charge of air brake repairs on the Missouri Pacific, and others not connected with railway work. Cars are now being equipped for the Union Depot Railway, St. Louis, the Toledo & Miami Valley Railway, of Toledo, O., and the Lancaster, (Pa.), Traction Company. It is certainly a great improvement over hand braking, as far as quickness and ease of application is concerned. The men at the head of this enterprise are good evidence of its integrity and merit, and our readers may expect to hear from the brake in the near future.

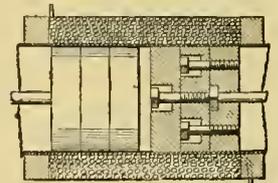

FIG. 3.

The many friends of B. F. Harris, Jr., the enterprising manager of the Urbana & Champaign Electric Railway, will regret to know that he has recently passed through a severe sickness, and has gone to Bermuda to remain until his health is recovered, which time, we hope, is not far distant.

## REVIEW OF THE YEAR WITH OUR ADVERTISERS.

As a Rule, Trade Has Exceeded Expectations.—Customers Increased On An Average of 30 Per Cent.—  
Bright Outlook For 1895.

The supply business for 1894 is practically closed. During the remaining two weeks there will be few large orders, and, aside from small lots of supplies for immediate use, comparatively little purchase of renewals. The manager is now trying to squeeze through December as economically as possible in the effort to help out this year's statement. Then, as usual, he will stock up in January, for there are only twelve hours between this year and next, and he has twelve good months, full of promise in sight, from which to pay; and so we may say the supply business for 1894 is now practically ended. It has been in many respects a curious year. Many who hardly dared to hope to pull through have toiled manfully at the oars and have brought their craft into shelter. Others who, while not fearing the storm, scarcely expected to do more than keep her head to the wind, now are pleased to find a very creditable record in the log book. Some tied up in port and did little more than keep up steam, and in readiness to charter the moment a cargo was offered at paying rates. Only a few, and those were craft where the barnacles of rash expenses or the toredoes of bad credit had weakened the hull, went to pieces in the rough water. The wrecks were surprisingly few, but as a rule went down with all on board, and are hardly worth raising.

The effect of the past twenty months has on the whole been a salutary one. Competition among manufacturers and absolute plunging by promoters had reached a point which not only could not long continue, but was beginning seriously to threaten the welfare of established and legitimate enterprises. When the collapse occurred the bags were punctured and those traveling on wind fell. True, many worthy schemes went down in the deluge, but they are steadily and firmly raising their heads and re-asserting their merits, and are only deferred for a time. When they do regain their feet it will be on a firmer foundation and with less crowding of the road they seek to travel.

It is a matter of congratulation that sellers continue to adhere to strict terms of sale, and that uncurbed credit has for a long time, at least, been turned down. There has been a general decline in prices, it is true, but on many articles the old prices were unreasonable and maintained only through a lack of knowledge on the part of the buyer as to actual cost of production and the small number of competitors. Especially has this been true in the item of railway motors, a much superior article of which can now be purchased at one-third the price the old style motors so readily commanded two years ago. Indeed, in this line competition has been so active that large orders have been accepted at prices it is difficult to believe can yield any margin of profit. This is, in one sense, of advantage to the buyer. At the same time no business can afford to sell at cost nor

should buyers expect it. Generators have also suffered in price, but not quite as severely.

Cars are also subject to exceedingly close figures, and with the large number of bidders and the restricted demands of the year have made the year an anxious one for those with large plants engaged in this work. The small orders have commanded fair prices, but the large ones which have constituted the bulk of the business have been placed on a basis of profit never before offered the buyer.

Rails have been in better demand than was anticipated and at lower prices than ever.

The small supplies, overhead materials and car accessories have, as a rule, fared very well. On the whole, there has been both more of new construction, renewals and betterments than was anticipated.

Now, what of the outlook. From a careful study of the field as a whole, we are satisfied the opening year will be a good one for street railways and those supplying them. Confidence has been restored; investment has evinced a disposition to venture from its hiding, and while still timid and cautious, is steadily gaining ground and more inclined to favorably consider propositions, which, for a time, could not even secure a hearing. The return to active investment will be slow and by easy stages, but each encourages another, and with an abundance of really very meritorious and deserving opportunities there need be no fear but that such will soon find takers. With the cost of construction both in labor and materials, and the cost of equipment lower than ever before, the present is really a most opportune one for capital. There are several thousand miles of city and interurban lines, which would to-day pay from the start, that have been held in abeyance or have come to maturity during the period of depression; that are now fully ripe for development. Managers, also, have now demonstrated ability to forecast construction and operating expenses and earnings with such a degree of certainty that the ordinary investor feels he knows what he is assuming in entering the field. All this, with the surprising ability of roads to adapt themselves to straightened circumstances, to an extent heretofore believed impossible, combine to create a healthful condition which is full of promise.

Each new enterprise will make possible another, and by the middle of '95, unless some great and unpredictable disaster, no more liable now than any other time occurs, the demand for materials will be so active that prices will have a strong upward tendency. Contracts placed the first quarter will almost certainly be taken at a much lower figure than can be obtained thereafter.

Industries are gradually regaining activity, which means immediate relief to street railway earnings, which in turn means ability to pay additional interest on new capital. Hence we anticipate a good, strong, steady

business in the street railway field for 1895. With the exception of new devices and small supplies, the field is not at present particularly inviting for the large investment of money in new plants for the manufacture of street railway supplies. Present plants, as a rule, have facilities sufficient to take care of business in sight for some time to come.

The Paige Iron Works, Chicago, has built the special work for the Metropolitan Elevated Railway Company, Chicago. The outlook for next season is "good."

The Partridge Carbon Company, Sandusky, O., has had a satisfactory year, increasing its customers twenty per cent. The company has placed on the market self-lubricating brushes. The outlook is "good."

The Storm Manufacturing Company, Newark, N. J., has had a satisfactory year, with an increase of 400 per cent in customers for its sleet-cutting trolley wheels, which have been described in the REVIEW. The outlook is "good."

The Johnson Company, Johnstown, Pa., says its business last year was very large, although prices were correspondingly low. "The outlook next year is decidedly bright, and we have no doubt we will, as usual, have all we can do."

The Weston Electrical Instrument Company, Newark, N. J., has had an increase of 50 per cent in customers. The capacity of the plant has been doubled and the round pattern railway instruments put on the market. The outlook is "good."

The Mica Insulating Equipment Company, New York, and Eugene Munsell & Co., have had a very good year, increasing their customers one-third. New micanite insulations were placed on the market, and a good foreign business was received. The outlook is "good."

The C. D. Morse Car Manufacturing Company, Millbury, Mass., has added to its customers a small per cent. No new devices, except for use in the works, were brought out during the year. The company believes it is "too early to estimate for 1895."

The Farist Steel Company, Bridgeport, Conn., has doubled its business in street car springs. An addition has been built to the rolling mill. The outlook for 1895 is a "fair business in this line, and should general business improve as we hope, very good."

The Fuel Economizer Company, Matteawan, N. Y., has seen fulfilled its expectations, with reference to trade. The foundry has been enlarged. The company has perfected new beveled edge, triple scrapers for the tubes, and an internal lid for top headers, to do away with bolts altogether for high pressures. The outlook for 1895 is "good."

The Watertown Steam Engine Company, Watertown, N. Y., has done fairly well during the year, and has increased its foreign business, making shipments to India and Africa. The full force has been worked full time all the year and night and day part of the time.

Shiffler Bridge Company, Pittsburg, has found business fully equal to expectations, with an increase in new customers of nearly 20 per cent. The company is now preparing plans for a large machine and blacksmith shop, to be erected at once. "The outlook is encouraging."

The Philadelphia Electrical Equipment Company, Philadelphia, is new in the business. It is equipping the League Island Navy Yard, as sub-contractor, with a sixty-day limit. Prospects for next season are "the best possible, there will be many interurban roads built, and the prospects are very bright."

The Shultz Belting Company, St. Louis, finds that the year's business has been beyond its expectations, and there has been an increase of 10 per cent in customers. A new hydraulic press has been added to its equipment. The well-known trade mark of the company, consisting of two worlds connected with a belt, is to be seen on many roads.

The Fitzgerald-Van Dorn Company, Lincoln, Neb., has increased its customers 40 per cent. An automatic draw bar, for elevated railroads, was put on the market, and the company has equipped the Metropolitan Elevated Railroad, Chicago, with the device. The company is also building special automatic draw bars for cable roads. The outlook is "very bright."

The Paragon Insulating Company, Cleveland, O., has only been in business six months, but the volume of trade has met all expectations. Howard L. Browning, formerly with the Edison Company, New York, has been made general sales agent. The company has bought out the Paragon insulating paint and "asphaltuk." The outlook for next year "is better than ever before."

The Hubley Manufacturing Company, Lancaster, Pa., has had more business than it expected. The new plant of the company is said by the officers to be the most complete and best appointed plant in the state. Many new devices have been put upon the market. One of the contracts was for the equipment complete of forty-three miles of electric road. The outlook for next season is "good."

The Ashley Engineering Company, New York, has received 20 per cent more customers. A new straight-way valve, a new check valve, and a new radiator valve, have been brought out. The check valve is meeting with favor, as it is complete in three pieces, and works in either a vertical or horizontal pipe, has no springs or pivots, and is first-class in workmanship, and low in price. The outlook is "very good."

The St. Louis Register Company, St. Louis, has increased its business way beyond expectations. Over 40 per cent has been added to its list of customers. Some expensive additions have been made to the plant, increasing its facilities for turning out the "old reliable security" in large quantities on short notice. "We believe 1895 will be the banner year for street railway supplies, especially for security registers."

The Lewis & Fowler Manufacturing Company, Brooklyn, N. Y., reports business equal to its expectations. President H. H. Dollard resigned and Charles C. Van Anglen was elected president pro tem. The other officers are: D. F. Lewis, treasurer; George W. Myers, secretary, and C. G. Dobbs, manager. The Acme car jacks were put on the market and improvements made in electric snow sweepers. The outlook is "very good."

The California Wire Works, San Francisco, Cal., had a business as good as was expected. The increase in customers was 10 per cent. No new devices were brought out. A number of cables were shipped to street railways of St. Louis and Pittsburg. The company also completed the Mt. Lowe Incline, Pasadena, Cal. A large business was done in Oregon, California, Washington and Mexico with the Hallidies ropeways. The outlook is "improving."

Warren, Webster & Co., Camden, N. J., have largely increased their customers. An addition was built to the boiler shop for making wrought iron heaters. Three new patents have been secured. The Canadian business is increasing. New machinery has been put in. One 2,500 horse-power Webster heater and purifier and the Williams system of steam heating, were sold to the Westinghouse Electric and Manufacturing Company, Brinton, Pa. The outlook is "very fair."

The American Car Company, St., Louis, has had a satisfactory business, with an increase of fifty per cent in customers. A \$20,000 addition to the plant has been built and a new single and double truck put on the market. The company equipped 100 cars of one of the St. Louis roads with double trucks and sold 100 open and 200 closed cars to the Electric Traction Company, Philadelphia. The outlook for next year is "fair."

The Griffin Car Wheel Company, Chicago, obtained 20 per cent more customers. The office building at the works was enlarged, new loading platforms were added, a new building for storehouse, and a grinding mill were built, and a new cupola and sundry machines added. Many new devices for use at the works were created, but none were put on the market. Twenty carloads of car wheels were shipped across the Atlantic, which was entirely new business. "No great improvement is looked for over this year."

E. Saxton, Washington, D. C., writes: "Business has been very good. Have been busy on electric lines

in and around Baltimore and on cable construction in Washington, D. C. I am well prepared and equipped for the construction of city and suburban trolley lines, underground electric and cable railways. The cost of construction of both cable and electric railways having been amazingly reduced in the last year or two, I am not without hope that 1895 will see a very large investment in such enterprises."

The Central Electric Heating Company, New York, N. Y., has increased its line of customers 300 per cent. Although the size of the factory has not been changed, the company employs three times as many men as last season. A new style of car heater has been placed on the market. Besides equipping many small roads with American electric heaters, the company has closed a contract for all the cars of the Metropolitan Electric Railroad Company, Chicago. The prospects for next season in this line "are very flattering."

Michigan Electric Company, Detroit, Mich., has no complaint in regard to the business of the year. It has been found necessary to double the store capacity in order to keep up with the demand: The new devices put on the market during the year are the "Michigan overhead material and railway specialties" and lights for electric cars. "We believe the result of the recent election has done much to restore general confidence throughout the country, and we look forward to a very satisfactory year's business in 1895."

The Eureka Tempered Copper Company, North East, Pa., reports through John C. Dolph, general eastern agent, New York, a satisfactory year, which has resulted in the addition to the eastern department of all the New England and a number of coast states, including Delaware, Maryland, Virginia and the District of Columbia. The principal work of the company is in connection with castings for dynamo and motor commutators. Many roads are making it a point to specify Eureka tempered copper when they have commutators to refill.

The Composite Brake Shoe Company, Boston, had more business this year than it expected at the beginning. The customers have been doubled during the year, and old customers have increased their orders. The Cincinnati Street Railway Company has bought 4,100 shoes since May. The company changed its name from Safety Brake Shoe Company to Composite Brake Shoe Company. Additional foundries were built for manufacturing at Philadelphia, Pittsburg and San Francisco. The company, speaking only for itself "considers the outlook very promising."

"Gates, of Chicago." Such is the trade mark of J. Holt Gates, Chicago. "Since passing of tariff bill," he says, "have sold more than factory can deliver, and customers have more than doubled. Have added General western agency of Elwell, Parker Electric Company,

Cleveland, O." The new departures during the year have been the electrical equipment of elevated roads, and direct connected alternating dynamos. One of the good orders, was the equipment of the Elkhart & Goshen Railroad with the Card railway motors and Mather generators. "Judging by amount of inquiries, business next year will be very good."

The Graham Equipment Company, Boston, has had a business that exceeded its most sanguine expectations, increasing its customers ten to one. A new plant was established in Providence with facilities for turning out twenty-five trucks a day. Graham's all-steel push plow, that requires neither extra crew nor motors, and is said to be light and effective and always ready for service, has been introduced. An inquiry for trucks was received from New Zealand. A fire at the Laconia car works in July destroyed the company's patterns, causing a loss of \$50,000 in cancels and inability to deliver goods. On July 26 a truck was on car ready for shipment at 4:30 p. m., the order having been received at 2 p. m. "A conservative business will be done and the payments will be invariably good. We do not expect to build more than 1,000 trucks."

The Ohio Brass Company, Mansfield, O., has had a satisfactory year, October bringing the largest trade, which is remarkable, as it is in the off season. At the beginning of the year only one or two Ohio roads were on the books of the company, but now the list includes nearly every road in the country. Considerable new special machinery has been added to the plant, and the employes increased in foundry and machine shop. The type K trolley insulators, Spillman trolley ear, Jewell trolley sling, reversible and adjustable track brush holder, and many other new devices have been put on the market. The company will equip 75 to 100 miles of the Indiana Electric Railway Company, if the latter's plans are carried out; deliveries have been made on this order. "We believe the coming year will be far better for every one interested in the street railway business than the past year has been. As manufacturers, we look forward to a business which will be several times larger than our business of last year, and, on the whole, we are inclined to take a very hopeful view of the outlook."

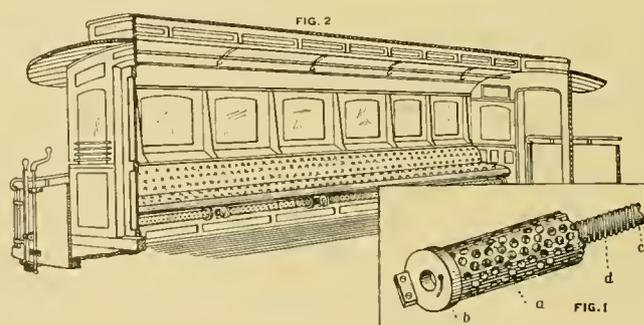

C. C. Caldwell, Shelbyville, Ind., will deliver his lecture on a collection of electrical, marine and railroad views, at the Lexington, Ky., Exposition, on two occasions, between Christmas and New Year's Day. In connection with an exhibit of his photographs, he showed in his exhibit space, many special instruments and small electrical machinery. Mr. Caldwell has had a successful season with his lecture, which has interested a great many people.

J. S. Hill, well known as the efficient superintendent of the La Fayette, Ind., Street Railway, and whose work has several times been mentioned in these columns, has resigned, and is now open to an engagement,

## COCHRANE'S RELIABLE ELECTRIC HEATER.

Within the month the Philadelphia Traction Company, has ordered through Charles Mayer, 400 of the Cochrane reliable electric heaters, manufactured by the Reliable Manufacturing Company, 53 State street, Boston, Mass., with a factory at Everett. The manufacturers experimented and investigated many styles of heaters before adopting this one, which they say has raised the temperature of a car to 55 degrees, when the external temperature was 17 degrees, using only four amperes of current, with the voltage 500. The Philadelphia Traction Company adopted the heater after thorough tests in its shops and in service on its cars.

The illustrations show the heaters in place, and a view showing construction. The heaters can be connected in series, in multiple, or multiple series. The heater consists of a metal tube (A) about three feet, six inches long and two inches in diameter, closed at both ends with a cap of

RELIABLE ELECTRIC HEATER.

hard rubber (B). Its sides are perforated. Within is another tube of metal (C) about an inch in diameter, open at both ends. The inner tube has a coating of asbestos around which is wound a spiral of wire (D), which, owing to the resistance which it affords to the passage of the electric current, becomes hot, when traversed by the current. One end of the coil is connected with the trolley, and the other with the ground. Air passing through the inner tube will be heated by contact with the hot wire, and by means of the perforations in the sides of the outer tube a constant circulation of air will be maintained between the tubes, which, being heated by the hot wire, a large volume of warm air will be diffused through the car, while the constant supply of cold air will prevent the wire from becoming excessively hot. It has been found in practice that the tube never becomes so hot but it is possible to bear the hand upon it. A series of tubes is secured end to end, on the rising board of the seat, as shown in Fig. 2, and are entirely out of the way. It is unnecessary to cut or disfigure the car to place them in position.

Frank X. Cicott, manager of the railway department of the Pettingell Andrews Company, sailed on the Lucania, Dec. 1st, for Europe, in connection with the firm's girder rail business with Dick, Kerr & Co., London.

PICTORIAL EVENTS OF A MONTH.

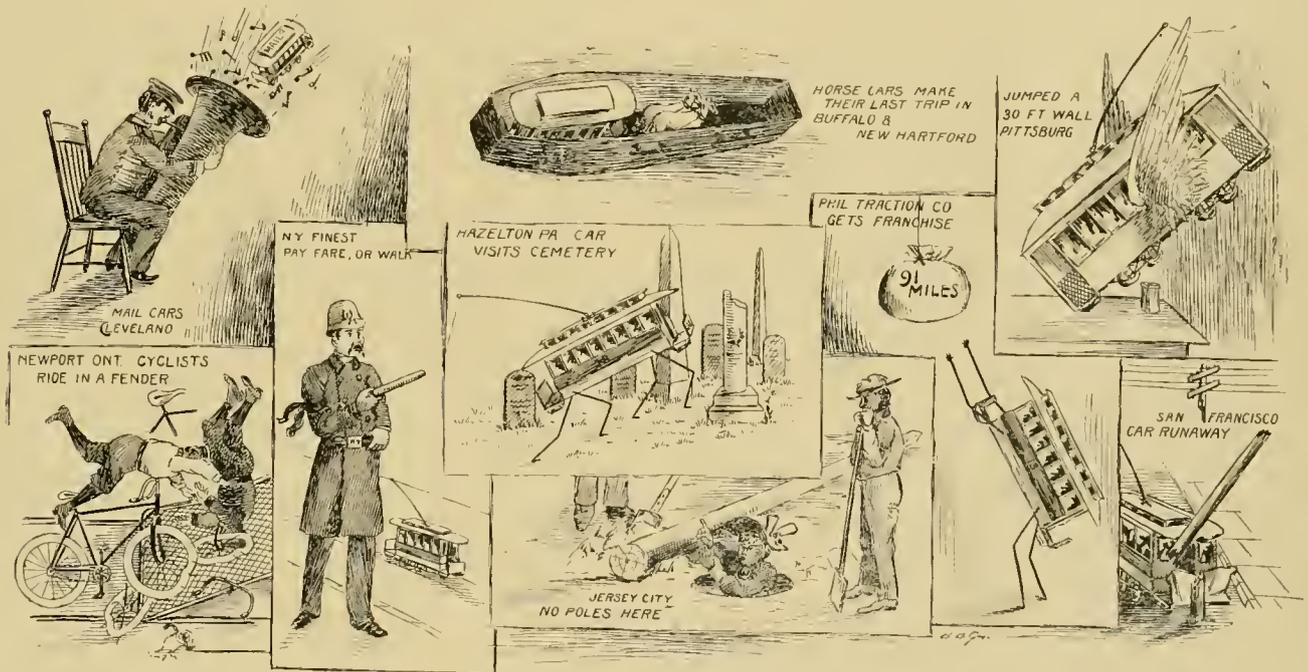

Cleveland is joyous, because there is a strong likelihood that she will secure a trolley mail service. The postmaster wants it, the people demand it, and the post office officials at Washington have given their consent. The only thing to be done is to get it, so the Clevelandites are blowing their horn in expectation of the happy event.

The gruesome looking picture at the top of the center of the page, is in reality not so mournful as it looks. While horse cars are no more in Buffalo, New Hartford, Conn., and several other cities, the municipalities are not dead. They have simply outgrown their garments and cast them off, having clothed themselves in new electric lines. These are signs of life, not of death, for it is the result of progress.

Two bicycle riders in Newport, Ont., were struck by an electric car as they were trying to cross a street. The fender caught them, saving them from injury. The wheels were not so fortunate.

This policeman is not so big as he looks, for he is suffering deep affliction, and is mourning because he has to pay street car fare or walk. He can no longer travel his beat by riding on the cars. New York has voted a constitutional amendment which provides a penalty for any public official who uses a free pass, and a like penalty for the company that issues it. Lawyers have agreed that under the law, policemen and firemen will, after January 1, lose their perquisite of free car rides.

The Consolidated Traction Company, Jersey City, N. J., met with an obstruction, when it tried to set poles in La Fayette. A lady property owner objected to one

One of the cars on a Pittsburg suburban line jumped through an iron fence, and landed on the roof a house about forty feet below. The conductor jumped, but the motorman stuck to his post until the car began to drop, when he was thrown off, being injured internally. Two passengers were thrown against the front door, and when the car struck, bounded to to the rear door, but were uninjured. A small girl, with her baby sister, was passing when the car crossed the sidewalk. The smaller child was caught by the fender, as if she was a tennis ball, and landed on the ground, ninety feet below the point from which she started. A passer by, who saw her falling, was surprised to hear her say, "Mister, please pick me up?" Her injuries were not serious. The track was covered with yellow clay, made slippery by rain. The car began to get away and reverse current was used, but without effect. When the car struck a short curve, it did not take it, but kept on its course.

being placed in front of her premises. The foreman told her he had orders and the right to put a pole up there. As he seemed determined to obey his orders, she jumped in the hole and defied the men to proceed. From 9 until 3 o'clock she "stood her ground," when she was relieved by a watchman.

The Philadelphia Traction Company has received a grant of franchises over 91 miles of streets from the city. This makes quite a bagfull, and will serve to keep out competitors.

San Francisco, like Pittsburg, had a runaway car down a grade. The car only ran through a telegraph pole. There were eight passengers who kept their seats, escaping without injury. The brake beam broke, as the car started, so it was impossible to control the car.

M. F. HEISKELL has been appointed general manager of the Wilmington (N. C.) Street Railway Company.

The Sweet Electric & Manufacturing Company, Grand Rapids, Mich., has increased its facilities for manufacturing, and is able to keep pace with its increasing business.

THE electrical repair work of the League Island Navy Yard, at Philadelphia, has been awarded the Philadelphia Electrical Equipment Company, of which C. P. Young is general manager.

The Falk Manufacturing Company is having good success with the introduction of its trolley wheel, as the wheel makes friends wherever tried. Some of them have made 12,000 miles without any repairs.

Charles A. Schieren & Co., New York, have sold to the Jacksonville Street Railway Company, Jacksonville, Florida, 104 feet of 30-inch, double leather belt, 104 feet 24-inch, 65 feet of 15-inch, and 79 feet of 15-inch belt.

J. M. Denniston, the well-known street railway man, has accepted the agency of the St. Louis Car Company. His office is 1064 Monadnock Building, Chicago. Mr. Denniston is very popular and has a great many friends in the street railway field.

The Alton Electric Street Railway Company, Alton, Ill., has ordered two 150-horse-power Buckeye engines and three 150-horse-power Wangler boilers. The company now has four 150-horse-power Buckeye engines and six 150-horse-power boilers.

The American Electrical Works, Providence, R. I., through its western agent, Francis E. Donohoe, has sold 900,000 pounds of copper feeder wire to C. T. Yerkes, for the North and West Chicago Street Railroad Companies. The contract amounts to \$118,000.

The Wenstrom Electric Works, Calverton, Md., will be devoted almost exclusively to street car equipment, all the lighter work being transferred to Ft. Wayne, Ind. R. T. McDonald, who controls the Wenstrom Company, has recently acquired the Ft. Wayne Company.

The Fitzgerald-Van Dorn Company, Lincoln, Neb., has just finished equipping 100 coaches and fifty-five motors for the Metropolitan Elevated Railroad Company with the Van Dorn automatic draw bar. The company is having many inquiries from cable and elevated roads.

B. M. Barr, of the Walker Manufacturing Company, Cleveland, has returned from a three weeks' trip in the south with orders for a large number of street railway

motors. He closed contracts for several car equipments with the Akron Street Railway Company before he went away.

The Link Belt Machinery Company, Chicago, has sold its standard water tube safety boilers to the Carnegie Library, Braddock, Pa., 50-horse-power; Morgan building, Buffalo, N. Y., 375-horse-power; North Chicago Street Railroad Company, Chicago, 3,000-horse-power.

Daniel Higgins, 1719 West Lombard street, Baltimore, Md., has been awarded the contract for supplying his new style number badge to the conductors of the Baltimore City Passenger Railway Company. A new system of operating the cable and electric lines made a change in the style of badges necessary.

The Storm Manufacturing Company, Newark, N. J., has sent to its friends a paper weight, which is a miniature of its "H. & C." patent ice and sleet cutting trolley wheel. J. H. Graham & Co., New York, sales agents, report many orders, and that every road that has tried them is enthusiastic in their praise.

The Taylor Electric Truck Company, Troy, N. Y., is building several sets of trucks for use under long cars, to run from thirty to forty miles an hour. The company reports that the construction of the Empire State radial truck is liked by practical street railway men, wherever they have had an opportunity to investigate it.

THE Cradock cables have again made a wonderful record, this time on the London (England) Tramway Company's line. A 30,000-foot rope of 1 1/8 inch diameter went into service July 8, 1893, and was still running on October 25, 1894, and far from worn out. It had on this latter date run 67 consecutive weeks, making 67,369 cable miles, or 1,809,000 train miles.

A. O. Schoonmaker, 150 William street, New York, makes a specialty of India mica for street railways, which he is prepared to furnish in any shape. For the accommodation of his western customers, Mr. Schoonmaker has placed stocks with his western agents, H. H. Williamson, 53 Public Square, Cleveland, and Reger & Atwater, 214 Pine street, San Francisco.

The following extract, shown us from a letter recently received by the Brownell Car Company, St. Louis, though short, tells a long story. It is in regard to Accelerator cars, and says:

"THE figure you name us is \$200 higher than any of our other quotations; but we give you the order, trusting you will give us our money's worth and a first-class car in every respect."

The Wheeler Rail Joint Company, New York, New York, has secured two large orders for its rail joints. The Chicago City Railway Company is one of the pur-

chasers, and the West End Street Railway Company, Boston, was the other. The mere fact of two such important street railway companies having become interested enough to buy, is sufficient recommendation of the utility of the Wheeler joint.

W. E. Sharp, agent for the Atlas Engine Company, Indianapolis, has sold two 12-inch by 15-inch tandem cycloidal heavy-duty engines, to be installed in direct connection with three Westinghouse 90-kilowatt machines in the New England Block, Cleveland, a fifteen-story building. The Westinghouse Company will also supply a marble switch-board 7 feet by 16 feet. The engine is the only four-valve tandem compound in the vicinity of Cleveland.

The Consolidated Car-Heating Company, Albany, N. Y., has received an order from the People's Traction Company of Philadelphia for the equipment of 300 cars with its system of electric heating. This is the largest order ever given for electric heaters. Other large orders recently received by the Consolidated Company are: 149 car equipments for the West End Railway, Boston; 187 for the Union Railroad, Providence; 60 for the Nassau road, Brooklyn, and many other smaller orders, aggregating in all about 500 car equipments. The heater is now in use in 100 cities and towns of the United States and Canada and on over 1,300 cars.

Edward F. Austin is in charge of the Pittsburg office of the Phoenix Iron Works Company, Meadville, Pa., manufacturers of the Dick & Church engines, boilers, feed water heaters, etc. He has sold a 15x18 engine to Jones & Laughlin, three 100-horse-power boilers for the Schenley Park Casino. The boilers are particularly designed for safety, and of special make all through. Mr. Austin reports several smaller orders, and looks forward to increased trade in the engine and boiler line. Mr. Austin was formerly sales agent for the Altoona Manufacturing Company, in the Pittsburg district, and was very successful in selling that company's engines.

The J. H. McEwen Manufacturing Company, Ridgeway, Pa., has sold two 150-horse-power simple engines, direct connected to General Electric generators, to the Continental Hotel, Philadelphia; one 300-horse-power simple engine, direct connected to Walker Manufacturing Company generator, to the Akron Street Railway Company, Akron, O.; two 60-horse-power tandem compounds, direct connected to C. & C. generators, to the Dundee Rapid Transit Company, Elgin, Ill.; one 280-horse-power tandem compound and one 250-horse-power simple, to the Scranton Electric Construction Company, Scranton, Pa. In addition are sales of thirteen engines, simple and compound, aggregating 2,125 horse-power.

Charles J. Mayer, Philadelphia, has secured a contract for equipping the cars of the Philadelphia Traction Company, with electric heaters. It will not surprise his many

friends, if Mr. Mayer succeeds in placing his heaters in the cars of all the Philadelphia street railway companies. The heater is known as the Cochrane Electric Heater, No. 2, manufactured by the Reliable Manufacturing Company, Boston. The radiating surface consists of two cylinders, one above the other, and, it is stated, requires no more than six amperes of a 500-volt current to heat the car to a temperature of 30 degrees above that outside. Experimental heaters were placed in cars Nos. 1081 and 1082, which were so greatly appreciated by the patrons of the company, that they took pains to remember the numbers of the electrically heated cars, and wait for them.

J. Holt Gates is installing six Card motor equipments and Mather generators, for the Elkhart & Goshen Railroad. He is also installing for the Bloomington (Ill.) City Railway Company a 100-kilowatt Mather railway generator and two Card motors, and in Fremont, Ohio, two Card motors. The Card Electric Company's factory is now entirely completed, and in active operation. Its series-parallel controllers, with quick break switches, are a new departure in car controllers. It seems strange that other electric companies have not used a similar device before. Mr. Gates reports the sale of thirty-six motors and generators in the month of October. The Elwell-Parker Electric Company, of which he is the western representative, makes a specialty of direct connected alternators, as well as the heaviest class of railway generators. Mr. Gates has five salesmen on the road, as well as an engineering corps.

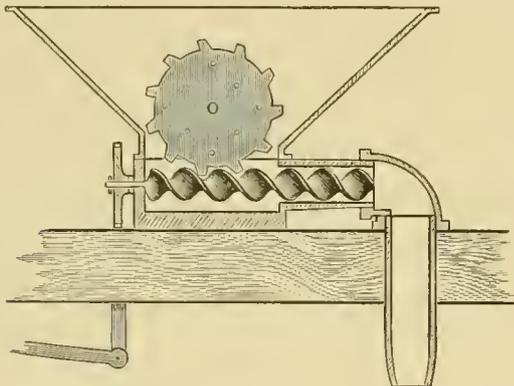

The Ohio Brass Company, Mansfield, O., reports a large number of initial orders for the reversible and adjustable track brush holders and steel-wire track brooms, which have been followed in almost every case by larger ones. In many instances the entire equipment of motor cars has been provided with these devices. Among the larger roads using them are: The Syracuse Street Railway, Syracuse, N. Y.; the Middletown-Goshen Traction Company, Middletown, N. Y.; the Cumberland Electric Railway, Cumberland, Md.; the Burlington Electric Railway, Burlington, Iowa; the Steinway Railway Company, Long Island City, N. Y.; the Central Electric Railway, Peoria, Ill. "The ease with which these holders can be manipulated," writes the company, "and the saving in consequence in the wear on the track brooms, is a strong recommendation in their favor. Every operator of a street railway company which requires a device of this sort should investigate these before placing his order."

Thomas V. Perkins, vice-president of the Mather Electric Company, Manchester, Conn., deserves much credit for the manner in which he has brought his company among the leaders in the manufacturing line. So many contracts have been placed of late, that the plant is compelled to run day and night to fill orders. Among the contracts are 100-kilowatt new type multipolar generator, two 25, one 20 and one 10-horse-power Manchester

motors, Overman Wheel Company, Chicopee Falls, Mass.; a 60-kilowatt generator, Connecticut River Paper Company, Holyoke, Mass.; one 80-kilowatt new type multipolar generator, Pierpont Manufacturing Company, New Bedford, Conn. (third order); 350 light dynamo, receivers Union Pacific Railroad, Pocatello, Id.; 350 light dynamo, Hub Gore Makers, Brockton, Mass.; 100-kilowatt railway generator, Ithaca Street Railway Company, Ithaca, N. Y.; 15-kilowatt direct connected dynamo, with Ideal engine, Wayne hotel, Detroit; 350 light dynamo (ring type), Meriden Britannia Company, Meriden, Conn.; 350 light dynamo, Berlin Iron Bridge Company, East Berlin, Conn.; 150 light dynamo, Curtis & Howard, Minneapolis, Minn.; 250 light dynamo, C. Dorflinger, White Mills, Pa.; 150 light dynamo, H. B. Coho & Co., New York; three 100 G. K. generators, Congressional Library, Washington. D. C.

### EUREKA SAND BOX.

The sand box shown in the accompanying engraving is being offered to the trade by the Eureka Sand Box Company, of Lebanon, Pa. It was designed by practical street railway men. The action is explained by the engraving. The disc disturbs and pulverizes the sand and the spiral delivers it to the discharge chute. It is operated by

EUREKA SAND BOX.

handle or foot lever. The roads using it are the People's Passenger Railway of Philadelphia, The Schuylkill Electric Railway of Pottsville, Pa., and the Schuylkill Traction Company of Girardville, Pa. The policy of

the manufacturers is to condemn no other box, but to prove worth by practical demonstration. The members of the company are S. P. Light, vice-president of the Lebanon & Annville Electric Railway; Thomas Williams, C. J. Barr, C. B. Andrews, and J. K. Raudenbush. The box seems to be doing good work with both sand and salt.

### NEW PUBLICATIONS.

THE Partridge Carbon Company, of Sandusky, O., is distributing a handy price list of its well known self-lubricating dynamo and motor brushes.

THE Lunkenheimer Company of Cincinnati has issued its 1895 catalog of valves, lubricators and steam engine specialties. Its 107 pages are profusely illustrated with excellent engravings.

C. W. HUNT & Co., have sent us a pamphlet which cannot fail to be of interest to all large power plant owners and builders. It is on the subject of coal handling machinery which has been adopted by several large electric power stations with a great saving in labor. The Brooklyn Heights Railroad is among important users.

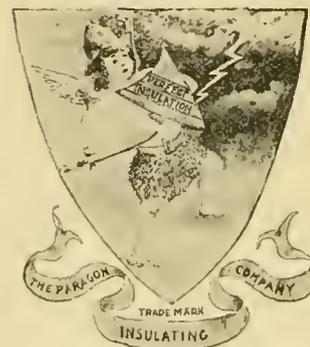

THE Barney & Smith Car Company, of Dayton, O., has issued a catalog giving a score of views of exteriors and interiors of street cars actually built by the company, besides a few sketches of trucks, gates, seats and steps. Some of the cars shown have been adopted as standard by different street railways. Although well printed on good paper the engravings can scarcely do justice to the fine workmanship of the cars turned out.
